Finely divided puffed porous coke. ALFRED H. WHITE (to Regents of the University of Michigan). U. S. 1,782,556, Nov. 25. Finely crushed material such as coal is carried through a retort, the walls of which are heated to substantially above 700°, while the particles are maintained out of contact with an appreciable amount of air, so that the particles are subjected to destructive distn. completely to carbonize the finest particles and partially to carbonize the larger particles. App. is described.

Coking pitch. HEINRICH KOPPERS A.-G. Ger. 506,141, July 6, 1928. A trough or basin contg. the pitch is heated externally until the pitch has fused, whereupon the container is closed by a cover to which a heating tube is attached so as to be embedded in the pitch. Addnl. details are given, and app. is shown.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

Compressibility and thermal expansion of petroleum oils in the range 0° to 300°. R. S. JESSUP. *Bur. Standards J. Research* **5**, 985–1039(1930). E. H.

Removal of sulfur from petroleum products. M. NAPHTALI. *Brennstoff-Chem.* **11**, 282–5, 375(1930).—The problems encountered in purifying petroleum products and gases are discussed. The H_2SO_4 and NaOCl processes of removing S from motor fuels are compared for effectiveness, cost and advantages. Recently developed processes of gas purification are described. F. W. JUNG

Investigation of Sakhalin crude oils. S. S. NAMETKIN AND E. M. SHAKHNAZAROVA. *Neftyanoe Khozyaĭstvo* **19**, 290–1(1930); cf. *C. A.* **24**, 230.—Crude oil from the Ekhabi district and Kadzussa No. 2 well had a sp. gr. of 0.9066; E_{50} 1.3; Abel-Pensky flash 31°, excise resins 22% and a cold test below —18°. It contained about 28% of a fraction boiling below 200°, 25% of kerosene, and a residue which is suitable for prepg. lubricating oils. Oil from the well Kadzussa No. 3 had a sp. gr. of 0.874; E_{50} = 1.2; flash —8°; excise resins 24% and a cold test below —20°. It contained 11% of gasoline of 0.776 sp. gr., 35% of kerosene of 0.867 sp. gr. and a high proportion of lubricating oils; a high-quality asphalt was obtained from the residue. A. A. BOEHTLINGK

Rationalization of crude-oil production. S. A. ANNENSKII. *Neftyanoe Khozyaĭstvo* **18**, 768–73(1930).—Wells low in crude-oil production should be left under gas pressure to increase the yield of crude oil. (1) The radius of drainage will be increased leading to an increase in the suction area proportional to the square of the radius. (2) The horizontal pressure in the strata will increase toward the well bottom as the result of static pressure of the gas, the oil thus becoming less viscous and therefore moving faster toward the shaft. (3) The amt. of the gas discharge decreases, thus leading to a lowering of the adhesion and the resistance of sand particles against the oil flow. (4) The counter pressure does not permit the gas to accumulate on the walls of the casing and therefore makes for free access of the oil to the shaft. (5) The wells are kept clean and water is kept out. (6) The gas factor is kept down to 65–86 cu m. per ton of oil, thus prolonging the life of the well. (7) The gas being discharged in the form of bubbles along the casing increases the production. A. A. BOEHTLINGK

Bright stocks from Grozny crude oil. A. N. SAKHANOV, L. G. ZHERDEVA AND G. V. POLYANSKAYA. *Neftyanoe Khozyaĭstvo* **18**, 800–5(1930).—Bottom oils, constituting about 50% of Grozny paraffinic fuel oil, of 0.960 sp. gr., E_{100} = 7.58, Holde cold test 45°, and excise resins 60%, were diluted with ligroin (1 1) and treated with H_2SO_4 (15%). This yielded 50% of a greenish oil, which was treated with 25% of fuller's earth at 65–70°, diluted again with ligroin, cooled down to —28°, centrifuged, the solvent evapd. with steam. The yield was 35.5% of a bright stock of 0.921 sp. gr., E_{100} 3.9, flash point 281° and cold test 3.5°; 3.5% of ceresin (m. 69°); and 3.5% of oil sepd from the petrolatum obtained by centrifuging. Heavier bottom oils produced a still lower yield of bright stock. However, when treating the fuel oil (mazout) under similar conditions only 24.2% was lost by treatment with H_2SO_4. Centrifuging the oil layer yielded 37% of petrolatum (on the fuel oil) which contained all the paraffins. This treated fuel oil which had an E_{50} of 7.38 was steam distd., yielding high-quality lubricating oils and bright stock. A vacuum distn. of the treated oil produced 16% of a bright stock of E_{100} = 5.18, 6% of machine oil, 5% of spindle oil, 23% of petrolatum, 11% of gas oil. The loss was 39%. The petrolatum after steam and a vacuum distn. yielded about 20% of paraffin. 2.7% of ceresin was recovered from the residue. A. A. BOEHTLINGK

Crude oil from gushers in Maikop. M. A. BESTUZHEV AND P. A. MALASHKIN. *Neftyanoe Khozyaĭstvo* **18**, 965–70(1930).—Crude oil from the layer *e* was subjected to the usual refining treatment. It contains some paraffin, 37–38% of a fraction b. below 200° and 15–16% of a kerosene fraction of 0.837 sp. gr. Lubricating oils obtained by vacuum distn. did not meet the specifications and the loss by treatment amounted to 60%. The asphalt prepd. from the residue was also below standard. Cracking, however, yielded 24% of gasoline, 66% of fuel oil and 10% of gas; with recycling a total yield of 37% of cracked gasoline was attained, together with 48% of fuel oil and 15% of gas. A. A. BOEHTLINGK

Apparatus for the determination of specific gravity of clay solutions used in rotary drilling. P. N. CHEKANOV, K. P. PONOMAREV AND N. N. MARKELOV. *Neftyanoe Khozyaĭstvo* **18**, 953–8(1930).—A lab. app. is described. A. A. BOEHTLINGK

Research problems in the oil industry and naphthology. A. N. SAKHANOV. *Neftyanoe Khozyaĭstvo* **19**, 163–7(1930).—A general article on technical, scientific, chem. and economic problems. A. A. BOEHTLINGK

Oxidizability of mineral oils. B. G. TUICHININ AND K. I. IVANOV. *Neftyanoe Khozyaĭstvo* **18**, 979–91(1930).—Baku gas oil treated with 12% of H_2SO_4 (monohydrate) added in 3 portions, followed by a washing with tap water, can be oxidized with O_2 at 15 atm. by heating at 150° for 3 hrs. to a sapon. no. of 104.3, while a treatment with 6% of oleum (10% SO_3) under identical conditions yields an oil of 63 sapon. no. after the above oxidation test. An addnl. treatment of the oil with 50% alc. soln. and washing with tap water increases the oxidizability considerably. If the treated oil still contains small quantities of naphthenic acids it should be washed with 50% alc. and water. A treatment with 253% of the amt. (by wt.) of SO_2 and evapn. of the SO_2 from the oil gives a sapon. no. of 112.6 after oxidation. The addn. of naphthenic acid salts of K, Na, Li, Fe and Mn to an acid-treated oil increases its oxidizability. The above oxidation method is used in detg. the stability of oils. A. A. BOEHTLINGK

Recent methods of utilizing waste refinery fuels. I. L. A. MEKLER. *Natl. Petroleum News* **22**, No. 46, 151–8(1930).—Heavy fuel oil is burned successfully by having the fuel line properly designed and by using valves and burners with large passages. Acid sludge is used most successfully in mixts. with liquid fuel. **II.** *Ibid* No. 47, 51–60.—Petroleum coke can be burned as powd. fuel by methods used with other similar fuels. The most important factor in burning refinery gas is to sep. out any liquid in the gas. R. W. KELLY

Continuously working agitators for treating crude-oil products. K. B. KOSTRIN. *Neftyanoe Khozyaĭstvo* **19**, 278–89(1930).—A description of known equipment used in the petroleum industry, with 44 literature references, is given. A. A. BOEHTLINGK

Pumping viscous fuel oils. V. S. YABLONSKII, P. P. SHUMILOV AND V. M. POKROVSKII. *Neftyanoe Khozyaĭstvo* **19**, 242–50(1930); cf. *C. A.* **24**, 952.—Paraffinic fuel oil of +35° congealing point was pumped through a pipe line warmed internally by heated gas oil passed through a concentric pipe inserted over the full length of the fuel-oil line, which was 477 m. long. Expansion joints, connections, heat transfer, etc., are discussed in detail. A. A. BOEHTLINGK

Content of naphthenic acids in Emba crude oil and its distillates. T. VUISTAVKINA. *Neftyanoe Khozyaĭstvo* **18**, 1000(1930).—Emba crude oil and its distillates were treated with a 2–3° Bé. soln. of NaOH. The table gives the % of naphthenic acids recovered, etc

	Acid no. in mg. KOH	% acids sepd.	Their acid no. in mg KOH	Theoretical yield naphthenic acids	Mol. wt of naphthenic acids
Dossor crude oil					
Sample 1	——	0.43	150	——	——
Sample 2	1.42	0.74	153	0.92	——
Kerosene distillate	0.76	0.18	257	0.29	218
Gas oil	1.12	0.36	232	0.48	241
Vaseline distillate	2.35	0.93	197	1.97	284
Transformer oil distillate					
Sample 1	2.66	1.13	174	1.52	321
Sample 2	2.79	1.44	162	1.8	——
Spindle oil distillate	2.5	1.32	158	1.58	354
Machine distillate					
Sample 1	1.94	0.4	120	1.61	466
Sample 2	2.08	1.42	138	1.5	406
Exhauster oil					
Light	1.86	0.77	201	0.92	276
Heavy	2.8	0.88	175	1.6	320

The alkali-treated oil was extd. with petr. ether and the naphthenic soaps were decompd. with H_2SO_4. The naphthenic acids were easily sol. in alc. and ether. Their soaps dissolved in H_2O lather freely on shaking. The yield of naphthenic acids from sludge was considerably lower. In refinery practice the neutralized sludge is salted out with

NaCl, whereby a viscous greenish mass of 0.952 sp. gr. is obtained, which is composed of 28% of H_2O, 43.5% of oil, 2.49% of dry residue (from machine-oil distillate and "Avtol" M); 18% of H_2O, 61.8% of oil, 1.37% of dry residue and 7.9% of naphthenic acids from heavy lubricating oils; 38% of H_2O, 42.7% of oil and 18.3% of naphthenic acids from vaseline oils. A. A. BOEHTLINGK

Pumping preheated paraffinic fuel oil through the Petrovskii pipe line. A. A KASHCHEYEV. *Neftyanoe Khozyaĭstvo* 19, 251–63(1930).—Fuel oil of 31° cold test was preheated to 67° and pumped through an 8-in. pipe line 42 km. long. The temp. of the discharged oil was 35° and no difficulties in pumping were experienced. A. A. B.

Setting and hardening of cements used for stopping oil wells. KEMMER AND BALAN. *Siroitelnuie Materialui* (Building Materials) No. 2, 35–41(1930).—Tests were made to ascertain the influence of water contg. petroleum and petroleum emulsions on the setting and hardening of cements used for plugging oil wells. Addns. of 5, 10 and 15% of petroleum (the compn. is given) were made. The results of these are tabulated and show that: (1) small addns. of petroleum (5%) do not influence the qualities of cement; (2) only cements of high quality, which harden quickly, can be used for plugging wells. M. V. KONDOIDY

Mixing fuel oils. N. I. CHERNOZHUKOV AND A. M. GUTZAIT. *Izvestiya Teplo-Tekh. Inst.* (*Trans. Thermo-Tech. Inst. Russia*) 1930, No. 4, 54–9.—Fuel oil mixts. composed of oils with different congealing points can be homogenized by heating with open steam and simultaneously agitating with cold air. The air can be admitted through the water-discharge line in the storage tank. A. A. BOEHTLINGK

Viscosities of fuel oils. N. I. CHERNOZHUKOV AND A. M. GUTZAIT. *Izvestiya Teplo-Tekh. Inst.* (*Trans. Thermo-Tech. Inst. Russia*) 1930, No. 2, 36–40.—The viscosity of paraffinic fuel oil is influenced by the nature of the heat treatment applied before congealing and is not influenced by a new heat treatment carried out on congealed fuel oil. To eliminate the effects of previous treatments of the fuel oil, heating to 100° should precede the cold test. A. A. BOEHTLINGK

Interlocked distillation controls are development of trend-analysis. A. E. KROGH AND H. BARNETT. *Natl. Petroleum News* 22, No. 46, 131–6(1930).—A method has been devised whereby 3 trend-analyzing controls have been interconnected to produce the desired result. Two of these instruments prep. an elec. current for the automatic control of a valve by the third. R. W. KELLY

Steam in rectification of petroleum products. A. TREGUBOV. *Azerbaĭdzhanskoe Neftyanoe Khozyaĭstvo* 1929, No. 12, 37–51; cf. *C. A.* 22, 952.—Complete calcns. are given. Satd. steam produces a very small temp. interval within the rectifying column, the temp. being below the b. p. of H_2O. It is able to carry over large amts. of petroleum vapors and reflux oil. The fractionating efficiency of the column is lowered, the consumption of heat is increased and a considerable load is thrown on the condensers. Superheated steam has an entirely different effect and in its presence the fractionation of the oil proceeds under conditions which are comparable to those when fractionation is carried out in the absence of H_2O vapors. V. KALICHEVSKY

Distillation of petroleum in refineries of Batum. E. FROLOV. *Azerbaĭdzhanskoe Neftyanoe Khozyaĭstvo* 1930, No. 9, 46–50.—The plant, including 2 flow sheets, is described. V. KALICHEVSKY

Artificial aging of mineral oils. F. EVERS AND R. SCHMIDT. *Brennstoff-Chem.* 11, 214–9(1930).—Various methods of testing insulating and turbine oils are discussed. A new method has been developed whereby electrolytic O_2 is absorbed at 100° by a measured amt. of oil distributed over SiO_2 gel impregnated with Fe_2O_3 as catalyst. The amt. of O_2 absorbed is detd. at intervals of 100 min. by measuring the current passing through the electrolytic cell. The rate of absorption, which is graphically almost a straight line, is taken as the aging const. With the O_2 absorbed expressed in amp.-min. and the time in min., the aging const. of a good insulating oil, *i. e.*, the tan of the line, averages 0.13 with a permissible max. of 0.21. The concn. of catalyst giving the highest aging const. was used, 0.01 mol. per mol. of SiO_2 gel. CuO and Fe_2O_3 were of equal effect but PbO was weaker and caused the formation of secondary aging products. The aging const. is mathematically related to the tar and sapon. nos. Sketches and details of the app. and procedure are given with graphs of exptl. results. F. W. JUNG

Corrosive action of naphthenic acids in the petroleum of Maikop. A. VUIBOROVA. *Azerbaĭdzhanskoe Neftyanoe Khozyaĭstvo* 1930, No. 9, 117–21.—Naphthenic acids and not the S compds. are responsible for corrosion of refinery equipment working on the Maĭkop crude oils. V. KALICHEVSKY

New shell still batteries of Azneft. N. EGIAZAROV AND K. KOSTRIN. *Azerbaĭ-*

dzhanskoe Neftyanoe Khozyaĭstvo **1930**, No. 9, 95–101.—A complete description is given including drawings, temps. at various points of the system, properties of the intermediate and final products, etc. The installation consists of 9 shell stills divided into 3 batteries. Gasoline, kerosene, gas oil and mazout are the final products. V. K.

New vapor-phase cracking process for high-compression fuel. NORMAN W. KRASE. *Chem. Met. Eng.* **37**, 624–5(1930); cf. Ziegenhain, *C. A.* **24**, 5992.—The Pratt vapor-phase cracking process is briefly described. In this process gas oil, preheated in heat exchangers to about 450°F., is passed through a heating coil, the lower or convection section of which is made of low-C steel boiler tubes and the top, or high-temp. radiant section, of high Cr-Ni steel. The oil vapors in the coil reach a temp. of 1100°F. and are discharged into an evaporator together with fuel oil heated to about 550°F. by coils in the upper portion of the evaporator. Vapors from the evaporator pass through an exchanger to preheat the incoming fuel oil and enter a bubble tower at about 550°F. Vapors from the bubble tower pass to a condenser, and cycle stock is withdrawn from the bottom of the tower. The process (U. S. Patent 1,752,264) is claimed to produce directly a motor fuel of 85% benzene equiv. A semi-com. unit processing about 300 bbl. per day is in operation at the plant of the Lubrite Refg. Co. at East St. Louis. D. F. BROWN

Action of sulfuric acid on the lightest products obtained in vapor-phase cracking of crude oil. M. B. MARKOVICH AND V. V. PIGULEVSKII. *Neftyanoe Khozyaĭstvo* **18**, 627–40(1930).—The "amylene" fraction contg. an av. of 43% of dissolved gases was subjected to H_2SO_4 treatment at —45°. The whole was shaken for 2 days and fractionally distd. through a dephlegmator immersed in a cooling mixt. of —40°, the gases so obtained were measured, and the mixt. was gradually heated to 25°, whereby all butylenes and divinyls were distd. off. The acid and the hydrocarbon layer were then sapond. separately by the usual methods. It was found that 75 and 66% acid dissolve more polymers than 85% acid. The low temp. prevailing during the sapon. acted favorably on the yield of alcs. It was made possible by adding H_2SO_4 to ice. M and P. succeeded in converting 12.8–25.5% of the gas into alcs., corresponding to 61% of the gaseous olefins. They recommend a sepn. of fractions and separate treatment of the individual components. A. A. BOEHTLINGK

Cracked gases obtained in vapor-phase cracking and their utilization. M. B. MARKOVICH. *Repts. of the Sci.-Tech. Council of the Oil Ind. Session of the Refinery Section in Baku in 1929.* **1930**, I, Cracking 61–88; cf. preceding abstr. A. A. B.

Vickers cracking unit. YU. E. BOGOSLOVSKII AND A. N. MARGULOV. *Repts. of the Sci.-Tech. Council of the Oil Ind. Session of the Refinery Section in Baku in 1929*, 1930, I, Cracking 7–44.—A complete description of the unit is given, including changes made after unsuccessful trial runs. A vapor-phase treating plant for refining the gasoline with fuller's earth is a part of the unit. Complete flow sheets showing yields of various oil products are given. Analyses of the products are shown. Improvements of the process are specified and causes of troubles are discussed. A. A. B.

Semi-cracking. K. P. LIKHUSHIN. *Repts. of the Sci.-Tech. Council of the Oil Ind. Session of the Refinery Section in Baku in 1929*, **1930**, I, Cracking 45–60.—Surakhanui paraffin-base fuel oil of 0.8861 sp. gr., E_{50} = 2.86, Brenken flash 132° and cold test of +12°, was cracked in a Pintsch-gas producer, yielding 9.68% gasoline of 0.8051 sp. gr., 67.5% of a fuel oil of 0.8779 sp. gr., E_{50} = 1.65 and —15° cold test; 10% of gas which contained 2.5–6.2% CO_2, 27–38% heavy hydrocarbons, 1.3–1.6% O_2, 1.2–1.4% CO, 44.1–49.1% CH_4, 0–9.2% H_2 and 5.8–15.6% N_2 (by difference). Cracking in a coil heated to 500° yielded a fuel oil of 0.878 sp. gr. and —5° to —7° cold test, as well as gasoline and other products. The velocity of flow of the fuel oil through the coil was 0.2 to 0.3 m. per sec. This expt., undertaken on a small refinery scale was made to ascertain the feasibility of prepg. commercially a fuel oil which could be easily pumped through pipe-lines over long distances in cold weather. A. A. BOEHTLINGK

Influence of high pressure and the amount of cracking on the yields and the character of cracked gasolines. A. N. SAKHANOV AND M. D. TILICHEEV. *Repts. of the Sci. Tech Council of the Oil Ind. Session of the Refinery Section in Baku in 1929*, **1930**, I, Cracking 89–94.—Cf. *C. A.* **24**, 5889. A. A. BOEHTLINGK

Cracking process without coke formation. M. NAPHTALI. *Brennstoff-Chem.* **11**, 247–9(1930); cf. *C. A.* **23**, 2820, 3340.—The operation of the "Carburol" process is described in detail by a schematic diagram. Yield data of crude motor spirit, heavy oil and gas are given for various gas oils, mazout, etc., for both stages of the cracking process. The oil, cracked in a uniformly heated coil, is mixed before sepn. of C and after passing an expansion valve, with fresh oil. This mixt. is transferred to a dephlegmator which returns the intermediate fractions for a second cracking. F. W. J.

Effect of time and temperature in treating cracked distillate. R. B. PIERCE. *Natl. Petroleum News* **22**, No. 46, 121–30(1930).—For the best reduction of S, best color, and lowest formation of H_2SO_4 compds., the acid and oil should be contacted for 3 to 5 min. Acid formation was reduced and color was very much improved by using 20% of steam during the distn. Storage before rerunning improves the color and reduces the formation of acid at the rerun stills. A low-temp. treat gives better color and less formation of acid derivs. but a higher-temp. treat gives lower S. Settling time increases the formation of acid compds. and lowers the color, but lowers S only slightly.
R. W. KELLY

Floor-tube radiant section increases cracking plant throughput. JOHN POWER. *Natl. Petroleum News* **22**, No. 45, 51–5(1930).—At the refinery of the Texas Pacific Coal and Oil Co. at Fort Worth, a floor-tube radiant section has increased the daily cracking capacity by 250 bbls. The only changes necessary in the plant were to increase the speed of the pumps, increase the chamber outlet from $1^1/_2$ to $2^1/_2$ in. on the low-pressure side, and increase the size of the running lines. The length of runs was decreased from 35 to 30 days but it is believed that this loss can be corrected by changes in the plant.
R. W. KELLY

The problems of the determination of aromatic hydrocarbons in cracked gasolines. M. D. TILICHEEV AND M. P. MASINA. *Neftyanoe Khozyaĭstvo* **18**, 641–6(1930) H_2SO_4 acts more vigorously on aromatic hydrocarbons in presence of olefins. Ninety % H_2SO_4 is too weak to remove olefins but it attacks the aromatic hydrocarbons quite noticeably. Ninety-eight % acid removes the olefins and aromatic hydrocarbons completely at 0°. It can be used to remove the aromatic hydrocarbons at room temp. while fuming H_2SO_4 is not recommended because it causes an excessively high aniline point.
A. A. BOEHTLINGK

Blending natural gasoline to volatility specifications. R. G. ALDEN AND M. GAGE BLAIR. *Natl. Petroleum News* **22**, No. 46, 107–20(1930).—A no. of charts have been made by means of which predictions of the volatility of a blend of natural gasoline and blending naphtha can be made.
R. W. KELLY

Meaning of the gasoline distillation curve. G. EDGAR, J. B. HILL AND J. A. BOYD. *Oil and Gas J.* **29**, No. 26, 144, 256, 259(1930).—Motor-fuel volatility affects engine performance chiefly in the following ways: (1) ease of starting a cold engine; (2) tendency to interrupt operation because of vapor lock; (3) ease of acceleration; (4) relative ease of forming a dry mixt.; (5) tendency to cause crankcase diln. It has been shown that if the A. S. T. M. distn. curve is known, the characteristics of a fuel with regard to all 5 of these factors can be at least approx. calcd.
CHAS. WIRTH

Detonation of gasoline. N. A. BUTKOV. *Izvestiya Teplo-Tekh. Inst. (Trans Thermo-Tech. Inst. Russia)* **1930**, No. 2, 41–4.—A 650-cc. bomb provided with a pressure gage was charged with 2 cc. of fuel and filled with O_2 at a pressure of 5 atm. It was then heated in an oil bath to 250° for 90 min. It was found that substances more resistant to detonation are also more resistant to oxidation. Heptane and $C_{10}H_{22}$, which were oxidized to a great extent without an explosion, formed a large amt. of carbonaceous material insol. in C_6H_6 and in a C_6H_6-C_2H_5OH mixt. The product was acidic. The same changes occurred with ethyl ether, CS_2 and pinene. A 10% addn. of toluene to C_7H_{16} caused an explosion, which indicates a change in the character of the oxidation. Solid products and acids were not formed in this case. Alc. has a similar effect. The above conditions were identical with those existing in an automobile engine with a 5:1 compression ratio. Expts. carried out at 285° made it possible to obtain a finer classification of antidetonants. Heavy gasolines have a high antiknock value and are easily oxidized. The properties of a fuel were further characterized by the compn. of the combustion gases, *i. e.*, by the proportion of O and fuel and other reaction products left in the bomb.
A. A. BOEHTLINGK

Shirak crude oil. V. N. KHUDAKOV. *Neftyanoe Khozyaĭstvo* **18**, 543–50(1930). Crude oil produced in Shirak (Caucasus) has a sp. gr. of 0.8074–0.885 and a flash pt. 0°; it contains 15% of gasoline of 0.7307 sp. gr., 35% of kerosene of 0.8074 sp. gr. and 50% of residue of 0.9023 sp. gr. The production at present is small.
A. A. B.

Condensation of hydrocarbons. B. K. TARASOV AND N. V. POPOVA. *Neftyanoe Khozyaĭstvo* **18**, 992–5(1930); cf. *C. A.* **24**, 3347.—A cracked gasoline boiling below 200° and cracked gasoline to which 10% of C_6H_6 was added were treated with 90% H_2SO_4 at 0°, distd. and the fractions treated with 98% H_2SO_4. These fractions were free from unsatd. and aromatic hydrocarbons, the latter being found only in the higher fraction polymers that were formed by this treatment. In the presence of 60% of unsatd. hydrocarbons, only $^1/_3$ is converted into acid-sol. compds. while $^2/_3$ undergoes a further change. In this operation the main part is condensed with aromatic hydro-

carbons and satd. hydrocarbons also are formed. Eighty % acid produces slight condensation unsatd. with aromatic hydrocarbons and a few acid-sol. compounds are formed. A. A. BOEHTLINGK

Antiknock fuels. L. EDELEANU AND W. GROTE. *Brennstoff-Chem.* **11**, 212–4 (1930); cf. U. S. Pat. 1,661,566 (*C. A.* **22**, 1461).—Antiknock agents for motor fuels and the possibility of obtaining a fuel with good characteristics entirely by suitable methods of refining are discussed. By adding to the fraction of the motor benzine boiling below 175°, the aromatic and unsatd. hydrocarbons extd. with liquid SO_2 from the fraction boiling above 175°, the blend has an antiknock value that compares well with that obtained by the addn. of $Pb(Et)_4$ and ethylene dibromide to the same motor benzine. Curves are shown. F. W. JUNG

Illuminating properties of commercial kerosene. M. P. KORSAKOV. *Neftyanoe Khozyaĭstvo* **18**, 975–8(1930).—Heavy kerosene can be used in ordinary lamps provided that the font is of a flat shape. This construction keeps the oil level comparatively stable and causes the oil to burn with a uniform flame. A. A. BOEHTLINGK

Properties of Grozny commercial kerosenes. A. I. VORONOV AND H. I. LOGVINOVA. *Neftyanoe Khozyaĭstvo* **18**, 971–4(1930).—Kerosene fractions of various origins were mixed and treated in the usual manner. Because of a sharper sepn. of gasoline, the kerosene was short in light fractions in comparison with the usual kerosene. Tests carried out with various burners showed that the illuminating power and other properties were satisfactory when using the "Kosmos" burner with a modification that permitted heating the kerosene. A. A. BOEHTLINGK

Shale oil industry in Scotland. RAGNAR WINBLADH. *Svensk Kem. Tids.* **42**, 236–49(1930). A. R. ROSE

The uniformity of Esthonian oil shale layers. K. LUTS. *Sitzb. Naturforsch.-Ges. Univ. Tartu* **36**, 9–26(1929).—Samples of Esthonian shale from Kokoloki, Wanamoisa, Kunda concessions, Kochtel, Kucker, Iisaku and Tudulinu, which cover the entire Esthonian shale deposit, represent a fair av. This established the presence of one profile which is composed of layers A, B, C, D, E, F, G and H. Bituminous lime layers are present between B and C, and D and E. This shale belongs to the class of sapropelites, according to the chem. compn. of the org. substance which is as follows: C 76.5–76.7, H 9.1–9.2, S 1.7–2.2, Cl 0.5–0.7 O, N 12.2–11.2%. The ash in unweathered shale has these compns.: Layer E, SiO_2 30.8, Fe_2O_3 5.5, Al_2O_3 10.7, CaO 40.1, SO_3 7.9, MgO 1.5, $K_2O + Na_2O$ 3.7%. Layer B, SiO_2 28.8, Fe_2O_3 7.2, Al_2O_3 6.8, CaO 42.9, SO_3 9.3, MgO 1.8, $K_2O + Na_2O$ 3.6%. The ash content varies with the degree of weathering, it averages 50% for air-dry layers, the highest being, for the layer D, 63–65%, and the lowest, for layer E, 36–40%. The oil yield in a Fischer retort was for A 27, for B 34, for C 32, for D 19 and for E 36%. The oil yield, calcd. on the org. substance is for A 55, for B 69, for C 66, for D 56, for E 66, for F 61, for G 66 and for H 66%. Calorimetric detns. were made and a large no. of tables is given. A. A. B.

The composition and properties of the higher fractions of Esthonian shale oil and their possible application as lubricating oils. J. HÜSSE. *Sitzb. Naturforsch. Ges. Univ. Tartu* **36**, 127–50(1929).—The crude shale oils and distillates differ greatly from crude petroleum oils and their distillates. The lower-boiling constituents are similar to fractions of cracked crude oil, while the higher-boiling oils, the lubricating-oil fractions, are distinguished by a higher lubricating value and by a lower resistance to heat and air. They also have a higher viscosity (at lower temps.) than lubricating oils from crude petroleum oils. The distillates are high in S and O compds. and contain Cl. O compds. are represented by phenols, carbonic acids and bases. O compds. decrease with decrease in the boiling points of the fractions. The neutral oils contain esters, hydroxyl and carbonyl compds., as well as other O compds. which were not detd. The last statement is true of S and Cl compds. The oils are highly unsatd. and therefore very unstable. Up to 35% of neutral oils was obtained by a vacuum distn. which yielded 25–30% of refined oils. Treatment with reagents causes polymerization and condensation but not oxidation. Tables and other data are given. A. A. BOEHTLINGK

Gaseous products of shale retorting. Their composition and possible utilization. ALFRED W. NASH. *J. Inst. Petroleum Tech.* **16**, 626–34(1930).—See *C. A.* **24**, 3105. E. C. K.

Effect of temperature on formation of fatty acids in oxidation of paraffin wax. I. GUIF AND A. PLOTKO. *Azerbaĭdzhanskoe Neftyanoe Khozyaĭstvo* **1930**, No. 9, 108–16.—Increase in velocity of the air blown through heated paraffin wax has almost no effect on the total amt. of acids formed, but decreases the yield of acids sol. in petr

ether, increases the yield of oxy acids and decreases the mol. wt. of the oxidation products. Similar effects are produced by increasing the time of oxidation to over 30 hrs. at 150°. Increase in temp. increases the velocity of oxidation and the yield of acids insol. in petr. ether. At 125° oxidation is rather slow, the yield of oxy acids diminishes and the mol. wt. of the oxidized products decreases in comparison with higher-temp. runs. At 175° the reaction velocity is high but a considerable amt. of oxy acids is formed, the color of the products is poor and the loss is high. Expts. show that 150° is the best temp. for oxidation of paraffin wax to fatty acids as the yield and the mol. wt. of the acids formed are relatively high. Some oxy acids are, however, produced, but their yield can be controlled by discontinuing oxidation of the wax at the proper time. Oxidation of the unsaponifiable residue from the oxidized paraffin wax for 13 hrs. at 150° failed to yield oxy acids. High oxidation temps. have an unfavorable effect on the color of the acid formed. V. KALICHEVSKY

The action of treating on the oxidizability and oiliness of lubricating oils. N. I. CHERNOZHUKOV AND A. M. GUTZAIT. *Neftyanoe Khozyaĭstvo* **18**, 806–17(1930).—Emba spindle oil had the highest oiliness when treated with 15% of fuller's earth. The degree of wetting is independent of the acidity of the oil. The color of the oil is directly proportional to the amt. of fuller's earth used. A treatment with 5% of SiO_2 gel is equiv. to treatment with 18% of fuller's earth. Oxidation tests carried out by blowing O_2 at 120° through oil showed that Emba distillate forms a ppt. of asphaltic character after being treated with fuller's earth at 50°, while Baku spindle-oil distillate seps. hydroxy acids under the above conditions. A fuller's-earth treatment together with air agitation at 150° is more efficient and absorbs the asphalt more rapidly. Both oils on being treated with 3% of H_2SO_4 produce a stable product provided that the suspended matter has sufficient time to settle out. An addnl. treatment with 10% alc. soln. improves the stability. A stable oil is then obtained after fuller's-earth treatment. A quite stable Emba spindle-oil distillate is obtained after treatment with 1% of acid and 2% of silica gel, while for Baku distillate 1% of acid and 2–3% of fuller's earth are required. The addn. of 1% of sulfonic acids to Baku machine oil makes it resistant against oxidation. Eighty % of fuller's earth is required to stabilize Baku distillate if this is the only treatment. Residual fuel oil (mazout) was treated with 10% of H_2SO_4 at 60° and the upper layer taken out and treated with 10–15% of fuller's earth at 200° for $^1/_2$ hr. A stable oil was obtained. A. A. BOEHTLINGK

Bituminous pipe coatings. RUSSELL R. BRANDT. *Metal Cleaning and Finishing* **2**, 799–802(1930).—Coal-tar pitch, if used for a protective coating, should be refined by distn. to remove light oils. This operation will render the tar more resistant than asphalt, although it is affected by changes in temp. This defect can be overcome to some extent by a more thorough refining of the tar and also by a careful blending with drying oils or with other pitches. Several brands of bituminous coating on the market have a coal-tar base and show real merit. Coal tar primer coats seem to give quite satisfactory results if they are coated with a proper finish. Care must be taken in applying a cold-cut primer of this type because the solvents will usually flash at or below room temp. Furthermore, air bubbles are easily entrapped and porous coats result. Natural asphalts, as they are taken from the lakes, differ considerably in character and do not, even after refining, have the desired characteristics. They must be blended, usually with other asphalts, to produce the desired consistency and temp. range. Petroleum pitch is a compd. which has the properties of an asphalt. The manuf. can be regulated so as to give a product that meets the required specifications. Two or more asphalts of this type may be blended or a natural asphalt incorporated, to give certain desired characteristics. In coating the pipes with bituminous materials other than primers, the method of dipping is ordinarily used. Various methods are described in detail. In the manuf. of emulsions of asphalt and water, lately appearing on the market, the asphalt is broken up into particles with a diam. of $^1/_{5000}$–$^1/_{10,000}$ in. in the presence of H_2O and a small % of an inert mineral colloid such as clay. This material has the consistency of cup grease, but may be thinned with H_2O. It may be applied by brushing or preferably by spraying. When the water evaps., after application the min. particles of asphalt coalesce and give a uniform film of pure asphalt. D. T.

Surface tension-temperature curves of asphalt bitumens and similar products. F. J. NELLENSTEIJN AND N. M. RODENBURG. *Kolloid-Chem. Beihefte* **31**, 434–46 (1930).—Surface tension-temp. relationships were detd. according to the Jäger drop method on the micelles and on the medium and the interfacial tension between the micelles and the medium for 6 different bitumens. In all cases the surface tension was found to decrease with increase in temp., the curve showing a sharp break at the melting point. The app. and method used are described in detail. D. F. BROWN

Organic matter, P and V in the Black Sea deposits (ARKHANGELSKII, KOPCHENOVA) **8.** Breaking up natural petroleum emulsions or other colloid systems by use of rays of short wave length (U. S. pat. 1,783,471) **13.** Preserving rubber (Brit. pat. 332,764) **30.** Distilling carbonaceous material such as wood, lignite, coal, shale, etc. (U. S. pat. 1,781,871) **21.** Apparatus for gravity separation and recovery of oils and grease from garage waste, etc. (Brit. pat. 332,569) **1.** Thick walled electrically welded metal pressure vessels [for oil cracking] (U. S. pat. 1,784,080) **9.** Filtering paper (U. S. pat. 1,784,509) **23.** Recovery of volatile hydrocarbons (Ger. pat. 504,731) **13.**

Storage of petroleum liquids containing volatile fractions. THOMAS S. COOKE and JOHN E. ROUSE (to Standard Oil Co. of Ind.). U. S. 1,783,701, Dec. 2. Vapor lines from storage tanks are provided with enlarged sections contg. a flame-arresting material such as a permeable mass of metal. Various structural features are described.

Treating petroleum oils containing sulfur. GEORGE J. ZISER and JAMES H. OSMER (to Standard Oil Co of Calif.). U. S. 1,784,215, Dec. 9. The oil is treated with an aq. soln. of a Cu salt such as a Cu NH_4 salt contg. dissolved O. App. is described.

Revivifying spent clays used for decolorizing and clarifying petroleum oils. WIRT D. RIAL and WHITFORD R. BARRATT (to Richfield Oil Co. of Calif.). U. S. 1,782,744, Nov. 25. The spent material is washed with a solvent such as naphtha to remove petroleum-oil constituents, and the coloring matter is then extd. from the clay with a solvent obtained from acid sludge by sepg. the water-sol. constituents, and the treated clay is hydrated.

Solvents from partial oxidation products of petroleum. JOSEPH H. JAMES (to Clarence P. Byrnes, trustee). U. S. 1,782,963, Nov. 25. Partial oxidation products contg compds. in the range from alcs. to org. acids are fractionated up to about 300° to 325°, and sepd. into different portions. U. S. 1,782,964 relates to the use of a selective solvent such as alc. for sepg. different portions of similar partial oxidation products.

Treating hydrocarbon materials such as sulfur-containing petroleum oils with hydrogen. DONALD L. THOMAS. U. S. 1,781,826, Nov. 18. Materials such as oils to be desulfurized are brought into intimate contact with substantially dry, O-free, electrified atomic H previously produced in an elec. arc so that reaction between the material treated and the H takes place in a zone out of the direct influence of the arc. App. is described.

Dewaxing petroleum oil. LEO D. JONES (to Sharples Specialty Co.). U. S. 1,784,525, Dec. 9. In dewaxing petroleum oil which contains cryst. wax and amorphous wax, the temp. of the oil is reduced and the wax is removed which ppts. in amorphous form while the oil contains those impurities which naturally occur in petroleum oil and which cause all of the wax pptd. in the oil by reduction of temp. to be in the amorphous state. Various details of procedure are described.

Alkaline treatment of petroleum vapors. RAYMOND C. WHEELER and PAUL W. PRUTZMAN U. S. 1,784,262, Dec. 9. A mixt. of oil vapors and steam is brought into contact with NaOH soln. without substantial condensation of the petroleum vapors, thus producing a reaction product substantially insol. in the soln., and a body of the soln. is maintained in continuous contact with the vapor mixt. and at such concn. as to neither evolve nor absorb a material quantity of steam during the treatment. Contact of the soln. with the vapors is effected (in an *app.* which is described) by cyclic counterflow, and the reaction product is withdrawn from the body of the soln. without discontinuing the operation.

Apparatus for dehydrating petroleum emulsions by electric treatment. JOHN T. WORTHINGTON (to Petroleum Rectifying Co. of Calif.). U. S. 1,783,595, Dec. 2. The emulsified material to be treated is introduced within an inner perforated rotatable electrode and passed through the perforations of this electrode into a surrounding drum which constitutes the other electrode.

Condenser suitable for use in petroleum distillation. PHILIP B. SADTLER (to Swenson Evaporator Co.). U. S. 1,783,369, Dec. 2.

Fractional extraction of petroleum hydrocarbons with alcohol. THEODORE A. WERKENTHIN (to Solar Refining Co.). U. S. 1,783,203, Dec. 2. Oil is successively extd with alc. at an elevated temp. which, however, does not exceed the b. p. of the alc., and each successive alc.-extn. product is cooled to a low temp. to decrease the soly. of the oil in the alc. and permit the oil to settle out, the cooling being so effected as to allow about 1–3% of alc. to be retained in the oil to decrease its viscosity and permit it to be easily pumped, and the oil is cold-pressed in the presence of the alc. so that crystal formation of the wax is improved. An arrangement of app. is described. Cf. *C. A.* 24, 4146.

Cracking petroleum oils. CARBON P. DUBBS (to Universal Oil Products Co.). U. S. 1,783,228, Dec. 2. Oil is passed through a series of stills of successively increasing temp., vapors are taken off from each still and passed to a reflux condenser individual to each still, and the reflux condensate sepd. from the vapors is passed to a still of higher temp. than that from which they were derived; vapors not condensed in the reflux condenser connected to a still of higher temp. are passed directly through the reflux condenser connected to a still of lower temp. and vapors are finally taken off from the reflux condenser connected to the still of lower temp. An arrangement of app. is described. U. S. 1,783,229 describes an app. and process in which oil is passed through a narrow annular passage adjacent to the walls of the still where the oil is subjected to a cracking temp., followed by the discharge of the heated oil from this narrow passage to a main interior chamber of the still where it is maintained out of contact with the oil being heated in the narrow passage; vapors from the main chamber are subjected to reflux condensation and reflux condensate is returned to the narrow passage; residuum is withdrawn from the interior chamber and the app. is maintained under superatm. pressure. Cf. *C. A.* **24**, 3637.

Cracking petroleum oil. GUSTAV EGLOFF and JACQUE C. MORRELL (to Universal Oil Products Co.). U. S. 1,783,231, Dec. 2. Oil is heated to a conversion temp. in a heating zone such as pipe coils in a furnace and passed to a conversion zone such as an insulated tank where it is maintained in a body with dephlegmation and condensation of evolved vapors and passage of uncondensed gases through an adsorbent substance such as charcoal which takes up vapors entrained by the gases; the adsorbed substances are driven off by treating the adsorbent material with heated gases of combustion from the heating zone so regulated as to relieve the substance of adsorbed products and the products thus driven off are condensed. App. is described. Cf. *C. A.* **25**, 198.

Cracking petroleum oil. ROBERT T. POLLOCK (to Universal Oil Products Co.). U. S. 1,783,259, Dec. 2. Oil is subjected to cracking temp. and pressure (suitably in a pipe coil), high-boiling fractions of the evolved vapors are sepd. from the low-boiling fractions in the form of a condensate, and the condensate while still hot is subjected to increased cracking temp. and pressure; another body of oil is simultaneously distd., evolved vapors are sepd. according to their b. ps. and the condensate thus formed is commingled with the oil in one of the pressure zones. App. is described. Cf. *C. A.* **25**, 198.

Cracking hydrocarbons. GEORGE C. HARGROVE and WALTER B. MONTGOMERY (to Gasoline Products Co.). U. S. 1,784,065, Dec. 9. A stream of heavy hydrocarbons is forced under pressure through a cracking app. and raised to a cracking temp., and the supply of the heavy hydrocarbon material is shut off whenever the deposition of C renders it desirable to remove it and the heavy hydrocarbons in the app. are displaced by a relatively light hydrocarbon distillate, the supply of heat to the app. is then shut off and the pressure on the material then in the app. is reduced. An arrangement of app. is described.

Cracking hydrocarbons. JOSEPH G. HAWTHORNE (to Walter M. Cross). U. S. 1,782,686, Nov. 25. Oil is raised to a conversion and vaporizing temp. in a primary heating zone such as pipe coils and the vaporized material is reheated and superheated under reduced pressure in a sep. zone, the vapors are cooled to a predetd. temp. selected to effect sepn. of the heavier liquid and lighter vapor constituents in a sepg. stage, the vapor constituents are subjected to reflux condensation, and vapors not condensed in the refluxing are subjected to a final condensation. Heavier liquid divided out in the sepg. stage is diverted from the system, and a balanced pressure is maintained between the hydrocarbon vapors within the conduits in the superheating zone and the combustion gases in the enclosure surrounding the conduits, in order to permit use of conduits of refractory ceramic material. Various details of app. are described.

Cracking hydrocarbons in liquid phase. JOHN C. BLACK (to Gasoline Products Co.). U. S. 1,782,676, Nov. 25. A primary supply of material is heated by a furnace to cracking temp. and the material is then discharged into a carbon-pptg. and reaction chamber, and throughout the cracking system there is maintained sufficient pressure to prevent vaporization of the hydrocarbons; simultaneously, there is heated in a tubular heater such as a pipe coil a secondary supply of hydrocarbon material in the terminal combustion spaces of the primary heating furnace, also under pressure to prevent substantial vaporization. Various details of app. are described. Cf. *C. A.* **24**, 5147.

Cracking hydrocarbon oils. EDWIN W. BEARDSLEY and MYRON W. COLONY (to Petroleum Conversion Corp.). U. S. 1,784,126, Dec. 9. A heated carrier gas such

as residual gases, comprising H and CH_4, and steam, is introduced into a reaction chamber where it mingles with vapor of the oil to be converted; conversion products from the reaction chamber are passed through a heat exchanger, with sep. vaporization of the incoming hydrocarbon material and passage of the produced vapor in heat-exchange relation with the products of reaction in the heat exchanger and thence into the reaction chamber. The heat-carrier gas entering the cycle is passed into heat-exchange relation with the products in another heat exchanger and thence to a gas-heating device and to the reaction chamber to serve as a heating agent. Reaction products are condensed. Details of app. arrangement are described. Cf. *C. A.* 24, 4385.

Cracking hydrocarbon oils. JOHN E. BELL and EDWARD W. ISOM. (to Sinclair Refining Co.). U. S. 1,782,056, Nov. 18. Oil is passed through a heating coil in which it is heated to conversion temp. and is discharged into an enlarged conversion chamber and vapors from the latter are passed to a dephlegmator; reflux condensate from the dephlegmator is returned to the heating coil, vapors from the dephlegmator are condensed and the distillate collected; unvaporized oil from the conversion chamber is circulated through an independent heater in which it is subjected to a lower temp. than the oil in the heating coil and thence back to the conversion chamber, and superatm. pressure is maintained on the oil undergoing conversion. App. is described.

Cracking hydrocarbon oils. DAVID G. BRANDT (to Doherty Research Co.). U. S. 1,784,087, Dec. 9. A body of oil is maintained in a cracking zone and oil from this zone is passed through a heating zone such as heating tubes at a relatively high velocity so that a portion of the oil is vaporized; unvaporized oil is passed at a relatively low velocity from the heating zone directly into the body of oil in the cracking zone, and the vapors from the heating zone are passed independently from the heating zone and are caused to percolate through the body of oil in the cracking zone. App. is described.

Cracking hydrocarbon oils. WM. BRINK and GEORGE L. HESS (to General Oil Products Co.). U. S. 1,783,697, Dec. 2. Small quantities of a heated topped oil are delivered to a large body of oil, a portion of which continuously flows through a horizontal lower drum and past C settling chambers and then up through towers of smaller diam.; this latter portion of the oil is heated to a cracking temp. and the partially cracked oil is discharged at an angle to the larger body of oil so as to create a froth at the oil level, and vapors arising from the main body of oil are condensed. App. is described.

Cracking hydrocarbon oils. RICHARD J. DEARBORN (to Texas Co.). U. S. 1,783,010, Nov. 25. Oil is passed through a heating coil in which it is heated to substantially cracking temp., delivered to a cracking drum where a body of oil collects, and oil is simultaneously cracked in vapor phase and the resulting cracked vapors and gaseous products are passed in indirect contact with the body of oil mentioned to maintain a cracking temp. in it and effect cracking of the oil in liquid phase. App. is described. Cf. *C. A.* 24, 6001.

Cracking hydrocarbon oils. JACQUE C. MORRELL and HARRY P. BENNER (to Universal Oil Products Co.). U. S. 1,783,257, Dec. 2. Oil is heated to cracking temp. under pressure (suitably in pipe coils) and discharged to a reaction zone such as an expansion chamber maintained under superatm. pressure, sepd. vapors are removed and unvaporized oil is separately removed from the reaction zone, pressure on the unvaporized oil is reduced to effect partial distn., resulting vapors are refluxed and the reflux condensate is directly injected into the oil in the reaction zone to prevent C from settling out. An arrangement of app. is described.

Cracking hydrocarbon oils. HORACE K. ROGERS (to Sinclair Refining Co.). U. S. 1,781,884, Nov. 18. A gas and vapor mixt. is taken off from the cracking operation, including vapors of the desired product, the desired product is condensed from the mixt., and the gases and vapors then remaining uncondensed are scrubbed with an absorbent menstruum and the latter with its absorbed constituents is passed in indirect heat-exchange relation with the gas-vapor mixt. from which the desired product is condensed, thus vaporizing absorbed constituents from the menstruum. An arrangement of app. is described.

Cracking hydrocarbon oils. JOSEPH H. WELCH. U. S. 1,784,562, Dec. 9. A hydrocarbon material is heated at a cracking temp., vapors are withdrawn from the heating zone and passed in finely divided condition through a body of heated liquid hydrocarbon material such as fresh stock in a reflux system, and entrained oil and C particles are sepd. from the hydrocarbon vapor centrifugally, the vapor is passed through another body of heated hydrocarbon liquid, followed by fractionation and condensation. App. is described.

Cracking and refining hydrocarbon oils and vapors. ROY CROSS (to Cross Development Corp.). U. S. 1,782,808, Nov. 25. Fractionated vaporous material from the reflux-

ing stage of a cracking system is directed through a bed of a metal compd. such as Cu or Fe or their oxides or other compds. having an affinity for the S compds. in the hydrocarbon vapors, and thence through a bed of highly adsorbent material such as charcoal or clay for further purification. An arrangement of app. is described.

Apparatus for cracking hydrocarbon oils. CARBON P. DUBBS (to Universal Oil Products Co.). U. S. 1,783,185, Dec. 2. A vapor chamber receives products of conversion from a cracking coil in a furnace and a reflux condenser is connected with the vapor chamber. Raw oil is admitted to one of a pair of tanks through a valve actuated by the level of oil in the tank; light residue is discharged from the vapor chamber, and there is supplied to the cracking coil a mixt. of oil from the raw oil tank, light residue from the vapor chamber and reflux condensate from the reflux condenser. Independent means is provided for passing heavy residue from the vapor chamber to the other tank, and discharge of oil from the tank is controlled by the oil level. Various details of construction are described.

Converting hydrocarbon oils into products of lower boiling point. EDWARD E BARTELS (to Standard Oil Co. of Ind.). U. S. 1,782,160, Nov. 18. Oil is heated to conversion temp. in a pipe coil or the like through which it is passed at such a rate as to prevent substantial deposition of coke, is maintained at conversion temp. to effect the desired conversion, vapors formed are dephlegmated in countercurrent to reflux condensate, and all of the fresh oil entering the system is passed in indirect heat conductive relation with uncondensed vapors from the dephlegmating chamber in a reflux condensing zone, condensate thus formed is sepd. and a controlled portion of the condensate is returned to the dephlegmating chamber and the remainder of the condensate is discharged together with the uncondensed vapors into a condenser, and feed stock preheated by the vapors is charged into the pipe-coil heater or like device. App. is described.

Distilling hydrocarbon oils. JEAN DELATTRE-SEGUY (to Universal Oil Products Co.). U. S. 1,782,809, Nov. 25. A relatively thin film of oil is caused to flow by gravity over an unheated inclined surface and a distg. heat is applied solely to the upper surface of the film without heating the film from below, evolved vapors being removed and condensed. App. is described. U. S. 1,782,810 relates to a process involving passing oil to be distd. in a relatively wide shallow stream over an inclined plate and simultaneously heating the upper surface of the film by heat radiated from a hot molten bath such as molten Pb or molten glass. App. is described. U. S. 1,782,811 relates to cracking hydrocarbon oils by flowing the oil in a relatively thin film through a cracking zone maintained under superatm. pressure and applying to the flowing film a cracking heat radiated from a heating surface spaced away from the film, so that carbon deposition within the cracking zone will not interfere with transfer of heat to the film. App. is described.

Distillation of hydrocarbon oils. GEORGE W. WATTS, PHILIP L. KRAUEL and THOMAS E. STOCKDALE (to Standard Oil Co. of Ind.). U. S. 1,784,561, Dec. 9. Superheated steam is supplied to a gradually expanding passage (the temp. of the steam being reduced as it travels through the passage) and oil is supplied to the at least partially expanded steam where the temp. of the steam is less than 500°, steam and oil carried by it are discharged into a conduit at reduced pressure (the conduit being of substantially larger cross-section than the steam passage) and the mass of vapors and oil are caused to pass in steady flow through the conduit before sepn. is effected. App. is described. Cf. *C. A.* **24**, 2592.

Centrifugal dewaxing of hydrocarbon oils. ARTHUR R. GREIG (to Texas Co.). U. S. 1,782,467, Nov. 25. In centrifuging chilled oil to sep. wax, a heating medium such as steam or hot water is periodically introduced into the centrifuge during its operation, at the point where the wax-bearing oil is normally introduced, to remove accumulations of solidified wax and moisture from the working surfaces of the app. App. is described.

Dewaxing mineral oils. ELI F. BURCH (to Crew Levick Co.). U. S. 1,782,028, Nov. 18. A mixt. of chilled mineral oil contg. wax in suspension is continuously introduced into a centrifugal separator bowl by which the wax is sepd. as an outer layer surrounding the oil; a gaseous heating medium such as steam is applied to the outer surface of the separator bowl to melt the wax, and wax and oil are separately discharged. App is described.

Mineral oil composition suitable for use in transformers, as a lubricant or for treating cables, etc. CHARLES F. KAEGEBEHN (to R. T. Vanderbilt Co.). U. S. 1,784,359, Dec. 9. A "fraction of 1%" (suitably about 0.2–0.5%) of a hydroxybiphenyl such as

4-hydroxybiphenyl is added to mineral oil in order to render it more stable to light, air and elec. action.

Increasing the productivity of oil wells. PAUL E. WORKMAN. U. S. 1,784,214, Dec 9. An electrode insulated from the ground is introduced into the well and immersed in water present in the well and an elec. current of sufficient strength to effect electrolysis of the water is supplied to the electrode.

Apparatus for separating oil from natural gas at oil wells. MEINHARDT H. KOTZEBUE (to Trumble Gas Trap Co.). U. S. 1,782,783, Nov. 25. Structural features.

Tube-still furnace suitable for oil treatment. HENRY THOMAS (to Sun Oil Co.). U. S. 1,782,885, Nov. 25.

Gasoline filter. MARTIN E. E. DARDANI (to New England Filter Corp.). U. S. 1,784,622, Dec. 9.

Filter for gasoline, etc. GEORGE F. THOMAS and OTTO J. HERB (to Alemite Corp.). U. S. 1,781,964, Nov. 18. Structural features.

Oil filter suitable for use with internal-combustion engines. CHARLES W. MCKINLEY (to A C Spark Plug Co.). U. S. 1,783,924, Dec. 2.

Lubricant suitable for use in internal-combustion engines. ROSCOE E. CLOUGH (to Castorlube Refining Co.). U. S. 1,782,501, Nov. 25. Castor oil is heat treated at a temp. not exceeding about 310° until no more than 4.2% of the total wt. of the oil has been removed under atm. conditions, and the treated castor oil is mixed with mineral oil in various proportions.

Lubricant and cooling composition suitable for preventing "hot boxes" on railway cars. FRANK C. BROEMAN (to National Products-Supply Co.). U. S. 1,784,220, Dec. 9. One hundred lb. K vegetable-oil soap contg. 60% of water is mixed with water 30, neat's foot oil 3, graphite 3, coconut oil 3 and stearic acid soap 6.25 lb.

Petroleum asphalt. GENE ABSON (to Chicago Paving Laboratory, Inc.). U. S. 1,782,186, Nov. 18. In the conversion of petroleum residuum to blown asphalt having a higher penetration for a given m. p. than can be obtained from the same residuum without treatment, the residuum is incorporated with a relatively small quantity of an inorg. non-alk. earth metallic salt such as chloride of Zn, Fe, Cu or Sb which is nonvolatile at blowing temps. (in insufficient quantity to effect cracking at blowing temps.), and the residuum is heated and blown with air.

Methanol from pyroligneous acid liquor. JESSE M. COAHRAN. U. S. 1,784,270, Dec 9. MeOH is distd. off from the liquor and fractionated to a concn. above substantially 27% (Tralle's scale), the product is dild. with water sufficiently to cause the dissolved oils to pass out of soln., and the oils are filtered out. An arrangement of app. is described.

Absorption of acetic acid. VEREIN FÜR CHEM. INDUSTRIE A.-G. (Eduard Löw, inventor). Ger. 504,722, Feb. 5, 1926. AcOH is absorbed from the vapors given off in the carbonization of wood by passing the vapors into a suspension of porous "acetone-ash" (the residue left by heating $(AcO)_2Ca$ to form acetone) in water or in $(AcO)_2Ca$ soln.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Fifty years of German cellulose industry. R. O. HERTZOG. *Z. angew. Chem.* **43**, 1017–8(1930). E. H.

The year's technical developments in rayon manufacture. HAROLD DEWITT SMITH. *Textile World* **78**, 1490–3(1930). RUBY K. WORNER

Reduction of the viscosity of nitrocellulose in manufacture. HANNS SCHMIDT. *Nitrocellulose* **1**, 169–71(1930); cf. Milliken, *C. A.* **24**, 2597. E. M. SYMMES

Investigation of cotton and cellulose for nitrocellulose plants. M. STEUDE. *Nitrocellulose* **1**, 193–5(1930).—A review. E. M. SYMMES

Highly polymerized compounds. XXXIX. Cellulose (STAUDINGER, *et al.*) **10.** Highly polymerized compounds. XLI. Molecular weight determinations on acetylcelluloses (STAUDINGER, FREUDENBERGER) **10.** Ti acid sulfate (U. S. pat. 1,783,684) **18.** Storage vessel for viscose and like masses (Ger. pat. 506,147) **1.**

Cellulose. I. G. FARBENIND. A.-G. (Rudolf Müller and Karl Horst, inventors). Ger. 506,229, Aug. 23, 1927. Ligneous materials are opened up by treatment at a temp.

not exceeding 45° with a $Ca(OCl)_2$ soln. contg. at least 2% of active Cl and maintained feebly alk. with $Ca(OH)_2$, the soln. being taken in the exact amt. required for the complete oxidation of the lignin. Examples are given.

Cellulosic material from sugar cane. EUGENIO A. VASQUEZ (to Vazcane Process, Inc.). U. S. 1,782,751, Nov. 25. An abraded sugar cane from which substantially all sugar has been removed is suitable for manuf. of paper, pulp board, etc. App. and details of treatment are described.

Rotary suction-filter drum for cellulose manufacture. MASCHINENFABRIK BUCKAU R. WOLF. A.-G. Ger. 504,706, May 7, 1926.

Preparing cellulosic material for esterification. CAMILLE DREYFUS and GEORGE SCHNEIDER (to Celanese Corp. of America). U. S. 1,783,184, Dec. 2. Cellulosic material such as cotton linters or purified wood pulp is subjected to a vacuum and treated, while under reduced pressure, with a heated lower aliphatic acid such as formic, acetic, butyric or propionic acid until all portions of the material are in suitable condition for esterification.

Sulfonated cellulose derivatives. I. G. FARBENIND. A.-G. (Georg Kränzlein, Arthur Voss and Franz Brunnträger, inventors). Ger. 504,630, Sept. 11, 1926. Alkali cellulose is treated with sulfonic acids of aralkyl halides. In the example, cotton is kneaded with alc. NaOH for 2 hrs. and sulfonated with Na α-chloro-*o*-toluenesulfonate

Cellulose esters. BRITISH CELANESE, LTD., and CELANESE CORP. OF AMERICA Brit. 332,607, April 17, 1929. Various cellulosic materials are rendered more reactive to esterification by pretreatment with org. acid anhydrides such as Ac_2O or propionic anhydride either alone as liquid or mixed with a liquid hydrocarbon material such as C_6H_6 or as a vapor which may be dild. with air, N or CO_2, and after this pretreatment the material is preferably (but not necessarily) given a further pretreatment with org. acid (preferably one serving in the subsequent esterification after addn. of a condensing agent). Numerous details of procedure are described. Brit. 332,608 involves a modification of the pretreatment, in which the cellulosic material is first treated with one or more org. acids and then with one or more org. acid anhydrides with or without org. acids, and also describes numerous details of procedure.

Cellulose ester films. SAMUEL E. SHEPPARD and JAMES G. MCNALLY (to Eastman Kodak Co.). U. S. 1,784,758, Dec. 9. Substantially flat laminated films comprise at least 2 laminae with their grain at an angle to each other.

Mixed organic acid and nitric esters of cellulose. FRANZ BECKER (to I. G. Farbenind. A.-G.). U. S. 1,783,771, Dec. 2. A cellulosic material such as cotton is treated with an org. esterifying agent such as Ac_2O in the presence of an acylation catalyst such as H_2SO_4 which will not react with HNO_3 in the course of the process, and, after partial esterification, the intermediate product is reacted on with HNO_3. The product is suitable for *film manuf.*

Acetylcellulose composition suitable for films, lacquers, etc. OSKAR LOEHR (to I. G. Farbenind. A.-G.). U. S. 1,783,176, Dec. 2. Acetylcellulose is used with an ester of a polyglycol such as diethyl eneglycol dibenzoate, and a solvent and diluent such as acetone and cyclohexanone.

Partly hydrolyzed cellulose acetate. SAMUEL I. VLES. U. S. 1,782,796, Nov. 25. A soln. of cellulose triacetate (suitably with use of glacial HOAc as the solvent) is treated with dil. H_2SO_4 at a temp. of about 20° for about 6 days. The product thus obtained gives solns. with acetone of a viscosity about $1^1/_2$ times that from a somewhat shorter treatment.

Mercerized wood fiber for conversion into derivatives such as nitrocellulose. MILTON O. SCHUR and ROYAL H. RASCH (to Brown Co.). U. S. 1,783,313, Dec. 2. A mercerized wood fiber suitable for nitration is prepd. by treating a product such as wood-fiber tissue with NaOH soln. of mercerizing strength. Cf. *C. A.* **24**, 2290.

Apparatus for preparing viscous mixtures such as solutions of cellulose or its esters. WM. L. SMITH (to Viscose Co.). U. S. 1,782,370, Nov. 18. Structural features.

Viscose for artificial silk manufacture. F. STEIMMIG and ERSTE BÖHMISCHE KUNSTSEIDEFABRIK A.-G. Brit. 332,628, Feb. 28, 1929. In order to control the rate of ripening of viscose to which substances such as multivalent alcs. or sugars have been added (which have a coagulating action and also tend to diminish oxidation of the H_2S), there is added to the viscose either substances that retard ripening such as sulfites, amides or imides, or an arsenite or a mixt. of such substances, such as Na arsenite and urea.

Artificial textile products (of reduced luster) from viscose solutions. THEODOR KOCH (to Algemeene Kunstzijde Unie N.-V.). U. S. 1,784,014, Dec. 9. In prepg. a soln. of viscose contg. PhCl (which may be used with $C_6H_4Cl_2$) for spinning into arti-

ficial silk threads with reduced luster and of a size below 6 denier, the soln. is emulsified (suitably by a homogenizing app.) to such an extent as to form particles of PhCl of a diam. which is a function of the denier number of the threads to be produced (which diam. varies according to the formula $D^2 = c(a^2 + a)$, in which D is the denier no., a the largest allowable diam. of the particles in microns, and c is a const. (which for normal viscose is about 0.67). Cf. *C. A.* 25, 205.

Exchangeable filter suitable for artificial-silk-spinning apparatus. WALDEMAR ZUR LÖWEN (to American Bemberg Corp.). U. S. 1,784,103, Dec. 9. Structural features.

Pumping unit for artificial-silk-spinning apparatus. CHARLES W. LAWSER (to Wicaco Machine Corp.). U. S. 1,783,439, Dec. 2. Structural features.

Apparatus for dry spinning cellulose derivative solutions for artificial silk manufacture. HENRI F. NIOGRET (to DuPont Rayon Co.). U. S. 1,782,581, Nov. 25. A cell which may be heated is directly connected by a single large aperture with a condenser which may be cooled.

Artificial filaments. BENNO BORZYKOWSKI. Ger. 492,279, Sept. 19, 1922. Fine filaments are manufd. by spinning fresh or only slightly ripened viscose, having a cellulose content of 10% or more, into a feebly acid bath with high salt content, the filaments being stretched before they are converted into cellulose hydrate.

Cooking cellulosic materials to obtain fiber. GEORGE A. RICHTER (to Brown Co.). U. S. 1,781,733, Nov. 18. Material such as wood chips is cooked in a soln. of Na_2CO_3 to dissolve a portion of its cementitious content and is then cooked in a soln. of Na sulfide to effect fiber liberation.

Fibrous material from sugar cane. JOAQUIN J. DE LA ROZA, SR. (to Bagasse Products Corp.). U. S. 1,782,869, Nov. 25. The fibrous part of the cane is treated with substantially neutral water at a temp. (suitably about 160°) sufficient to remove or transform most of the substances combined with the fibrous part, the treatment being effected in the substantial absence of air. The product is suitable for *paper manuf.* and other uses. Cf. *C. A.* 24, 2880.

Bleaching vegetable-fiber pulp. DENNIS C. ANDREWS (to Northwest Paper Co.). U. S. 1,782,800, Nov. 25. Bleach liquor is caused to flow through a relatively quiescent slurry of pulp at normal pressure and temp. and maintained in contact with the pulp to effect the desired bleaching. An arrangement of app. is described.

Wood pulp. JOSEPH H. WALLACE (to Pine Waste Products, Inc.). U. S. 1,781,712, Nov. 18. In pulp manuf., excess moisture is removed from a mass of wood chips by treating the mass with steam in the presence of heated gases, and the mass is then immediately transferred to a digester. App. is described.

Refining wood pulp. GEORGE A. RICHTER and MILTON O. SCHUR (to Brown Co.). U. S. 1,784,161, Dec. 9. Unbleached wood pulp is treated with an oxidizing agent such as $Ca(OCl)_2$ or Cl until the residue from this treatment shows a max. α-cellulose content and this residue is then digested in an alk. liquor such as dil. hot NaOH soln. under such conditions as further to increase the α-cellulose content and produce a fiber well adapted for *paper-making;* the digested pulp is then bleached. Cf. *C. A.* 24, 3648.

Apparatus for producing and refining wood pulp by grinding and screening. LINUS A. BRAUN. U. S. 1,784,039, Dec. 9. Structural features.

Circulating apparatus (with an upright Venturi tube) for wood-pulp digesters. ALBERT G. NATWICK. U. S. 1,784,197, Dec. 9. Structural features.

Digester for decomposing vegetable fibers for paper manufacture. GASTON AMÉDÉE MOURLAQUE. Ger. 504,613, Sept. 11, 1927.

Paper. HEINRICH EGGERS (5% each to Alexander Orgovan, Otto S. Leszay and Irving Matusoff). U. S. 1,782,382, Nov. 18. Fibrous plant material such as stalks, leaves, husks or shells together with a mixt. of waste paper and powd. chalk is subjected to the action of a soln. of NaOH in a closed converter under superatm. pressure, in order to obtain a paper-making material.

Paper. KÖNIGSBERGER ZELLSTOFF-FABRIKEN UND CHEMISCHE WERKE KOHOLYT A.-G., HEINRICH KIRMREUTHER and WALTER COLDITZ. Ger. 504,705, June 24, 1928. In working up wood and other fiber into pulp in water, sufficient acid or acid salt is added to reach the neutral point of methyl orange, to prevent sepn. of the Fe compds. in the fiber, and so prevent ultimate discoloring.

Filtering paper. WALTER S. BAYLIS (to Filtrol Co. of Calif.). U. S. 1,784,509, Dec. 9. A filtering paper which is suitable for filtering and decolorizing oils, gasoline, etc., contains an acid-activated clay which contains no free acid.

Dewatering paper, etc., sheets. ALOIS DANNINGER, HERBERT SCHMOLKA and RICHARD KASTNER. Austrian 118,876, Apr. 15, 1930. In dewatering paper, etc.,

sheets by repeated pressing, the sheet is heated, before the last pressing, by radiation devices not in contact with the sheet, *e. g.*, by elec. heating lamps. This reduces the viscosity of the water, so that more is extd. by the final pressing.

Paper-making apparatus. HARRY LIEBECK (to Scott Paper Co.). U. S. 1,781,928, Nov. 18. Structural features.

Paper-making apparatus. WM. H. MILLSPAUGH (to Paper & Textile Machinery Co.). U. S. 1,783,969–70, Dec. 9. Mech. features.

Paper-making apparatus. FRIEDRICH SCHIEBUHR (to Siemens-Schuckertwerke A.-G.). U. S. 1,784,545, Dec. 9. Mech. features.

Wet-felt for paper machine. RICHARD KASTNER. Ger. 506,409, Dec. 18, 1927.

Press roll for use in paper manufacture. MAX WENZEL. U. S. 1,783,868, Dec. 2. Structural features.

Paper-coating composition. DONALD B. BRADNER and CHARLES H. MILLIGAN (to Champion Coated Paper Co.). U. S. 1,781,716, Nov. 18. Clay or other mineral pigment is used with a chlorinated protein adhesive such as chlorinated casein.

Recording paper suitable for typewritten impressions, etc. CHARLES W. MAYER and EVERETT F. SILLER. U. S. 1,783,442, Dec. 2. A deeply colored paper stock is covered with a waxy crystd. coating of contrasting color and with an outer layer of inert powder such as talc.

Paper for photographic purposes. G. T. LANE (to Kodak, Ltd.). Brit. 332,745, March 1, 1929. Paper suitable for use as a support for photographic emulsions is prepd. by sizing wood-pulp fiber (preferably having an α-cellulose content greater than 90% in the beater) with a saponified satd. fatty acid having an I no. less than 40 (and preferably less than 5). A size from triple-pressed stearic acid is suitable and the size may be pptd. with salts such as Al sulfate, $MgSO_4$, $CuSO_4$ or K, NH_4 or Cr alum.

Filter paper. FRED W. MANNING (to Filter Fabrics, Inc.). U. S. 1,782,785, Nov 25. In making filter paper, cellulose fibers, with or without asbestos, etc., are dispersed in an inert liquid (such as an oil, glycerol or a sugar soln.) having sufficient surface tension completely sep. to the fibers for filtration purposes 1,782,784 describes an app. and procedure for filter sheet manuf.

Use of bagasse in wall board manufacture. WM. L. S. WILLIAMS (to Hawaiian Cane Products, Ltd.). U. S. 1,782,755, Nov. 25. The fibrous portion is sepd. from the pith portions of bagasse, and the fibrous portion is digested (suitably with Ca(OH)$_2$ under steam pressure) to produce a clear fiber. The pith portion is cooked with water to effect the desired degree of hydration, and the resulting stocks are mixed.

Apparatus for making felted fiber board. EDWARD S. SHEPERD (to Albert D Stewart). U. S. 1,782,214–15, Nov. 18. Structural features.

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

Measuring the coefficients of thermal expansion of some explosives. TROV. *J. Chem. Ind.* (Moscow) **6**, 1686–8(1929).—Coeffs. of thermal exp, detd. for T. N. T., dinitronaphthalene, picric acid, molten mixts. of picric naphthalene and picric acid-naphthalene by means of a modified Dulo method. The quant. compn. of the above mixts. is not given. The meth are described. These data do not appear in either the "International Crit. Landoldt-Börnstein's Phys. Chem. Tables. ROBERT

Absolute amount of radiant heat emitted during gaseous explosions. AND K. TAWADA. *Trans. Faraday Soc.* **26**, 600–5(1930).—During the ex mixt. of H_2 and O_2 in a narrow, cylindrical bomb 2.83% of the heat of co radiated through a quartz window, and 23.94% during explosion of a dry and O_2 in the same bomb through a fluorite window. The latter result agr obtained by Garner and Roffey (*C. A.* **23**, 4406) indirectly. The large radiation from the CO–O_2 explosion on drying the gases is probably chemil E. M.

Detonation of solid explosives. W. E. GARNER. *Trans. Faraday Soc* (1930).—From consideration of mol. layers of the space lattice of Rb azide a is derived for the rate of reaction on detonation. E. M.

Inflammability of hydrogen. XI. Prevention of flame propagation in air mixtures by wire gauze. YOSHIO TANAKA AND YAZABURO NAGAI. *J. Ind., Japan* **33**, Suppl. binding 361–4(1930); cf. *C. A.* **24**, 4394.—Extinctio

ropagating in H_2-air mixt. by wire gauze is easier if explosion suppressors, such as $SnMe_4$, $PbMe_4$, C_6H_6, are present in small amts., due to the rise in theoretical flame-ropagation temp. of H_2 so caused. The speed of flame is higher at a distance from the oint of ignition than near it, so that at the distant point a finer gauze is necessary.
E. M. SYMMES

Blasting cast-iron retorts. LOHR. *Nitrocellulose* **1**, 195-6(1930).—The retort was illed with water. The charge was 500 g. of compressed gun cotton, detonated by 50 g. f gelatin dynamite and a blasting cap. E. M. SYMMES

Initiating explosives. ALFRED HEINEMANN. *Nitrocellulose* **1**, 196-8(1930).—A eview. E. M. SYMMES

Ignition of carbon monoxide-oxygen mixtures: the effect of impurities. A. KEITH ...EWER AND W. EDWARDS DEMING. *J. Am. Chem. Soc.* **52**, 4225-33(1930).—The elation $VP = k$ of ignition voltage and pressure of a $2CO-O_2$ mixt. holds also for ex-losive mixts. of O_2 with EtOH, Et_2O and CS_2. k is different for each mixt. Impurities resent are pos. and neg. catalysts; the former lower ignition voltage and the latter aise it. Vapors that burn to H_2O as 1 product are pos. catalysts if present in small uantities, and neg. catalysts if present in large amts. Pos. action of a catalyst is due o H_2O formed before ignition of the main mixt. If sufficient O_2 is present, all impurities which form H_2O are pos. catalysts. The hyperbolic, quant. relation $(V-b)(p+a) = c$ s derived, where $p + a$ is the pressure of the explosive mixt. added as impurity, V gnition voltage and b, c are consts. for each catalyst. E. M. SYMMES

Emulsions and suspensions of various kinds (Brit. pat. 332,533) **13.**

Nitrocellulose propellant explosive. CHARLES H. KECK. U. S. 1,784,189, Dec. 9. n colloiding nitrocellulose, it is incorporated with a nitroaromatic such as T. N. T. to which has been added only sufficient solvent to carry the nitroaromatic material into oln. and the material is subjected to pressure and heat.

Projectiles for signaling or illuminating purposes. LOUIS L. DRIGGS, JR., and HENRY B. FABER. U. S. 1,782,291-2, Nov. 18. Structural features.

"Salute." ALBERTO CIMOROSI. U. S. 1,783,999, Dec. 9. A container such as asteboard and a sawdust mixt. carries a charge of explosive material such as a mixt. of $KClO_4$, Al and Sb "sulfate" within which is a charge of coloring matter and the device provided with a fuse.

Loading detonator tubes. CLIFFORD A. WOODBURY (to E. I. du Pont de Nemours Co.). U. S. 1,783,372, Dec. 2. The tubes are charged with a mixt. of at least 2 xplosives, at least one of which, such as T. N. T. or erythritol tetranitrate, m. below 100°, nd the charge is heated at least sufficiently to melt the explosive of low m. p. and is hen allowed to solidify by cooling. The other portion of the charge may be formed of tetryl."

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Azo dyes and their intermediate products. II. Reduction splitting of eriochrome ack and the 1,6-diamino-2-naphthol-4-sulfonic acid (formed). PAUL RUGGLI, A. ERMANN AND F. KNAPP. *Helv. Chim. Acta* **13**, 748-56(1930).—The formula of iochrome black T (Geigy & Co.) was established as Na 1-(1-hydroxy-2-naphthylazo)-nitro-2-naphthol-4-sulfonate. By reduction with $SnCl_2$ it yielded 2-amino-1-naphthol and *1,6-diamino-2-napthol-4-sulfonic acid* which were identified by a series of reac-ns **III. 6-Amino-2-naphthol-4-sulfonic acid as a dyestuff component.** PAUL GLI AND ARTHUR ZIMMERMANN. *Ibid* 756-63.—This is a continuation of *C. A.* **24**, The 2,6,4-$HO(H_2N)C_{10}H_5SO_3H$ described therein was coupled with aniline, *p*-aniline, dehydrothiotoluidinesulfonic acid, aminoazobenzenesulfonic acid, and zidine, yielding a series of red, brown, or black dyes. The corresponding 2,6,4-$(NO_2)C_{10}H_5SO_3H$, coupled with sulfanilic acid or *p*-nitroaniline, yielded orange-red (on wool). **IV. Monoacetyl-1,5-naphthalenediamine and its coupling.** PAUL GGLI AND FRANZ KNAPP. *Ibid* 763-8.—Acetylated 1,5-$NO_2(NH_2)C_{10}H_6$ was reduced Fe and AcOH to 1-amino-5-acetamidonaphthalene. This when coupled with sulfanilic acid gave only the *o*-compd., with reference to the NH_2 group, instead of expected *p*-compd., thus illustrating the rule that the occupation of the *peri*-position prevents substitution in the *p*-position. L. E. GILSON

Naphthalene green V. FRANZ FRISCH. *Helv. Chim. Acta* **13**, 768–85(1930).—The literature on the constitution of this dye is reviewed. By a special synthesis F. establishes a new structural formula. The 2 SO_3H groups of the naphthyl radical are in the 3,6-position with reference to the substituted methyl C and not in the 2,7-position as heretofore believed. The properties of 1-naphthylamine-2,4,7-trisulfonic acid and its salts are discussed. L. E. GILSON

Modern trends in bleaching and dyeing rayon-wool fabrics. H. L. ARIENTE. *Textile World* **78**, 1522–3(1930). R. K. WORNER

Dyeing and delustering hosiery. NOEL D. WHITE. *Textile World* **78**, 1520–1 (1930).—General and practical. R. K. WORNER

Still-bath method of boiling-off hosiery has marked advantages. HERBERT C. ROBERTS. *Textile World* **78**, 1679(1930). R. K. WORNER

What's patentable in textile manufacture? CHARLES W. RIVISE. *Textile World* **78**, 1330–2, 2134–7(1930).—Discussion with illustrations taken from the textile field. R. K. WORNER

Angora rabbit wool—its conversion into yarn. GEORGE HENDRICKS. *Textile World* **78**, 1338–9(1930). R. K. WORNER

The extensibility of cotton hairs. GEO. E. COLLINS. *J. Textile Inst.* **21**, 316–24T (1930).—The extension and recovery of single hairs from a sample of cotton previously soaked in NaOH soln. to smooth out the convolutions were observed at a series of humidities ranging from 0 to 100%. Measurements were made of the mean diam. and length, initially, after loading and after removal of the load. The results are given in tables and by diagrams. R. K. WORNER

The length changes of cotton hairs in solutions of caustic soda. MARY A. CALVERT. *J. Textile Inst.* **21**, 293–310T(1930).—The shrinkage of single cotton hairs in NaOH solns. of definite concns. was studied and the changes in length are shown graphically and in tables. The effect on the width was also observed in some cases. Scoured, raw, $CHCl_3$-extd. and mechanically treated hairs were studied under no load; under loads applied after shrinkage, under no load; and under loads maintained throughout the shrinkage. R. K. WORNER

The swelling of cotton hairs in water and in air at various relative humidities. GEO E. COLLINS. *J. Textile Inst.* **21**, 311–5T(1930).—A study of the desorption and absorption of cotton hairs shows a close parallelism between the extent of the dimensional changes and the amt. of the absorption, at least over the temp. range of 20–100° studied. The changes in area and in length of cotton hairs for relative humidities ranging from 100% (water) to 0% (obtained by drying with P_2O_5) and again to 100%, relative to dimensions at 0% relative humidity are tabulated. A max. av. swelling of 48.6% was obtained for cotton hairs at 100% relative humidity. The temp. of the H_2O has little effect on the amt. of swelling within the limits of 20–120° studied. R. K. WORNER

A new method for measuring and classifying raw-silk nature. WARREN P. SEEM. *Textile World* **78**, 1774–6(1930); cf. *C. A.* **24**, 4399.—The term "nature" is used to represent the inherent qualities of raw silk, namely, strength, elongation, cohesion and hand. An illustrated description is given of the "inclined-plane scrigraph" developed by Julius Kayser & Co., and built by H. L. Scott Co., Inc. The machine measures elongation, elasticity, fatigue and nature at a standard tension; and it also measures strength and elongation at the breaking stress. R. K. WORNER

Making rayon cross sections in three minutes. KEN G. NIBLACK. *Textile World* **78**, No. 17, 49(1930).—A slit $1/4$ in. long is cut in $1/2$-in. squares of black paper "quite a bit heavier than wrapping paper." The fibers are pulled into this slit and cut off with scissors, about $1/8$ in. on each side of the paper. The slips are then fastened to slides with rubber cement, and, when set, the protruding fibers are cut off with a razor blade. R. K. WORNER

Determination of moisture and oil in rayon. D. S. CHAMBERLIN, B. L. HATHORNE AND R. E. SARGENT. *Textile World* **78**, 1674–5(1930).—An approx. 30 g. sample of rayon is placed in a 500-cc. flask with a ground glass top. From 125 to 150 cc. xylene is poured over the sample so that it is well wetted. The distn. is carried on slowly until about 80 cc. of xylene and H_2O have passed over. The collecting flask, a calibrated Goetz tube, is filled to the 100 cc. mark and centrifuged. The moisture as H_2O is read directly in cc. and the percentage of moisture in the original sample calcd. For detg. the oil content, the sample is extd. with sulfuric ether in a Soxhlet extractor, and the sample then dried in the air oven at 103° C. Original wt. − wt. H_2O − wt. dry fiber = wt. oil in rayon. The method for detg. moisture is considered accurate to 0.1%. R. K. W.

Removing spots and stains from rayon fabrics. E. R. DONALDSON. *Textile*

World **78**, 1334–6(1930).—A brief description is given of the properties, uses and effect on fabric, dyestuffs and sizings of various solvents used for removing stains from the synthetic fabrics. R. K. WORNER

Recent developments in processing viscose-rayon fabrics. A. J. HALL. *Textile World* **78**, 1516–8(1930). R. K. WORNER

Present-day methods of rayon sizing. ARTHUR K. JOHNSON. *Textile World* **78**, 1500–2(1930). R. K. WORNER

Staple rayon and rayon waste in the woolen and worsted industries. HENRY R. WOODWARD. *Textile World* **78**, 1512–4(1930). R. K. WORNER

Rayon waste in the cotton mill. CHARLES A. WESTON. *Textile World* **78**, 1515 (1930). R. K. WORNER

Fungus dyestuffs (KÖGL, *et al.*) **10.** Filter for cleaning fluids such as naphtha (U. S. pat. 1,783,444) **1.** Ti acid sulfate (U. S. pat. 1,783,684) **18.** Nitro- and amino-aryl ethers (Ger. pat. 506,339) **10.**

Dyes. IMPERIAL CHEMICAL INDUSTRIES, LTD. Ger. 501,232, April 14, 1929. See Brit. 315,905 (*C. A.* **24**, 1745).

Dyes. I. G. FARBENIND. A.-G. (Hermann Wagner, Adolf Kuchenbecker and Richard Huss, inventors). Ger. 506,073, Dec. 14, 1927. Violet water-insol. dyes are prepd. by coupling with arylamides of 2,3-hydroxynaphthoic acid the diazo compds. from dialkyl, diaryl or diaralkyl ethers of 6-aroylamino-4-aminoresorcinols. Numerous examples are given.

Azo dyes. KARL THIESS (to General Aniline Works). U. S. 1,784,398, Dec. 9. Yellow dyes of good fastness to fulling and to light are obtained by coupling the diazo compd. of a 4,4′-diaminotriphenylmethane deriv. contg. at least 1 halogen atom in each of the 3 benzene nuclei with a 1-halosulfoaryl-3-alkyl-5-pyrazolone or a substitution product, or by coupling a 1-halosulfoaryl-3-alkyl-5-pyrazolone or a substitution product with the diazo compd. of a 4,4′-diaminotriphenylmethane which has in each of the amino contg. benzene nuclei a halogen atom and a methyl group in *o*-position to the amino groups and which has no halogen in the benzene nucleus free from an amino group. Several examples are given of the production of greenish yellow dyes.

Disazo dye. LEON W. GELLER (to National Aniline & Chemical Co.). U. S. 1,782,682, Nov. 25. By subjecting a mixt. of 4-hydroxy-4′-aminoazobenzene-5-carboxylic acid and 2,2′-dimethyl-5-alkoxy-4-aminoazobenzene-5′-sulfonic acid in the presence of Na_2CO_3 to the action of phosgene, a mixed dye is obtained which dried and pulverized and in the form of the Na salts is a reddish brown powder sol. in water, dyeing unmordanted cotton reddish yellow to greenish yellow shades which can be discharged to white with discharging agents.

Trisazo dyes. HAROLD E. WOODWARD (to E. I. du Pont de Nemours & Co.). U. S 1,784,617, Dec. 9. An amino-azo compd. prepd. from an aromatic amino sulfonic acid such as 1,3,6-anilinedisulfonic acid and α-naphthylamine-7-sulfonic acid and an aromatic amino compd. such as α-naphthylamine to which coupling can take place in the position *p*- to the amino group is diazotized and the resulting diazo azo compd. is coupled to *p*-aminobenzoyl-2-amino-5-naphthol-7-sulfonic acid or other aromatic amino compd. to which coupling can take place in the position *p*- to the amino group, followed by diazotizing and coupling the resulting diazo disazo compd. to compds. such as *p*-aminobenzoyl derivs. (or *p*-aminobenzoyl-*p*-aminobenzoyl derivs.) of aminonaphthol-sulfonic acids. The resulting trisazo dyes may be developed to green tetrakisazo dyes of good fastness to light and washing.

Vat dyes. FELICE BENSA. Austrian 119,032, April 15, 1930. Vat dyes are prepd. by electrolyzing solns. of perylene diketones. Thus, a soln. of dibenzoylperylene in concd. H_2SO_4 may be electrolyzed with a current of 0.1–0.5 amps. at 3.5–4 v., a dye giving violet shades on cotton being obtained. The concn. of the H_2SO_4 should be kept const. throughout the process.

Green vat dyes. WALTHER PENECKE (to Felice Bensa). U. S. 1,783,137, Nov. 25. 1,12-Perylenequinone is condensed with benzoyl chloride by use of $AlCl_3$ at a temp. of 140–80°.

Anthraquinone vat dyes. I. G. FARBENIND. A.-G. Brit. 332,579, March 25, 1929. Bromo-3,4,8,9-dibenzopyrene-5,10-quinones are used as starting materials in a process as described in Brit. 308,617 (*C. A.* **24**, 507). Vat dyes thus formed may be converted into other vat dyes by treating them with acid condensing agents such as H_2SO_4, chlorosulfonic acid or $AlCl_3$. Several examples are given.

Anthraquinonethioxanthone vat dyes. ARTHUR LÜTTRINGHAUS and FILIP KAČER

(to General Aniline Works). U. S. 1,783,659, Dec. 2. Dyes giving strong yellow shades of good fastness on cotton from a hyposulfite vat are obtained by causing ring formation to take place, by treatment with dehydrating agents, in those ethers of mercaptoanthraquinonecarboxylic acids which are obtainable by the condensation, for example, of 2 mol. proportions of a 1-chloroanthraquinone-2-carboxylic acid with 1 mol. proportion of a 2,6- or 2,7-dimercaptoanthraquinone (which may be obtained, for example, by boiling a 2,6- or 2,7-dichloroanthraquinone, resp., with alcoholic Na sulfide or polysulfide), or by the condensation of 2 mol. proportions of a 1-mercaptoanthraquinone-2-carboxylic acid with 1 mol. proportion of a 2,6- or 2,7-tetrazoanthraquinone sulfate, or by the condensation of 2 mol. proportions of a 1-diazoanthraquinone-2-carboxylic acid with 1 mol. proportion of a 2,6- or 2,7-dimercaptoanthraquinone.

Vat dyes of the benzothionaphthene series. KARL THIESS and ERNST FISCHER (to General Aniline Works). U. S. 1,783,592, Dec. 2. A dye producing corinth tints on cotton of better fastness to boiling and washing than various other dyes of the same class is produced by heating 5,6-benzo-7-chloro-3-keto-1-thionaphthene with 4,5-benzo-3-keto-1-thionaphthene *p*-dimethylamino-α-anil in a solvent such as glacial HOAc.

Isatin-carbazole compound vat dye. MAXIMILIAN P. SCHMIDT and OTTO LIMPACH (to General Aniline Works). U. S. 1,783,588, Dec. 2. See Ger. 501,626 (*C. A.* **24**, 4941).

Reduction products of vat dyes. EDUARD MÜNCH (to General Aniline Works). U. S. 1,784,379, Dec. 9. See Ger. 489,725 (*C. A.* **24**, 2305).

Triarylmethane dyes. I. G. FARBENIND. A.-G. Brit. 332,560, April 22, 1929. Triarylmethane dyes or their leuco compds. are prepd. by the reaction on an α- or β-haloethylbenzene with a primary or secondary aromatic amine, condensing the secondary or tertiary amine produced (or a sulfonic acid deriv. thereof) with an aromatic aldehyde, ketone or hydrol (or with formaldehyde and an aromatic tertiary amine) and if necessary oxidizing any resulting leuco compd. to the dye in usual manner. Several examples are given.

Acid dyes of the phenonaphthosafranine series. PAUL LAEUGER (to J. R. Geigy S. A.). U. S. 1,782,356, Nov. 18. Acid dyes fast to alkali are obtained by condensing an unsym. *N*-alkylated *p*-phenylenediaminesulfonic acid having a sulfo group in *o*-position to the primary amino group, with a phenonaphthazonium sulfonic acid having an alkyl group attached to the *meso* azine-N atom. Cf. *C. A.* **25**, 214.

Naphthoquinone derivatives. I. G. FARBENIND. A.-G. (Karl Schirmacher and Konrad Renn, inventors). Ger. 506,442, May 29, 1927. 7-Acylamino-1,4-naphthoquinones are prepd. by oxidizing 7-acylamino-1-naphthols or their substitution products with CrO_3 at a low temp. Examples are given describing the prepn. of *(inter alia) 7-acetamido-1,4-naphthoquinone*, decompg. 228–30°, and *7-benzoylamino-1,4-naphthoquinone*, decompg. above 232°. The products are *intermediates for dyes.*

Colloidal solutions and pastes of dyes, pigments, etc. I. G. FARBENIND. A.-G. Brit. 332,557, April 22, 1929. Zinc white, Helio Bordeaux BL or other dyes or pigments are dispersed in org. solvents of the polymerization products of butadiene or its homologs contg. alkyl radicals in the 1- or 1,4-positions, to which natural rubber or other polymerization products also may be added. Details of prepn. are given and products are obtained which may be applied as coating compns. by spraying, brushing or dipping and may be hardened by heating (in the presence of O or of vulcanizing agents if desired).

Color lakes. GELLERT ALLEMAN (to Sun Oil Co.). U. S. 1,781,772, Nov. 18. A water-sol. dye such as "Lithosol Rubine B powder" and an aq. soln. of a water-sol. metal salt such as $CaCl_2$ adapted to ppt. the soap are added to a water-sol. fatty acid soap derived from petroleum. Various examples, details and modifications of procedure are described.

Diazo solutions for ice colors. I. G. FARBENIND. A.-G. Brit. 332,630, March 27, 1929. A solid aryldiazonium fluoborate is dissolved in an aq. soln. of a neutral salt of NH_4 or of a metal of the first or third group of the periodic system (the basic residue of the salt having a greater affinity to hydrofluoboric acid than to the acid residue of the salt), the soln. contg. no acid or acid salt but if desired being mixed with neutral salts serving as dyeing assistants or diluents. Several examples are given.

Dyeing cellulosic fibers. ALBERT BODMER (to Heberlein & Co., A.-G.). U. S. reissue 17,894, Dec. 2. See original pat. No. 1,694,526 (*C. A.* **23**, 718).

Dyeing cellulose esters and ethers. BRITISH CELANESE, LTD., G. H. ELLIS and W. B. MILLER. Brit. 332,624, Feb. 23, 1929. Black dyeings are obtained by oxidizing aniline on the material in the presence of a chemically equiv. quantity of inorg. acid, and in the presence of addnl. inorg. or org. substances of acid reaction such as HOAc or $AlCl_3$. Various details and examples are given involving the use of padding agents, oxidizing

agents such as $NaClO_3$ and oxidation catalysts such as salts of V, Cu or Fe, and of the production of discharge or resist effects.

Dyeing cellulose esters and ethers. I. G. FARBENIND. A.-G. (Hermann Wagner, Adolf Kuchenbecker, Richard Huss and C. Erich Müller, inventors). Ger. 509,401, Jan. 18, 1928. Violet dyeings are produced by coupling with 2,3-hydroxynaphthoic acid, or its arylamino derivs., the diazo compds. from diaryl or dialkyl ethers of 4-amino-6-acylaminoresorcinols or their substitution products. Coupling is effected on the substance to be dyed. Examples are given.

Dyeing materials such as cellulose acetate or similar cellulose esters. HENRY DREYFUS. U. S. 1,783,607, Dec. 2. The material is dyed with a coloring compd. comprising at least one aliphatic hydroxy thioether grouping. Several examples are given.

Dyeing regenerated cellulose materials. IMPERIAL CHEMICAL INDUSTRIES, LTD., and R. BRIGHTMAN. Brit. 332,545, April 19, 1929. Level shades ranging from orange or red to bluish violet and blue are obtained by use of secondary disazo dyes produced from a monoamine of the benzene series not contg. a nitro group (alk.) coupled with an aminonaphtholsulfonic acid and with an end component. Numerous examples are given.

Dyeing artificial filaments, ribbons, etc. BRITISH CELANESE, LTD., and W. I. TAYLOR. Brit. 332,565, Jan. 11, 1929. Continuously with the production of the material by extrusion, dyes are applied at intervals along the lengths of the material. App. and various details of procedure are described.

Printing fabrics. CAMILLE DREYFUS. U. S. 1,783,606, Dec. 2. A fabric to be printed such as silk, wool, cotton or rayon is sprayed with a solvent for the dye, on a transfer medium, and the wetted fabric is applied to a transfer medium having a dye that is capable of dyeing the fabric to be printed under pressure, so that the dye on those portions of the transfer medium which come into intimate contact with the wetted fabric will be dissolved out and will combine with the fabric to color the latter. An arrangement of app. is described. Cf. *C. A.* **24**, 2898.

Printing wool with ester salts of leuco compounds of vat dyes. WALTER TAUSSIG (to Durand & Huguenin Akt.-Ges.) U. S. 1,784,768, Dec. 9. See Ger. 486,174 (*C. A.* **24**, 1991).

Treating yarn in packages with liquids for dyeing or other purposes. JOHN C. HEBDEN (to Dyeing Processes Corp.). U. S. 1,783,908, Dec. 2. Mech. features.

Apparatus for dyeing or other treatments of yarn. JAMES H. THOMPSON (to Walker & Davis, Inc.). U. S. 1,784,399, Dec. 9. Structural features.

Treating textile fibers. LEON LILIENFELD. Austrian 119,200, April 15, 1930. Cotton and other vegetable textile fibers, or fabrics made therefrom, are strengthened and lustered by treatment with a warm or hot alkali sulfide soln. of not less than 25% strength, calcd. as Na_2S. Examples are given. Cf. *C. A.* **24**, 3911.

Treating fabrics such as those with cellulose acetate pile. GEORGE H. ELLIS, HENRY C. OLPIN and ERIC E. WALKER (to Celanese Corp. of America). U. S. 1,783,608, Dec. 2. A fabric with a pile of material such as cellulose acetate filaments and a backing of other material such as cotton, wool or silk or regenerated cellulose is softened and weakened in selected areas of the fabric (suitably by use of a selective solvent or swelling agent) and the weakened pile filaments are afterward removed while in substantially undissolved state and in filament form (suitably by brushing or plucking), to produce ornamental effects.

Bleaching and other treatments of fabrics. F. BARKER, E. BARKER and P. V. BARKER. Brit. 332,718, July 3, 1929. The material is passed through kiers for liquid treatments while festooned in movable carriers over bars which may be formed of a steel alloy contg. C 0.35, Mn 0.25, Si 0.30, S 0.01, P 0.015, Ni 8 and Cr 18%. Various details of the app. are described.

Apparatus for washing, bleaching or dyeing hanks or spinning cakes of artificial silk. JOSEPH VON DER DRIESCH (to Fr. Küttner A.-G.). U. S. 1,783,103, Nov. 25. Structural features.

Washing artificial fibers wound on perforated bobbins. BENNO BORZYKOWSKI. U. S. 1,783,493, Dec. 2. Washing liquid is drawn inwardly through the material by suction within the bobbin in an app. which is described.

Drying and finishing lengths of fabric. M. LENDERS. Brit. 332,500, Nov. 25, 1929. Mech. features.

Artificial yarns of cellulose acetate, etc. BRITISH CELANESE, LTD., and W. I. TAYLOR. Brit. 332,527, March 21, 1929. Yarns, threads or filaments of cellulose acetate or other cellulose derivs. are subjected to a vacuum treatment after spinning to

remove residual solvent (which is recovered). The process may be accompanied by heating and supply of small quantities of air or other suitable gas or humidification, and various details of procedure are described.

Composition for preserving knitted textile fibers. LEIELLA MORRIS. U. S. 1,781,730, Nov. 18. A compn. which may be used for treating silk hosiery, etc., is prepd. from alum 2, $MgSO_4$ 1 and NaCl 1 part, mixed with warm water.

Apparatus for mercerizing textile fabrics. W. MYCOCK & CO., LTD., and W. MYCOCK. Brit. 332,751, July 31, 1929. Structural features.

Weighting silk. R. CLAVEL. Brit. 332,778, March 16, 1929. The process described in Brit. 266,640 (*C. A.* **22**, 690), modified as described in Brit. 283,019 (*C. A.* **22**, 3997), is further modified by immersing the silk yarn or fabric in a metal salt bath such as $SnCl_4$, squeezing out excess soln., and then transferring to an acid fixing bath without intermediate washing, deacidification or neutralization. As fixing bath there may be used a soln. of NaH_2PO_4 to which acids or acid salts or protective agents may be added, or a bath prepd. from Na_2HPO_4 with HCl or other suitable acid or acid salt to produce an acid reaction. After rinsing the material may be given a final treatment with a bath contg. soap and waterglass. Cf. *C. A.* **24**, 3657.

Protecting wool. I. G. FARBENIND. A.-G. Ger. 506,432, Aug. 1, 1925. Bacterial attack of wool, particularly wool stored damp after an alk. washing, etc., treatment, is prevented by treating the wool with Cr or Zn salts at about 50°. Suitable salts are basic Cr–Mg sulfate, or $K_2Cr_2O_7$ with bisulfite. Examples are given.

Mothproofing wool, fur, etc. I. G. FARBENIND A.-G. (Max Weiler, Karl Berres, Berthold Wenk and Hermann Stötter, inventors). Ger. 506,989, Oct. 11, 1928 Addn. to 503,256. The method of Ger. 503,256 (*C. A.* **24**, 5169) is modified by using hydroxy-di- or -tri-arylmethane compds. prepd. by condensing aldehydes with phenols other than those specified in the prior patent, or with naphthols or their derivs. contg. indifferent substituents. Examples are given.

Plant with centrifugal apparatus for recovery of fats from emulsions such as wash waters of wools. JEAN A. L. ROZIERES (one-half to Soc. française de centrifugation). U. S. 1,782,974, Nov. 25. Structural features and details of operation are described.

Waterproof fibrous articles. HAROLD L. LEVIN (to Flintkote Co.). U. S. 1,782,855, Nov. 25. A waterproofing material such as an asphalt dispersion is added to an aq. stock of fibrous material and fixation of the waterproofing material upon the fibers is effected by a fixing agent formed *in situ* in the mixt. such as by use of Na silicate and alum at the isoelec. point of the fixing agent; the mixt. thus prepd. is forced against a foraminous mold to form articles of desired shape.

Felting. CHARLES D. PARKS. U. S. 1,782,764, Nov. 25. Fur such as that for hat manuf. is treated with an alk. soln. of an oxidizing agent such as an aq. soln. of H_2O_2 and NaOH to attack the wax on the fibers, the fur is dried, formed into a bat, and the bat is treated with an aq. acid soln. such as HOAc or H_2SO_4 soln. and felted while applying such a soln. U. S. 1,782,765 describes a similar process in which an alkali such as NaOH is used for the preliminary treatment.

Retarding fading of vegetable materials. EDGAR W. GEISLER (to R. H. Comey Brooklyn Co.). U. S. 1,783,114, Nov. 25. A soln. of a thiosulfate such as $Na_2S_2O_3$ is applied to materials such as straw braid for hat manuf.

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

Chalking (of paints). II. Experiments in determining the degree of chalking by the "stamping" method. RICHARD KEMPF. *Farben-Ztg.* **36**, 171–2(1930); cf *C. A.* **24**, 5513; **25**, 219.—The value of K.'s device is illustrated by photographs of results obtained on various types of paint. The app. also reveals cracks in paint and irregularities in brushing paints. G. G. SWARD

The usefulness of zinc green in paints. M. BERGER. *Farbe u. Lack* 1930, 501, 515, 527.—Green pigments using $ZnCrO_4$ as the yellow ingredient are characterized by good hiding power and brilliance. The new method of pptg. $ZnCrO_4$ from hot solns. results in a grit-free pigment which is readily mixed dry with blue pigments in the prepn. of greens. For easy brushing and non-floating, the soft steel blues should be used with $ZnCrO_4$. Zinc greens are very sensitive to alkalies but are probably 4 to 5 times as light proof as chrome greens. This stability may be due to the non-darkening of Zn salts in H_2S atms., or to traces of dichromate which may reoxidize any ferrocyanide that

has been reduced photochemically. Soly. in H_2O and low tinting strength are disadvantages of zinc green. It loses its brilliance in water paints. It should not be used with high acid resins as soaps may be formed. G. G. SWARD

A dressing plant for "Bideford Black." HUMPHREYS M. MORGANS. *Bull. Inst. Mining Met.* No. 314, 9 pp.(1930).—A flotation plant for black ocher is described. The raw ocher has 70% ash. The concd. ocher may contain 60–70% that is volatilizable, chiefly C, and 30–40% SiO_2 + Al_2O_3. Reagents (lb. per ton) are creosote 0.9–1.10, cresylic acid 1.5–1.75, and xanthate 0.2–0.27 for primary flotation and pine oil 0.09–0.135 for retreatment. Power consumptions are: primary grinding and classifier 20, flotation plant and thickener 50, Oliver filter plant 27, dryer 23, Hardinge mill 70 and air sepn. 21 h. p. ALDEN H. EMERY

Colloidal-chemical studies of the drying process of linseed oil. HERBERT FREUNDLICH. *Farbe u Lack* 1930, 526.—Examn. of raw, blown and boiled linseed oils for polarization of light, plasticity and ultramicroscopic particles did not yield direct evidence of colloidal states. If linseed oil be classed as a gel, study of the diffusion of its oxidation products through it might yield valuable data. G. G. SWARD

Detecting adulteration of wood oil from Indo-China (abrasin oil) with castor oil and peanut oil. ERICH STOCK. *Farben-Ztg.* 36, 173(1930).—A wood oil from Indo-China with the following consts.: sp. gr. 0.935, acid no. 8, n_{19} 1.512, and sapon. no. 193 was mixed with varying proportions of castor oil, peanut oil and both. From the detn. of the above consts., definite conclusions regarding the compn. of the mixts. could not be drawn. G. G. SWARD

Phenol resinoids in oil varnishes. V. H. TURKINGTON, R. C. SHUEY AND W. H. BUTLER. *Ind. Eng. Chem.* 22, 1177–80(1930).—Distinctly new types of phenol-condensation products have been developed which are sol. in drying oils without the use of rosin or an inactive ingredient to promote soly. They range from dark brown to practically colorless resins and are sol. in China wood oil; most of them are sol. in linseed oil. Useful properties of phenol resins are: durability, rapid drying, toughness, waterproofing, alk. resistance and acid resistance. The methods employed in testing these resinoids are outlined, the data tabulated on 8 varnishes and the results discussed. W. H. B.

A note on the determination of the melting point of resins. M. RANGASWAMI. *J. Oil & Colour Chem. Assoc.* 13, 287(1930).—The Hg method of Durrans (cf. *C. A.* 23, 4355) is adapted for small samples by melting 0.2 g. of the resin in a 17 cc. porcelain crucible. After cooling, about 25 g. Hg is added, a thermometer is inserted in the Hg and the crucible heated at the rate of 2° per min. until the resin appears at the surface of the Hg. The requirements as to amt. of Hg or exact shape of the crucible are not rigorous and good precision is claimed. G. G. SWARD

Resenoplast. KRUSE. *Farbe u. Lack* 1930, 550.—Resenoplast (compn. not given), a proprietary product combining the properties of both resin and plasticizer for use in nitrocellulose lacquers, is a yellowish brown viscous material with a mild odor and an acid no. of 14.5. It is characterized by extreme resistance to ultra-violet light, alkalies and alc. It is sol. in most of the nitrocellulose solvents, but only slightly so in aliphatic alcs. and hydrocarbons. The proportions to use in lacquers are indicated. G. G. SWARD

Resin of *Garcinia mangostana* L. (DRAGENDORFF) 10. Ethers (Brit. pat. 332,756) 10. Colloidal solutions and pastes of dyes, pigments, etc. (Brit. pat. 332,557) 25. Condensation products from polyvinyl esters (Ger. pat. 506,148) 18.

Roof paint. MICHAEL M. CONNOLLY. U. S. 1,783,702, Dec. 2. Coal tar 20, gasoline 5 and alc. 1 part.

Pigment. DAVID V. AULT. U. S. 1,784,411, Dec. 9. A clay-like material contg. sericite in a naturally-occurring, finely divided condition is dried and the finely divided sericite is sepd. from the gritty particles (suitably by air sepn.).

Black pigment from peat. STATE IMPORT AND EXPORT TRADING OFFICE "GOSTORG." Austrian 119,013, April 15, 1930. See Brit. 307,861 (*C. A.* 24, 212).

Apparatus for grinding pigments, etc. EUGENE DE ROZIERES. U. S. 1,781,808, Nov. 18. Structural features.

Manifolding with ink-forming reagents. EDWIN R. GILL, JR. U. S. 1,781,902, Nov. 18. Contacting sheets carry reagents such as gallic acid and an Fe salt with glycerol which under the action of pressure react to form an ink.

Preventing spontaneous combustion of spray residues of coating compositions such as those containing nitrocellulose. EARLE C. PITMAN (to E. I. du Pont de Nemours

& Co.). U. S. 1,782,126, Nov. 18. The spray residue is treated with an anti-oxidant such as hydroquinone or tannic acid in dil. soln.

Alumina lacs. I. G. FARBENIND. A.-G. (Fritz Baumann, inventor). Ger. 504,599, Aug. 1, 1928. Anthraquinonedisulfonic acid dyes are stirred into the alumina lac. Examples mention Na quinizarine-2,6-disulfonate and Na anthraquinone-1-hydroxy-4-amino-2,8-disulfonate as dyes used.

Method and apparatus for drying lacquered goods, etc., with a circulating current of hot air. LUFTHEIZUNGS- UND ABGASVERWERTUNGS-G. M. B. H. (Walter Oparsky, inventor). Ger. 506,121, Sept. 22, 1927.

Coating metal articles with lacquer. JAMES S. GEORGE and ROGER S. SPERRY (to Scovill Mfg. Co.). U. S. 1,783,188, Dec. 2. App. and various details of procedure are described, for submerging the articles in a bath of the coating material, withdrawing the articles substantially at the same rate as the excess coating drains from them, and drying.

Shellac composition for phonograph records, etc. RICHARD E. SUMNER (to Calco Chemical Co.). U. S. 1,781,711, Nov. 18. A shellac binder is used with a filler such as cotton flock and a mineral filler and with an azine base dye such as nigrosine base or inulin base.

Coating composition. ROY H. KIENLE and LESTER V. ADAMS (to General Elec Co.). U. S. 1,783,364, Dec. 2. An alkyd. resin such as a glycerol phthalic acid resin is dissolved in an org. liquid solvent such as acetone and the soln. is brought into contact with an alkali such as CaO in solid, granular form, and basic mineral matter such as ZnO, Ti oxide or basic Pb carbonate is suspended in the resulting soln. The product is suitable for coating metals, porcelain, etc.

Apparatus for applying and baking coatings such as insulating enamel on wire. RICHARD D. JESSUP (to Western Elec. Co.). U. S. 1,782,425, Nov. 25. Structural features.

Cement-coated wire. J. BIRCHARD GREEN (to Chicago Steel and Wire Co.) U. S. 1,783,613, Dec. 2. Coating material such as a naphtha soln. of China wood oil and glycerol ester gum is applied to the wire in coil form and the coated wire is dried while suspended on a rotating support upon which it is constantly changing its position.

Resinous coating for metals. STANTON I. CHARLESWORTH and ARCH W. HARRIS U. S. 1,782,341, Nov. 18. A compn. adapted to form a hard resinous coating on metal or other surfaces comprises a resinous base consisting of the residue remaining after the distn., up to 300° under approx. 28 in. of vacuum, of the pure still residue remaining after the distn. of the light oils recovered from by-product coke-oven gas, this resin base being mixed while molten and hot with approx. 30% by wt. of benzene or other light oil products. App. is described.

Rosin oil. JOSEPH N. BORGLIN (to Hercules Powder Co.). U. S. 1,782,401, Nov. 25. Wood rosin is heated in the presence of about 0.05–1.0% of a B compd. such as H_3BO_3, B oxide or a borate which reacts with impurities and is then subjected to destructive distn. (suitably under reduced pressure).

Cracking rosin. GUSTAV EGLOFF and HARRY P. BENNER (to Universal Oil Products Co.). U. S. 1,783,230, Dec. 2. In cracking rosin in the presence of water, the mixt. is introduced into a still and subjected to heat and pressure to raise its temp. to above 480° and to generate a vapor pressure exceeding 5000 lb. per sq. in. to convert a substantial portion of the mixt. into a light oily product which may be used in *paints*. App. is described.

Removing color from rosin. WM. B. LOGAN (to Newport Co.). U. S. 1,782,267, Nov. 18. A rosin soln. is treated with a light colored metal halide such as $SnCl_4$, $SnCl_2$ or $AlCl_3$ capable of forming an insol. compd. with the coloring substances in the rosin, and the ppt. formed is sepd. from the rosin soln. Cf. *C. A.* **24**, 3387–8.

Mixed esters of colophony, etc. HERMAN A. BRUSON (to Resinous Products & Chemical Co.). U. S. 1,783,165, Nov. 25. Tough and flexible products are obtained by heating together colophony or other acidic resin or "gum" such as Congo or Manila gums, a polyhydric alc. such as glycerol or ethylene glycol and an acid such as adipic acid, pimelic acid, suberic acid, azelaic acid or sebacic acid. The products may be used with nitrocellulose, etc., in making lacquers or other products and maintain their flexibility even at a temp. of —5°. U. S. 1,783,166 describes the plasticizing of phenol aldehyde resins by incorporating with them a condensation product of glycerol or other suitable polyhydric alc. and sebacic acid or one of the other similar specified acids. Products are thus obtained which form tough films. U. S. 1,783,167 describes the production of rubber-like products by heating castor oil with polyhydric alcs. such as glycerol and an acid such as sebacic, adipic or azelaic acid, with or without a drying oil such as linseed oil. Various examples with details of procedure are given. U. S. 1,783,-

168 describes the manuf. of similar products with use of fatty acids of castor and linseed or China wood oils instead of the oils themselves, together with a polyhydric alc. such as glycerol and an acid such as sebacic acid. The products are suitable for plasticizing nitrocellulose and may be used as coatings on various materials.

Floor covering. CARLETON ELLIS (to Ellis-Foster Co.). U. S. 1,784,135, Dec. 9. A satd. felt suitable for transport in rolls carries an adherent tread "veneer" contg. nitrocellulose, a glyceride resin, and a finely divided fire-retarding mineral substance such as hydrated $CaSO_4$.

Floor-covering material. CARLETON ELLIS (to Ellis-Foster Co.). U. S. 1,784,799, Dec. 9. A waxed paper base is provided with a plastic adherent tread layer comprising nitrocellulose with a plasticizer and filler. U. S. 1,784,800 specifies the use of a base such as asphalt-impregnated felt with a covering layer of nitrocellulose, plasticizer, volatile solvent, wax and filler dried at a temp. above that at which the wax dissolves freely in the volatile solvent. U. S. 1,784,801 relates to a similar waterproofed base coated with a figured coating comprising pigment, nitrocellulose and a small proportion of wax. U. S. 1,784,802 specifies forming the tread layer of nitrocellulose compn. with a non-uniformly textured surface. U. S. 1,784,803 specifies similar material with a textured white surface which may be produced by rolling hardened plastic fragments such as nitrocellulose compn. into the surface. U. S. 1,784,804 relates to similar material with a color-variegated surface.

Floor-covering material. BORIS N. LOUGOVOY (to Ellis-Foster Co.). U. S. 1,784,805, Dec. 9. A highly waxed paper support impregnated with wax substantially free from dark color carries a tread layer of nitrocellulose compn.

Linoleum. LINOLEUM MFG. CO., LTD., and A. C. MCKISSOCK. Brit. 332,543, April 19, 1929. Various details are given relating to production of tile pattern linoleum "enriched" with pieces cut from a patterned linoleum.

Resinous condensation product. ANDRE H. V. DURR (to Compagnie nationale de matieres colorantes et manufactures de produits chimiques du Nord, réuniés établissements Kuhlmann). U. S. reissue 17,878, Nov. 25. See original pat. No. 1,739,447 (*C. A.* 24, 982).

Synthetic resins. BAKELITE CORP. Ger. 504,682, May 2, 1926. See Brit. 267,736 (*C. A.* 22, 1245).

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Preparation of pure fatty acids of higher molecular weight occurring in nature. D. HOLDE AND W. BLEYBERG. *Z. angew. Chem.* 43, 897–902(1930); cf. *C. A.* 24, 5520.—This is a review of the work by Holde and others on the prepn. of pure fatty acids, showing that the "heptadecanic acid" is a mixt. of palmitic and stearic acids, proving that the higher satd. acids are normal acids with the exception of isovaleric acid, and establishing the fact that natural fats contain closed series of the higher satd. acids differing by C_2; thus, beeswax contains $C_{28}H_{56}O_2$, neocerotic, m. 77.8°, $C_{27}H_{54}O_2$, cerotic, m. 82.5°, $C_{29}H_{58}O_2$, montanic, m. 86.8°, and $C_{31}H_{62}O_2$, melissic acid, m. 90.0°; peanut oil contains C_{20} and C_{22} acid and mountain wax C_{26}, C_{28} and higher acids. These results were obtained by fractional pptn. with Mg acetate, by micro-fractional distn. in high vacuum, by examg. the mother liquor as long as it showed a different m. p. from that of its crystals and by comparison with synthetically prepd. pure acids. One of the criteria for the purity of an acid of C_{18} to C_{28} is its brittle, coarsely cryst. nature on solidification after fusion; mixts. of acids would form a coherent mass with smooth lustrous surface and microcryst. structure. P. ESCHER

Simple methods for the preparation of pure palmitic and stearic acids in any desired quantity. HUGO DUBOVITZ. *Chem.-Ztg.* 54, 814(1930).—D. preps. pure palmitic acid from Chinese vegetable tallow (*Stillingia*) by sapong. and acidifying, or by Twitchells process, presses the acids cold, then warm, and dissolves them in an equal amt. of 90% (by wt.) alc. Upon solidification of the alc. soln. the cakes are pressed cold and hot and the remaining alc. is driven off at 100°. The resulting product is pure palmitic acid, showing a titer of 62.6°, I no. 0.45 and an acid no. 219.2. Stearic acid is prepd. in analogous manner, using shea butter acids as a starting material, the final product showing a titer of 69.7°, I no. 0.41, acid no. 197.5 and unsapon. matter 0.10%. Stearic acid may also be prepd. from olive oil by liberating its acids, removing palmitic acid by pressing at low temp., hydrogenating the resulting oleic acid until its I no. sinks to 35–40

and then treating this product in the same manner as the Chinese tallow. These methods are in com. use. P. ESCHER

Determination of total fatty acids. A. K. CHURCH. *Soap* **6**, No. 3, 31–3(1930).—A modified Stokes flask is used in place of the usual separatory funnel. This flask is 8 in. high, 3 in. in diam. at the bottom and 2 in. in diam. at the widest point of the bulb above the shoulder. Below the shoulder it has a capacity of 125 cc. and above the shoulder a capacity of 50 cc. Five g. of soap is dissolved in water and washed into the flask, making the total vol. about 75 cc. After heating, 10 cc. 1:1 HCl is added and the flask heated under a reflux until the fatty layer is clear. It is cooled and 30 cc. of ether added and then 10% NaCl soln. until the ether and water layers are just above the shoulder of the lower part of the flask. The siphon is inserted so that the turned up end of the tube projects about $^1/_8$ in. above the H_2O layer. The forefinger of one hand is placed over the end of the short tube and the other hand over the upper part of the flask. The ether soln. will siphon off into a weighed 150 cc. flask. The soln. is washed with ether to a total vol. of 90 cc. which is then evapd. and the flask dried and weighed. The combined alkali is titrated after adding 100 cc. alc. The total soap is detd. by evapg. the alc., drying and weighing. The unsaponifiable matter is detd. separately by dissolving the soap in 50% alc. and extg. with petr. ether. Rosin is detd. by Wolff's method except that the modified Stokes flask is used. Results with different soaps using the Stokes flask, the A. C. S. method with separatory funnel, and the method whereby the fatty acids are weighed directly all agree closely. E. SCHERUBEL

Which drying method leads to a reliable fatty acid determination in soaps? J. DAVIDSOHN. *Chem. Umschau Fette, Oele, Wachse u. Harze* **37**, 293–6(1930).—D. compares the Hefelmann-Steiner method (*Z. öffentl. Chem.* **1898**, 393), which titrates the total fatty acids and weighs them as K soaps, with the Goldschmidt method which dries the ether soln. of the total fatty acids at room temp. with anhyd. Na_2SO_4, evaps. at 50–60° and weighs the acids. D.'s series of lab. tests by drying the acids at 100° show appreciable losses in the tallow-coconut oil soaps and thus confirms the accuracy of the Goldschmidt method. In another series D. hastens evap. of the ether by an air blast and thereby shortens the time in reaching const. wt. P. ESCHER

Oleic acid rancidity. IV. Isomeric oleic and elaidic acids and erucic and brassidic acids. K. TÄUFEL AND E. SPIEGELBERG. *Chem. Umschau Fette, Oele, Wachse u. Harze* **37**, 281–4(1930).—The above fatty acids were exposed to air in daylight and darkness, and the resulting changes measured by the intensity of the Kreis reaction and the increase in wt. Elaidic and brassidic acids remained practically unchanged; the oleic acid which had been exposed to light began to increase in wt. and to show a more intense Kreis test after 2 weeks; oleic acid in darkness increased in wt. only after 4 months and the Kreis color increased little. Erucic acid did not change in the dark, and the sample which had been exposed to light increased in wt. only after 8 months, with a neg. Kreis test. P. ESCHER

American cherry-kernel oil. GEO. S. JAMIESON AND SAMUEL I. GERTLER. *Oil and Fat Ind.* **7**, 371–2, 387(1930).—The oil contains 87% of unsatd. acids and 7.7% of satd. acids which consist chiefly of palmitic and stearic acids along with small quantities of arachidic and myristic acids. The unsatd. fraction consists of oleic and linolic acids. The refined oil after more than a year was found to be in excellent condition; and it should prove useful as a salad oil and in the manuf. of cosmetics. E. SCHERUBEL

Investigations on sulfonated oils. VIII. Solubilities of ricinoleic acid sulfuric ester and its alkali salts in hydrochloric acid and salt solutions. KINZIRO WINOKUTI. *J. Soc. Chem. Ind., Japan* **33**, Suppl. binding 342–4(1930); cf. *C. A.* **24**, 1756.—The soly. of pure ricinoleic acid sulfuric ester and that of its alkali salts in HCl and various salt solns. were detd. at 25 ± 0.02°. The results are tabulated. A new modified process of the ether-brine method is given for the samples which are scarcely or not at all salted out by concd. brine, by acidifying first with HCl to transform the alkali salts into acid salts and the soaps into fatty acids; the sepn. of brine is facilitated without any bad effect upon the analytical results. With respect to the washing process of sulfonated oils in their manuf., it is shown that if Glauber's salt soln. is used the loss of the sulfuric esters will be small, but when brine is used some loss must be expected. In the process of sepg. the ricinoleic acid sulfuric ester or its homologous substances from their H_2O soln., it is shown that when inorg. salts such as alkali chlorides or sulfates are used as double decompg. and salting out reagents, almost quant. results will be obtained. **IX. Properties of sulfonated oils on the market.** KYOSUKE NISHIZAWA, KINZIRO WINOKUTI AND SYOZI IGARASI. *Ibid* 344–9.—Five sulfonated oils from Germany and 2 from Japan were studied. The relative viscosity increases with increase of concn. The relation between the concn. and the surface tension decreases with increase of concn. The

influence of the concn. on the relative surface tension against kerosene is similar to that stated above. Stability against turbidity by the addn. of acid depends on the concn. and in one case it increases its value with increase of concn. The stability against turbidity by the addn. of $CaSO_4$ increases with increase of concn. From the study on normal and acid salts of pure H_2SO_4 ester of ricinoleic acid it was thought that the properties of sulfonated oils will be controlled with the degree of neutralization. The results of the authors confirm this. The differences in properties between sulfonated oils on the market and those just neutralized generally coincide with those between normal and acid salts of H_2SO_4 ester of ricinoleic acid. Fourteen graphs are given.
E. SCHERUBEL

Soap solutions. VIII. Protective activities of soaps on Congo rubin sol. JIRO MIKUMO. *J. Soc. Chem. Ind., Japan* **33**, Suppl. binding 369–70(1930); cf. *C. A.* **23**, 4841.—Rubin nos. of various pure soaps (Na salts of valeric, caproic, heptylic, caprylic, nonylic, capric, lauric, myristic, oleic and ricinoleic acids) on a Congo rubin sol after addn. of KCl were measured at 25°. C_{12} exhibits some protective activity. C_{10} and C_9 soaps have poor activities and the color change of rubin sol is quick; C_8 has the poorest activity. Moderately concd solns. of C_7 by itself reveal a distinct coagulating tendency upon rubin; 0.4 *N* solns. of C_6 and C_5 soaps are almost equiv. to 0.16 *N* KCl in their coagulating activities upon 0.01% rubin. C_8 is the lowest soap. Solns. below C_7 have too little colloidality; they are rather pure common electrolytes in low concns., and consequently the antagonistic coagulating effect of Na^+ prevails over the peptizing activity of soap itself. It is preferable to exclude these salts of lower fatty acids from the soaps in the manuf practice. The protective activity of soap on a hydrophobic sol seems to be related to its adsorptive activity.
E. SCHERUBEL

Is fat extraction of raw bones possible with liquid solvents? G. GÜNTHER. *Chem.-Ztg.* **54**, 761–2(1930).—It is impossible to ext. raw bones completely with liquid benzine and the extd. bones may become moldy; they further require steaming to remove the solvent Benzine extn. is feasible with oil seeds but bone structure prevents thorough penetration in the raw bones.
P. ESCHER

Twitchell reagent. IV. Effect of the addition of electrolytes on the colloidal property of the reagent on the market. KYOSUKE NISHIZAWA, RYUZIRO ASADA AND BUNTYU SAKUMA. *J. Soc. Chem. Ind., Japan* **33**, Suppl. binding 349–52(1930); cf. *C. A.* **24**, 3915.—The effect of common electrolytes at 25°, 60° and 95° on Idrapid was measured with Ostwald's viscometer for viscosity and for surface tension with Traube's stalagmometer. Strong acids have a more marked effect than weak acids on the surface tension, and the salts of strong acids act in the same manner. With Kontakt and Pfeilring at 95°, the influence of electrolytes on viscosity is similar to that with Idrapid. The lowering of the temp. causes results depending on the salting out property of the electrolyte but the relation to viscosity and surface tension is similar to that at 95°. The effect of weak acids decreases viscosity and surface tension and is harmful to the fat-splitting power of the reagents. Six graphs are given.
E. SCHERUBEL

Component glycerides of stillingia (Chinese vegetable) tallow. T. P. HILDITCH AND J. PRIESTMAN. *J. Soc. Chem. Ind.* **49**, 397–400T(1930).—The fatty acids present are mainly palmitic 57–69, oleic 21–34, myristic 3–6 and stearic 1–3%. The Am. sample examd. contained 27.6% of fully satd. glycerides (largely tripalmitin), and over 60% of mono-oleo-disatd. glycerides, chiefly oleodipalmitins. The solidifying temp. varies widely in different samples, that of the Am. sample being 48.2°.
E. SCHERUBEL

Rapid determination of total fat. II. CLARENCE P. HARRIS. *Oil and Fat Ind.* **7**, 383–4, 387(1930); cf. *C. A.* **24**, 5519.—Instead of an analytical balance, 100-g. samples are weighed on a balance accurate only to 0.1 g. With cacao powder or chocolate liquor about 2 in. of the beaker is filled with the solvent and the mixt. stirred after which the soln. is filtered through a Büchner funnel with shredded asbestos. The soln. is then tested with a special hydrometer standardized at 20° and having a temp. correction scale making accurate readings possible between 17° and 23°. For use on cottonseed meal the method is simpler, requiring only that 80% will pass through a 60-mesh sieve. All of the solvent is weighed at once and the entire operation, exclusive of grinding the sample, requires 10 min. The results agree well with the standard A. O. A. C. method.
E. SCHERUBEL

Use of promotors in the hydrogenation of fats and vegetable oils. V. S. SADIKOV. *Zhur Prikladnoĭ Khim.* **3**, 573–84(1930).—Small quantities of CeO_2 when added to a NiO catalyst decrease the activity of the latter when hydrogenating vegetable oil while an addn of La_2O_3 acts as an accelerator without increasing the amt. of hydrogenated oil. A theory is developed that the first portion of the catalyst added is required to overcome the influence of impurities present in any oil and that a second addn. is required for the

actual hydrogenation. The influence of various other promotors and protectors in hydrogenation is studied on seal fat, its esters and distillates which are mixed with paraffin and glycerol, also on oleic acid and sun-flower oil. A. A. BOEHTLINGK

Application of the thiocyanate number. IV. Analysis of soy-bean oil. WASABURO KIMURA. *J. Soc. Chem. Ind., Japan* **33**, Suppl. binding 325(1930); cf. *C. A.* 23, 4838; 24, 4898.—By use of Kaufmann's thiocyanate method and the Pb salt-alc. method for analysis, a soy-bean oil from the Hônen Oil Co. showed the following compn.: satd. acids 11.8, oleic 25.9, linolic 58.8, linolenic acid 3.8%. The original oil had an acid no. 1.66, sapon. no. 195.04, ester no. 193.38, I no. (Hanus) 133.79, thiocyanate no. 79.71, unsapon. 0.54%, I no. of fatty acids 139.8 (Wijs), 139.2 (Hanus), thiocyanate no. 83.1. P. ESCHER

Utilization of by-products from saccharin manufacture. W. HERZOG. *Chem. Umschau Fette, Oele, Wachse u. Harze* **37**, 296–8(1930); cf. *C. A.* **24**, 6021.—It is suggested that *p*-toluenesulfonamide be utilized by converting it into *N*-chloro-*p*-toluenesulfonamide and chloramine, a H_2O-sol. powder, contg. 25.2% active Cl, valuable as a *disinfectant* and *bleaching agent*. Similar compds. have been prepd. from *p*-sulfamylbenzoic acid, also a by-product of saccharin manuf. In the fat industry chloramine is used as a preservative in amts. of 0.05%. It may also be used as a reagent in place of I in the detn. of the Hübl I no., since the values obtained with it are in close agreement with the Hübl nos. P. ESCHER

Extraction and rejuvenation of used bleaching earth. B. HASSEL. *Seifensieder-Ztg.* **57**, 722–4(1930).—Petr. ether, free from aromatic compds., gives the best results in the factory, except for castor oil; ether usually exts. too much non-fatty material. Comparative data are given for rejuvenated earth from linseed, coconut, cottonseed, castor and cylinder oil and from tallow. Rejuvenation of expensive bleaching earth will pay for itself; other cases are doubtful. P. ESCHER

Relation between the properties of soaps and the degree of unsaturation of fatty acids. I. Surface tension and detergent power of the soap solutions of C_{18} acids. MASAWO HIROSE AND TSUNEO SHIMOMURA. *J. Soc. Chem. Ind., Japan* **33**, Suppl. binding 337–8(1930).—Surface tensions of 0.025–2.0% Na soap solns. of stearic, oleic, linoleic and linolenic acids were measured at 10–80° by P. L. du Nouy's app. and the detergent powers tested with lanolin indigo cloth. At high temps. the surface tension increases with the no. of double bonds of the fatty acids, stearic acid giving the lowest value. At low temps. the same tendency is observed with soaps of unsatd. acids, but the stearate has the highest value. With the stearate, transformation into gel and crystal becomes more marked with increase in concn., while the soaps of unsatd. acids become turbid by dilu. The detergent power of soaps of unsatd. acids decreases with increase of unsatn. of fatty acids; that of stearate at high temps. is greater than the corresponding values of other soaps; but the value for stearate at low temps. is smallest. The soaps of more highly unsatd. acids are not satisfactory in detergent power, though the change of color and the odor may be prevented by adding antioxidant. At low temps. the soaps of highly unsatd. acids have the tendency to approach oleate in detergent power. With concns. below 1% the detergent power at 10–80° increases with the concn. The detergent power and surface tension of various soaps are mutually related only at the same concn. and temp. After a long exposure to air, stearate and oleate solns. remain odorless, linoleate evolves odor and linolenate evolves offensive odor. The soaps of C_{20} and C_{16} acids show the same tendency as the C_{18} acids. **II. Drop number and relative viscosity of the soap solutions of C_{18} acids.** *Ibid* 338–40.—The drop nos. of 0.025–2.0% soap solns. at 10–80° were measured by Hillyer's stalagmometer, with a petroleum fraction b. 150–200°. Except stearate, drop nos. generally increase with fall of temp. and the increase of concn. With concns. above 0.5% the drop no. increases with increase of unsatn. of fatty acids up to linolate while linolenate has a smaller drop no. than linolate. In a concn. below 0.25% oleate shows a max. drop no. while linolate has a smaller value. Detergent power of the soap soln. detd. by lanolin indigo cloth decreases with the increase of double bonds of fatty acids and is mutually related to the surface tension of the soap soln., but no definite relation is found between drop no. and detergent power. In relative viscosity, stearate stands highest and the soaps of unsatd. acids have smaller values. With the concn. below 2% no marked difference in viscosity is observed among the soaps of various degrees of unsatn.; with 1% soln. the linolate shows the largest value, while with 1.5% soln. the linolenate shows the largest value. **III. Lathering power of the soap solutions of C_{18} acids.** MASAWO HIROSE AND SABURO KITAJIMA. *Ibid* 340–1.—Stearate soln. of high concn. solidifies below 40°, and in low concn. the lathering is nearly nil. Lathering vol. rises with the increase of the double bond of the fatty acid, concn. and temp., but the lather stability shows a reverse tendency. Lather-

ing no. decreases with the increase of the double bond and rise of temp. As regards concn. influence, oleate passes through a max. at about 1% while linolate decreases with the decrease of concn. Sp. vol. of lather shortly after shaking rises with the increase of double bonds, but the corresponding values after 10 min. show a reverse relation. In general, the higher the degree of unsatn. the larger the vol. of lather, which, however, becomes more unstable. Oleate is the most moderate in its soap character of the soaps of C_{18} acids. Among the soaps of C_{22} or C_{24} acids, the soaps of the fatty acids with 2 double bonds are likely to show the best property. With the soaps of C_{18} acids the influence of unsatn. on the detergent power and the lowering of surface tension is similar to the case of lathering no. but contrary to lathering vol. E. SCHERUBEL

Solubilities of soaps in water. JIRO MIKUMO. *J. Soc. Chem. Ind., Japan* **33**, Suppl. binding 367–8(1930); cf. *C. A.* **24**, 1757.—The effects of the presence of highly sol. lower satd. fatty acid soaps or very sol. unsatd. fatty acid soaps upon the solubilities of sparingly sol. higher satd. fatty acid soaps were studied with various binary mixts. at 20°. Clear soap solns. prepd. by warming were kept in a thermostat for 3 to 15 days and then filtered; portions of the filtrate were treated with HCl and the fatty acids analyzed for their constituents. Solubilities, mols. per l.: Na myristate 4.8×10^{-4}, Na palmitate $4.8 - 5.2 \times 10^{-4}$, Na stearate $0.9 - 1.4 \times 10^{-4}$, Na arachidate $1.3 - 1.4 \times 10^{-4}$, Na behenate $1.2 - 1.5 \times 10^{-4}$. The exptl. temp., the m. p. of the fatty acids of class II soaps (caproates, etc.) and the concns. of their solns. exert great influence upon the solubilities of class I soaps (stearates, etc.). Soaps II always diminish the solubilities of less sol. homologous soaps I at lower temp. by salting out I, while at high temp. (50°) they can increase the solubilities of I by peptization. Common crystalloidal solns. have a retarding tendency upon the solubilities of I because of Na^+ effect acting in predominancy. Soaps III (oleates) in moderate concns. increase the solubilities of soaps I through mutual adsorption at 20° while at 0° Na oleate has no dissolving effect upon Na stearate. In any case mixed soaps in soln. exert colloidal influence upon each other; either one component is expelled from the soln. phase or they go together into the liquid phase through mutual adsorption. Soaps II or III always remain more or less in solid phase with I in some complex colloidal form. E. SCHERUBEL

Continuous saponification of neutral fat with ammonia under pressure. H. KEUTGEN. *Seifensieder-Ztg.* **57**, 697–9(1930).—K. refers to Barth's paper (*C. A.* **24**, 2220) on sapon. under pressure with NH_3, producing fatty acids, glycerol and $(NH_4)_2SO_4$. He doubts the advantages claimed for it. P. ESCHER

Determination of the cleansing power of soaps. E. BOSSHARD AND H. STURM. *Chem.-Ztg.* **54**, 762–3(1930).—A new washing test is described in which 25 mg. Fe_2O_3 is deposited upon 1 sq. dm. of woolen flannel and the moist test piece is hung on a rotating glass rod (100 r. p. m.) in a 2.5 l. beaker; it is washed in a 1% soln. of the washing compd. at 90° for 15 min. and rinsed in distd. H_2O at 90° for 15 min. The test piece is dried, ashed and the Fe_2O_3 detd. *Results.*—A settled soap washes best with a 0.4% soln.; at 90° the cleansing effect is twice as great as that at 25°; addn. of perborate lowers the cleansing effect; soaps contg. fat solvents show 10–20% better cleansing power than soaps without them. P. ESCHER

The Mackey test. H. WOLF AND R. HEILINGÖTTER. *Chem. Umschau Fette, Oele, Wachse u. Harze* **37**, 284–6(1930).—Presence of metallic soaps in the oil to be tested may cause a temp. increase in the Mackey test and since the free acid of an oil may easily form a soap when in contact with the metal gauze of the app., W. and H. suggest the use of brass on Pt gauze which expts. have shown to be free from any catalytic influence. They also advise the placing of the thermometer bulb in the exact center of the satd. cotton and give detailed direction for this. P. ESCHER

Reciprocal influence of soaps and perfumes. E. L. LEDERER. *Seifensieder-Ztg.* 57, 687–8, 703–4, 749–50(1930); cf. *C. A.* **24**, 4948.—*II. Influence of soaps on perfumes. A.*—Through the soap body. (*a*) At neutrality. Some 90 synthetic and natural compds. are tabulated with reference to keeping quality in soaps with less than 0.04% free alkali. The presence of linseed oil, deodorized by-product fats or more than 15% coconut oil diminish or change the character of perfumes; aulepine, coumarin and other aldehydes, ketones and lactones will not keep in the presence of heliotropin, cinnamaldehyde, hydroxycitronellal, isoeugenol, indole, vanillin, phenylacetaldehyde, etc. (*b*) Excess of alkali. When the alky. reaches 0.04% or more, the esters begin to saponify and change their odor; also vanillin, heliotropin, coumarin, indole, skatole and civet. Eugenol, isoeugenol and oil of cloves weaken in strength, while methyl-, ethyl- and benzylisoeugenol are more resistant toward alk. soaps. (*c*) Lack of alkali or the presence of unsapond. fat endangers the perfume greatly; resins or unsaponifiable substances do not. *B.*—Mech. and temp. influence. (*a*) Milled soaps.

Granite rolls permit losses of the more volatile perfumes, especially when the temp. increases. Cooled steel rolls are preferable. (*b*) Settled and non-settled soaps. The perfume should be added at the lowest possible temp.; benzaldehyde, citronellol and safrole or cedar-wood oil are useful. Non-settled soaps require special care because the temp. may rise while free alkali is still present. The alc. in glycerol soaps may influence the character of the perfume somewhat, but a large no. of perfumes may be used for these soaps: anisaldehyde, calmus oil, cedar-wood oil, citronellol, geranium oil, etc. Cold-made soaps have the least choice in perfumes; benzaldehyde, terpineol, citronellol, geraniol, xylol, musk, etc., are useful. *C.*—Changes by air and light. Terpenes and sesquiterpenes may resinify and alc. and aldehydes may easily become oxidized to non-odorous acids. Anthranilic methyl ester, bromostyrene, coumarin and thymol are not light-proof. Anisaldehyde, benzaldehyde, benzyl alc., geraniol, indole, phenylethyl alc., cinnamaldehyde and cinnamic alc. are either not proof or incompletely proof against air. Anethole, citral, eugenol, isoeugenol, heliotropin, phenylacetaldehyde, terpineol and vanillin are not proof against light or air. *III. Influence of the perfume substance upon the soap body; A.*—Technically pure soaps. (*a*) Color changes. Definite color changes have been observed with a no. of perfumes although the nature of the reaction is not accurately known. A table of 18 substances is given causing a yellow or brown color, among them anisaldehyde, benzaldehyde if not free from Cl, eugenol and isoeugenol, heliotropin, indole and vanillin; 21 substances are tabulated which cause no color change, among them are benzyl acetate, benzyl alc., bornyl acetate, citronellol, geraniol, ionone, linaloöl, terpineol, thymol and cinnamic alc. Fifty ethereal oils are likewise tabulated for permanence and discoloration. (*b*) Rancidity. Terpenes and sesquiterpenes are blamed for rancidity in soaps through autoxidation. The following substances act as antioxidants: benzyl benzoate, sandalwood oil, safrole, thymol, eucalyptal, benzoin, storax, guaiacum, myrrh and hyposulfites. P. ESCHER

Decomposition of the acids of peanut oil with the use of a new principle in fractional distillation (JANTZEN, TIEDCKE) **10.** Plant with centrifugal apparatus for recovery of fats from emulsions such as wash waters of wools (U. S. pat. 1,782,974) **25.** Preserving rubber (Brit. pat. 332,764) **30.** Washing and emulsifying agents (Ger. pat 506,338) **18.** Wetting, etc., agents (Ger. pat. 506,960) **18.**

Continuous apparatus for extraction of fats, etc., from animal carcasses, food refuse, etc. A. SOMMERMEYER. Brit. 332,637, April 24, 1929. Structural features of a digester and sepg. app.

Apparatus (with baffles) for separating fat from gases. GORDON W. F. CATLIN. U. S. 1,784,418, Dec. 9. Structural features.

Distilling column for distillation of fatty acids with steam. HERMANN BOLLMANN. U. S. 1,781,745, Nov. 18.

Stabilized fatty acid glycerides. CHARLES F. KAEGEBEHN (to R. T. Vanderbilt Co.). U. S. 1,784,360, Dec. 9. A small proportion (suitably about 0.4%) of a phenol having a nuclear H atom substituted by an aryl group, such as 2- or 4-hydroxybiphenyl is added to a material such as a com. fat or triolein, tristearin or tripalmitin in order to prevent decompn. from influence of light, heat, etc.

Press for expressing juices or liquids from oil-bearing seeds or other materials. OTTO RIEMANN. U. S. 1,782,273, Nov. 18. Structural features.

Apparatus for cooking oleaginous materials such as cotton seeds preparatory to oil extraction. JOSEPH DAVIDSON (to Davidson-Kennedy Co.). U. S. 1,782,714, Nov. 25. Structural features of a steam-cooking app. with superposed compartments.

Oil from cashew-nut shells. EDWARD R. HUGHES (to Harvel Corp.). U. S. 1,784,628, Dec. 9. The nuts are subjected to a sudden change from about normal temp. to about the charring temp. to produce an explosive pressure in the cellular structure by which the liquid is forced from the shell, followed by cooling before charring can take place. An arrangement of app. is described.

Soap powder. A. WELTER. Brit. 332,590, April 22, 1929. Liquid grain soap is heated by injection of compressed steam, and then atomized under the pressure prevailing in the treating vessel (solid electrolytes having a salting-out action such as NaCl or caustic alkali being added before heating, and if desired, the lower aq. layer being sepd. after stratification and before atomization of the upper soap layer). Various details of procedure are described.

Soap powder. A. WELTER. Brit. 332,599, April 22, 1929. In atomizing liquid grain soap heated to above 100°, compressed air or other non-condensing gas is pumped

into an autoclave contg. the soap before or at the beginning of the heating. Formation of crusts on the inside of the vessel is prevented.

Cleansing composition. ADOLF MÜLLER. Ger. 506,306, June 13, 1928. Kieselguhr that has been mixed with suitable binders, *e. g.*, kaolin and water glass, and sintered at about 1000°, is incorporated into soap.

28—SUGAR, STARCH AND GUMS

J. K. DALE

Storage experiments with raw (beet) sugar; emphasizing the relation between behavior on storage and affinability. O. SPENGLER AND ST. BÖTTGER. *Z. Ver. deut. Zuckerind.* **80**, 690–709(1930).—A review is given. Exptl. studies on temp. and relative humidity were made to det. the conditions under which the affinability of raw sugar remains unaltered on storage. Two types of sugar were used. *A* was dark colored, high in org. non-sugars, had high phenolphthalein alky., contained invert sugar and was of low rendement. *B* was light colored, of high rendement, lower in org. non-sugars and had lower phenolphthalein alky. These sugars were left in contact with air of different humidities at const. temp., 15° or 25°. By plotting % water content of the sugar *vs.* time, and color of sugar *vs.* time of storage, it was shown that the water content and the color value remained practically const. at a relative humidity of about 54 for *A* and of 59 for *B*. Temp. rise increased the rate of change, but did not affect the final result High relative humidity caused the absorption of H_2O by the sirup film on the sugar crystals, resulting in a more ready removal of this film in affination. *A* absorbed more water than *B*, for its lower purity sirup film exerted a lower vapor pressure than that of *B*. Low humidity caused low H_2O content, darkening of color and difficult affining. Samples of *A* and *B* stored at their resp. optimum humidities showed no change of color or H_2O content. Conclusion: Raw sugar of less than 2% H_2O content can be stored at 50–60% relative humidity without change in H_2O content or affinability, and as temp. has practically no effect on the equil., the relative humidity of the storage house can be readily adjusted (*e. g.*, by heating the air). Dried as well as moist sugars attain to the equil. value after about 2 to 3 weeks storage at the optimum relative humidity though the moist sugars give up their excess moisture slowly Notes on ash, org. non-sugars, invert sugar and polarization changes are given. The optimum relative humidity for white sugar storage is found to be about 60%, while that for raw sugars is 50–55%. F. CAMPS-CAMPINS

Sulfur dioxide in Natal sugar. D. J. COGHILL. *S. African Sugar J.* **14**, 565–75 (1930).—Three methods are in general use: the S stain method (*C. A.* **21**, 1199), titration with I (*Ibid*) and distn. in acid soln. with subsequent oxidation to H_2SO_4 (*C. A.* **21**, 2510). The 1st of these is applicable only to very small quantities of SO_2, and it has not been used in this investigation. The 2nd is carried out by C. as follows: Fifty g. of the sugar is dissolved in 150 cc. H_2O with gentle warming. Cool to room temp. and mix with another 100 cc. H_2O. Add 20 cc. of 5% NaOH soln., agitate the flask until the soln. clears and acidify with an excess of H_2SO_4. Immediately run in 10–20 cc. 0.02 *N* I soln.; there should be an excess of at least 5 cc., which is titrated back with 0.032 *N* $Na_2S_2O_3$ soln., with starch indicator. For the distn. method, as used by C., 100-g. sugar is dissolved in 100 cc. recently boiled and cooled tap water. A round flask is used in which 500-cc. water and 10 cc. concd. HCl are placed. The flask carries a funnel with stop cock for the sugar soln., an inlet tube for CO_2 and a reflux condenser set upward at an angle of about 45°; the upper end of the condenser is connected with 2 absorption vessels, each of which contains 10 cc. H_2O_2 (20% by vol.). CO_2 is passed through the app., and the contents of the flask are boiled for 5 min. Then the sugar soln. is run in from the funnel at such a rate that all of it is passed in 30 min. It is finally washed through with a little water. The water for the condenser is cut off and the distn. continued, always in a current of CO_2, until the upper end of the condenser becomes hot. Then the CO_2 gas is stopped, the tube between condenser and absorption tubes rinsed down and the entire contents of the absorption tubes are transferred to a beaker where they are titrated with 0.1 *N* NaOH, with bromophenol blue (0.1% soln. in alc.) as indicator. A blank is run on the H_2O_2, and a correction applied for it. The 2 methods were used on 104 samples of various types of Natal sugars, and the detailed results are tabulated. The I titration method gave 14 to 488 mg. per kg. of SO_2, and the distn. method 4 to 370 mg. Fifteen % of the samples contained over 70 mg. per kg., by the distn. method. The I method gave higher results, because the sugars contain volatile

compds., other than SO_2, which act on I. This was shown by distg. and passing the vapors first through H_2O_2 and then through I. Some of the I was reduced, but no H_2SO_4 could be detected as the reaction product. The SO_2 content of the sugars diminishes during storage. Bibliography of 9 references. F. W. ZERBAN

Crystalline dextrose. WM. B. NEWKIRK (to International Patents Development Co.). U. S. 1,783,626, Dec. 2. Normal anhyd. dextrose crystals are crystd. from an aq. dextrose soln. contg. 93% or more dextrose without addn. of seed, and the crystg. magma is maintained at a temp. (suitably about 50°) favorable to the formation of the anhydride and in movement so as to effect a uniform dispersion of the solid-phase dextrose throughout the mass. Cf. *C. A.* **24**, 2631.

Inverting sucrose solutions. LEONARD WICKENDEN (to John J. Naugle). U. S 1,783,551, Dec. 2. Material such as an affination sirup is treated with a monosaccharide sugar-contg. sirup contg. invertase. Numerous details of the treatment, clarification in successive stages, etc., are described.

Starch products. INTERNATIONAL PATENTS DEVELOPMENT CO. Brit. 332,680, Dec. 26, 1928. See Fr. 676,181 (*C. A.* **24**, 3128).

Monosaccharide material from hydrolysis of starch liquor. THEODORE B. WAGNER. U. S. 1,784,402, Dec. 9. A product which consists of a mixt. of dextrose and non-gummy dextrins may be produced by converting starch liquor by acid hydrolysis to a point at which the dextrins have lost their gummy and mucilaginous condition, and is suitable for use in *producing baker's yeast.*

Solubilizing gums. GEBR. JENTZSCH A.-G. (Heinz Perndanner and Josef Hackl, inventors). Ger. 506,037, June 3, 1928. Vegetable gums that swell but do not dissolve in water, *e. g.*, gum from *Sterculia urens*, are rendered sol. in water by treatment while in the swollen state with a water-sol. hypochlorite or the Na salt of *p*-toluenesulfochloroamide or its homologs. The treatment may be effected at ordinary or raised temp. An example is given.

29—LEATHER AND GLUE

ALLEN ROGERS

Some physical properties of leather. H. BRADLEY. *J. Intern. Soc. Leather Trades Chem.* **14**, 516–23(1930).—A discussion of the significance of such properties as sorption of water vapor, absorption of and permeability to liquid water and air permeability. H. B. MERRILL

Study of the dyes suitable for dyeing synthetic tanned leather (leathers tanned with syntans). GEO. F. KNOWLES. *J. Intern. Soc. Leather Trades Chem.* **14**, 562–7 (1930).—Acid dyes differ much among themselves in their capacity to be fixed by leather tanned with syntans while all basic dyes are very readily taken up. Those acid dyes that give satisfactory fixation on syntan-tanned leather all contain some basic groups H. B. MERRILL

Estimation of insoluble matter in tanning extracts. E. STIASNY. *J. Intern. Soc Leather Trades Chem.* **14**, 542–62(1930).—See *C. A.* **24**, 6059. H. B. MERRILL

Problem of tannage. LOUIS MEUNIER AND KHOA LE VIET. *J. Intern. Soc. Leather Trades Chem.* **14**, 524–36(1930); cf. *C. A.* **24**, 2634, 4652.—In support of the theory that tannage consists essentially of depolarization of hydrophylic groups in general and the NH_2 group in particular, it is shown (1) that the wt. of water absorbed by hide powder from air at a given relative humidity is decreased when the powder is tanned by exposure to vapor of quinone or HCHO; (2) that the viscosity of gelatin

soln. is markedly lowered by the addn. of small quantities of quinone (below the pptn. point); (3) that skin tanned with a wide variety of agents (Br, H_2CrO_4, $CrCl_3$, $KMnO_4$, syntans, 2-bath Çr-tannage) loses its ability to retain water of plumping. The action of $KMnO_4$ is believed to be an oxidation: $R—CH—NH_2—COOH + O = R—CHO + NH_3 + CO_2$. H. B. MERRILL

Technic of the electrometric method for measuring the p_H value of chestnut extract with the quinhydrone electrode. A. DE LA BRUÈRE. *J. Intern. Soc. Leather Trades Chem.* **14**, 567–73(1930).—Details for prepg. the quinhydrone and calomel electrodes and for making the measurements are given. The tannin soln. should contain not less than 1% quinone; the concn. of tannin is immaterial. H. B. MERRILL

Control of p_H value of official hide powder. A. JAMET. *J. Intern. Soc. Leather Trades Chem.* **14**, 540–2(1930).—The p_H value of the hide powder infusion prepd. in accordance with the official method for testing hide powder is somewhat affected by the kind of filter paper employed, some papers being slightly acid and others slightly alk. The p_H value of the KCl soln. used for the infusion should be more rigidly defined. H. B. MERRILL

Standardization of hide powder. V. Calculation of "official" (mean) results from data submitted by members of the hide powder committee. H. G. BENNETT. *J. Intern. Soc. Leather Trades Chem.* **14**, 537–40(1930); cf *C. A.* **24**, 6057.—The application of the Chauvenet criterion to det. whether divergent results should be rejected or included in the av. is advocated. H. B. MERRILL

Ornamenting "leather cloth." IMPERIAL CHEMICAL INDUSTRIES, LTD., and G. E. SCHARFF. Brit. 332,602, Jan. 23, 1929. A self-cracking enamel is applied having a base of cellulose deriv. such as nitrocellulose sol. in org. solvents and contg. a high proportion of pigments or fillers or both (suitably 3 to 30 times the wt. of the cellulose deriv.) with a quantity of softening and plasticizing ingredients (if any) less than that which would render the coating sticky if the proportion of pigment were such as is normally present in ordinary non-cracking enamels. Examples are given of white and black cracking enamels.

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Historic facts relating to the chemistry of rubber. I. L. KONDAKOV. *Rev. gén. caoutchouc* **7**, No. 65, 7–13(1930).—A crit. review and discussion of a recent book by Memmler (*Handbuch der Kautschukwissenschaft*, Leipzig, 1930; cf. *C. A.* **24**, 2638). C. C. DAVIS

The influence of increasing proportions of different loadings on the shrinkage effect of uncured rubber mixtures and the determination of their behavior on calendering. RUDOLF DITMAR AND KARL H. PREUSSE. *Caoutchouc & gutta-percha* **27**, 15212–4 (1930).—If rubber is mixed with a filler on an ordinary roll mill and is then removed quickly, the sheet shrinks both transversely and longitudinally with corresponding increase in thickness. This phenomenon must not be confused with the de Visser effect (cf. *Diss. Delft*, **1925**). This shrinkage was studied on a micro-mill, where various quantities of whiting, ZnO, C black and SiO_2 gel were incorporated in 10 g. of rubber and sheets 2 mm. thick were removed as quickly as practicable. The roll temp. was 30° The contours of the sheets were traced on parchment paper and the shrinkage was then followed. With whiting, the shrinkage was the same for all proportions, and above 20% crimping was negligible and sheets 2 mm. thick could be calendered. With ZnO, shrinking was the same up to 50% and then increased greatly. Above 30° there was no crimping, and calendering to 2 mm. was possible. The greater the proportion of C black the smaller the shrinkage, and above 30% crimping ceased and calendering to 2 mm. was possible. With increasing proportions of SiO_2 gel shrinking became rapidly smaller, above 40% there was no shrinkage, and above 10% there was no crimping and the mixt. could be calendered 2 mm. thick. In general, the expts. show that very absorbent fillers decrease the shrinkage effect and render the mixts. more readily calendered. C. C. DAVIS

Some aspects of double refraction and structure in rubber. B. W. ROWLAND. *Ind. Eng. Chem.* **22**, 1182–4(1930).—The present work includes a no. of observations of double refraction in rubber under compression and also in a stretched state, and attempts to interpret the behavior in terms of the Wiener theory of micellar double

refraction. The exptl. evidence shows that (1) the micelle in distorted rubber is anisotropic and exhibits a pos. rod-like type of double refraction, (2) upon stretching, the micelle orients itself with its long axis in the direction of stretching, and (3) upon compression the micelle orients itself as a rod-like structure perpendicular to the direction of compression. The idea is advanced that stretching involves an intimate distribution of the sol. viscous hydrocarbon within the interstices of the elongated gel phase, which tends toward an optical homogeneity of the mass and a loss of distinction between the 2 phases. The double refraction of artificially polymerized isoprene resembles closely that of natural rubber. Natural color photographs show the similarity of double refraction in rubber to that of a uniaxial crystal. The n values of both natural rubber and of synthetic rubber (polymerized isoprene) are 1.5350 (Abbé refractometer). C. C. DAVIS

X-ray investigations on rubber. EMIL OTT. *J. Am. Chem. Soc.* **52**, 4612(1930); cf. *C. A.* **20**, 2428.—A sample of crepe rubber gave a distinct x-ray pattern on the first exposure, which became increasingly sharper with each exposure; simultaneously the opaqueness of the milky spot increased; these show increase in particle size and progressing crystn. Evidently rubber under the influence of x-rays behaves like gutta-percha under ultra-violet light (Kirchhof, *C. A.* **23**, 1525). C. J. WEST

A study of gutta-percha and balata by means of x-ray spectra. H. HOPFF AND G. V. SUSICH. *Rev. gén. caoutchouc* **7**, No. 65, 23–6(1930).—A survey of the expts. of Clark (*C. A.* **20**, 3837), Hauser (*C. A.* **22**, 697) and Ott (*C. A.* **20**, 2428) shows agreement in only 2 respects: *viz.*; that (1) gutta-percha (I) and balata (II) are already cryst. in the unstretched state, and (2) the lattice of gutta-percha and balata is different from that of rubber. To settle the discrepancies in the work of these investigators, unpurified and purified I and II of different origins were tested in the unstretched and in the stretched state at different temps. (0–140°). It was found that only the hydrocarbon is cryst., and if allowance is made for the amorphous ring of the impurities in I or II then it is immaterial whether purified or unpurified substances are exposed to the x-rays in spectrographic tests. The spectra showed that the hydrocarbons of I and of II are identical, but different from that of natural rubber. The hydrocarbon of I and II exists in 2 polymorphous modifications, the transformation point of which is approx. 60°, and depends upon the impurities. The modification which is stable at room temp. (gutta-α) is cryst. even in the unstretched state. The modification which is stable above 60° (gutta-β) is, on the contrary, amorphous in the unstretched state, like rubber at room temp. By stretching while hot it becomes cryst., oriented and gives a fiber diagram. From the fiber diagrams of stretched and cooled samples an identity period of 4.7 and 9.4 A. U., resp., can be calcd. The presence of these 2 modifications explains at least in part the contradictory results of Clark, Hauser and Ott. Though the transformation of gutta-α into gutta-β takes place readily upon heating, it is not easy to pass from gutta-β to gutta-α by simple cooling. The heated samples show a marked tendency to remain amorphous for a long time, as with glass, and when at length they crystallize, gutta-β (stable at high temp.) is more often formed. The latter can, however, be transformed into gutta-α if it is dissolved and repptd. at a lower temp. than the point of transformation. As this is a discontinuous phenomenon, samples which give a mixed diagram are often obtained I and II were purified by dissolving the com. products in $CHCl_3$ contg. 2% piperidine, filtering, pptg. by addn of acetone and extg. the ppt. with acetone until free of resins. Also in *Kautschuk* 6, 234–7(1930). C. C. DAVIS

Phenomena of the mechanical deformation of rubber. H. MARK AND E. VALKO. *Rev. gén. caoutchouc* **7**, No. 64, 11–6; *Gummi-Ztg.* **44**, 2077(1930).—The deformation of rubber is in general reversible and elastic, and involves a reversible hardening, in contrast to the irreversible deformation of crystals. It is most easily shown by x-ray expts. that the mol. phenomena are quite different in the 2 cases, and that the elongation of rubber can be explained by intramol. and intermol. changes. In the 1st case, the mols. do not change in form, whereas in the 2nd case the atoms in the mol. rearrange themselves in a new way. On the basis of the concept of fibrous primary valence chains, Meyer, Fikentscher and Mark have developed a model of the rubber mol. with which the mech. behavior of rubber can be satisfactorily explained on an intermol. basis. This model conforms to the elastic thermodynamic, röntgenographic and chem. properties. However, to correlate these properties on a quant. basis, it is necessary to employ the very same material throughout, and this the present paper attempts to do. The expts. were carried out with raw rubber from ammoniacal latex, a soft vulcanizate with a high rubber content and a tire tread mixt. with a high gas black content. The breaking tests were made at —195° (liquid N), and it was found that the differences at room

temp. in the tensile strength of samples previously stretched to varying degrees also held true at —195°. In an approx. way the strength of a given sample depended upon the preliminary elongation, and gutta-percha behaved in a similar way. In contrast to the earlier work, the present expts. do not show at the temp. of liquid air any high extensibility of previously stretched samples. The mol. mechanism of the resistance to rupture depends in all probability upon a micellar orientation. At rupture either the individual mols. can break (in which case the interlocked primary valence chains loosen and slide apart), or whole bundles of parallel primary valence chains, *i. e.*, micelles, slide apart. The latter phenomenon is the more probable. During stretching micelles of crystd. rubber are formed in increasing numbers, which behave like a filler in the remaining uncrystd. rubber. Since highly stretched raw rubber is almost completely crystd. and possesses about 10 times the strength of unstretched rubber, it may be assumed that the strength of the cryst. phase is 10 times as great as that of the amorphous phase. The strength of stretched rubber would accordingly be the sum of the strengths of the amorphous and cryst. portions present in a cross section. At room temp. rubber can be stretched several hundred %, but at the temp. of liquid air its ultimate elongation is less than 10%. A study of the tensile properties of raw rubber between 20° and —80° showed a sudden transition at —67°. At room temp. the ultimate elongation of raw rubber was approx. 900% and the tensile strength approx. 30 kg. per sq. cm. At —20° the ultimate elongation was the same, but the tensile strength was 10 times as great. Samples stretched in the cold showed an extraordinarily great elastic after effect. At —40° and —60° no essential changes were observed, and only between —60° and —70° did any appear. In the latter case the rubber broke without any elongation. At sufficiently low temps., there was a characteristic elastic limit of the stress, at which the resistance to deformation was greater than the resistance to rupture. This was the *temp. of brittleness*, which lay between —65° and —72°, according to the rate at which the stress was applied. Below this brittleness point, stretched rubber developed cracks, which appeared like white milky streaks, and which were visible even after warming. Above this temp. of brittleness, stretched samples became milky and turbid but remained homogeneous, and after release of the stress became transparent again. To explain this phenomenon, it may be assumed that upon lowering the temp. the intermol. vibrations of the spiral mol. became slower, so that the coiled position became stabilized. Simultaneously the viscosity increased. At a sufficiently low temp., the state of equil. within the stretched mol. became so well stabilized that the force necessary to overcome this equil. became greater than that of the cohesion between mols., and rupture without elongation occurred. Near the brittleness point there was in definite zones a stretching of the mol., but in the neighboring regions changes in position were no longer possible because of the high viscosity and the material became porous and absorbed gases. Also in *Kautschuk* 6, 210 5(1930). C. C. DAVIS

Study of the mechanical deformation of vulcanized rubber. P. PRACHE. *Caoutchouc & gutta-percha* **27**, 15003–8, 15046–9, 15125–8(1930).—A review and discussion of all types of mech. deformation of rubber, with a new study of the influence of 2 or more forces acting in different directions (the deformation of an inflated object distended by internal pressure). C. C. DAVIS

Change of electrical properties of rubber and gutta-percha during storage under water. HARVEY L. CURTIS AND ARNOLD H. SCOTT. *Bur. Standards J. Research* **5**, 539–52 (1930).—Samples of rubber and of gutta-percha were stored under water for about 7 yrs. and elec. measurements were made periodically to det. the effect of aging on their resistivities, dielec. consts. and powers. The dielec. const. was measured under 3 different conditions, *viz.*, an a. c. of 60 cycles, a pulsating d. c. with 0.6 sec. charge and 0.1 sec discharge, and a pulsating d. c. with 0.6 sec. charge and 1 sec. discharge. In all cases the dielec. consts. increased with time, unless failure was near. A sample was considered to have failed when its capacitance could no longer be measured. Changes in the resistivity and in the power factor varied from sample to sample. The approach to failure was first indicated by the resistivity. By plotting the time that a sample had been under observation against the resistance of the sample, it was found that the curves of the sample which failed showed a break or a marked change in direction several months before actual failure. Similar curves of the power factor and d. c. dielec. const. showed breaks at a later time. The time interval between the break in the resistivity curve and the breaks in the other curves was a function of the rate of decrease of the resistivity. This latter decrease has been ascribed to the formation of fine holes through the material, and this explanation was confirmed by microscopic examn. of microtome sections of the samples which failed. These sections showed

fern-like figures which projected into the rubber. All of the samples which failed were of a tubular form, with water electrodes both inside and outside the tubes. Some Cu salts were inadvertently allowed to form inside the tubes, and the catalytic action of these Cu salts accelerated the aging and probably altered its character. C. C. DAVIS

The determination of sulfur in rubber. J. G. MACKAY. *J. Soc. Chem. Ind.* 49, 401–3T(1930).—The difficulties encountered in the routine use of the method already developed for detg. total S (cf. *C. A.* **24**, 4423) have necessitated a modification so that the following procedure is recommended: Introduce the sample (0.25 g. of soft vulcanizate or 0.15 g. of hard rubber) in a small glass tube into a Kjeldahl flask contg fuming HNO_3 (10 cc. of d. 1.50), $HClO_4$ (5 cc. of d. 1.54) and Br (0.5 cc.), warm until oxidation is complete (using a water condenser), replace the condenser with a tube, boil gently until the nitric products are removed and the liquid is almost colorless (if it does not clear, cool, add 1–2 cc. of $HClO_4$ and heat), transfer to an evapg. dish, add pure NaCl (2 g.), evap. to dryness, add concd. HCl (10 cc.), evap. to dryness, moisten with 2 *N* HCl (2–3 cc.), dil. with water, filter, dil. to 250 cc., heat to boiling, ppt. with boiling 0.2 *N* $BaCl_2$ (50 cc.) (adding all at once), and proceed in the conventional way. When the rubber contains Pb, it is recommended that the $PbSO_4$ be detd. by the method of Hay (cf. Mackay, *C. A.* **24**, 4423). When Sb is present, add before pptg. $BaSO_4$ a sufficient vol. of satd. K Na tartrate to keep the Sb in soln. *Free S.*—The method does not take into consideration acetone-sol. S compds. (cf. Kelly, *Rubber Age* 1920, 520; cf. *C. A.* **14**, 3167), but is claimed to destroy more completely the org. ext. Ext the finely ground sample (1 g.) with boiling acetone for 6 hrs., evap. the solvent, dry at 90°, add fuming HNO_3 (10 cc. of d. 1.50), $HClO_4$ (5 cc. of d. 1.54) and Br (0.5 cc.), warm gently for 30 min., boil 15 min. to complete soln. (end of frothing), add NaCl (1 g.), evap. to dryness, add concd. HCl (10 cc.), evap. to dryness, and det. the sulfate in the residue by the method of Hintz and Weber (cf. *Z. anal. Chem.* **45**, 31(1906)) In spite of the new method being more rapid, it is just as precise as the older well-known methods. C. C. DAVIS

Action of zinc oxide containing iron in rubber mixtures. R. DITMAR AND K. H. PREUSSE. *Caoutchouc & gutta-percha* **27**, 15219–20(1930).—Comparative tests of some of the phys. properties of vulcanized mixts. of pale crepe 100, S 3, mercaptobenzothiazole 1, ZnO 30 and increasing proportions of Fe_2O_3 (0–30) showed that up to 2% the color effect is the only appreciable one and that with the higher proportions Fe_2O_3 acts merely as an inactive filler. C. C. DAVIS

The viscosity of rubber solutions under the influence of benzoyl peroxide. A contribution to methods for determining inorganic fillers, etc., in rubber mixtures. G. FROMANDI. *Rubber Age* (N. Y.) **28**, 197–8(1930).—English version of *C. A.* **24**, 4956. C. C. DAVIS

Is the presence of rubber in coal possible? LEO ECK. *Gummi-Ztg.* **45**, 287 (1930).—Comments on supposed discoveries of rubber in coal by Kindscher (*C. A.* **18**, 2862), Jurasky (*C. A.* **23**, 1844) and Hoffmann and Kirchberg (*Brennstoff-Chem* **11**, 389(1930)). C. C. DAVIS

Toxic substances in the rubber industry. XVI. Guanidine compounds. P. A. DAVIS. *Rubber Age* (N. Y.) **26**, 143–4(1930); cf. *C. A.* **25**, 233.—The guanidines most used as accelerators are relatively innocuous, and with proper ventilation and safety measures there should be no trouble. C. C. DAVIS

Carbon black in rubber insulating compounds. H. CURTIS AND A. T. MCPHERSON. *Ind. Eng. Chem.* **22**, 1258–9(1930).—Comments on an article by Boggs and Wiegand (cf. *C. A.* **24**, 4958).—The results of C. and McP. are not at variance with those of B. and W. **Reply.** C. R. BOGGS AND W. B. WIEGAND. *Ibid* 1259–60. C. C. DAVIS

Fertilizing experiments on *Hevea* (GRANTHAM) **15.** Soft rubber-like composition (U. S. pat. 1,784,070) **18.**

Conservation of rubber latex. KURT SCHUSTER and HEINRICH HOPFF (to I. G. Farbenind. A.-G.). U. S. 1,783,057, Nov. 25. See Ger. 503,645 (*C. A.* **24**, 6063).

Adhesive from rubber latex. GUSTAVE S. MATHEY (to Johnson & Johnson). U. S. 1,784,740, Dec. 9. In prepg. an adhesive suitable for use on surgical dressings, etc., refined latex emulsion is subjected to repeated concn. such as by shaking with gum tragacanth in the presence of an agent such as Na silicate giving an alk. reaction, a germicidal agent such as CH_2O is added, and the stock is heated in the presence of preservatives to reduce it to a jelly-like mass upon cooling and the cold mass is strained to liquefy it so that it will not jell again.

Preserving rubber. S. I. STRICKHOUSER (to Naugatuck Chemical Co.). Brit.

332,489, Nov. 26, 1928. **Cracking of rubber on exposure to air and light is retarded** by treatment with an α-diketone such as benzil, phenanthraquinone or furil (0.5% of which may be added to the rubber mixt. before vulcanization, added to latex or applied in soln. to the surface of the vulcanized articles).

Preserving rubber. J. TEPPEMA (to Goodyear Tire & Rubber Co.). Brit. 332,764, Nov. 26, 1928. A *preservative for use with rubber, transformer oils, soaps*, etc., comprises the reaction product of a naphthol such as β-naphthol with an aldehyde such as CH_2O, acetaldehyde, butaldehyde, crotonaldehyde or benzaldehyde.

Rubber composition. P. H. W. CLOUD. Brit. 332,537, April 19, 1929. Rubber is mixed with a large proportion of animal fibers (such as 4 times as much wool, flocks, mungo, etc.) and with fillers such as whiting and other usual ingredients such as S, ZnO and an accelerator, and the mixt. is vulcanized at a temp. below that which would carbonize the fibers.

Heat-plastic composition. HAROLD GRAY (to B. F. GOODRICH Co.). U. S. 1,782,036, Nov. 18. A compn. which may be used for bonding rubber to other materials comprises a heat-plastic rubber isomer having a less chem. unsatn. than rubber and a Pb salt of a higher fatty acid such as Pb oleate. Various other specified ingredients may be used.

Heat-plastic rubber derivatives. HARRY L. FISHER and HERBERT A. WINKELMANN (to B. F. Goodrich Co.). U. S. 1,782,140, Nov. 18. A dialkyl sulfate (suitably about 10% or more of Et_2SO_4) is incorporated with rubber and the mixt. is heated (suitably to about 125–140° for 8 hrs.) to produce a thermoplastic product, which is of tough stable character.

Compounding rubber with paracoumarone resin and sulfur. STUART P. MILLER (to Barrett Co.). U. S. 1,782,693, Nov. 25. Paracoumarone resin with a m. p. between 78° and 95° is melted, mixed with S and the resulting soln. is added to rubber.

Isomerizing rubber. I. G. FARBENIND. A.-G. Brit. 332,762, Aug. 6, 1929. Rubber is treated with P oxyhalides or mixts. of these with P halides or other suitable agents decompg. rubber, such as P oxybromide, together with PCl_5 (suitably in the presence of an org. liquid inert to the P compds. and having a dissolving or swelling action on rubber, such as benzine or benzene). Thermoplastic products and transparent films may be obtained.

Apparatus and operation for making hollow rubber articles by electrodeposition from aqueous rubber dispersions. PAUL KLEIN and ANDREW SZEGVARI (to American Anode Inc.) U. S. 1,783,435, Dec. 2. A quantity of the aq. dispersion is confined in contact with a mold-forming surface of the exterior contour of the article to be produced, electrodeposition is effected with use of a cathode immersed in the dispersion, and gases formed at the cathode are oxidized to inhibit their entrainment in the rubber layer deposited.

Sponge rubber. DUNLOP RUBBER CO., LTD., W. H. CHAPMAN, D. W. POUNDER and E. A. MURPHY. Brit. 332,525, March 21, 1929. Aq. dispersions of rubber or the like which have been rendered capable of gelling on heating or in the cold after a definite and controllable time interval are converted into a froth (suitably by adding soap or saponin and blowing with air) while still remaining reversible and are subsequently caused to set to an irreversible mass. Several examples with details of procedure are given.

Sponge rubber. DUNLOP RUBBER CO., LTD., E. A. MURPHY and E. W. B. OWEN. Brit. 332,526, March 21, 1929. Frothing substances such as soaps, casein, licorice or saponin are added to aq. rubber dispersions (preferably highly concd. and viscous) and a froth is formed (as by stirring or blowing with gas) without destroying the reversible character of the dispersion, and the froth is caused to set (as by gentle heating) to an irreversible form. Vulcanizing ingredients may be added and the sponge vulcanized after setting.

Rubberizing fibrous material such as woven, knitted or felted fabrics. ERNEST HOPKINSON. U. S. 1,784,523, Dec. 9. Articles such as gloves, bathing shoes, etc., may be superficially treated with water-repellant material such as a rubber cement contg. lithopone, ZnO, S and paraffin to prevent substantial penetration by water, and then provided with a relatively thick coating by a single coating operation with concd. latex contg. low-temp. curing ingredients, followed by curing, thus retaining a good flexibility.

Uniting rubber coverings with sheet steel as in automobile running-board manufacture. BUDD BRONSON (to Ohio Rubber Co.). U. S. 1,784,780–1–2, Dec. 9. Mech. features.

Use of hard rubber for outer surfaces of reels for winding thread. F. CLOUTH

RHEINISCHE GUMMIWARENFABRIK A.-G. Brit. 332,812, Sept. 18, 1929. Metal parts may be coated with hard rubber.

Rubber vulcanization accelerator. HARRY O. CHUTE. U. S. 1,782,713, Nov. 25. As an accelerator, there is employed a reaction product of a cyanamide, CH_2O and an amine, *e. g.*, thiocarbanilide, toluidine or aniline.

Rubber vulcanization accelerator. MAX BÖGEMANN and HERMANN FRIEDRICH (to I. G. Farbenind. A.-G.). U. S. 1,783,216, Dec. 2. As an accelerator, there is used a mixt. of di- and poly-amines obtained by reaction of NH_3 upon ethylene dichloride.

Rubber-vulcanization accelerator. HAROLD A. MORTON. U. S. 1,784,703, Dec 9. A condensation product of α-ethyl-β-methylacrolein with an amine such as aniline, neutralized with abietic acid, is used with rubber, ZnO and S.

Use of mono- and di-carbalkoxydiarylthioureas as accelerators in rubber vulcanization. CECIL J. T. CRONSHAW and W. J. S. NAUNTON (to British Dyestuff Corp., Ltd.) U. S. 1,782,842, Nov. 25. Use of the diethyl deriv. is particularly mentioned.

Rubber vulcanization. WINFIELD SCOTT (to Rubber Service Laboratories Co.). U. S. 1,784,498, Dec. 9 Vulcanization of rubber with S is effected in the presence of an accelerator comprising a reaction product of a dichloroacetate and a mercaptobenzothiazole and preferably also a guanidine vulcanization accelerator. Cf. *C. A.* 25, 234.

CHEMICAL ABSTRACTS

Vol. 25. FEBRUARY 10, 1931 No. 3

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Recent progress in instrument design. EZER GRIFFITHS. *Chemistry and Industry* **49**, 1044–8(1930). E. H.

Laboratory devices. CURT MÜCKENBERGER. *Chem.-Ztg.* **54**, 889–90(1930).—Various uses of elec. heating in distn. and to prevent crystn. in condensers or to avoid explosions are mentioned. J. H. MOORE

A microbalance of new design. G. R. STANBURY AND N. TUNSTALL. *J. Sci. Instruments* **7**, 343–9(1930).—The app. was designed for weighing *wool fiber* or *pieces of yarn*. Details are given, with 1 cut, and it is discussed mathematically. Cf. King, *Trans Faraday Soc.* **25**, 451–7(1929). J. H. MOORE

Resistance thermometers for chemists. CHAS. G. MAIER. *J. Phys. Chem.* **34**, 2860–8(1930).—Details for the construction, calibration, method of using for greatest precision and method of calcg. temps. are given for thermometers of Cu for use below 100°; also a modified type for general lab. use is described, and 8 references are given. J. H. MOORE

Measurement of surface temperatures. WM. F. ROESER AND E. F. MUELLER. *Bur. Standards J. Research* **5**, 793–802(1930).—A contact pyrometer consisting of a gold disk to which chromel and alumel thermocouple wires were soldered is described. This is satisfactory for temps. up to 705°. A compensated contact thermometer in which the contact is heated to the same temp. as the surface to be measured is also described. This enables precise measurements below 205° to be made. M. D.

An integrating photometer for x-ray crystal analysis. B. WHEELER ROBINSON. *Proc. Roy. Soc.* (London) **A130**, 120–33(1930).—Improvements of the α-ray photometer developed by Astbury (*C. A.* **21**, 3310; **23**, 3404) are the power of adjustment of the tissue *in situ*, a better method of current measurement, the ability to exchange apertures and to change the position of the ionization chamber with reference to the source. Measurements of the intensities of reflections of copper K_α radiation from several planes of anthracene crystals are given as typical examples. M. D.

Oxygen bomb calorimeter. EDGAR STANSFIELD AND JOHN W. SUTHERLAND. *Can. J. Research* **3**, 464–72(1930).—A stainless steel Scholes bomb made by G.C ussons, Ltd., Manchester, and using rubber gaskets proved highly satisfactory. After 2 years of use the bomb was found to be as bright and smooth inside as out. By cutting down the steel ignition posts and substituting a Pt wire triangle for the crucible support, the time for temp. equil. to be attained was reduced to 5 min. A new calorimeter equipment, a simplified method for correcting Beckmann thermometer readings and a description of a vacuum cup calorimeter are included in the paper. J. W. SHIPLEY

A new pipet viscometer. J. ROMNEY. *Chemistry and Industry* **49**, 986–8(1930).—The dimensions and method of operating are given for a simple glass app. which requires only about 25 cc. of lubricating oil to give satisfactory results. When 4 are mounted in a thermostat 1 operator can make 3 times as many detns. as are possible with a Redwood, and cleaning requires only 20–60 sec. J. H. MOORE

The determination of corrections for Redwood viscometers. GUY BARR. *J. Sci. Instruments* **7**, 359–61(1930).—The National Phys. Lab. method of detg. corrections is described and illustrated by a chart. J. H. MOORE

Nitrocellulose filter cloths. HANS GRADL. *Chem.-Ztg.* **54**, 871–2(1930).—A filter cloth made from 12% N nitrocellulose lasted 4 years. Raising the N content of natural fibers increases the durability in acids and Cl. Nitrated cotton filter cloth cannot be used with 40% H_3PO_4, but filter cloth woven from nitrated cotton fiber can. Weaving must be done while moist. E. M. SYMMES

A method of filling a siphon barometer. SEVERIANO GOIG. *J. chim. phys.* **27**, 452–4(1930).—The detailed directions are illustrated by 1 cut. J. H. MOORE

The centrifugal action in the use of horizontal as compared with vertical centrifugals. G. OEHLER. *Chem. Fabrik* **1930**, 510.—An explanatory supplement to *C. A.* **24**, 4428. J. H. MOORE

The technic of vacuum evaporation and distillation. HANS N. NAUMANN. *Chem. Fabrik* **1930**, 505–7; cf. *C. A.* **25**, 1.—Descriptions and directions are given for operating various lab. app. with water jet pumps in which the distillate is either collected or permitted to escape with the water. The advantages of a capillary boiling tube of V2A steel are mentioned, and a bibliography is given J. H. MOORE

A note on the purification of mercury. A. O. JONES. *Chemistry and Industry* **49**, 437–8T(1930).—Figure 2 of the Record app. (*C. A.* **23**, 2605) is greatly improved by substituting a narrower tube for the wide up-take tube *C*, giving smaller droplets of Hg. J. H. MOORE

Double-pole double-throw mercury switch. GLENN H. DAMON. *J. Phys. Chem.* **34**, 2627–8(1930).—The app. was developed to perform better all the functions of the knife-edge switch. To eliminate breakage it is made of bakelite or similar material. The middle part of the long contact chamber is depressed, giving a neutral point when the switch is in a horizontal position. It may be operated automatically. J. H. M.

Superheated steam instead of air for blowing. A 1785 proposal worthy of confirmation. MAX SPETER. *Chem.-Ztg.* **54**, 829(1930).—A description of melting furnaces blown by superheated steam. E. M. SYMMES

Safe handling of unfired pressure equipment. M. E. BONYUN. *Chem. Met Eng.* **37**, 695–6(1930).—Design and inspection of containers and relief valves are described. E. M. SYMMES

Laboratory extraction apparatus (Soxhlet type). SCHALWA ZINZADZE. Ger. 507,360, Jan. 19, 1929.

Test tube. JOHANNES HOPPE. Ger. 507,359, Nov. 18, 1927. A tube for testing gases evolved on treating a solid with acid, etc., is formed with a side pocket near the top into which the testing reagent is introduced. The pocket has a small hole for the escape of the gases, and in use the solid is placed in the tube, the acid, etc., is added, and the mouth of the tube is closed.

Temperature indicators, particularly for superheaters. COMPAGNIE DES SURCHAUFFEURS (SOC. ANON.). Fr. 686,622, Dec. 13, 1929.

Photometer. ASKANIA-WERKE A.-G. VORM. CENTRALWERKSTATT DESSAU UND CARL BAMBERG-FRIEDENAU (Walter Brecht, inventor). Ger. 507,086, Oct. 25, 1927. The app. is particularly intended for detg. the thickness of suspensions of fibrous materials from the amt. of light absorbed.

Filter sieves suitable for use with liquids or gases. AUGUST PAHL. U. S. 1,786,361 Dec. 23. A metal screen such as one formed of woven wire is provided with a covering coat of particles of absorbent material such as charcoal or lime secured by "Liquid glass," gum or other suitable adhesive.

Device for filtering air or other gases. ANDERS JORDAHL (to American Air Filter Co.). U. S. 1,786,208, Dec. 23. Structural features.

Heatable swinging stirrer for rotary filters. MASCHINENFABRIK BUCKAU R. WOLF A.-G. Ger. 505,887, Mar. 16, 1927.

Filter press. LOUIS REVEL. U. S. 1,785,494, Dec. 16.

Apparatus for stripping filter cakes from filter screens. JOSEPH V. ZENTHOEFER (to Oliver United Filters, Inc.). U. S. 1,785,237, Dec. 16.

Apparatus for gravity separation of liquids such as oil and water. IGNAZ MÜLLER. U. S. 1,784,943, Dec. 16. Structural features.

Apparatus for separating liquid particles from steam, etc. GRANT D. BRADSHAW (to Blaw-Knox Co.). U. S. 1,785,931, Dec. 23. Structural features.

Drum centrifuges for purifying liquids. RAMESOHL & SCHMIDT A.-G. Fr. 686,372, and 686,373, Dec. 10, 1929.

Electron tube. SIEMENS-SCHUCKERTWERKE A.-G. (Rudolf G. Berthold, inventor). Ger. 504,839, Nov. 9, 1924. Details of construction.

Vacuum tubes by the absorption of gas by alkali or alkaline earth metals. INTERNATIONAL GENERAL ELECTRIC CO. Ger. 505,702, Mar. 24, 1926. The metals are present as gauze.

Indirectly heated thermionic cathodes. WESTINGHOUSE LAMP CO. Brit. 333,011, June 24, 1929. In the construction of a heating element surrounded by an insulator such as quartz, porcelain or "isolantite," erosion and consequent failure of the heating filament, due to deleterious gases such as water vapor and C oxides evolved by the insulator, are prevented by providing a protecting material (such as Cr, Zr, Th, U,

Ta, B, Si, V or Ti) between the filament and the insulator to absorb and retain the gases. Cr is preferably used, and various details of manuf are described. Cf. *C. A.* 24, 2386

Laminated metal hammers for impact pulverizing mills. FRED J. BULLOCK (to Papec Machine Co.). U. S. 1,785,435, Dec 16 Mills of the impact or hammer type are provided with hammers arranged to operate through travel in the plane of lamination, formed with outer laminae which are relatively hard such as steel, iron or other metal and one or more intermediate laminae which are relatively soft.

Apparatus for humidifying and conditioning air. CARROLL E. LEWIS (to Lewis Corp.). U. S. 1,785,741, Dec. 23. Structural features.

Apparatus for condensing vapors and separating gases therefrom. RENÉ MERCIER. Ger. 507,127, Jan. 26, 1927. An indifferent liquid is supplied to a no. of rotors on a common shaft, analogous to the vanes of a rotary pump, the rotors being so constructed that the liquid escaping from some of them condenses the vapors but has an insufficient velocity to carry along the accompanying gases, which are led away by liquid from the other rotors.

Apparatus for separating entrained liquid from vapors. RUHLANDWERK A.-G. Ger. 507,063, April 13, 1927.

Centrifuge for separating liquids or solids from gases. MASCHINENFABRIK BAUKAU R. WOLF. A.-G. Ger. 505,514, Jan. 7, 1930. Details of construction and operation.

Counter-current apparatus for treating liquids with liquids or gases. WALTHER FELD & Co G M. B. H. and RICHARD GISNER Ger. 507,315, Aug. 29, 1928. The app comprises a no. of beaters and baffles superposed on a common shaft.

Apparatus for mixing liquids with gases or vapors. G. SCHUY NACHF. A.-G. (Theodor Schmiedel, inventor). Ger. 505,793, May 20, 1928. Details are given.

Screw propeller apparatus for mixing liquids. FRIEDRICH DUWE (to Maschinenfabrik Augsburg-Nürnberg A.-G.). U. S. 1,786,009, Dec. 23. Structural features.

Apparatus for mixing and sampling liquids. FAIRRIE & Co., LTD., and G. FAIRRIE. Brit 332,919, April 30, 1929. Structural features.

Apparatus for emulsifying liquids. Deutsche Orriswerke G. m. b. H. Ger. 505,890, Nov. 20, 1927. Structural details are given.

Apparatus for concentrating liquids. AKTIEBOLAGET SVENSKA MASKINVERKEN. Ger 507,064, Sept. 2, 1927. The app. is of the type in which a hollow rotary heating member is arranged in the container for the liquid.

Apparatus for determining the viscosity of liquids. LOUIS SCHOPPER. Ger. 504,882, Mar. 2, 1928. The viscosity is detd. by a system swinging in the liquid.

Apparatus for measuring the color and turbidity of materials especially liquids. HEINRICH THIELE. Ger. 505,587, Nov. 20, 1928. A light-sensitive device, such as a thermocolumn or K cell and an elec. measuring device are incorporated in the app.

Condensation vessel or chamber for chemical works. FIRMA C. CONRADTY. Ger. 504,908, July 22, 1928. The structure is ma le of C or graphite.

Apparatus suitable for drying or purifying air, oxygen, acetylene or other gases under pressure. ISAAC H. LEVIN (to Gas Industries Co.). U. S. 1,785,273, Dec. 16. Structural features.

Shaft drier for granular goods. MASCHINEN- UND ELEKTROBAU G. M. B. H. Ger. 501,830, Aug. 21, 1928.

Shaft drier for lac coatings, sand molds, etc ALLGEMEINE ELECKTRIZITÄTS-GES. Ger 501,066, Nov. 6, 1928. Addn. to 485,985 (*C. A.* 24, 995).

Plate drier for lignite, chemicals, etc. BÜTTNER-WERKE A.-G. (Wilhelm Krisch, Alfred Rumberg and Hans Giesswein, inventors). Ger. 505,606, Nov. 30, 1927.

Apparatus for drying, heating or evaporating various materials. W. HOBSON. Brit. 332,951, Feb. 27, 1929. An app. is described having chambers each provided with tubes to contain the material and a movable bottom to facilitate discharge. The material in one chamber is heated by a medium such as steam and the material in the other chamber is treated by the waste products arising from the material in the first chamber. Various details of construction are described.

Evaporating plant. ALBERT WINANDS. Ger. 507,067, July 24, 1928. The plant comprises a series of evapg. vessels and means for heating the vapors from each vessel before passing them to an adjacent vessel.

Circular current gas purifier. ZIMMERMANN & JANSEN G. M. B. H. Ger. 505,515, Aug 25, 1927. Details of construction and operation.

Water-feed-control apparatus for moistening air or other gases. SOUTHWORTH MACHINE Co. Brit. 333,848, Dec. 10, 1928. A hygrometric device controls a water-supply valve. Various details of construction are described.

Spray jet and baffle plate gas-washing apparatus. T. CARTWRIGHT. Brit. 333,317, May 21, 1929. Structural features.

Time-controlled wet gas meter suitable for use with recording gas calorimeters. SCIENTIFIC & PROJECTIONS, LTD., C. FAIRWEATHER, G. L. WINDERS and W. H. B. HALL. Brit. 333,292, May 11, 1929. Structural features.

Pressure-controlled valve. R. SMITH. Brit. 333,653, May 27, 1929. Steam pressure may be used to control supply of gas to the heater of a vulcanizer or other app

Temperature-compensating device for "Salinometers" determining solution concentrations by electric resistance measurements. EVERSHED & VIGNOLES, LTD., and C. E. PERRY. Brit. 333,727, Aug. 2, 1929. Structural features are described of a thermostatic device which alters the dimensions of the liquid column, the elec. resistance of which is measured.

Apparatus for endothermic reactions. SOC. D'ÉTUDES & DE RÉALISATION DIT "ERÉAL" S. A. Fr. 686,462, Dec. 12, 1929. An app. is described for carrying out strongly endothermic reactions such as dissocns., reductions or combinations taking place at very high temps. A reaction vessel is used which is heated exteriorly by dipping into a heating mass in ignition such as the incandescent mass of a gas producer, and interiorly by an element, preferably gaseous, compatible with the reactions in the vessel, superheated immediately before its introduction into the vessel, by its passage in the said heating mass.

Device for indicating the presence of poisonous gases in the atmosphere. FRIEDRICH FREITAG. Ger. 506,795, Apr. 25, 1929. A bimetal bow with one end attached to an alarm relay is embedded in a catalytic Pt-asbestos mass which imparts temp changes to the bow to cause the alarm to sound, if CO, coal gas, H, etc., are present in the air.

Degreasing device. ALEXANDER WACKER GES. FÜR ELEKTROCHEMISCHE INDUSTRIE M. B. H. (Georg Wolff, inventor) Ger. 504,910, Jan. 30, 1927. The app. contg. org solvents and heating and cooling devices is described.

Purifying and degreasing device for objects of metal, glass, celluloid, etc. ALEXANDER WACKER, GES. FÜR ELEKTROCHEMISCHE INDUSTRIE G. M. B. H. (Georg Wolff, inventor). Ger. 505,980, July 19, 1927. Details of the app. are described. A solvent of high vapor density *e. g.*, CCl_4, C_2HCl_3, etc., is used.

Covers for luminous bodies. GERTRUD EPPINGER NÉE HELLNER Ger. 505,872, June 26, 1928. Covers or shades for luminous bodies used in lighting are formed from the condensation products of multivalent alcs. and polybasic acids or anhydrides, *e. g.*, from glycerol and phthalic acid anhydride. The product may be treated with a softening agent such as oil or oleic acid and may be colored with dyes.

Tubular condenser. INGERSOLL-RAND CO. Brit. 332,946, April 29, 1929.

Filling material for reaction towers, etc. CHEMISCHE FABRIK CURTIUS A.-G. (Fr. A. Weber, inventor). Ger. 488,886, June 13, 1928. See Fr. 676,558 (*C. A.* **24**, 2921).

Wall construction for reaction towers such as those used for gas and liquid contact operations. FREDERICK J. BOWMAN (to Grasselli Chemical Co.). U. S. 1,785,178, Dec. 16. The joints between the wall blocks drain toward the inside of the tower and are widened at the outside of the walls to form grooves and ledges.

Device for feeding solid reagents to a reaction vessel. FRITZ NIEHAUS. Ger. 507,041, Feb. 21, 1929. The app. is intended particularly for supplying precipitant, etc., to water which is to be purified.

Atmospheric cooling tower. GUY T. MARTIN (to Fluor Construction Co.). U. S. 1,786,076, Dec. 23. Structural features.

Tower for purifying gases by liquid sprays from atomizing disks. SAMUEL C. CULLER. U. S. 1,786,150, Dec. 23.

Devices for indicating and recording the quality or density of smoke. FRANK SAWFORD and FRANK SAWFORD, JR. U. S. 1,785,392-3, Dec. 16. Various details are described of devices utilizing a light-sensitive device such as a photoelectric cell.

Apparatus for generating smoke screens from materials such as white phosphorus. NICHOLAS E. OGLESBY. U. S. 1,785,744, Dec. 23. Structural features.

Acetylene generator (water to carbide type). I. G. FARBENIND. A.-G. Ger. 507,445, June 25, 1929.

Furnace plant. DEUTSCHE BABCOCK & WILCOX DAMPFKESSEL-WERKE A.-G. Ger. 505,816, June 14, 1929. Details are given of a device for removing the ash into a water quencher.

Rotary furnace for the evaporation of solutions. CHEMISCHE WERKE VORM. H. & E. ALBERT (Carl Frenkle, inventor). Ger. 504,811, Jan. 12, 1927. Structural details.

Underblast furnace, with supplementary air supply. ALEXEJ LOMSCHAKOFF and PETER DMITREVSKI. Ger. 507,444, June 24, 1928.

Regenerative hearth furnace. WITKOWITZER BERGBAU- UND EISENHÜTTEN-GEWERKSCHAFT and CARL SALAT. Ger. 506,341, Feb. 26, 1927. Addn. to 500,792 (*C. A.* **24**, 4670). Details of operations are given.

Open-hearth regenerative furnace. JOHN O. GRIGGS. U. S. 1,785,549, Dec. 16.

Annealing furnace for tubes. "ILVA" ALTI FORNI & ACCIAIERIE D'ITALIA. Ger. 504,864, Nov. 26, 1927. Details are given.

Annealing muffle furnace. ALFRED G. LOBLEY and BIRMINGHAM ELECTRIC FURNACES, LTD. Ger. 505,691, Jan. 11, 1929. Details.

Rotary plate furnace for annealing. EMIL F. RUSS. Ger. 505,901, Mar. 20, 1925.

Furnace for thermal treatment of magnetic materials. SOC. ANON. UGINE-INFRA. Ger. 507,069, May 25, 1929. A furnace for continuous treatment is described, in which the materials are moved forward electromagnetically and are heated up to the temp. at which they lose their magnetic properties.

Recuperator furnace with parallel adjacent flue-gas canals. ENGELBERT JUNGEBLODT. Ger. 489,754, Nov. 23, 1928.

Device for preventing sweating of metallic recuperative furnace air heaters. MAX and ERNST HARTMANN. Ger. 505,934, June 23, 1927. Details of construction.

Coal-dust furnace. ALLGEMEINE ELEKTRIZITÄTS-GES. and FRIEDRICH MÜNZINGER. Ger. 504,221, Aug. 30, 1925. Addn. to 486,841. The furnace of 486,841 (*C. A.* **24**, 1257) has a side air chamber and a lower ash chamber cooled by fuel gas.

Coal-dust furnace. FRIED. KRUPP A.-G. Ger. 510,821, June 16, 1929. Details of the air supply are given.

Coal-dust furnace. GEWERKSCHAFT ORANGE. Ger. 505,510, Feb. 13, 1926. Details of the combustion chamber.

Coal-dust furnaces. SIEMENS-SCHUCKERTWERKE A.-G. (Wilhelm Abendroth, inventor). Ger. 510,896, Oct. 9, 1927. Details of leading the coal dust into several burner-supply tubes.

Coal-dust-furnace plant. SOCIÉTÉ D'ÉLECTRICITÉ DE LA RÉGION DE VALENCIENNES-ANZIN. Ger. 505,679, May 21, 1927. Details of construction and arrangement.

Coal-dust furnace burner with an inner nozzle for supplying the dust-air mixture. ADOLF STEINBRÜCKNER. Ger. 504,814, April 12, 1927.

Supplying air to an incinerating or calcining muffle furnace. HANS VOLCKMANN and KARL LUDWIG. Ger. 506,627, Oct. 30, 1928. Details are given.

Supplying air to an incinerating or calcining muffle furnace. HANS VOLCKMANN and KARL LUDWIG. Ger. 508,111, Jan. 21, 1930. Addn. to 506,627. Further details are given of supplying air in the furnace of 506,627 (preceding abstr.)

Annular kiln. CARL ROST. Ger. 487,934, May 8, 1928. Details of heating by blowing in fuel.

Annular kiln. CARL ROST. Ger. 497,879, Sept. 7, 1928. Addn. to 487,934 (preceding abstr.). Details of heating by blowing in fuel.

Fuel-charging device for annular furnaces. ADOLF AUER & Co. Ger. 504,988, Aug. 24, 1929.

Reverberatory furnace roof. W. ALBERTS. Brit. 332,850, July 4, 1929.

Suspended reversing device for a travelling-grate furnace. L. and C. STEINMÜLLER. Ger. 504,963, Feb. 11, 1928.

Travelling grate for furnaces with a broad hearth. JOHANN PLACZEK. Ger. 504,962, Jan. 25, 1926.

Mechanical draft regulator. CHRISTIAN HÜLSMEYER. Ger. 507,443, April 1, 1926. The device operates according to the pressure difference before and behind the boiler.

Gas burner. FRANCIS J. CANCIANICH. U. S. 1,786,396, Dec. 23.

Gas burner. W. E. N. CLARK and ELECTROLUX, LTD. Brit. 333,269, April 1929.

Gas burner. FRANK X. HAMBERGER. U. S. 1,785,900, Dec. 23.

Apparatus and system for atomizing and burning fuel oil. HENRY ADAMS. U. S. 1,785,804-5, Dec. 23.

Vertical retort for carburizing finely comminuted materials. F. E. HOBSON. Brit. 333,563, May 13, 1929.

Heat-exchange apparatus suitable for heating water by waste gases. F. K. WOODROFFE. Brit. 333,397, Aug. 14, 1929. Structural features.

Heat-exchange coil device suitable for heating water. HERBERT G. ULLMAN. U. S. 1,785,159, Dec. 16. Structural features.

Electric water heater. S. NUSSBAUM. Brit. 333,791, Oct. 7, 1929. Structural features.

Thermostatic control systems for hot water or other heating systems. FRED I. RAYMOND. U. S. 1,785,425–6, Dec. 16.

Thermostatic control device suitable for control of electric circuits. ALBERT PENN (to Penn Electric Switch Co.). U. S. 1,786,083, Dec. 23. Structural features.

Thermostatic and pressure-actuated control devices for liquid fuel and gas burners. M. KNUPFFER. Brit. 333,613, May 16, 1929. Structural features.

Thermostatic valve for regulating the feed of fuel oil to burners. BUCKEYE INCUBATOR CO. Brit. 333,145, June 7, 1929. Structural features.

Thermostatic control device suitable for operating through flexible shafts. CHAS. L. RAYFIELD (to Rayfield Mfg. Co.). U. S. 1,785,787, Dec. 23. Structural features.

2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

Pierre Auguste Adet. LYMAN C. NEWELL. *J. Chem. Education* **8**, 43–8(1931).—Biography with portrait. E. H.

Jöns Jakob Berzelius. R. WINDERLICH. *Z. physik. chem. Unterricht* **42**, 193–203 (1929).—Biographical sketch on the occasion of B.'s 150th anniversary. M. BEBER

Moses Gomberg. ALFRED H. WHITE. *Ind. Eng. Chem.* **23**, 116–7(1931).—A biography with portrait. E. C. K.

Chemistry in prehistoric American arts. FLORENCE M. HAWLEY. *J. Chem. Education* **8**, 35–42(1931). E. H.

The progress of American chemistry since the outbreak of the World War. WM A. HAMOR AND LAWRENCE W. BASS. *Ind. Eng. Chem.* **23**, 10–14(1931). E. C. K.

Statistics of 1927 for chemistry teaching. FRIEDRICH HOFMANN. *Z. physik. chem. Unterricht* **42**, 74–9(1929).—Figures for production of coal, pig iron, steel, oil, bauxite, Al, Cu, Pb, Zn, Sn, Ni, Hg, Ag, Au, Pt, Na salts and K salts are given. M. B.

Statistical data for 1928 for chemistry teaching. FRIEDRICH HOFMANN. *Z. physik. chem. Unterricht* **43**, 75–9(1930).—Figures for production of coal, pig iron, raw steel, petroleum, Pb, Cu, Zn, Sn, Al, lime and H_2SO_4 are given. M. BEBER

The teaching load of college chemistry instructors. AXEL L. JOHNSON. *J. Chem. Education* **8**, 115–27(1931). E. H.

The training of teachers in service. B. S. HOPKINS. *J. Chem. Education* **8**, 95–102 (1931). E. H.

Present status of teacher training in the United States. BEN W. FRAZIER. *J. Chem. Education* **8**, 63–83(1931). E. H.

The qualifications of chemistry teachers in colleges and universities. NEIL E GORDON. *J. Chem. Education* **8**, 88–95(1931). E. H.

The qualifications of chemistry teachers in secondary schools. WILHELM SEGERBLOM. *J. Chem. Education* **8**, 83–8(1931). E. H.

Report of the committee on preparation of high-school chemistry teachers. A. J. CURRIER. *J. Chem. Education* **8**, 102–6(1931). E. H.

More effective individual laboratory instruction in general inorganic chemistry. II. An experiment on molecular weights. W. E. BRADT. *J. Chem. Education* **8**, 152–9 (1931); cf. *C. A.* **24**, 32. E. H.

Student experiments in chemistry. R. WINDERLICH. *Z. physik. chem. Unterricht* **42**, 79(1929).—Expts. dealing with osmosis, ozone and the origin of H_2S in illuminating gas are described. M. BEBER

Some experimental data on time reactions for student exercises. WALFRIED SEEGER. *Z. physik. chem. Unterricht* **43**, 215–8(1930).—The reactions between H_2O_2 and HI and $HBrO_3$ and HI are used. Data are given. M. BEBER

An atomic model contest for high-school students. WALTER B. DYE. *J. Chem. Education* **8**, 140–2(1931). E. H.

Practical introduction of the conception of chemical equilibrium and mass action. ALFRED WEIS. *Z. physik. chem. Unterricht* **42**, 151–60(1929).—Class expts. to demonstrate these two concepts are described. M. BEBER

The amorphous state and molecular movement. BERNHARD BATSCHA. *Z. physik. chem. Unterricht* **43**, 159–62(1930).—Molecular movement in the amorphous state is demonstrated by the fluorescent and phosphorescent glassy melts obtained by melting traces of fluorescein with either tartaric or citric acid. These amorphous prepns. gradually become crystalline, the rate of change being dependent on temp. M. B.

A brief lesson in the chemistry of pig iron. G. T. FRANKLIN. *J. Chem. Education* 8, 143–8(1931). E. H.

A modification of the standard high-school experiment on the destructive distillation of soft coal. GUSTAV L. FLETCHER AND IRVING FINE. *J. Chem. Education* **8**, 150–1(1931). E. H.

The distillation of petroleum as a teaching experiment. H. ZEITLER. *Z. physik. chem. Unterricht* **42**, 160–3(1929).—Simple expts. to prove that petroleum is a mixt. whose higher-boiling fractions have higher sp. gr. and darker color than the lower ones, are described. Reference is made to other demonstrations using the fractions obtained, *e. g.*, surface tension, viscosity, rate of vaporization, refining. M. BEBER

The composition of nitric acid and the analysis of nitrate. P. RISCHBIETH. *Z. physik. chem. Unterricht* **42**, 111–4(1929).—The ratio $H_2O:NO:O = 1:2:3$ is demonstrated by decomposing concd. HNO_3, whose HNO_3 content is detd. preferably by titration either before or after the expt. with baryta soln., with a soln. of HCl contg. an excess of Fe and setting free NO. The excess Fe is titrated with 0.1 *N* permanganate and from this the O_2 liberated is calcd. The NO is collected and measured. H_2O is detd by subtracting O_2 and NO from the total HNO_3 used. The procedure is suggested as a method for the analysis of nitrates. M. BEBER

The synthesis of magnesium sulfide. L. DOERMER. *Z. physik. chem. Unterricht* **42**, 70–4(1929).—After a study of the reaction the following conclusions are reached: The syntheses of Mg, Ca and Al sulfides by heating powdered S and metal in a test-tube are dangerous explosion expts., the performance of which, because of their slight teaching value, should cease. If they are to be carried out, not more than 1 g. of the mixt should be used; a plate-glass enclosed hood should be used, closed on the spectator side and half-open on the other, with care taken against the entrance of people into the room on this side. The test-tube should be at least 50 cm. from the glass on the observer's side. After placing the Bunsen burner under the test-tube the experimenter should immediately retreat to safety. M. BEBER

The synthesis of urea from carbon monoxide and ammonia as a teaching experiment. P. RISCHBIETH. *Z. physik. chem. Unterricht* **42**, 212–3(1929).—CO is converted to $COCl_2$ and this is treated with NH_4OH. M. BEBER

Synthesis of ethyl mercaptan with officinal ethyl chloride. SIGBERT GENELIN. *Z. physik. chem. Unterricht* **43**, 80–1(1930).—About 1/4 stick of KOH is dissolved in about 20 cc. C_2H_5OH and the soln. satd. with H_2S. A few cc. of C_2H_5Cl is now squirted in and the flask corked. KCl begins to ppt. and the odor of mercaptan is noticed in about an hr. When the reaction is complete the mercaptan separates out as an oil on addn. of H_2O. M. BEBER

Mineralogy in the school. W. FLÖRKE. *Z. physik. chem. Unterricht* **43**, 198–203 (1930).—A criticism of the tendency to place mineralogical and crystallographic concepts in the background in the teaching of chemistry. A method for the development of the subject is given. M. BEBER

The education of Spanish women in chemistry. MARY LOUISE FOSTER. *J. Chem. Education* **8**, 30–4(1931). E. H.

Chemistry laboratory fees. V. F. PAYNE AND LYDA MAY SMILEY. *J. Chem. Education* **8**, 133–9(1931). E. H.

The metastability of matter and our so-called physical-chemical constants. ERNST COHEN *Z. physik. Chem.*, Abt. A, **150**, 418–20(1930); cf. *C. A.* **24**, 1259.—Regnault recognized the fact that many of the systems he investigated were mixts. of stable and unstable forms. ARTHUR FLEISCHER

The principle of the inaccessibility of the absolute zero. HEINRICH MACHE. *Phil Mag.* [7], **10**, 931–7(1930).—Polemical with Kolosovskii (cf. *C. A.* **24**, 2946). Nernst should receive credit for the third law of thermodynamics. A. F.

The nature of friction. P. E. SHAW. *Phil. Mag.* [7], **9**, 628–39(1930).—Triboelectricity and friction are 2 aspects of the same phenomenon. In all cases of solid contact, solid combination takes place on contact. Charging of both surfaces occurs when they sep. In friction, the work is the work performed in total elec. sepn. plus the work in deformation of the surface structure. The law of friction is limited in application and becomes invalid for extreme surface curvatures as well as for extreme loading. ARTHUR FLEISCHER

Frictional electricity. P. E. SHAW. *Phil. Mag.* [7], **9**, 577–83(1930).—To discharge a rod, use the surrounding zone of a flame to prevent damage to the charged rod. When glass is rubbed with silk, the pos. charge is due to the presence of an org. film. If properly cleaned, a neg. charge appears on the glass. Charges obtained on rubbing like bodies are due to difference in surface strains. The theory of polar struc-

ture of atoms and mols. with the resultant orientation in surface films should prove important in explanations of phenomena in triboelectricity. ARTHUR FLEISCHER

Friction of dry solids in vacuo. P. E. SHAW AND E. W. L. LEAVEY. *Phil. Mag* [7], **10**, 809–22(1930).—The friction between rods of Fe, Ni, Cu, Ag, Al and soda-glass was detd. from 15° to 350°. The results are higher than those obtained by Tomlinson (cf. *C. A.* **24**, 2924). The coeff. of friction must be defined in terms of the history and phys. condition of the reacting surfaces. ARTHUR FLEISCHER

Temperature measurements with a platinum resistance thermometer to 1100°. HELMUT MOSER. *Ann. Physik* **6**, 852–74(1930).—A resistance thermometer was constructed of very pure Pt wire (for which $R_{100}/R_0 > 1.390$) 0.5–0.6 mm. diam. wound upon notched porcelain supports and surrounded by an unglazed ceramic material (*K-Masse*) impervious to gases at 1200°. Temps. were measured up to 1100° (the solidification point of Au 1063°) with an accuracy of 0.1°. Between 0° and 1100° the dependence of resistance on temp. is expressed by the formula $t = [100(R_t - R_0)/(R_{100} - R_0)] + \delta\{(t/100)[(t/100)-1]\} + \gamma\{(t/100)[(t/100)-1][(t/444.60)-1]\}$, the consts. of which, R_0, R_{100}, δ and γ, are detd. by calibration at the ice point 0.000°, steam point 100.000° m. p. of S 444.60° and m. p. of Au 1063°. Usually $\delta < 1.500$ and $\gamma > 0.004$. The changes occurring in Pt at high temps. do not influence the temp. measurements if the corresponding R_0 is detd. after each R_t (cooling thermometer to 0° during 15 min.) and if the value $R_t - R_0$, considered as independent of the temp., be substituted in the formula. This rule, in part derived from Mathiessen's rule, is valid with $[R_{100}/R_0] > 1.390$ if R_0 does not vary more than the quiv. of ±0.05° from the values at which the consts. were detd. This thermometer is to be preferred to the Pt/Pt 10% Rh because of its greater accuracy. E. R. SCHIERZ

The photographing of cooling curves. H. D. CROCKFORD AND A. E. HUGHES. *J. Phys. Chem.* **34**, 2624–6(1930).—An app. is developed for photographing cooling curves. The method is accurate to 0.1° and the photographic curves show the mechanism of supercooling much better than do the ordinary thermometric curves. H. W. L.

The motion of flames in closed vessels. C. W. STEPHENSON. *Trans. Faraday Soc.* **26**, 577–87(1930); cf. *Fuel*, **7**, 195, 245, 300, 336, 408, 449, 502, 526(1928).—A math. consideration of prior work. E. M. SYMMES

The place of beryllium and magnesium in the periodic system. PAUL PFEIFFER, THEODOR FLEITMANN AND RUDOLF HANSEN. *J. prakt. Chem.* **128**, 47–62(1930).—The α-naphthalenesulfonates of Be, Mg, Zn and Cd contain 4 or 6 mols. H_2O while Ca and Sr salts add little H_2O. The complex salts of Be, Mg, Zn and Cd with NH_3 are similar. The β-naphthalene-, benzene- and *p*-toluene-sulfonates group themselves similarly except that the *p*-toluenesulfonate of Ca forms a tetrahydrate. The coördinate valence no. of Be may be 6 from the crystal lattices of Be sulfonates. Also the sulfates, double nitrates and such oxides as $Al_2O_3 \cdot BeO$ suggest the grouping of Be and Mg with the Zn family. Mg and Zn form inner salts of pyrocatechol and porphyrin, while the alk earths do not. Only in their nitrides and heats of combustion, do Be and Mg come nearer the alk. earths. The prepn. of 28 sulfonates is described in detail. M. E. L.

The conduction of electricity in liquid dielectrics. D. H. BLACK AND R. H. NISBET *Phil. Mag.* [7], **10**, 842–62(1930); cf. *C. A.* **22**, 4240.—The conductivities of 2 highly purified paraffin oils were measured. Departures from Ohm's law occurred at high stresses in sufficiently thin films. The gas theory is able to account for all of the facts. ARTHUR FLEISCHER

Dielectric polarization of some pure organic compounds in the dissolved, liquid and solid states. S. O. MORGAN AND H. H. LOWRY. *J. Phys. Chem.* **34**, 2385–432 (1930); cf. *C. A.* **22**, 3572.—The dielec. consts., ds. and *n*s of CH_3Cl, CH_2Cl_2, CH_3Br and CH_3I were detd. in dil. solns. of either hexane or CCl_4 or both. The calcd. moments agreed with the values detd. by others for these substances in the gaseous state. In addn. the dielec. consts. and ds. were detd. for $CHCl_3$, CCl_4, C_2H_5Br, *p*-$C_6H_4Cl_2$, C_6H_6, C_6H_{14}, CH_3Cl, CH_2Cl_2, CH_3Br and CH_3I in the pure liquid and solid states and the components of polarization for these substances calcd. A no. of condensers were designed to det. the dielec. const. of liquids and solids and their use in direct capacity measurements is discussed. An equation is presented which represents the dependence of the dielec. const. of the Me halides upon temp. The ds. of the Me halides are nearly linear functions of temp., while the conductance and power factor of CH_3Cl and CH_2Cl_2 are functions of both temp. and frequency. H. W. LEAHY

The influence of high voltage on the dielectric constant of liquids. HERMANN GUNDERMANN. *Ann. Physik* [5], **6**, 545–73(1930).—It was found experimentally that the dielec. const. decreases as the square of the voltage. The decrease is greater for a large dielec. const. but is not as great as the simple theory of Debye requires. Mixts. of

polar liquids do not give an av. value for the constituents. Mixts. of polar liquids and benzene show specific effects that were detd. as a function of concn., for the pairs butanol-benzene and ethanol-benzene. The latter pair behaved anomalously. This is attributed to assocn. FRANK URBAN

The exchange of energy between gas atoms and solid surfaces. J. K. ROBERTS. *Proc. Roy. Soc.* (London) **A129**, 146–61(1930).—Expts. on the accommodation coeffs. of He with W and Ni surfaces were made under conditions that gave results for catalyst surfaces free from adsorbed gas. The values obtained, 0.05 to 0.07 for W and 0.08 for Ni, are lower than those for gas-covered surfaces. J. B. AUSTIN

A new application of azeotropism. MAURICE LECAT. *J. Phys. Chem.* **34**, 2508–18 (1930).—A new method of azeotropic analysis of org. compds. is described. P. H. E.

A method for determining critical constants and its application to biphenyl. J. M. CORK. *Rev. Sci. Instruments* **1**, 563–8(1930).—A method is described that gives directly the crit. temp. and crit. vol. or d. as well as liquid and vapor d. at all temps. The crit. pressure may be obtained from a vapor pressure-temp. curve by using the vapor pressure at the crit. temp. Three Pyrex glass tubes contg. the substance to be examd. were mounted on a Cu block in a furnace consisting of a resistance-wound Pyrex glass cylinder. The liquid levels were read by a cathetometer. Observation of the meniscus levels in the 3 tubes expressed in terms of vapor and liquid vol. gave 3 simultaneous equations from which liquid and vapor d. were evaluated. For biphenyl the crit. pressure is 31,400 mm. Hg, crit. temp. 528° and crit. d. 0.343 g./cc. ALLEN S. SMITH

Influence of the size of the grain upon the dissociation pressure of solids. Red mercuric oxide. Iceland spar. J. KRUSTINSONS. *Z. physik. Chem.*, Abt. A., **150**, 310–6(1930).—Red HgO and ground Iceland spar were sepd. into 4 fractions by sieves and the dissocn. temp. was measured at pressures up to 900 mm. in a vertical dissocn. compensated app. It was again established that the dissocn. temp. of the smallest grains differs markedly from that of the larger. The surface tension for HgO, calcd. from the Thomson formula, is 750,000 dynes/cm. and for Iceland spar, 120,000 dynes/cm. It is shown that Valeton's conception, that macroscopic crystal surfaces all have the same soly., does not apply to their thermal dissocn. pressures. (Cf. *C. A.* **15**, 983.) MARY E. LEAR

Electrical conductivity of glasses. The system B_2O_3 + Na_2O. S. A. SHCHUKAREV AND R. L. MÜLLER. *Z. physik. Chem.*, Abt. A, **150**, 439–75(1930); cf. *Protokoll der Chem. Abtl. Russ. Phys. Chem. Ges.* **32**, No. 7, 10(1926).—The cond. of Na_2O-B_2O_3 glasses contg. 0.01 to 33.83% Na_2O, cast in the form of disks, was measured at temps. from 25° to 300°, Na amalgam electrodes being used. For each glass the results are expressed by the equation, $\ln K = -(A/T) + B$, A and B being consts. given in the following table:

%Na_2O	A	B
0.01	25,070	12.80
0.043	24,710	14.62
0.73	26,790	21.36
2.74	29,170	26.25
5.2	22,450	14.07
5.9	21,050	11.95
7.27	17,140	5.43
12.60	13,800	3.18
16.9	11,600	4.33
25.0	9,103	3.04
25.27	9,103	3.04
30.8	8,204	3.45
32.4	8,204	3.45

The isotherms for increasing Na_2O content show a slow increase with a sudden jump in the curve, corresponding with the crystn. limits of the glass. In glass, ions are present and are sepd. by excess B_2O_3. ARTHUR FLEISCHER

Crystal forms of fatty acids. YOSHIO TANAKA, RYÔNOSUKE KOBAYASHI AND KENJI SHIMIZU. *J. Soc. Chem. Ind. Japan* **33**, Suppl. binding 364–5(1930).—The fundamental crystal of fatty acids is a rhomb whose adjacent angles are 70 ± 1° and 110 ± 1°. It exhibits double refraction and parallel extinction, and has 3 crystal axes parallel to 3 vibration axes, like solid paraffin. Paraffin hydrocarbons aggregate in the direction of their angles, fatty acids in the direction of their sides.

E. M. SYMMES

A note on the representation of crystal structure by Fourier series. W. L. BRAGG AND J. WEST. *Phil. Mag.* [7], **10**, 823–41(1930); cf. *C. A.* **23**, 3398.—The double Fourier series representation of the Hartree model of the NaCl crystal is compared with the actual x-ray photograms. The use of the incomplete series leads to an image of crystal structure which has defects similar to those produced by optical diffraction. The numerical aperture in x-ray analysis must be defined as 2 sin Θ_0. A. F.

Lattice distortions in glide planes indicated by an x-ray investigation of rock salt. WOLFGANG BERG. *Wiss. Veröffentlich. Siemens-Konzern* **9**, 119–43(1930).—Study of some structural features of certain crystals has been aided by the production of photographs of the exterior surfaces, obtained by simple reflection of a beam of directed monochromatic x-rays. With rock salt these pictures show fairly regularly arranged light and dark striae, of which part are parallel to the cube edges and part to the surface diagonals. Very similar striations may be artificially produced by compression of the crystals, which have been subjected to heat treatment. Consequently the striations appearing in natural crystals seem to be the result of gliding and the corresponding traces of glide planes upon the cube surfaces. The study of the behavior of the striations aids in the detn. of the lattice deformations occurring in the glide planes. The observation of the striae also furnishes a very sensitive method of establishing glide planes and their orientations in single crystals. The method is expected to prove useful with metal crystals. C. J. HUMPHREYS

X-ray investigation in the sulfur-selenium system. I. The rhombic mixed crystals of sulfur and selenium. F. HALLA AND F. X. BOSCH. *Z. physik. Chem.*, Abt. B, **10**, 149–56(1930).—Rhombic mixed crystals of S and Se, prepd. from solns. in CS_2 satd. with one or both components, were subjected to measurements of d., surface angles and ratio of axes. The sepn. of the (111) lattice planes was detd. by the Bragg method of x-ray analysis. Crystals were examd. contg. varying amts. of Se up to more than 7%. The linear dimensions of the elementary solid increase with the Se content. Consequently the mixed crystals have a statistical distribution of components. The measurement of the ratio of the at. radii of S and Se yields a value in satisfactory agreement with the estimate of V. M. Goldschmidt. The mixed-crystal form depends upon the activation of the S. C. J. HUMPHREYS

Study of the system: HgO–SO_3–H_2O. M. PAIĆ. *Bull. soc. chim.* [4], **47**, 1254–9 (1930).—See *C. A.* **24**, 4208. E. C. K.

Solution of mixed crystals sodium chloride–silver chloride in pyridine, and x-ray investigation of these mixed crystals. M. LE BLANC AND J. QUENSTÄDT. *Z. physik. Chem.*, Abt,. A, **150**, 321–48(1930).—The rate of extn. of AgCl by pyridine from mixed crystals of NaCl and AgCl seems to change continuously with the compn., although the rate decreases rather abruptly as the mol. fraction of NaCl is increased beyond 5/8. The expts. revealed no definite "resistance limit" for any compn., bringing new evidence that Tammann's claims in this regard are not correct. While the amt. of AgCl dissolved in a given time decreased with increasing NaCl content small quantities of AgCl were extd. from crystals contg. more than 90% NaCl. In such cases the extn. appeared to proceed indefinitely without approaching an end point, and the amt. dissolved could be increased greatly by reducing the size of grain. X-ray diagrams of the mixed crystals showed no lines other than those of a NaCl lattice, only the lattice const. varied with the compn.; the departures from Vegard's additive relation were fairly small. Conclusion: There is no preferred arrangement of Na and Ag atoms in (Na, Ag)Cl, but rather a haphazard distribution. L. ONSAGER

The conductivity and density of chromic acid solutions. H. R. MOORE AND W. BLUM. *Bur. Standards J. Research* **5**, 255–64(1930).—The cond. and d. of CrO_3 solns. having the compn. CrO_3 99.75, Cr_2O_3 0.11, SO_4 0.017, alkali salts 0.10, and insol. 0.02% were detd. for concns. up to 10 *M*. The d. was found to be a linear function of the concn. and the cond. increased to a max. at 5 *M* and then decreased. Data are given for 0°, 25° and 45°. The position of the max. varies with the temp.; thus the optimum cond. occurs at concns. of 4.1, 4.8 and 5.0 *M* for temps. of 0°, 25° and 45°, resp. H. R. MOORE

Iodine and potassium iodide. T. R. BRIGGS AND W. F. GEIGLE. *J. Phys. Chem.* **34**, 2250–9(1930).—Curves are given illustrating the temp.-concn. data from cooling curves of I_2-KI mixt. and soly. data are presented from analyses of the liquid phase. The 2 mixts. of 40 and 60 mol. % KI used were not homogeneous above 82°, but this does not prove the existence of solid polyiodides. The soly. of KI in liquid I_2 is almost independent of temp. up to 190°. Temp. arrests do not connote polyiodide formation, but are due merely to sepn. of salt. There is no evidence for the existence of KI_3 as a stable solid above 25°. H. R. MOORE

The boric acid problem. WILDER D. BANCROFT AND HERBERT L. DAVIS. *J. Phys. Chem.* **34**, 2479–507(1930).—Evidence is presented against the theory that H_3BO_3 is activated by various substances through formation of compds. The evidence points rather to soly. phenomena involving increased dissocn. of the H_3BO_3 and abnormal effects of the H_3BO_3 solns. on the optical rotation and other properties of the hydroxy substances. H. W. LEAHY

The relation between gas charge and the adsorption of electrolytes by activated charcoal. IV. The adsorption of acids by degassed and by hydrogen-saturated charcoal. R. BURSTEIN, A. FRUMKIN AND D. LAVROVSKAYA. *Z. physik. Chem.*, Abt. A, **150**, 421–38(1930); cf. *C. A.* **22**, 8; **23**, 3614.—The previous measurements are extended to higher acid concns. For HCl adsorption on platinized and H_2-treated charcoal the adsorption is independent of the amt. of Pt. With platinized and H_2-treated charcoal H_2SO_4 shows pos. adsorption at a concn. of 0.8702 equivs. per kg. of soln., HCl at 0.6285 and HBr at 0.1152. ARTHUR FLEISCHER

A new method for the determination of sorption isothermals of vapors as charcoal. L. J. BURRAGE. *J. Phys. Chem.* **34**, 2202–17(1930).—The new method consists in satg. a known wt. of charcoal with vapor at a definite temp. and pressure, reweighing and then passing dry air through the charged charcoal column at a known rate. The container is reweighed at frequent intervals when the flow of gas is interrupted. The weights of sorbed vapor per unit weight of charcoal thus found (q) are plotted against (V) the total vol. The relation $q = K \cdot V^n$ prevails for CCl_4 and H_2O vapor isothermals. Retentivity curves are given and tangents $-(\partial q)/\partial v)T$ drawn for different values. The test may be modified to yield true sorption isothermals and may be applied generally to sorption of vapors by solids. H. R. MOORE

Adsorption at crystal-solution interfaces. V. Effect of adsorbed dye on the lattice size of potassium alum crystals. F. G. FOOTE, F. C. BLAKE AND W. G. FRANCE. *J. Phys. Chem.* **34**, 2236–40(1930); cf. *C. A.* **24**, 2656.—The lattice consts. for pure K alum and alum dyed with diamine sky blue are 12.082 A. U. and 12.078 A. U., resp., thus refuting previous reports that dye causes a change in crystal form. Hence it appears that adsorbed dye does not affect the plane spacing, and is probably adsorbed interstitially rather than on individual planes. H. R. MOORE

Capillary activity of organic substances in aqueous salt solutions. P. P. KOSAKEVICH AND N. S. KOSAKEVICH. *Z. physik. Chem.*, Abt. A, **150**, 370–80(1930).—Li halides enhance the effect of phenol, *o*-cresol, thymol and menthol on the surface tension of water. The max. concn. of the active substance in the surface layer does not depend on the concn. of salt in the soln. Rideal's relation: $FA/RT = (B/RT)F + x$, where $F = \sigma_0 - \sigma$ = surface-tension depreciation, and A = area per mol., applies to all the solns. investigated, except menthol. The activities (fugacities) of phenol in salt solns. are calcd. from the surface-tension data in good agreement with direct measurements. L. ONSAGER

The state of water and the active surface of Japanese acid clay. YOSHIO TANAKA AND MITSUO NAKAMURA. *J. Soc. Chem. Ind. Japan* **33**, Suppl. binding 365–6(1930).—Dehydration of Japanese acid clay was followed by the thermobalance continuously from room temp. to 1200°, and the results compared with those from SiO_2 gel, Al_2O_3 gel, kaolin and Japanese acid clay treated with HCl. The H_2O content of air-dried Japanese acid clay is less than that of clay in equil. with air satd. at 20°, but the states of hydration above 100° are almost the same. The H_2O of the clay evolved at 450–500° is still somewhat reversible. The SiO_2 gel dehydration curve showed no bend at 450° (*J. Chem. Soc.* **53**, 59(1888)) but was straight from 150 to 600°. In Al_2O_3 gel dehydration there was no level corresponding to $Al_2O_3.3H_2O$, $Al_2O_3.2H_2O$ or $Al_2O_3.H_2O$. Dehydration of gels is continuous in temp. rise. E. M. SYMMES

An investigation of the limits of the colloidal state of the calcium phosphates in the presence of several electrolytes and organic compounds. L. K. LAPINSKII. Vologda Molochno-Khozyaistvo Inst. (Vologda Dairy Inst.), *Bull.* **76**, 7–30(1929).—The results of a series of expts. are summarized: (1) The electrolytes NaCl, Na_2SO_4, KCl and $Na_3C_6H_5O_7$ stabilize satd. colloidal solns. of $CaHPO_4$ and $Ca_3(PO_4)_2$; $Na_3C_6H_5O_7$ is most effective. (2) Addns. of these electrolytes, with the exception of $Na_3C_6H_5O_7$, after the formation of $CaHPO_4$ or $Ca_3(PO_4)_2$ (by adding a soln. of $CaCl_2$ to either Na_2HPO_4 or Na_3PO_4) do not produce conditions for stabilization. (3) Milk sugar added before the formation of $CaHPO_4$ and $Ca_3(PO_4)_2$ also produces stable conditions. (4) Gelatin added before or after the formation of $CaHPO_4$ or $Ca_3(PO_4)_2$ has a protective effect J. S. JOFFE

Highly polymerized compounds. XLIII. The streaming double refraction of colloid molecules. R. SIGNER. *Z. physik. Chem.*, Abt. A, **150**, 257–84(1930); cf. *C. A.*

25, 280.—Numerous solns. of polymerized org. substances which consist of rod-like mols. show important double refraction. The strength of this anisotropy depends upon concn. The specific double refraction $(n_\gamma - n_\alpha)/G.\eta$ is a const., characteristic for each substance. The colloid particles show partly pos. and partly neg. specific refraction in relation to their length. The optical characteristics of several polymers can be explained by their chem. constitution. M. E. LEAR

A study of the influence of hydrolysis temperature on some properties of colloidal ferric oxide. II. The stability. GILBERT H. AYRES AND C. HARVEY SORUM. *J. Phys. Chem.* **34**, 2629–35(1930); cf. *C. A.* **24**, 2657.—The flocculation values of Fe_2O_3 sols prepd. at different temps. showed no regular variation with temp. Stock sols, however, after being heated to various temps. were less stable toward a flocculating electrolyte, the higher the temp. of heating. High temps. produced sols of a red-orange color with very opaque liquids. The decrease in stability and increase in turbidity resulting from raising the temp. are ascribed to decreased hydration of the sol rather than to increase in particle size. P. H. EMMETT

Titania gel. A comparison with silica gel. SIMON KLOSKY. *J. Phys. Chem.* **34**, 2621–3(1930).—The prepn., adsorptive capacity and catalytic activity of TiO_2 gel and SiO_2 gel are compared. TiO_2 gel is a poorer adsorbent and catalyst support than SiO_2 gel. P. H. EMMETT

Fractionation of gliadin. G. HAUGAARD AND ARNOLD H. JOHNSON. *Compt. rend trav. lab. Carlsberg.* **18**, No. 2, 132 pp.(1930); cf. *C. A.* **24**, 2507.—It is desirable to prove whether or not proteins which act as pure chem. substances toward ordinary reagents are "co-pptn." systems, as defined by Linderstrøm-Lang (*C. A.* **23**, 5083), in which the components are combined in a mutually reversible manner, so that the system behaves as a single substance as regards osmotic effects. Accordingly, an attempt reversibly to fractionate gliadin by cooling its solns. is described. Values for p_H of EtOH-H_2O solns are calcd. from H electrode values just as for H_2O solns. Corrections to be added to the *quinhydrone electrode* were 0.37 p_H for 60% EtOH by vol (= 52.2% by wt.), 0.33 for 47.5% and 0.39 for 67.5% EtOH by vol. For gliadin, α_{Hg579} = about −94°, based on the concn. 1 g. per 1 cc. in a 10-cm. tube. Under all circumstances, gliadin was *l*-rotatory. At low concns. of salts, the pptn. temp. was increased, while at higher concns. it was lowered. The p_H of min. soly. was 7.3, whereas the isoelec. pt. seemed to be 7.10. Studies of various factors affecting soly. and viscosity were made, and osmotic pressures were detd. also. After acid hydrolysis of the gliadin, analyses were made for humin, NH_3, arginine, amino N, total acid and basic groups, tyrosine and tryptophan. Hydrolysis with enzymes was also studied. A crit. study of the equil. between gliadin, alc., and water at 0° is reported. From all the relationships studied, it appears that gliadin is a reversibly fractionable co-pptn. system. W. D. LANGLEY

Phase-rule studies on the proteins. III. Quinquevalent nitrogen in organic compounds. 2. WILDER D. BANCROFT AND C. E. BARNETT. *J. Phys. Chem* **34**, 1217–53(1930); cf. *C. A.* **24**, 2944, 3794 and following abstr.—The addn. of HCl by compds. contg. 2 atoms of N in the mol. is discussed. $C_6H_4(NH_2)_2$, the ethylenediamines, N_2H_4, nicoteine, cuscohygrine, sparteine, quinine, quinidine, cinchonine, cinchonidine, cinchotine, hydrocinchonidine, hydroquinine and cupreine add 2HCl each. The amidines, quinazoline, $PhNHNH_2$, urea, biuret, succinimidine, uramil, uracil, antipyrine, nicotine, nicotimine, strychnine, brucine, hypaphorine, harmine and pilocarpine add only 1HCl each. In general, when the 2N are attached to the same C atom, only 1HCl can be added. **IV. Quinquevalent nitrogen in organic compounds. 3.** *Ibid* 1930–46.—The addn. of HCl by compds. contg. 3 atoms of N in the mol. is discussed. The ethylenetriamines, triaminophenol, triaminoresorcinol and diaminoacridine add 3 HCl. Chrysaniline, phenotripyridine, hydrazotriazene, hydrazomethyltriazene, histidine and histamine add 2HCl, while guanidine and its derivs., the triazines and aminouracil add only 1HCl. Considering the linkage :C.O.C: as equiv. to a keto linkage, one can predict that neither caffolide, allocaffolide, apocaffeine, isocyanuric acid nor cyamelide will add any HCl and that melamine will add 3HCl. R. C. R.

Phase-rule studies on the proteins. V. WILDER D. BANCROFT AND C. E. BARNETT. *J. Phys. Chem.* **34**, 2433-71(1930); cf. preceding abstr.—With the same methods as used previously it is shown that when there are more than 4 N atoms in the mol., the exceptions to theory are more numerous than when only 2 or 3 N atoms are present. Thus the safranines, triaminotriethylamine, triaminopyrimidine and tetraaminopyrimidine, add less than 4HCl. On the other hand hexamethylenetetramine and tetraaminobenzene add 4HCl. Biguanide and *p*-tolylguanide have 5N atoms, but add only 2HCl. Benzenetriphenazine adds 1HCl, but has 3N atoms. While xanthine, theophylline and theobromine crystallize with 1HCl each, caffeine adds 2HCl.

Tetraethyl- and tetramethyltetrazones add only 1HCl as does 1-methyltriazole, but 3-hydrazotriazole forms a dihydrochloride. Arginine adds $2HNO_3$. Guanazol forms 2 hydrochlorides at the side-chain N. Urazole, aminourazole and alloxantin do not add HCl. There are no peptide linkages in zein. Perchloric acid gives 2 compds. with triphenylamine, $(C_{18}H_{15}N)_2.HClO_4$ and $C_{18}H_{15}N.HClO_4$. No necessary connection exists between hydrolysis consts. in aq. soln. and ability to react stoichiometrically with HCl. R. H. FERGUSON

The solubility of naphthalene in some aliphatic alcohols. ARTHUR A. SUNIER. *J. Phys. Chem.* **34**, 2582–97(1930).—The soly. of $C_{10}H_8$ in MeOH, EtOH, *n*-PrOH, iso-PrOH, *n*-BuOH, iso-BuOH, *sec*-BuOH and *tert*-BuOH was detd. by the synthetic method at 20–70°. Regularities were found in the solubilities of the normal alcs. The influence of small quantities of H_2O (about 2%) on the soly. of $C_{10}H_8$ in MeOH and EtOH was also studied. The results indicate that small quantities of H_2O may lead to results as much as 20% too low. H. W. LEAHY

The reciprocal influence of sodium sulfate and potassium sulfate on their solubilities in water. EDWARD J. SALTSTROM AND G. McP. SMITH. *J. Phys. Chem.* **34**, 2241–9(1930).—Data are given for the solubilities of K_2SO_4 in H_2O and in solns. of Na_2SO_4 up to 2.0 wt. *N*, and for pure Na_2SO_4 solns. and Na_2SO_4 in solns. of K_2SO_4 up to 1.20 wt. *N*. The solubilities increase sharply up to 1.00 wt. *N* of added salt. Evidence of double salts of the type $x\ Na_2SO_4, y\ K_2SO_4$ was found. The data are interpreted in the light of Noyes and Harkins' postulate of intermediate ions of the type KSO_4^- and Brønsteds' thermodynamic principles for the equality of activity coeffs. for salts of the same type. H. R. MOORE

The solubility of sodium chloride in saturated solutions of sodium chlorate. WU MA NA. *Lignan Sci. J.* **9**, 91–6(1930).—The soly. of NaCl, both in mols. per l. and mols. per mol. H_2O, decreases with rising temp. in the presence of excess $NaClO_3$. The concn of NaCl in mols. per l. at 99.6° is 0.1180, at 93.0° 0.1231, at 86.1° 0.1307, at 85.8° 0.1317, at 76.1° 0.1491, at 75.8° 0.1494 and at 60.4° 0.1823. J. B. AUSTIN

Mutarotation in pure and in mixed solvents. JITENDRA NATH RAKSHIT. *J. Phys. Chem.* **34**, 2539–48(1930).—The mutarotation of morphine-HCl, codeine-HCl and narcotine-HCl was measured in H_2O, EtOH and mixts. of both. Conclusions: Mutarotation may be due to reaction between solute and solvent. All the mols. of a solute are under the simultaneous reversible influence and action of mols. of both solvent in proportion to their nos. in the field. H. W. LEAHY

The relationship between the refractive index of solutions of variable concentrations and the change in state of the dissolved substance. A method for the study of the changes in state of dissolved substances. MAX FRANKEL. *Biochem. Z.* **227**, 304–18(1930).—There is a strict proportionality between the concn. and the *n* of a soln. provided that the state of the solute remains unchanged within this range of concn. If assocn. occurs the *n* falls below the calcd. value, and in dissocn. exceeds it. However, if the assocn. or dissocn. keeps pace with the changes in concn. the direct proportionality of the *n* values is retained. A method of extrapolation is described whereby one can det. whether the solute has undergone a change in the dispersion state within the concn. range investigated. S. MORGULIS

Optical activity and salt effect. P. A. LEVENE AND ALEXANDRE ROTHEN. *J. Phys. Chem.* **34**, 2567–81(1930).—The optical activity of mandelic acid, α-methylglucoside and sucrose in the presence of alkali halides and hydroxides was studied. In general the alkali compds. increased the mol. rotation. However, the mol. rotation of the mandelate ion was the same at zero concn. regardless of the alkali compd. present. H. W. LEAHY

Electrical conductivity of very dilute solutions in antimony trichloride. Z. KLEMENSIEWICZ AND (MISS) Z. BAL. *Roczniki Chem.* **10**, 481–91(491 French)(1930).—The elec. conductivities of a no. of very dil. solns. (5×10^{-5}–10^{-2} *N*) in fused $SbCl_3$ were detd. The results agree well with previous measurements in more concd. solns. (*C. A.* **19**, 2156). Particularly according to Gosh the linear relation between the logarithm of equiv. cond. $ln\mu$ and cube root of the concn. $\sqrt[3]{\eta}$ was exactly verified for uniunivalent salts. The behaviors of the chlorides (common anion with that of the solvent) and the bromides (both anions different) are identical. The cond. for multivalent electrolytes is much smaller and its relation with the concn. more complicated. J. K.

The influence of volume and buffer value of a solution on the buffer value of another solution. GIUSEPPE RUSSO. *Boll. soc. ital. biol. sper.* **5**, 759–62(1930). P. M.

The chloroplatinate-chloroplatinite electrode. EDGAR R. SMITH. *Bur. Standards J. Research* **5**, 735–40(1930).—The e. m. f. of the cell formed by immersing a Pt electrode in 0.1 *N* KCl soln. contg. relatively small concns. of K_2PtCl_4 and K_2PtCl_6 was

measured at 35° against the 0.1 *N* calomel electrode. E. m. f. values were extrapolated to pure 0.1 *N* KCl soln. The equation $E = E_0 - (RT/2F)\log_e(m_1/m_2) + k\sqrt{\sigma}$, in which k is a const. and σ is the ionic strength of the soln., represents the exptl. data for values of $[m_1(K_2PtCl_4) + m_2(K_2PtCl_6)]$ ranging from 0.001 to 0.01, and gives a value of 0.4573 v. for E_0 in 0.1 *N* KCl. From the value of E_0 and the known change in heat content, the change in thermodynamic potential, change in entropy and the equil. were calcd. The results compare favorably with those of Miller and Terrey (cf. *C. A.* **21**, 2094). ALLEN S. SMITH

The platinum-hydrogen electrode. MARG THALINGER AND M. VOLMER. *Z. physik. Chem.*, Abt. A, **150**, 401–17(1930).—The anodic behavior of the Pt-H_2 electrode (cf. Sankine, *C. A.* **22**, 2870) is similar to the passivity phenomenon of metals. The effect of impurities usually occurring in H_2 is merely to change the fluctuations and periods. Impurities do not cause the phenomenon. By a study of the amalgamation of Pt surfaces it is shown that the effect is due to a monatomic O_2 film, which is not optically determinable. ARTHUR FLEISCHER

Cells with liquid-liquid junctions. III. Cells with a bridge of concentrated potassium chloride. A. UNMACK AND E. A. GUGGENHEIM. *Kgl. Danske Videnskab Selskab Math.-fys. Medd.* **10**, No. 8, 1–24(1930); cf. *C. A.* **24**, 5580.—The e. m. fs. of cells of the type H_2/soln. *S*/3.5 *N* KCl/0.1 *N* KCl, HgCl/Hg (*S* = dil. HCl, dil. alkali or a buffer) were measured by Bjerrum and Unmack, *C. A.* **24**, 2361. New measurements of this type were made in the light of Guggenheim's conclusions concerning the conditions for reproducibility and stability in cells with liquid-liquid junctions (*C. A.* **24**, 5580). Special care was taken in the present measurements to obtain, by having the liquid-liquid junction in the side-tube of the H electrode, the cylindrical symmetry of the junction which G. found so important. The initial values of the e. m. fs. agreed with those given by B. and U., within their exptl. error of several tenths of a mv. The e. m. fs. generally changed a few tenths of a mv. in the first 15–30 mins., but always reached a steady value reproducible to about 0.1 mv., and stable for a whole day. The sharper the initial junction, the sooner was the steady state reached. The values also agreed (where tested) with similar cells having a liquid-liquid junction of the free diffusion type designed by G. (loc. cit.). When cylindrical symmetry of the junction was deliberately avoided the e. m. fs. were erratic (several mv.). Cells of the type (*a*) Hg/HgCl, 0.1 *N* KCl/3.5 *N* KCl/0.1x*N*HCl + 0.1 $(1-x)$*N* *R*Cl/H_2 (*R* = alkali metal., x varied from 0.05 to 1.0) were studied for comparison with B. and U.'s measurements, and cells of the type (*b*) Hg/HgCl, 0.1 *N* KCl/3.5 *N* KCl/0.01x*N* HCl + 0.01 $(1-x)$*N* LiCl/H_2 (x varied from 0.10 to 1.00) were studied to compare the observed values with those calcd. theoretically. The greatest deviation observed between the 0.1 *N* KCl calomel cells used was 0.3 mv., while 3.5 *N* KCl calomel electrodes were found to be less stable and slightly less reproducible. The e. m. f. of the combination Hg/HgCl, 3.5 *N* KCl/0.1 *N* KCl, HgCl/Hg, "as long as the left-hand electrode was fairly newly prepd.," was found to be 83.1 ± 0.2 mv. at 18°. The curves obtained by plotting $E - (RT/F)\log_e C_{H^+}$ against the ratio of H-ion concn. to total anion or cation concn. are regular. A thermodynamic discussion of the e. m. fs. of such cells is given, and the conclusions are compared with the exptl. results. A method for computing E_s (the salt effect potential) in cells of type (*b*) (above) is given. E. B. S.

The theory of hydrogen overvoltage. T. ERDEY-GRUZ AND M. VOLMER. *Z. physik. Chem.*, Abt. A, **150**, 203–13(1930).—During the building up of overvoltage, as long as no evolution of H_2 occurs, the H ions are not discharged by the current at the electrode in marked amts. but arrange themselves in the double layer. A theory of overvoltage is developed which gives the abs. value of the const. $b = d\eta/d\log I = 0.116$ from the Tafel equation. The temp. relations and the decline in overvoltage after breaking the current agree with this value. MARY E. LEAR

The state of equilibrium. VERNON BOSMAN. *J. Chem. Met. Mining Soc. S. Africa* **31**, 28–37(1930). ALDEN H. EMERY

The Le Chatelier-Braun principle. I. A thermodynamic proof. HENRY S. FRANK. *Lingnan Sci. J.* **9**, 81–90(1930).—This principle is discussed with applications to salt solns. A general function φ, useful in setting up a criterion of equil., is defined by the equations $\partial\varphi/\partial\eta_2 = 0$ and $\partial^2\varphi/\partial\eta_2^2 > 0$ which together constitute the necessary and sufficient conditions that the system shall be in stable equil. with respect to small changes in η_2, the variable describing the position of the equil. φ may be the Lewis free energy, the Helmholtz free energy or the entropy, depending on the conditions

of the change. If $\pi_1, \pi_2, \pi_3 \ldots \pi\eta$ are the arbitrarily fixed parameters of the system, stable equil. is defined by $(\partial\varphi/\partial\eta_2)_{\pi_r\pi_s} = 0$ and $(\partial^2\varphi/\partial\eta_2^2)_{\pi_r\pi_s} > 0$. If π_r is altered by $d\pi_r$, π_s remaining const., then $\partial^2\varphi/\partial\eta_2$ remains pos. by hypothesis and the first condition becomes $(\partial^2\varphi/(\partial\eta_2\partial\pi_r))d\pi_r$. If both the parts of this last quantity > 0, η_2 decreases as equil. is restored. But since $\partial^2\varphi/\partial\eta_2\varphi\pi_r = (\partial/\partial\eta_2)(\partial\varphi/\partial\pi_r) > 0$ this decrease in η_2 is the change which, operating alone would have decreased $(\partial\varphi/\partial\pi_r)_{\pi_s}$. If $\partial^2\varphi/\partial\eta_2\partial\pi_r$ is neg. the same result follows. In either case a neg. $d\pi_r$ causes a shift which, acting alone, increases $(\partial\varphi/\partial\pi_r)_{\pi_s}$. Therefore, when any system in stable reversible equil. is subjected to a change $d\pi_r$ in any detg. parameter, other parameters remaining const., the equil. shifts in a way that, acting alone, causes a change in $(\partial\varphi/\partial\pi_r)_{\pi_s}$ of sign contrary to $d\pi_r$. Various statements of this principle are discussed but a completely satisfactory one is not given. J. B. AUSTIN

Equilibria in the iron–hydrogen–oxygen system. Indirect calculation of the water-gas equilibrium constant. P. H. EMMETT AND J. F. SHULTZ. *J. Am. Chem. Soc.* **52**, 4268–85(1930).—The equil. const. $K = P_{H_2O}/P_{H_2}$ for the reaction $FeO + H_2 = Fe + H_2O$ was detd. by a flow method. At 600, 700, 800, 900 and 1000°, K is, resp., 0.332, 0.422, 0.499, 0.594 and 0.669. For the reaction $Fe_3O_4 + H_2 = 3FeO + H_2O$ K is 1.18 at 700° and 2.37 at 800°. The water-gas consts., calcd. by combining these Fe–H–O equil. values with those for the Fe–C–O system, agree excellently with consts. measured directly by Neumann and Kohler. P. H. EMMETT

Kinetics of permanganate reduction by formaldehyde in neutral solution. JOSEF HOLLUTA AND AUGUST MUTSCHIN. *Z. physik. Chem.*, Abt. A, **150**, 381–400(1930).—In neutral soln. HCHO ordinarily reduces $KMnO_4$ to MnO_2; but a great excess causes further reduction to Mn_2O_3. The reaction appears to be of the second order; but initial irregularities indicate catalysis by intermediate or final products. The disturbance is attributed to H ions from HCOOH, which occurs as an intermediate product in the reaction L. ONSAGER

Velocity of decomposition of diazo compounds in water. VI. E. YAMAMOTO. *J. Soc. Chem. Ind. Japan* **33**, Suppl. binding 358–60(1930).—The velocity const. of *m*-nitrobenzenediazonium chloride at 0° is 4.0×10^{-8}, temp. coeff. = 13,600; *p*-nitrotoluene-*o*-diazonium chloride 6.8×10^{-7} and 12750, *p*-nitrobenzenediazonium chloride 6.9×10^{-4} and 14,150, resp. E. M. SYMMES

Some consideration of a simple phase-rule study. HERBERT L. DAVIS. *J. Chem. Education* **7**, 2675–86(1930).—Phase-rule methods are outlined for getting at the compn. of solid phases in three-component systems. By applying these methods to the system, boric acid–tartaric acid–H_2O, it is shown that tartaric acid increases the soly. of boric acid in water over ten-fold, while boric acid doubles the soly. of tartaric acid. No compd. forms at room temp., the 2 substances crystg. together at the invariant point. R. H. FERGUSON

Studies on the mechanism of ammonia synthesis over iron catalysts. P. H. EMMETT. *J. Chem. Education* **7**, 2571–83(1930).—A résumé is given of all published work on the mechanism of catalytic synthesis of NH_3 and on the effect of promoters on the activity of Fe catalysts. P. H. EMMETT

Effect of copper and lead ions upon the rate of decomposition of hydrogen peroxide at various acidities. HARRY W. RUDEL AND MALCOLM M. HARING. *Ind. Eng. Chem.* **22**, 1234–7(1930).—The rate of decompn. of 30% H_2O_2 at varying acidities in the presence of varying concns. of Cu and of Pb ions was investigated. The rate increases with p_H; traces of Cu ion markedly accelerate, whereas Pb ions inhibit the decompn. P. H. EMMETT

The effect of water upon the decomposition of ethyl alcohol at the surface of nickel. W. WALKER RUSSELL AND ROBERT F. MARSCHNER. *J. Phys. Chem.* **34**, 2554–66(1930).—Over a wide range of concns. H_2O increases the amt. of alc. decompd. and decreases the % of aldehyde decompd. The Ni catalysts decreased in activity while in use but were reactivated by treatment with H at 350°. H. W. LEAHY

The thermochemistry of sulfur. III. W. A. ROTH, R. GRAU AND A. MEICHSNER. *Z. anorg. allgem. Chem.* **193**, 161–75(1930); cf. *C. A.* **24**, 2930, 2946.—The heat of oxidation of gaseous SO_2 by dil. H_2O_2 solns. at 20° was detd. calorimetrically as + 74.84 ± 0.05 kg.-cal. per mol. The heat of dissocn. of H_2O_2 at 20° is 22.70 ± 0.03 kg.-cal. per mol. With the aid of these values the following heat effects are calcd.: $SO_2 + {}^1/_2O_2 = SO_3$ (l) + 33.66 ± 0.06 kg.-cal., $SO_2 + {}^1/_2O_2 + H_2O$ $(l) = H_2SO_4$ anhyd. + 54.88 ± 0.05 kg.-cals. $S_{rh} + 1^1/_2O_2 = SO_3$ (l) + 104.57 ± 0.07 kg.-cal. $S_{rh} + 1^1/_2O_2 + H_2O$ $(l) = H_2SO_4$ anhyd. + 125.79 ± 0.10 kg.-cal. $S_{rh} + 2O_2 + H_2 = H_2SO_4$ anhyd. + 194.1 ± 0.1 kg.-cal., where SO_3 (l) means liquid SO_3 and S_{rh} means rhombic S. Old values for these reaction heats are critically discussed and are found in general to be too high.

Attempts to det. the heat of formation of SO_2 and SO_3 by burning S in a bomb to a mixt. of both oxides failed because of analytical difficulties. J. B. AUSTIN

Heats of dilution and heats of solution of potassium nitrate, potassium chloride, rubidium fluoride and calcium sulfate at low concentrations. J. LANGE AND J. MONHEIM. *Z. physik. Chem.*, Abt. A, **150**, 349–69(1930).— The heats of diln. of KNO_3, RbF and $CaSO_4$ at 25° and of KNO_3 at 12.5° were measured with an adiabatic differential calorimeter. The heats of soln. were also detd., integral and partial heats of soln. being calcd. from the combined data. In addn., partial and apparent *sp. heats* of KNO_3 solns. were calcd. from the temp. dependence of the heats of soln. L. ONSAGER

Some problems in the conduction of heat. GEORGE GREEN. *Phil. Mag.* [7], 9, 241–60(1930); cf. *Phil. Mag.* [7], **3**, 784–800(1927); **5**, 701–20(1928).—The wave-train method of solving problems is applied to heat conduction in a uniform medium. ARTHUR FLEISCHER

Thermal decomposition of the system calcium sulfide and calcium sulfate. J. ZAWADZKI AND I. KOWALCZEWSKI. *Roczniki Chem.* **10**, 501–8 (508–9 French)(1930).— Transformation of 4 $CaSO_3$ into $CaS + 3\ CaSO_4$ takes place slowly and probably is incomplete. According to the phase rule $CaSO_3$ is not one of the phases of possible equil. The thermal decompn. $CaS + 3\ CaSO_4 \longrightarrow 4\ CaO + 4\ SO_2$ is complicated by secondary processes which take place with the liberation of S—always when SO_2 acts on CaO. The static method makes it possible to measure the total pressure of gas (SO_2 + S) by driving out the gases of the reaction with a current of N_2 and, after detg the content of SO_2, calcg. the partial pressure of SO_2. By combining these data the partial pressures of SO_2 and S in equil. with the system $CaS + CaSO_4 + CaO$ were detd. J. KUČERA

The heat of combustion of salicylic acid. P. E. VERKADE AND J. COOPS, JR. *J. Phys. Chem.* **34**, 2549–53(1930).—Polemic with Keffler (*C. A.* **24**, 3422). P. H. E.

3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

W. ALBERT NOYES, JR.

An acoustical interpretation of the Schrödinger wave equation. R. B. LINDSAY. *Phil. Mag.* [7], **10**, 863–72(1930). A. F.

Axial orientation of light emission and atomic structure. VIII. Oriented and polarized x-ray radiation from a crystal. J. STARK. *Ann. Physik* [5], **6**, 637–62 (1930); cf. *C. A.* **24**, 5600.—The axial orientation of an electron drop from the lowest Ne shell into the He shell of a Br atom is a property which is characteristic of the structure of the atom. An axial orientation of the intensity and polarization of secondary *K*-radiation from the Br atoms in dibromoanthracene has been demonstrated experimentally. This leads to the conclusion that the electrons in the outer shell of the Br atom are oriented in certain equil. positions with respect to a singular axis. It follows that in a crystal of dibromoanthracene the axes of the Br atoms are at least approx. parallel; and that, therefore, the mols. in this crystal show a parallel orientation, at least with respect to the Br-Br axis. This can be possible only if the valence field shows an axis which is at least approx. parallel to the axis which dets. the arrangement of electrons in the interior of the at. shell. Further expts. will be undertaken with Hg_2Cl_2 and TiO_2 crystals, with the intention of confirming the above findings on other crystals. FRANK URBAN

Axial orientation of light emission and atomic structure. IX. Axial orientation of valence fields of the carbon and nitrogen atoms. J. STARK. *Ann. Physik* [5], **6**, 663–80(1930); cf. preceding abstract.—The axial arrangement of the C valence electrons is in entire agreement with the theory of von Baeyer (1885). The 5 valence electrons of the N atom are of 3 types: 2 metalloid electrons of electronegative character which can remain inactive; one valence electron of weakly electropositive character which can dissoc. electrolytically in the quinquevalent linkage of the N atom; and 2 metalloid valence electrons of amphoteric character which engage other valence electrons in the tervalent or quinquevalent linkage of the N atom. The change in the nature of the weakly electropositive electron is conditioned upon the axial linkage of the 2 electronegative valences. Sommerfeld's theorems of swarming electrons are entirely incompatible with chem. experience. They rest on the dogmatic interpretation, far removed from reality, by him and others of a differential equation, to which previously Schrödinger had given a different interpretation. FRANK URBAN

The relation of electronic waves to light waves, to light quanta and to Planck's law.

J. J THOMSON. *Phil. Mag.* [7], **9**, 1185–94(1930).—An electron is considered as consisting of 2 parts, a core of neg. electricity equal to e and a system of waves surrounding the core. The velocity of the core is equal to the group velocity of the waves in its neighborhood. With this assumption an equation is derived which is shown to be identical with Planck's law. The energy and mass of a light quantum are calcd. by consideration of the moment of momentum of a light quantum about its axes. A. F.

Absorption measurements of the x-ray general radiation. LAURISTON S. TAYLOR. *Bur. Standards J. Research* **5**, 517–38(1930).—Cu absorption curves for heterogeneous x-rays were studied as a possible means of detg. the quality of radiation. A standard and 2 thimble ionization chambers were used. The log Cu absorption curves for heterogeneous high-voltage x-radiation do not become straight for filtrations up to 3 mm. Cu when measurements are made with a standard ionization chamber. Absorption measurements made with the thimble chamber are subject to error from the chamber "wall effect." Half-value layers and effective wave lengths derived from the 3 sets of results were compared. The "effective wave length" as derived from the slope of the absorption curve and the "half-value layer" are about equally sensitive to changes in quality at least up to 3 mm thickness of filter. The absorption coeff. obtained with a standard thickness of Cu (or Al) is recommended as the simplest general method of describing the quality of a heterogeneous beam of x-rays for therapeutic uses. On the basis of the effective wave length detns. it is found that, contrary to the accepted views, the greater part of the highly filtered energy is not concd in the W K lines.
ALLEN S. SMITH

Investigations on the artificial disintegration of some elements. C. PAWLOWSKI. *Compt. rend.* **191**, 658–60(1930).—By the retrograde method C, Si, S, Fe, Zn, Al, Mg, Ag and Pb were investigated. Po was the source of the α-particles. The results were in accord with those of Bothe and Fränz (*C. A.* **24**, 1791). L. D. ROBERTS

Remarks on the fine structure of α-radiation. JEAN THIBAUD. *Compt. rend.* **191**, 656–8(1930).—Two mechanisms for the emission of γ-rays are considered: the displacement of pos. charges between the intra-nuclear energy levels; emission by variation of the energy of nuclear rotation (analogous to the emission of the spectra of mols.).
L. D. ROBERTS

Processes for extracting radium from carnotite. H. A. DOERNER. Bur. Mines, *Report of Investigations* **3057**, 35 pp.(1930); cf. *C. A.* **24**, 1325.—The economic and technical aspects of the production of Ra from carnotite are bound up with the production of V and to a lesser extent with that of U. Ores now worked for V waste Ra in the slime. If the tailings were deslimed, dewatered and stored the Ra would be saved in a low-cost concentrate. Ra concentrates are always in the form of slime. It is, therefore, more difficult to recover Ra from concentrates than from ore of the same grade. All processes consume large amts. of chemicals and require many operations. No proved process stands out above the others as to metallurgical efficiency or costs of operation. V recovered from carnotite of low Ra content will pay for mining, concn. and recovery of V. This is not true for high-Ra ores of the same V content because of scarcity and greater mining costs. Low-grade ores may therefore offer the best opportunity for cheaper Ra. The HNO_3-modified method for Ra recovery (*C. A.* **22**, 3348) seems to be the best for treatment of slime concentrates. Several new but untried processes are interesting. In one, SiO_2 is volatilized as the fluoride; Ra recovery is reported to be complete and all expensive reagents are regenerated. A bibliography and list of patents are included.
ALDEN H. EMERY

A note on the formation of long-lived active molecules in hydrogen subjected to the action of α-particles from radon. EDWARD C. TRUESDALE. *J. Phys. Chem.* **34**, 2472–8(1930).—Repetition of the work of Duane and Wendt on the activation of H_2 by α-particles revealed no evidence for the existence of any long-lived active H, such as H_3. The rate of recombination of the H ions and electrons formed is so great as to prevent any reactivity toward S 0.1 sec. or longer after their formation. The formation of small quantities of H_2S could be detected only, when the S was present in the reaction sphere surrounding the radon.
P. H. EMMETT

Passage of an electron beam through a field-free enclosure. F. L. ARNOT. *Proc. Roy. Soc.* (London) **A129**, 361–77(1930).—An investigation of the fields set-up by the passage of an electron beam through an otherwise field-free enclosure is described. The app. used in one series of expts. is discussed in detail. Many curves are given. The essential object was the investigation of the pos. ions formed along the path of the electron beam. The curves apply to the following: angular distribution of the pos. ions; variation of intensity of peak at 90° with electron-beam current; velocity distribution of pos. ions.; relation between velocity of pos. ions and velocity of elec-

trons; relation between velocity of ions and electron current. The results are discussed. The investigation was also made by use of a Langmuir probe electrode. The whole of the enclosure through which the electron beam passes is found to be filled with a gas of slow electrons having a Maxwellian velocity distribution corresponding to a temp. of several thousand degrees K. WILLIAM E. VAUGHAN

The exchange of energy and electrons between neutral particles under conditions of resonance in collisions of the second kind. H. BEUTLER AND W. EISENSCHIMMEL, *Z. physik. Chem.*, Abt. B, **10**, 89–105(1930).—It follows from a conservation law deduced from quantum mechanics by E. Wigner that, upon the exchange of energy resulting from collisions of the second kind under conditions of resonance, the term multiplicity is unchanged. This means that a simultaneous inter-system combination accompanied by an interchange of terms in both colliding particles is preferred to the occurrence of the inter-system combination in the one and a permitted intra-system transition in the other. This has been experimentally proved in the transfer by collisions of the energy of excited Kr to Hg. It has been shown that the process represented by equation (1) is preferred to (2) by a factor of 30: (1) $(2^3P_2)_{Kr} + (1^1S_0)_{Hg} = (1^1S_0)_{Kr} + (5^3D_n)_{Hg} + 0.038$ v. (2) $(2^3P_2)_{Kr} + (1^1S_0)_{Hg} = (1^1S_0)_{Kr} + (5^1D_2)_{Hg} + 0.033$ v. Similarly (3) is preferred to (4) by a factor of about 3. (3) $(2^3P_1)_{Kr} + (1^1S_0)_{Hg} = (1^1S_0)_{Kr} + (6^3D_3)_{Hg} + 0.019$ v. (4) $(2^3P_1)_{Kr} + (1^1S_0)_{Hg} = (1^1S_0)_{Kr} + (6^1D_2)_{Hg} + 0.017$ v. The verification of the conservation law is explained by the interchange of 2 electrons with anti-parallel spin between 2 neutral particles, the spin direction being preserved. The interchange mechanism is called upon to explain by electron collision the excitation function of Hg terms. It is expected to be significant in the explanation of such chem. reactions as the splitting of H_2 by electron collision and by excited Hg, and also the transformation of para- into ortho-hydrogen. C. J. HUMPHREYS

The mobility of ions in pure gases. A. M. TYNDALL AND C. F. POWELL. *Proc. Roy. Soc.* (London) **A129**, 162–80(1930); cf. *C. A.* **23**, 4134.—A *new all metal-glass app* with a high resolving power for ions of different mobilities, which can be subjected to rigorous heat treatment, has been used in making the measurements. Results with this app. for pos. ions agree with Langevin's law. Expts. with He and N emphasize the great importance of small traces of impurity on the mobility of pos. ions. The absence of "normal" neg. ions is not an adequate criterion of purity. The highest value for the pos. ion in He greatly exceeds those of previous workers but is of the order of magnitude of the value deduced from classical kinetic theory for the mobility of a pos He ion moving through He. J. B. AUSTIN

An improved form of standard ionization chamber. LAURISTON S. TAYLOR AND GEO. SINGER. *Bur. Standards J. Research* **5**, 507–16(1930).—A modification of the open-air parallel-plate ionization chamber, readily portable and adapted to field use as a secondary standard, is described. In this chamber, narrower guard plates supplemented by a guard wire system across the ends of the chamber are used. The wires are so spaced that x-ray scattering from them is negligible. The results of direct comparison between this chamber and the primary standard indicate that the rontgen is reproducible by the former with the same accuracy as by the latter. The problem of diaphragming is identical for the 2 chambers, and for a given tube the same inverse-power law holds for both. Like the standard chamber, the new chamber requires no correction for differences in x-ray quality. ALLEN S. SMITH

The role of barium in vacuum tubes. J. A. BECKER. *Bell. Lab. Record* **9**, No 2, 54–8(1930).—The electron current which is produced from a heated Pt wire coated with a single layer of Ba atoms is enormously greater than that from a wire of either Pt or Ba alone. Theoretical considerations are deduced to account for this and similar phenomena. R. H. FERGUSON

The effect of systematic surface treatment on the photoelectric emission from metals. R. H. HANSTOCK. *Phil. Mag.* [7], **10**, 937–44(1930). ARTHUR FLEISCHER

Electric discharge in rare gases and its application to lighting. M. LAPORTE. *Rev. gén. sci.* **41**, 543–8(1930).—Discussion of reasons, both chem. and phys., why rare gases are superior to others in the operation of luminous tubes. FRANK URBAN

The effects of gases on photoionization of cesium by line absorption. F. L. MOHLER AND C. BOECKNER. *Bur. Standard J. Research* **5**, 399–410(1930); cf. *C. A.* **24**, 4703.—The collisions of excited Cs atoms with foreign atoms change the state of excitation and modify the probability of ionization. Thus the photoelec. ionization of Cs vapor by radiation of wave length greater than the series limit is modified by the presence of H, He and H. Photoionization was measured as hitherto by using the neutralizing effect of pos. ions on a thermionic current. Curves giving photoionization as a function of wave length show that the ratio of the ordinates at any λ is a measure of the

ffect of gas, whose chief action is reduction of the amplification factor of the space-harge tube by an unknown amt. The no. of ions produced by direct ionization is un-hanged. H. R. MOORE

Fine structure of zinc lines in the visible and ultra-violet regions. WALI MOHAM-IAD AND PREM NATH SHARMA. *Phil. Mag.* [7], **10**, 916–21(1930); cf. *C. A.* **22**, 2885; 3, 3560.—Lines from 6362.58 to 2756.53 A. U. have been analyzed. A. F.

Hyperfine structure in some spectral lines from highly ionized atoms of thallium nd bismuth. GUSTAF ARVIDSSON. *Nature* **126**, 565–6(1930).—Hyperfine structure as been observed in the extreme ultra-violet by using a grating of 1.5 m. radius at razing incidence so that the dispersion at 800 A. U. is 2.6, and at 1400 A. U., 3.4 A. U./-nm. Measurements are given for 8 Tl lines and for 4 Bi lines characteristic of doubly r trebly ionized atoms. It is expected that measurements of hyperfine structures will be an aid in classifying spectra from some highly ionized heavy atoms. W. F. M.

A method of measuring excitation potentials of spectral lines and its application to the many-lined spectrum of hydrogen. W. FINKELNBURG, E. LAU AND O. REICHEN-HEIM. *Z. Physik* **61**, 782–91(1930).—An arrangement whereby it is possible to obtain spectrum lines of different excitation potentials in different lengths is described. It s based on the observation that under certain conditions the spectra emitted in the os. column of a gas discharge are sepd. according to excitation potential, the exten-sion of various lines into the Faraday dark space being inversely proportional to their excitation. This "excitation dispersion" permitted development of a method for mea-suring the excitation potentials of individual lines. Tested by the classified lines in the H_2 spectrum the av. error is detd. to be ± 0.1 v. Excitation values are given for 42 H_2 lines in the region 4379–6091 A. U.; they indicate the presence of a new spectral term. W. F. MEGGERS

The absorption spectrum of lithium vapor. R. W. FRANCE. *Proc. Roy. Soc.* (London) **A129**, 354–60(1930).—Accurate values of the wave lengths for 31 members of the principal series of Li are obtained by photographing them in absorption with a grating spectrograph giving a dispersion of 4.3 A. U./mm. in the first order. The best value for the limit of the series derived from the Hicks formula is 43486.76 ± 0.28 $^{-1}$, corresponding to a wave length 2298.837 ± 0.015 A. U. W. F. MEGGERS

The second spark spectrum of krypton. D. P. ACHARYA. *Indian J. Physics* **5**, 385–405(1930); cf. *C. A.* **24**, 2049.—A list of wave lengths of Kr III, many of which are new, is given, extending from 4404 A. U. to 1930 A. U. Many of these lines have en classified as combinations between terms whose identity is not yet established. By means of the irregular-doublet law the prominent ^5P term, and the ^5S and ^5D terms which combine with it, have been found. From the value 254,718 cm.$^{-1}$ which these terms give for the N_2 level an ionization potential of 31.4 v. is derived for Kr^{++}. C. C. KIESS

Band spectrum of antimony oxide. B. C. MUKHERJI. *Nature* **126**, 725(1930).—ands showing a doublet structure, and therefore attributed to the neutral Sb oxide ol, have been observed in the spectral region 3250 A. U. to 6700 A. U. Some of ese bands have been classified as members of at least 3 systems with origin at 29,619, 480 and 24,203 cm.$^{-1}$. C. C. KIESS

Spark spectra of bismuth, Bi II and Bi III. Evidence of hyperfine structure. J. C. cLENNAN, A. B. MCLAY AND M. F. CRAWFORD. *Proc. Roy. Soc.* (London) **A129**, 79–88(1930).—Wave lengths in the spectrum of a condensed discharge in heated i vapor have been measured from 7050 A. U. to 2000 A. U. and those in the spectrum a condensed spark between Bi electrodes in H between 2000 A. U. and 1340 A. U. lany of these lines have been classified as members of Bi II and Bi III. The Bi III rms are doublets; those of Bi II are singlets and triplets. Lines with hyperfine struc-ure have been observed in both spectra, which was to be expected because the Bi ucleus is known to have an angular momentum of $4.5\,h/2\pi$. The lowest term of Bi III, $6^2P_{1/2}{}^\circ$, has not been found, but is placed at approx. 205,400 cm.$^{-1}$, which gives an ioniza-on potential of 25.4 v. The lowest term of Bi II is $6p^2\,{}^3P$, but its abs. value is as yet nknown. C. C. KIESS

The spectrum of doubly ionized thallium. P. PATTABHIRAMAYYA AND A. S. RAO. *ndian J. Physics* **5**, 407–16(1930).—A list of classified lines of Tl III extending from 001 A. U. in the infra-red to 995 A. U. in the extreme ultra-violet is presented. The nes represent combinations between doublet and quartet terms arising from the addn. f *s*, *p*, *d*, electrons to the ions d^{10} and d^9s. C. C. KIESS

Measurement of the spark spectrum of iodine. WOLFRAM KERRIS. *Z. Physik* **61**, 74(1930); cf. *C. A.* **24**, 2048. W. F. MEGGERS

Measurement of the spark spectrum of iodine. LEON AND EUGENE BLOCH. *Z. Physik* **61**, 873(1930); cf. *C. A.* **23**, 2655. W. F. MEGGERS

The spectrum of trebly ionized selenium. K. R. RAO. *Nature* **126**, 568(1930). W. F. MEGGERS

Absorption of light by gaseous, liquid and solid xenon. J. C. MCLENNAN AND R. TURNBULL. *Proc. Roy. Soc.* (London) **A129**, 266–83(1930).—The absorption of O is discussed. The possibility that the mols. of Hg in the liquid and solid states remain unassocd. just as in the vapor state is considered; this raises the question as to whether or not very thin films of liquid Hg or solid Hg would show absorption bands corresponding to the 2 wave lengths, 2537.72 A. U. and 1849.6 A. U. It was attempted to det. this but no definite results were obtained. Xe was next utilized. Resonance lines appear at 1293 and 1469 A. U. A fluorite spectrograph was employed; H was contained therein. Schumann plates were used with a light source of a condensed spark between Au electrodes in an atm. of H. Two types of cells fitted with fluorite windows were designed, one for low pressures, the other for high (up to 50 atms.). The construction of these is described in detail. The procedure is detailed. The expts. show that at a pressure of 2 mm. of Hg the absorption appears as a line at 1469 A. U. As the pressure increased the absorption widened out into a band and at 50 atms had a width of 156 A. U. The data are tabulated for all pressures. The plates are shown. Preliminary expts. with liquid and solid Xe are given. New cells were designed. The long-wave-length limit of absorption is 1990 A. U., a quartz spectrograph being used. With a fluorite instrument the long-wave-length limit was detd. as 1783 at a temp. of —110° for the liquid and approx. 1800 for the solid (a colorless, glass-like substance). Further work is promised on this subject. WILLIAM E. VAUGHAN

The λ3400 band of phosphorus hydride. R. W. B. PEARSE. *Proc. Roy. Soc.* (London) **A129**, 328–54(1930).—The band lying between 3371 and 3485 A. U., attributed to PH was photographed in the 2nd order of a 10-foot grating with a scale of 2.7 A. U. per mm. Wave lengths and estd. intensities are given for 310 lines. The band has been completely analyzed into 27 branches and is believed to afford the most complete data at present available for a $^3\Pi \longrightarrow {}^3\Sigma$ transition. The fine structure arising from the $^3\Sigma$ level has been resolved and the observed sepns. are compared with Kramers' theoretical formula; good agreement is obtained. The $^3\Pi$ levels are found to be inverted. An approx. estn. of the electronic energy sepns. between the component levels shows that they are not equally spaced but that $^2\Pi_2 - {}^2\Pi_1 = -121$ cm.$^{-1}$, while $^2\Pi_1 - {}^2\Pi_0 = -111$ cm.$^{-1}$. W. F. MEGGERS

Spectroscopic researches on nitric oxide and nitrogen peroxide. MAURICE LAMBREY. *Ann. phys.* **14**, 95–183(1930); cf. *C. A.* **24**, 549.—The absorption spectrum of NO was photographed by means of a small quartz spectrograph, with H as a source of continuous spectrum. It is composed of 2 systems of doublets of unequal intensity. The most intense doublets have edges facing longer waves; they comprise system γ extending from 2368.6 A. U. to 1871 A. U. The others, weaker and degraded in the opposite sense, comprise system β extending from 2210.5 A. U. to 1908 A. U. The initial state is the same for all these doublets; it is described as ^2P, the normal state of the NO mol. The final state for the γ system is a ^2S state; for the β system, a ^2P level. The coeff. of absorption of NO was measured between 2400 and 2100 A. U. Outside of the β and γ bands there is general absorption such that for a tube of const. length the optical density is proportional to p^n where p is the pressure and n ranges from 1.5 to 2. The introduction of a foreign gas produces a considerable increase in the absorption coeff. General absorption increases also with temp. The ultra-violet absorption spectra of nitrogen peroxide consists of 2 wide bands attributable to N_2O_4 and some bands of complex structure ascribed to NO_2. W. F. MEGGERS

The ultra-violet absorption of alkali and alkaline earth halides; zinc iodide, cadmium bromide, cadmium iodide, mercuric bromide, and mercuric iodide in aqueous and nonaqueous solutions. EKBERT LEDERLE. *Z. physik. Chem.*, Abt B, 10, 121–41 (1930).—The electron affinity spectra of aq. and alc. solns. of the alkali and alk.-earth halides have been measured down to 1860 A. U. Results of a study of the effect of temp. and of different solvents are presented. These results may all be explained on the hypothesis offered by Franck and Scheibe. The halides of the elements of the 2nd sub-group of the periodic system are only partially dissocd. in non-aq. solns.; their absorption spectra are ascribed to the mols. The work supports the conclusion indicated by the observations of Terenin that the photoreaction in the case of HgI_2 leads to HgI + I, in which case both dissocn. products can appear in the excited state. C. J. HUMPHREYS

Gaseous combustion in electric discharges. V. Spectroscopic examination of the

cathodic **combustion of carbonic oxide.** G. I. FINCH AND H. H. THOMPSON. *Proc. Roy. Soc.* (London) **A129,** 314–9(1930); cf. *C. A.* **24,** 300.—Spectroscopic examn. of the elec combustion of CO and O was carried out with a quartz instrument. The procedure is similar to that employed in earlier papers (*C. A.* **23,** 4896). Electrodes of Ag, Pt, Cu, Ni, Mg and W were used. The spectrograms show that CO mols. are excited, not ionized, that the CO bands are superimposed on a faint continuous background in the "detonating gas," and that the metals are sputtered as atoms. In pure O the spectrograms revealed O_2^+, O and O^+. These results necessitate a revision of the mechanisms proposed in earlier papers, which postulate prior ionization of the CO.
WILLIAM E. VAUGHAN

Combination of nitrogen and hydrogen activated by electrons. G. F. BRETT. *Proc. Roy. Soc.* (London) **A129,** 319–27(1930).—The earlier work of Caress and Rideal (*C. A.* **21,** 3548) is extended with improvements upon the technic used. The rate of reaction of H and N in a 3:1 mixt. has been studied as function of the speeds of the electrons used to activate the mols. The method consists essentially in detg. the change in pressure produced by freezing out the products of the reaction; a Pirani gage was used. The various curves are given. The rate of reaction increases markedly at electronic speeds corresponding to 17.0, 18.5, 20.5, 24.5 and 27.0 v.; these steps are related to the production of N_2^+, H and H^+, N_2^{++}, N and N^+, N and N^+ and (or) H and H^+, resp.
WILLIAM E. VAUGHAN

Geometrical inversion in light. BHADRAMUKH K. VAIDYA. *Proc. Roy. Soc.* (London) **A129,** 299–313(1930).—Quantum efficiencies for the inversion of the following geometrical isomers have been detd.: maleic and fumaric acids, citraconic acid, *o* coumaric acid, cinnamic and isocinnamic acids. All materials were purified by recrystn. or extn. The source used was an Hg arc with suitable filters; 3130 A. U. was the av. wave length used in all calcns. Energy measurements were made with a thermopile-galvanometer set-up. The absorption spectra of the solns. were detd. The courses of the reactions in all cases were followed by cond. measurements. Mol. conductivities were detd. for all of the solutes and the data are listed. Concns. of the solutes in the photochem. expts. vary between 0.002 and 0.01 *M*. There is some very slight variation in the results depending upon concn. Quantum efficiencies: maleic acid, 0.01 *M*, 0.048, 0.005 *M*, 0.052; fumaric, 0.01 *M*, 0.117; 0.005 *M*, 0.083; citraconic, 0.01 *M*, 0.18, 0.005 *M*, 0.22; coumaric, 0.005 *M*, 0.031; 0.002 *M*, 0.023; cinnamic, 0.003 *M*, 0.61, 0.002 *M*, 0.53; isocinnamic, 0.003 *M*, 0.21; 0.002 *M*, 0.15. Theoretical discussion is given.
WILLIAM E. VAUGHAN

Spectrophotometric investigation of the action of light on silver nuclear hydrosols. II. Silver nuclear hydrosols and derivatives. A. GALECKI AND R. SPYCHALSKI. *Roczniki Chem.* **10,** 492–500 (500 German)(1930); cf. *C. A.* **23,** 1572.—Quant. spectrophotometric investigations have proved that the action of ultra-violet light on Ag nuclear hydrosols is a reaction of the first order. The temp. coeff. is 1.2–1.3. J. K.

Constitution of the aqueous pink and blue cobaltous chloride solutions. II. Spectrometric research (BRDIČKA) **6.** Photochemical oxidation of lactic acid (BURNS) **10.** An integrating photometer for x-ray crystal analysis (ROBINSON) **1.** Absorption spectra of the γ-pyrones and pyroxonium salts (GIBBS, *et al.*) **10.** Lattice distortions in glide planes indicated by an x-ray investigation of rock salt (BERG) **2.**

Apparatus for irradiating liquids with ultra-violet rays. N.-V. PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 332,977, May 13, 1929. The liquid is passed through an irradiation chamber in which it flows around an elec. discharge tube which may be of helical shape and may contain Hg and A. Various structural details are described.

Ionization chambers for Röntgen rays. HANS KÜSTNER. Ger. 504,220, Mar. 2, 1928. Addn. to 490,656 (*C. A.* **24,** 2056).

COLIN G. FINK

The development of the calcium carbide industry and of that of its by-products. JEAN GORNOSTAI-POLSKY. *J. four elec.* **39,** 369–71; 411–4(1930).—A review.
C. G. F.

The electrodeposition of cobalt-nickel alloys. I. S. GLASSTONE AND J. C. SPEAKMAN. *Trans. Faraday Soc.* **26,** 565–74(1930).—A paper dealing with the influence of:

(1) H-ion concn., (2) c. d., and (3) stirring, on the compns. of Co-Ni alloys deposited from various mixed solns. of Co and Ni sulfates at 15°. The c. ds. ranged from 0.0028 to 5–6 amp./sq. dm. The compn. of the alloy at low c. ds. was found to be almost independent of the diln. of the soln. and is not influenced to any marked extent by stirring. The alloys always contained relatively more Co than did the electrodes. The decrease of Co content at increased c. ds. has been correlated with the impoverishment of the catholyte in the Co ion, on account of their preferential deposition. Diln. causes a marked decrease, while stirring partially eliminates it. The compn. of the initially deposited alloys is independent of the H-ion concn. of the soln.; the current efficiency for metal deposition increases with increasing p_H; and the effect of impoverishment of the electrolyte is observed at lower c. ds. Acetate ions appear to have no influence on the relative tendencies for Co and Ni to deposit from solns. of the mixed sulfates. Also in *J. Electroplaters and Depositors Tech. Soc.* **6**, 49-57. W. H. BOYNTON

Addition agents in copper electrotyping solutions. R. O. HULL AND W. BLUM. *Bur. Standards J. Research* **5**, 767–73(1930).—The effects of glue, dextrin, urea and phenol as addn. agents in Cu electrotyping solns. were investigated. *Phenol* in the form of phenolsulfonic acid was most satisfactory, permitting harder electrotypes to be produced in much shorter time. It is effective over a wide range of concn. and its effects persist over a long period of operation. Operating conditions are suggested. ALLEN S. SMITH

Plating tank rheostats. M. M. ROSE. *Metal Ind.* (N. Y.) **28**, 473–4(1930).—Factors affecting the heating and ampere-carrying capacity of tank rheostats are noted. Most tank rheostats are designed for a 3-v. drop, so that on a 6-v. bus current, with rated amp./capacity flowing through the rheostat, the voltage drop in the rheostat will be 3 v., giving 3 v. across the tank. It is indicated that: (1) a rheostat designed for a 3-v. drop should be liberally constructed so as to withstand the max. overload to which it may be subjected, and (2) amp. current-carrying capacity should be provided in the resistors and also in the conductors and contact surfaces. A math. proof of the factors involved is based on the formulas covering Ohm's laws and the equiv. resistance of parallel and series circuit. Because of the different classes of work encountered in the same tank and with the same rheostat, the voltage drop may reach 4–4½ v. The rheostat chosen should have a liberal ampere overload capacity, and solid contacts securely fastened together. The ideal arrangement of the rheostat is illustrated and shows the method of making contact between grids and toggle switch W. H. BOYNTON

Normal potential of beryllium. MILDA PRYTZ. *Z. anorg. allgem. Chem.* 193, 113–8(1930).—Dil. Be amalgams were prepd. by electrolysis and their potentials detd. against aq. solns. of $BeCl_2$. The p. d. between the amalgam and metallic Be was measured by means of a propylamine soln. of Be acetylacetonate. The normal potential of Be calcd. from these investigations was found to be: Be/Be^{++}; $E_o = 1.9$. H. STOERTZ

The nickel-iron storage battery. MANUEL SEVILLANO. *Ing. y construccion* (Madrid) **7**, 566–72(1929); **8**, 19–23(1930).—Construction details and complete charge and discharge characteristics are given. E. M. SYMMES

A new carbon arc lamp for industrial applications. W. C. KALB. *J. Am. Inst Elec. Eng.* **49**, 1031(1930).—A powerful C arc lamp (110–220 volt a. c. or d. c.) with a long burning period to be used chiefly for *ultra-violet* light radiation is described. One trim of carbons operating at 45 amp. arc current will burn continuously for 12 hrs. The carbons are *cerium*-cored and produce a light very close to natural sunlight. At 60 amp. current the c. p. equals 30,000. With "C" carbons, cored with salts of Fe, Ni and Al, the ultra-violet radiation exceeds that of sunlight. C. G. F.

The modern theory of dielectrics. L. G. CARPENTER. *World Power* **14**, 391–6 (1930).—A review dealing in particular with Debye's extension of dielectric theory to include polar mols. C. G. F.

Corona loss measurements on a 220 kilovolt-60 cycle, 3-phase experimental line. JOS. S. CARROLL, LELAND H. BROWN AND D. P. DINAPOLI. *J. Am. Inst. Elec. Eng.* **49**, 987–92(1930).—Tests show that the corona loss on new cleaned Cu conductors is the same as that for new cleaned Al conductors. Other data on the choice of conductor are given. C. G. F.

Transformers for electric furnaces. M. G. MARTY. *J. four elec.* **39**, 378–80, 415–8(1930). C. G. F.

Electric batteries. NATIONAL CARBON CO., INC. Fr. 686,162, Dec. 5 1929. In the manuf. of batteries, particularly dry batteries, having a metal anode and a carbonaceous cathode, a conductive paste contg. a solid halogen deriv. of NH_4, *e. g.*, NH_4Cl, is introduced into the space between the electrodes.

Electric battery. W. HASSE. Brit. 333,639, May 21, 1929. A battery depolarizer is made by pressing a wet mixt. of pyrolusite, soot, graphite and a binder into a block and then pulverizing the block. More graphite may then be added and the material pressed around a carbon electrode. Various details of battery manuf are described.

Dry cell electric battery. WALTER B. SCHULTE (to Burgess Battery Co.). U. S. 1,785,981, Dec. 23. Structural features of high-voltage batteries.

Machine for paraffinizing the carbon pencils of dry battery elements. HERMANN A. BUMKE G. M. B. H. Ger. 489,945, Dec. 16, 1927.

Storage battery. CARL H. O. LUBECK. U. S. 1,785,202, Dec. 16. Structural features.

Storage battery. PRITCHETT & GOLD & E. P. S. Co., LTD., and H. M. GENESE. Brit. 332,875, Dec. 21, 1929. Structural features.

Storage-battery plates. HENRY P. DODGE (to Luthy Battery Equipment Co.). U. S. 1,785,939, Dec. 23. Exhausted lead battery plates are ground by directly subdividing the unmelted plates; a paste is formed directly from the ground material; this paste is forced into a grid; and the product is rendered uniformly porous by charging.

Separator plate for storage batteries, etc. ABRAHAM S. BEHRMAN. U. S. 1,784,-981, Dec. 16. Silica gel mixed with a binder such as rubber cement is used for separators of batteries or other electrolytic cells.

Storage-battery separator. RAYMOND C. BENNER and NEWCOMB K. CHANEY (to Prest-O-Lite Storage Battery Corp.). U. S. 1,786,328, Dec. 23. Separators are formed with a fabric such as loosely woven material embedded in bonded fiber such as rubber-bonded fiber. Cf. *C. A.* **24,** 1301.

Storage-battery electrodes. H. ELSNER. Brit. 332,841, March 26, 1929. Structural features.

Storage-battery electrodes. I. G. FARBENIND. A.-G. Brit. 332,884, Feb. 5, 1929. The process described in Brit. 325,581 (*C. A.* **24,** 3955) is modified by the use of graphite which has been freed from impurities, especially Fe, as by boiling with HCl or other suitable acid and then treating with alkali.

Cell cap and hydrometer in associated construction for storage batteries. CHARLES F. LINEBARGER. U. S. 1,785,963, Dec. 23.

Float-controlled electrolyte-supply device for storage batteries. S. J. RUBINSTEIN. Brit. 333,291, May 10, 1929.

Galvanic cell. GEORGE W. HEISE and CLARENCE W. BROKATE (to National Carbon Co.). U. S. 1,786,406, Dec. 23. Various structural details are described of a cell with a caustic electrolyte such as NaOH, a depolarizing oxide cathode, and an area such as sand or alundum fragments exposed to the electrolyte and having a rough surface favoring crystn. of compds. of the anode metal such as Zn compds.

Selenium cell. W. PRIOR and C. CRISP. Brit. 333,293, May 11, 1929. The electrodes are wound on a cylinder or rod and the Se is spread over the entire cylindrical surface so that on rotation the surface exposed to illumination may be constantly changed. Various details and modifications of construction are described.

Selenium cell. C. ZEISS. Brit. 332,877, Jan. 7, 1929. Structural features of a cell in which 2 interlacing Pt electrodes are fixed on a base such as glass or quartz, the Se being contained in a groove in the base between the 2 electrodes. Various details of manuf. are described.

Selenium cell. V. K. ZWORYKIN (to Westinghouse Elec. & Mfg. Co.). Brit. 333,116, Nov. 6, 1928. A closed container of transparent material carries on its inner surface a deposit of Au so thin as to be almost transparent and on this layer is deposited a layer of Se of such dimensions as to absorb at least one-half of the incident light,

backed by a layer of reflecting metal such as Ag of such thickness as to be almost opaque. The Au and Ag layers are connected with electrodes. Various details of manuf. are described.

Electroplating. ROBERT J. PIERSOL. U. S. 1,785,389, Dec. 16. An elec. system is described for utilizing rectified current from an a. c. line.

Electroplating ceramic articles. PORZELLANFABRIK KAHLA, ZWEIGNIEDERLASSUNG FREIBERG. (Werner Hofmann, inventor). Ger. 507,218, May 12, 1929. To render the articles conductive, a metal layer is fused on at the edge of the article, or of the part to be plated, while to the remainder a conductive coating, *e. g.*, of graphite, is applied by painting and drying

Tank for chromium plating. C. ROY GLEASON. U. S. 1,784,987, Dec. 16. A tank for electrodeposition of Cr is formed of any suitable material, such as steel, with a lining of Pb and an inner lining of glass.

Metal coatings such as chromium on steel sheets or other articles. COLIN G. FINK and CHARLES H. ELDRIDGE (to Chemical Treatment Co.). U. S. 1,786,398, Dec. 23. Articles such as steel sheets, etc., are provided with a relatively thin coating of metal such as Cr by electrodeposition, the plate is exposed to gas at sub-atm. pressure, and plating is then resumed to produce a coating free from "pin-hole" defects. App. is described.

Electrodeposition of gold and silver. A. MOZER. Brit. 333,462, Dec. 11, 1928. The metals are deposited from their O-free I compds. such as solns. of Au or Ag iodides contg. also KI. Various details are given.

Gold leaf manufacture by electrodeposition. W. F. GRUPE. Brit. 333,246, May 3, 1929. Numerous details of app. and procedure are described by which Au may be plated on a Ag-faced carrier which is subsequently sepd. after transfer to a suitable paper support or the like.

Electrolytic preparation of alloys. ERNST KELSEN. Ger. 505,968, Aug. 17, 1928. Alternating layers of the metals to be alloyed are deposited on a rotating cathode passing through the various baths.

Separating aluminum from its alloys. RICHARD MÜLLER. Ger. 505,965, Dec. 1, 1928. Pure Al is sepd. by electrolysis of a fused salt mixt. at temps. above the m. p. of the alloy and below that of pure Al. The alloy is used as the anode.

Apparatus for the electrolytic separation of tin from its alloys. LUIGI UGHETTI LA CORSA. Ger. 505,967, Dec. 28, 1928. The cathode is constructed as a trough in which the anode lies. Cf. *C. A.* **24**, 791.

Apparatus for production of metal salt solutions. FRIEDRICH M. KÖHLER. Ger. 481,898, June 5, 1926. An app. is described for the direct production of metal salt solns. from ores, alloys, foundry residues and similar metal waste by aq. electrolysis. The electrodes have alternating flanges to help prevent the formation of a cathode deposit.

Zinc. URLYN C. TAINTON. Fr. 686,336, Dec. 9, 1929. Deposits of Zn of great purity and high ductility are obtained electrolytically by using an anode composed of an alloy of Pb with a small proportion of a metal which is electroneg. with respect to Pb, preferably Ag, and carrying out the electrolysis in the presence of an inorg. colloid such as H_2SiO_3, with the addn., if necessary, of an org. colloid such as gum arabic.

Metal blocks. SOCIÉTÉ "LE NICKEL." Ger. 505,966, July 1, 1927. Metal blocks are produced by the electrolytic deposition of the metal on a wire core of the same metal.

Acetylene from methane. I. G. FARBENIND. A.-G. Brit. 332,917, April 24, 1929. Various details are given for the production of C_2H_2 from CH_4 or gases contg. at least 20% CH_4 in an elec. arc (suitably an arc furnace of the Schönherr type). An example also is given of the use of a mixt. contg. both CH_4 and H to produce C_2H_2 and C_2H_4. Cf. *C. A.* **25**, 39.

Metallized paper or fabrics. KARL KEY. (Carl Müller, inventor). Ger. 505,995, June 5, 1928. The paper or fabric is coated with a binding material to which an electrolytically pptd. thin metal layer is caused to adhere. The binding material contains a very finely divided substance, *e. g.*, a dispersion of metal or metal oxide. Cf. *C. A.* **24**, 2063.

Oxidizing plates for copper oxide rectifiers. SIEMENS-SCHUCKERTWERKE A.-G. (Hans Gerdien, inventor). Ger. 505,811, Oct. 25, 1927. The Cu plates are subjected to the action of high-frequency elec. current of such strength that they are raised to the temp. requisite for oxidation in a fraction of a minute. Cf. *C. A.* **24**, 2062.

Coating the oxide layer of a metal oxide rectifier with metal. SIEMENS SCHUCKERTWERKE A.-G. (Felix Baron von Kleist, inventor). Ger. 505,812, Jan. 8, 1929. The

oxide layer is covered with a perforated plate of good elec. cond., *e. g.*, Cu, and the whole then sprayed with a good conducting metal such as Sn.

Dielectric for electric condenser. SPRAGUE SPECIALTIES CO. Brit. 332,899, March 28, 1929. Porous material such as paper is impregnated with material such as paraffin, ceresin, "halowax" or a synthetic phenolic resin which also forms very thin interposed layers. Various details of manuf. are described.

Electrically heated rotating furnaces for the reduction of ores. BO M. S. KALLING and CARL VON DELWIG. Fr. 686,262, and 686,263, Dec. 7, 1929.

Electric induction furnace. N. R. DAVIS, P. G. H. BURBRIDGE and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Brit. 333,254, May 8, 1929.

Electric induction furnace. HIRSCH, KUPFER- UND MESSINGWERKE A.-G. Brit. 333,155, Oct. 15, 1928.

Electric induction furnaces. PIERRE VIRY. Ger. 507,442, Dec. 13, 1928. To ensure regularity of heating, the means for feeding the articles to be heated is driven from the converter group generating the heating current. This corresponds to Brit. 302,235.

Electric induction furnace for melting metals. MAGNUS UNGER (to General Elec. Co.). U. S. 1,786,322, Dec. 23. Structural features.

Electric induction furnace suitable for volatilizing metals such as lead and zinc from ores, etc. MARCEL FOURMENT. U. S. 1,786,202, Dec. 23. Structural features.

Electric oven, operated with high-frequency induction current. JEGOR I. BRONN. Ger. 507,074, Mar. 20, 1926.

Electric resistance furnace. C. L. IPSEN and A. N. OTIS (to British Thomson-Houston Co., Ltd.). Brit. 333,457, Oct. 23, 1928. Structural features.

Reduction furnace for producing aluminium. VEREINIGTE ALUMINIUM-WERKE A.-G. Ger. 506,584, Dec. 18, 1928. A hole or depression, of the same size as the anode, is formed in the furnace wall below the anode so that during the process of electrolysis, a cathode of the same size is formed.

Electrodes. BERTHOLD REDLICH. Ger. 505,813, July 31, 1929. Addn. to 447,678. Electrodes with a metal covering formed to avoid unequal side action are covered with pressed spiral bands joined by broad welded seams.

Electrode operating devices for electric furnaces. FLODINJERN AKTIEBOLAG. Brit. 333,318, May 21, 1929. Structural features.

Machine for producing carbon electrodes. HANS BLACHE. Ger. 498,668, April 3, 1929.

Arc lamp electrodes. COMPAGNIE LORRAINE DE CHARBONS, LAMPES ET APPAREILLAGES ÉLECTRIQUES. Ger. 507,234, Mar. 17, 1927. Arc-lamp electrodes for high current strengths are made from a C mass to which are added B_2O_3 and refractory metal oxides such as MgO, ThO_2, Al_2O_3 or blue oxide of W, as well as the customary addns. of oxides and fluorides of rare earth metals. Examples and addnl. details are given.

Cleaning gases electrically. SIEMENS-SCHUCKERTWERKE A.-G. Ger. 507,520, Aug. 15, 1925. Addn. to 488,155 (*C. A.* **24**, 2066). An app. is described for preventing accumulation of dust on the insulators. Cf. Ger. 505,686 (*C. A.* **24**, 5648).

Electrical precipitation of dust from gases. METALLGES. A.-G. and LODGE-COTTRELL, LTD. Brit. 333,427, Sept. 23, 1929. To stabilize the cleaning of gases from revolving furnaces, the gas is fed to the elec. pptn. app. at a temp. above 150°, which is sufficiently high to increase the cond. of the dust, while reducing the velocity of the gas through the elec. field to about one-half that required when cleaning the gas at lower temps. A suitable temp. range for cement-kiln gas is 200–250°.

Removing dust from gases. SIEMENS-SCHUCKERTWERKE A.-G. Brit. 333,048, June 1, 1929. Prior to electrostatic dust pptn., gases are treated with steam produced by adding water to the products of combustion of a gas flame. App. is described.

Apparatus for purifying gases by electric precipitation. HEINRICH F. J. NOLZE. U. S. 1,785,592, Dec. 16. Structural and elec. features.

Electric gas purifier. "ELGA" ELEKTRISCHE GASREINIGUNGS-G. M. B. H. Ger. 505,516, Feb. 16, 1929. Details of securing the electrodes.

Device for scraping the precipitate from the electrodes of electric gas purifiers. SIEMENS-SCHUCKERTWERKE A.-G. Ger. 490,951, Mar. 25, 1924.

Electric gas-cleaning apparatus. HERTHA MÖLLER NÉE WEBER, ARNOLD LUYKEN, GERTRUD LUYKEN, ERNST LUYKEN, NORA LAMPING NÉE MÖLLER, ILSE VOGG-CASTENDYK, IRMGARD FREUDE NÉE CASTENDYK, FRITZ-KARL CASTENDYK, HENDRICH LUYKEN, GERDA LUYKEN, ELISABETH LUYKEN AND JOHANN LUYKEN. Ger. 507,316, Oct. 17, 1924.

Electric gas-purification chamber. SIEMENS SCHUCKERTWERKE A.-G. (Curt Gerhardt, inventor). Ger. 505,796, Nov. 26, 1927.

Electrical gas-purification plant. SIEMENS-SCHUCKERTWERKE A.-G. (Fritz Müller, inventor). Ger. 505,673, July 17, 1925. The app. is designed for use with inflammable gases, or gases contg. inflammable dust, and has a hinged safety cap cover.

Electric gas-purification plant. WITKOWITZER BERGBAU- UND EISENHÜTTEN-GEWERKSCHAFT and GEORG RASCHKA. Ger. 501,720, Feb. 22, 1928. Addn. to 467,040 (*C. A.* 23, 4899). Details of knocking app. for cleaning the electrodes.

Electrical gas-purification plant. METALLGESELLSCHAFT A.-G. (Eugen Engert inventor). Ger. 505,794, July 10, 1929. Details of cleaning the ppt. from electrodes.

Electrical gas-purification plant. OSKI A.-G. (Erich Oppen, inventor). Ger. 505,795, Feb. 27, 1926. Details of cleaning the ppt. from the electrodes.

Electrical thermometer suitable for remote indication. JOSEPH W. ALLEN. U. S. 1,784,922, Dec. 16. Structural features.

5—PHOTOGRAPHY

C. E. K. MEES

Effect of keeping on the spectral sensitivity and fog of commercial plates. L. KUTZLEB. *Kinotechnik* 12, 507(1930).—Of the various plates examd. for color sensitivity those not optically sensitized were the least affected by keeping for 12 months in a dry, airy room. Plates of high color sensitivity suffered a decrease in sensitiveness at all wave lengths, while plates of low color sensitivity showed a decrease only in the region of ordinary, and an increase in the region of extra, sensitivity. When kept for 12 to 18 months, about half of the plates examd. showed slight addnl. fog; of the rest, color-sensitive plates suffered most. From a study of the curves obtained when fog was plotted against increasing time of development 2 classes could be distinguished that in which the curves for the fresh and stored plates were roughly parallel, and that in which the fog of the stored plate increased much more rapidly with time of development than that of the fresh plate. L. G. S. BROOKER

Latent sensitivity of silver salts in solution. G. ZELGER. *Sci. ind. phot.* 1, 361 (1930).—A soln. of AgBr in Na_2SO_3 was found after exposure to light to be developable The addn. of a small quantity of gelatin increases the sensitivity of the soln. The sensitivity is confined almost entirely to the ultra-violet. Once exposed, the soln need not be developed immediately. The sensitometric curves are similar in shape to those obtained for Ag gelatin emulsions. Many more easily examd. Ag solns. were found to be sensitive. The sensitivity increases as p_H increases from 7 to 8, and then becomes const. Short heating followed by cooling does not increase developability, but long heating gives colloidal Ag particles. These act only feebly as nuclei. NH_4Cl and KBr increase developability; sensitizing dyes have no effect. Certain S compds act as desensitizers. L. A. STAIB, JR.

Hypersensitizing and ultrasensitizing of mosaic screen plates. L. D. TALAMON *Phot. J.* 70, 452(1930).—Lumière Pantochrome is the only sensitizing dye which, unaided, gives correct rendering of color for these plates, and it is recommended to beginners. Ammoniacal $AgNO_3$ is added to the dye bath, full particulars being given The plates are exposed through an esculin screen During development Aurantia Lumière is recommended as a desensitizer, or else Basic Scarlet N. L. G. S. B.

Insolubilizing action of formalin on gelatin and its increase in the presence of fixed alkali. R. NAMIAS. *Prog. fot.* 37, 188-90(1930). —In view of the increase in the insolubilizing action of formalin in the presence of carbonates, the following formula is recommended for rapid drying of negatives: CH_2O 100 cc., K_2CO_3 100 g., water 1 liter C. E. K. MEES

Concentration paradoxes. LÜPPO-CRAMER. *Kinotechnik* 12, 441(1930). —It has been found previously that dil. solns. of *p*-phenylenediamine base had a more destructive action on the latent image on certain plates than more concd. solns. The author also found that plates washed free from KBr are acted upon to a less extent and that they do not show the above concn. anomaly. He concludes that the destruction of the latent image depends upon the presence of both KBr and *p*-phenylenediamine. If the concn. of *p*-phenylenediamine is too high, it is adsorbed to the Ag halide grains to the exclusion of the KBr from the sphere of action. Consequently, dil. solns. are more effective than concd. solns. The hydrochloride of *p*-phenylenediamine does not show the concn. anomaly. Chlorohydroquinone closely resembled *p*-phenylenediamine in the concn. effect. M. W. S.

Photography. HEINRICH KÜHN. Ger. 505,447, Dec. 20, 1929. A method of overcoming extremes of contrast is described. Two negatives obtained after different periods of exposure, neither alone yielding a useful picture, are combined and printed as one after the more fully exposed negative has been treated, at the development stage or later, so that it shows an image in only a feeble density of the middle tones and high lights.

Photography. I. G. FARBENIND. A.-G. (Gustav Reddelien and Werner Müller, inventors). Ger. 507,022, Aug. 20, 1929. Addn. to 454,839, 465,902 and 467,818 (*C. A.* 23, 572). *N*-Hydroxyethyl derivs. of 2,4-diaminophenol or *N*-monoacyl-2,4-diaminophenol, excepting compds. having two C_2H_4OH groups attached to one N atom, are used as developers. Nuclear substitution products of these compds., other than nitro substitution products, may also be used. Suitable solns. are described by way of example. Cf. *C. A.* 25, 258.

Photography. FRIEDRICH LIERG. Ger. 504,892, Aug. 28, 1929. A process is described for obtaining positives, especially for cinematograph films, in natural colors by employing two or more different light-sensitive layers of Ag halide emulsion inseparably laid on each other. Chemically active material such as $MgCO_3$ or $CuCO_3$ is added to one or more or all of the layers to hinder the spreading of the reaction products (e. g., $Fe_4(FeC_6N_6)_3$, $Cu_2FeC_6N_6$, $Mg_2FeC_6N_6$) of the layers into each other when the Ag picture is developed, and to enable the colors in the various layers to be developed without running.

Color photography. H. HERZOG and C. HERZOG (trading as J. Herzog & Co.). Brit. 333,668, June 4, 1929. Component negatives for the production of color photographs consisting of superposed components produced on ready colored material by a tanning development method are printed on transparent supports coated with gelatin emulsions dyed with non-diffusing colloidal and highly transparent dyes such as mono-, di- or tetra-azo dyes (of which various examples are given). In developing the prints, a large proportion of sulfite is added to a developer such as pyrocatechin.

Color photography. F. LIERG. Brit. 333,697, July 2, 1929. Three inseparable layers of Ag halide emulsion, which may have intervening gelatin layers, are exposed and converted into color component images, the gelatin in each layer being rendered insol. after the production of the color image so as to protect the layer against further action during the treatment of the images in the other layers. Various details of procedure are described for successive production of the different color images.

Color photography. E. WOLFF-HEIDE. Brit. 332,893, Jan. 28, 1929. Photographic emulsions treated with sensitizers, such as pinacyanol, in colloidal solns. whereby a superficial layer is rendered color sensitive, are exposed through the transparent support and, after development and fixing, are treated with a soln. such as a U intensifier until the exposed gelatin in the superficial layer has been hardened. A yellow filter may be used for the exposure or the emulsion may be dyed yellow. The negative is treated with ferric NH_4 oxalate and HCl, washed, and immersed in Na hyposulfite soln., and the red values of the negative assume a transparent blue-green color. Before printing positives from the negative, the latter is immersed in a 5% soln. of pina-type blue D (which is absorbed by the soft gelatin in the superficial image layer) and is placed in contact with the positive film under water in the dark room. After exposure, development and fixing, the emulsion is hardened by a soln. of alum or the blue picture fixed by a mordant, and photographically exposed parts are colored red by converting the Ag image to a Ag-U compd. and dyeing with a basic color, or the AgBr picture is converted to AgI and then colored. A slight yellow color may be applied to the entire picture. Various other details and modifications of procedure are also described. Cf. *C. A.* 24, 4474.

Diazotype photography. KALLE & Co. A.-G. Ger. 507,171, April 28, 1929. Addn. to 487,247 (*C. A.* 24, 2072). For the production of pictures on oil cloth and like materials, the diazo compds. from *p*-aminodiphenylamine and its derivs. are deposited on the cloth with the aid of reagents that wet or are absorbed by the cloth, e. g., EtOH, acetone or C_6H_6. A small quantity of a lacquer may be added to the diazo compd. soln. The coupling component required for development may be used in soln. in water or an org. solvent. An example is given.

Rotary light filter for color cinematography. M. B. DUPONT. Brit. 333,505, Feb. 8, 1929.

Optical system, etc., for color cinematography. A. PILNY. Brit. 332,844, Oct. 30, 1928.

Photographic dye-impression process. UVACHROM A.-G. FÜR FARBENPHO-

TOGRAPHIE. Brit. 333,392, Feb. 16, 1929. In producing pictures in color by the dye-impression process from a hardened gelatin relief, dyes of a sp. degree of dispersion, such as may be obtained by dialysis, are used to color the relief and the latter is treated with distd. water to remove adsorbed particles of dye of low dispersion. Various details and modifications, auxiliary treatments, etc., are described.

Photographic toning process. F. LIERG. Brit. 333,361, July 8, 1929. Transformation of a Ag photographic image is effected by converting the Ag into an insol. compd. such as a Ag halide and then treating with a soln. contg. a complex-forming solvent such as manganic thiocyanate or thiosinamine and with a reagent which immediately reppts. the Ag as an insol. compd. such as $K_4FeC_6N_6$ or Seignette salt or Na phosphotungstate. Sulfonic acids such as hydracid 1,8-aminonaphthol-3,6-disulfonic acid may be used to produce a Ag compd. of the acid which may be converted into an azo dye. Use of thiocarbamide also is described.

Photographic sensitive layers. KALLE & Co., A.-G. Brit. 333,820, Nov. 3, 1928. An aryl azide such as azido-salicylic acid (prepd. by the action of Na azide on diazo-salicylic acid) which forms a dye under the action of light is incorporated in a layer of material such as gelatin. After exposure under a negative, unchanged azide is washed out. The color may be modified by addn. of acids, bases or metallic salts.

Photographic sensitive materials. I. G. FARBENIND. A.-G. Brit. 333,654, May 27, 1929. Sensitive layers for copying transparent colored pictures or for making anaglyphs are produced by dispersing into fine particles liquefied org. colloids contg light-sensitive substances and powders of water-insol. dyes or pigments insensitive to light and applying the particles to a sticky layer on a substratum. The exposed layers may be developed with a non-tanning developer, fixed and the particles contg. free Ag hardened (suitably with quinone), the layer being then transferred to a support and developed with water. Or, after development and fixing, Ag, together with gelatin and dye assocd. with it, may be removed in a bath of $CuSO_4$, H_2SO_4, H_2O_2 and KBr. Various other details and modifications of procedure also are described.

Photographic paper. KALLE & Co. A.-G. (Maximilian P. Schmidt and Walther Spietschka, inventors). Ger. 470,088, Dec. 11, 1927. The manuf. of light-sensitive paper from diazo compds. of aminonaphtholcarboxylic acids is described. In the example, paper is soaked with a soln. of 1-diazo-2-hydroxy-3-naphthoic acid in NaOH and dried. If exposed below a negative and washed with water, a blue-black print on a pure white ground is obtained.

Composite photographs such as those for cinematographic films. W. D. WALKER. Brit. 333,010, June 24, 1929. A transparent film of the background illuminated from the rear is photographed in superposition behind a film of the foreground illuminated from the front, in which the image is opaque but reflective of light. To render the images on the foreground film opaque, the emulsion side is coated with a mixt. contg. a colloid such as gelatin, a chromate or dichromate and a white pigment. In contact with the Ag of the image the colloid becomes insol., binding the pigment (the mixt. being then washed from the Ag-free parts of the film). Various details and modifications of procedure are described.

Photographs on chromated gelatin layers. NIKOLAUS LEBEDENKO. U. S. 1,785-635, Dec. 16. The exposed layer is subjected to treatment with a vapor atm. supersatd. with steam, followed by the usual washing and staining treatments.

Drying photographic layers. ZEISS IKON A.-G. (Hans Tappen, inventor). Ger. 507,021, Feb. 21, 1930. In drying colloidal photographic layers by treatment with EtOH or like dehydrating agent, better results are obtained by adding to the EtOH, etc., a non-hygroscopic softening agent for the colloid. An addn. of 0.1% of urea or 1% of salicylic acid is suitable.

Apparatus for developing photographic prints by gases. ADOLF LANGSNER. Ger. 505,742, Jan. 3, 1928. Details of arrangement.

Removing scratches and indentations from the backs of celluloid cinematograph films. OKO-PANZER FILM-ERNEURUNGS- UND VERWERTUNGS G. M. B. H. Ger. 505-841, Mar. 26, 1929. The back of the film is treated with a levelling layer of moistened nitrocellulose lac which drys transparent. A second layer of moisture-free nitrocellulose lac is added and the whole warmed till the layers flow into each other and unite with the body of the film.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

Decomposition of nitrates and nitrites of metals showing different valences. I. C. MONTEMARTINI AND E. VERNAZZA. *Industria chimica* **5**, 1260–6(1930).—When $Fe(NO_3)_2$ is heated it decomposes as follows: $2Fe(NO_3)_2 \longrightarrow 2FeO + 4NO_2 + O_2$; but as the FeO is oxidized and water of crystn. is always present up to 100°, the net reaction is $3Fe(NO_3)_2 + 7H_2O \longrightarrow 3Fe(OH)_3 + 5HNO_3 + NO$. The ferric hydroxide is not present as such but rather as $Fe_2O_3.H_2O$, identical with the oxide described by Pean de Saint-Gilles, which is insol. in acids. A. W. CONTIERI

The pyrogenous decomposition of alkaline earth bromates. HACKSPILL AND WINTERER. *Compt. rend.* **191**, 663–5(1930).—The alk. earth bromates when heated yield the corresponding bromide and O_2. The decompns. were measured in an app. which permitted the pressure to be recorded graphically as the temp. was raised. The curves show an inflection point near 300°, above which the evolution of O_2 is more rapid than that at lower temps. The isolation of the perbromate in the heated material, however, was not possible below the inflection temp. This fact indicates a direct decompn into the bromide at all temps., the slow reaction at low temps. being due to a period of induction. At the inflection temp. the reaction becomes explosive in nature H. F. JOHNSTONE

Bismuth oxide. J. FEISER. *Metall u. Erz* **27**, 585–9(1930).—By use of a loss in weight method, the vapor pressure of Bi_2O_3 was detd. up to 1300°, measurable volatility beginning at 950°. The b. p. of Bi_2O_3 was calcd. by the method of Ramsay and Young to be 1890°. Above 1350°, Pt is attacked by molten Bi_2O_3 with decompn. of the oxide. Complete destruction of the Pt vessel takes place at 1450°. H. STOERTZ

Bismuth separation from lead-containing materials as bismuth oxychloride. W. HERIEL. *Metall u. Erz* **27**, 557–60(1930).—The oxychloride method is applicable with any Bi content while the sulfate method can only be used with a Bi range of 0.02–0.05%. In the oxychloride method, 24 hrs. standing will facilitate the sepn. of Pb from the soln H. STOERTZ

Formation and composition of chloride of lime. Reply to Hugo Ditz. BERNHARD NEUMANN. *Z. Elektrochem.* **36**, 934–6(1930).—Cf. *C. A.* **24**, 1592, 3959. E. M. S.

Constitution of the aqueous pink and blue cobaltous chloride solutions. II. Spectrometric research. R. BRDIČKA. *Collection Czechoslov. Chem. Comm.* **2**, 545–58 (1930).—It has been previously shown (*C. A.* **24**, 5642) that reversible electrodeposition of Co occurs only in the blue solns. of $CoCl_2$, and at potentials about 0.30 v. more pos. than the deposition potentials given by the pink solns. These results were explained by postulating the formation of complexes. The present paper deals with the spectrographic analysis of the solns. used previously for the detn. of deposition potentials. The absorption spectra were obtained by a continuous automatic method (cf. *C. A.* **24**, 3441). The results (8 reproductions are given) show that a 10-fold diln. of the $CoCl_2$ causes a 10-fold change in the amt. of the blue component. The deposition potentials also indicated that a 10-fold change in the $CoCl_2$ concn. caused a 10-fold change in the activity of the cobaltous ions. The effect of increased temp. was found to be identical with the effect of increase of $CoCl_2$ concn. The blue color of cobaltous solns. is due to complexes, in which the Co^{++} ions assoc. with Cl, forming complexes of the type $CoCl_n^{(n-2)--}$, *e. g.*, $CoCl_4^{--}$. From the shifts of the extinction curves given by the blue solns. it is shown that the concns. of the substance causing the absorption in the red region are proportional to the concns. of $CoCl_2$, and, therefore, to the concn. of the complexes from which Co deposits reversibly at the dropping Hg cathode. Fajans' theory, of the dependence of light absorption on the deformability of the electronic shell of anions when they become deformed in the elec. field of cations, is used to explain the change from the pink color to the blue color in $CoCl_2$ solns. EDWARD B. SANIGAR

Solubility of silver iodide in solutions of alkali iodide in acetone. FREDERICK K. V. KOCH. *J. Chem. Soc.* **1930**, 2385–6.—While AgI is practically insol. in Me_2CO, more than 3 g. of AgI is sol. in 50 cc. 0.1 *N* NaI-Me_2CO; it thus appears that 3 mols. AgI are taken up per mol. of alkali halide. The soly. of NaBr in Me_2CO at 25° is 0.08 g. per 100 cc.; NaCl is practically insol. Appreciable quantities of AgCl and AgBr dissolve, however, in solns. of NaI in Me_2CO, so that the above cannot be used as a quant. method of sepn. Results for the sp. cond. at 25° of NaI in Me_2CO, both before (k_1) and after (k_2) satn. with AgI, show that k_1 in both cases (2 expts. recorded)

is greater than k_2 and may be explained by assuming a decrease in the mobility of the anion, $I(IAg)_3^-$. C. J. WEST

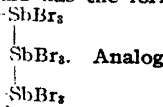
The binary system lithium oxide–silica. F. C. KRACEK. *J. Phys. Chem.* 34, 2641–50(1930).—Mixts. of highly purified Li_2CO_3 and selected quartz were studied over the range 46–100 wt. % of SiO_2. Differential heating curves for samples up to 67% SiO_2 and a quenching method for higher ratios indicated 3 compds.: Li_4SiO_4 (I), Li_2SiO_3 (II) and $Li_2Si_2O_5$ (III). The first decomposes at 1255°, *i. e.*, below its m. p. The I-II eutectic is at 55.3% SiO_2 and 1024°. By both methods II melts at 1201 ± 1°. Its liquidus curve meets the incongruent m. p. curve of III at 1033° and 80.1% SiO_2, within 0.05% of the compn. of III. The III-tridymite eutectic is at 80.2% SiO_2 and 1028°. B. A. SOULE

The interaction between nitrogen trichloride and nitric oxide at —150°. II. Further evidence for the formation of nitrogen dichloride and of mono-oxygen-dinitrogen dichloride. WM. A. NOYES. *J. Am. Chem. Soc.* 52, 4298–301(1930).—The interaction between NCl_3 and NO was investigated at —150° and was found to proceed approx. according to the equation $NCl_3 + 3NO = 2NOCl + N_2O + Cl$. The reaction is considered to take place in 4 steps, the intermediate products being NCl_2, N_2OCl_2 and N_2OCl. Attempts to isolate these intermediates were not successful. (Cf *C. A.* 23, 1339. C. L. READ

X-ray study of the products obtained by the action of the halogen acids on the mercury sulfates and the melting-point diagram of the system mercuric iodide and mercuric sulfate. M. PAIĆ. *Compt. rend.* 191, 941–3(1930).—Gaseous HCl and HBr acting on $HgSO_4$ at temps. of 130° and 105°, 250°, resp., liberate free H_2SO_4 and form $HgCl_2$ and $HgBr_2$ as proved by x-ray analysis. Evapn. to dryness of solns. of $HgSO_4$ and $3HgO.SO_3$ in the halogen acids produces the same effects. Heating the residue to 300° causes the complete sublimation of $HgCl_2$ and $HgBr_2$. In the case of HgI_2, a compd. having the compn., $HgSO_4.HgI_2$, crystallizes on cooling. A diagram of the fusion of HgI_2 with $HgSO_4$ is given. MALCOLM DOLE

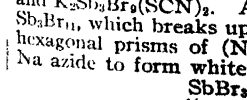
Formation of pyroarsenates. ARTHUR ROSENHEIM. *Z. anorg. allgem. Chem.* 193, 73–5(1930); cf. *C. A.* 24, 5250.—The prepn. of $Ba[Cu(As_2O_7)]$, $Ba[Cu(PO_4)_2]$ and $Cd_2As_2O_7$ is reported and the method given. WILLIAM E. VAUGHAN

The reaction between iodic acid (alkaline iodates) and hypophosphorous acid, phosphorous acid, or their salts. I. V. HOVORKA. *Collection Czechoslov. Chem Comm.* 2, 559–70(1930).—Theoretical consideration is given to the various equations advanced to explain the oxidation of H_3PO_3 and H_3PO_2 by HIO_3. It is shown that in acid soln. of the alkali salts of H_3PO_3 and H_3PO_2 the I_2 liberated in the first stages of the reaction oxidizes further quantities of H_3PO_3 and H_3PO_2 (cf. Vitali, *Boll. chim. farm.* 37, 545(1898); 38, 201(1899); Gmelin-Kraut, Handb. d. anorg. Ch 1909, I, 2, 3621(cf. *C. A.* 2, 3038); *Giorn. chim. farm.* 59, 1105(1910)). The first part of the work is a quant. study of the reaction, while the second is a study of the reaction in the presence of substances giving insol. iodides (*e. g.*, perchlorates of Pb, Ag, Hg^{++}) and thus removing the I as formed. Pb allows I to be formed, while in the presence of Ag or Hg the oxidation is less; this is due to HIO_3 rather than to the Ag or Hg salt. Hg chlorate oxidizes both phosphorous acids to phosphoric acid, while Ag chlorate oxidizes principally H_3PO_2 to phosphoric acid. Thus the presence of a Hg^{++} salt during the reaction is important during analysis. In the reaction between NaH_2PO_2 and KIO_3 in acid (dil. H_2SO_4) soln., about 80% of the oxidation occurs in the first 15 min.; the completion of the reaction is slow and may take 4 hrs. with boiling if the excess of iodate is small. Increase in acidity increases the reaction velocity, while increasing the amt. of oxidizing agent speeds up the reaction most in the most acid solns., particularly during the first hr. of boiling. Gentle boiling is not so efficient as rapid boiling. The above results hold also for the oxidation of phosphites, except that the oxidation of the phosphites is slower. Oxidation of the hypophosphites is also more rapid than that of phosphites under similar conditions at ordinary temps The slowness of the oxidation of the lower acids of P is explained by Orlov's supposition that 2 forms of mols., active and inactive, exist. The active form takes part in the reaction, but only exists in the soln. in small quantities. The facts observed show that in the first stage of oxidation, H_3PO_2 passes to H_3PO_3 (cf. Mitchell, *C. A.* 14, 3353). It has been shown that KIO_3 is reduced by NaH_2PO_2 in alk. soln.; with Na_2HPO_3 the formation of I_2 was not observed. EDWARD B. SANIGAR



Iso- and heteropoly acids. XX. Paratungstates. ARTHUR ROSENHEIM, ARTHUR WOLFF, JOACHIM E. KOCH AND NELSON SIAO. *Z. anorg. allgem. Chem.* 193, 47–63 (1930); cf. *C. A.* 17, 3144.—Boiling solns. of alkali paratungstates are sharply titratable with alkali with phenolphthalein as indicator. The formula of Na paratungstate has

been detd. as $5Na_2O.12WO_3.28H_2O$; the soly. of this salt has been measured over a range from 0 to 73°. In this range no other hydrate exists. "Two-kernel" ions are postulated for some of the paratungstates. In boiling soln. a two-kernel ion of the formula $[H_4(W_2O_7)_3(WO_4)_6]^{XIV}$ gives rise to the "single-kernel" ion $[H_2(WO_4)_6]^X$. It is also shown that NH_4 paratungstate exists as a 7- or 11-hydrate; the transition temp. is approx. 50°. The soly. of this salt has been detd. between 17 and 70°. Potentiometric titrations of Na tungstate solns., Na paratungstate and Na metatungstate have been carried out with HCl and NaOH. Paratungstate ions are unstable and exist in acidified solns. in equil. with tungstate ions. Metatungstate ions are more stable and are formed slowly by complex reactions. The hypothetical structure of the paratungstate and metatungstate ions is discussed. **XXI. Several heteropolytungstates.** ARTHUR ROSENHEIM AND ARTHUR WOLFF. *Ibid* 64–72.—The following compds. are reported: $9Na_2O.8As_2O_3.16WO_3.55H_2O$; $7(NH_4)_2O.2As_2O_3.18WO_3.18H_2O$; $4BaO.2As_2O_3.9WO_3.21H_2O$; $7K_2O.As_2O_3.18WO_3.24H_2O$; $3^1/_2(NH_4)_2O.As_2O_3.18WO_3.45H_2O$; the guanidine salt, $5(CN_3H_6)_2O.As_2O_3.18WO_3.41H_2O$; $2BaO.Sb_2O_3.11WO_3.18H_2O$; $6(NH_4)_2O.Sb_2O_3.18WO_3.38H_2O$; $6(CN_3H_6)_2O.Sb_2O_3.18WO_3.31H_2O$; $8K_2O.Sb_2O_3.19WO_3.37H_2O$; $2^1/_2(NH_4)_2O.2Sb_2O_3.10WO_3.12H_2O$; $3K_2O.2Sb_2O_3.10WO_3.6H_2O$; $2^1/_2(CN_3H_6)_2O.2Sb_2O_3.10WO_3.6H_2O$; $2^1/_2BaO.2Sb_2O_3.10WO_3.18H_2O$; $4Na_2O.P_2O_3.12WO_3.33H_2O$; $4K_2O.P_2O_3.12WO_3.34H_2O$ and $2(NH_4)_2O.P_2O_3.12WO_3.33H_2O$. W. E. V.



Theory of metal hydrate ions. PAUL PFEIFFER, THEODOR FLEITMANN AND TOSHI INOUE. *Z. anorg. allgem. Chem.* **192**, 346–65(1930).—The chem. structure of hydrated metallic ions was studied by prepn. of Ni, Cu, Zn and Cd salts of α- and β-naphthalenesulfonic acids and benzene- and toluene-sulfonic acids. These are related to Werner's salts of the type $[Ni(NH_3)_6]SO_4$, $[Ni\ en_3]SO_4$, $[Ni\ en_2(CH_2)_2]SO_4$, or $[Ni\ en(OH_2)_4]SO_4$, in which en represents an org. base; in this work it is generally ethylenediamine. The following are some of the compds. prepd.: $[Ni(OH_2)_6](O.SO_2.C_{10}H_7\alpha)_2$, $[Ni\ en(OH_2)_4](O.SO_2.C_{10}H_7\alpha)_2$, $[Ni\ en_2(OH_2)_2](O.SO_2.C_{10}H_7\alpha)_2$, $[Ni\ en_3](O.SO_2.C_{10}H_7\alpha)_2$, $[Cu\ en(OH_2)_4](O.SO_2.C_{10}H_7\alpha)_2$, $[Cu\ en_2(OH_2)_2](O.SO_2.C_{10}H_7\alpha)_2$, $[Cu\ en_2(OH_2)_2](O.SO_2.C_{10}H_7\beta)_2$, $[Cu(OH_2)_6](O.SO_2.C_6H_5)_2$, $[Zn\ en_3](O.SO_2.C_{10}H_7\alpha)_2$, $[Zn(NH_3)_4](O.SO_2.C_{10}H_7\alpha)$, $[Cd(NH_3)_6](O.SO_2.C_{10}H_7\alpha)_2$, $[Cd(OH_2)_6](O.SO_2.C_{10}H_7\alpha)_2$. The expts. also demonstrate that many Cu salts can be prepd. in which the Cu atom has the normal coördination no. of 6. H. STOERTZ

Increase in the rotation of tartaric acid by zirconium and hafnium in alkaline solution. J. H. DE BOER AND EMMENS. *Rec. trav. chim.* **49**, 955–61(1930).—Rimbach and Schneider (*Z. physik. Chem.* **44**, 481(1903)) have shown that the sp. rotation of ammoniacal tartrate solns. is increased by $ZrOCl_2$. Evidently Zr tartrate complexes are formed. de B. and E. find that the increase varies with the ratio of Zr to tartrate and is decreased by excess of alkali. With Hf, the increment of the rotation is slightly affected by the ratio of Hf to tartrate, but strongly influenced by excess of alkali. By controlling certain conditions, this change in rotation may be used in the *estn. of Zr-Hf mixts.* J. H. REEDY

Polymolecular bromoantimony compounds. A. CH. VOURNAZOS. *Z. anorg. allgem. Chem.* **192**, 369–82(1930).—$SbBr_3$ is found to form complex compds. with other bromides by interaction in acetone soln. Alkali bromides are insol. in acetone but readily dissolve in acetone solns. of $SbBr_3$ to form complexes of the type of $K_2Sb_3Br_{11}$. The mixt. is heated on the steam bath under a reflux condenser and is then allowed to evap. in a vacuum desiccator over H_2SO_4. The yellow cryst. residue is dried to const. weight and has the form of rhombic prisms. It is assumed to have the structure:

Analogous compds. of Na, Li and Cd are formed, and it is also possible to combine $SbBr_3$ with other halides to form such compds. as follows: $K_2Sb_3Br_9I_2$, $K_2Sb_3Br_9F_2$. KNO_3 or KSCN can be used in place of K halide, forming $K_2Sb_3Br_9(NO_3)_2$ and $K_2Sb_3Br_9(SCN)_2$. As confirmation of the structure, electrolysis indicates the anion, Sb_3Br_{11}, which breaks up to give $SbBr_3$ and Br_2. In attempting to prep. the NH_4 salt, hexagonal prisms of $(NH_4)_2SbBr_5.2H_2O$ sep. out. $SbBr_3$ is also found to react with Na azide to form white, cryst. $NaSb_3Br_9N_3$. This is believed to have the structure:

The authors believe that similar compds. can be prepd. with As and Bi. H. STOERTZ

Cobaltic cobalticarbonate. CLEMENT DUVAL. *Compt. rend.* **191**, 615–6(1930).—By eliminating light and alkali, *cobaltic cobalticarbonate*, $[Co(CO_3)_3]Co$, was prepd by treating a soln. of $CoCl_2.6H_2O$ with satd. $NaHCO_3$ and H_2O_2. R. C. R.

Double salt formation among the carbonates and bicarbonates of sodium and potasssium. A. E. HILL. *J. Am. Chem. Soc.* **52**, 3813–7(1930); cf. *C. A.* **23**, 4126.—Isothermal studies at 25° and 35° of the system $K_2CO_3 + 2\ NaHCO_3 \rightleftharpoons Na_2CO_3 + 2\ KHCO_3$ in water indicate the existence of the compd. $K_2CO_3.2KHCO_3.3/2\ H_2O$ and the tetragene salt $K_2CO_3.NaHCO_3.2H_2O$ as solid phases. L. F. AUDRIETH

Hydrated potassium sesquicarbonate, $K_2CO_3.KHCO_3.3/2\ H_2O$. A. E. HILL. *J Am. Chem. Soc.* **52**, 3817–25(1930); cf. *C. A.* **23**, 4616.—Isotherms for the ternary system K_2CO_3–$KHCO_3$–H_2O at 5°, 25°, 35° and 50° indicate the existence of the double salt $K_2CO_3.2KHCO_3.3/2H_2O$ stable in contact with soln. from —9.2°, its lower transition temp., to above 50°, but within a very narrow range of concns. L. F. A.

The combination of sucrose with boric acid. Considerations based upon variations of acidity of boric acid in the presence of sugar (VOICU, AXENTE) **10.**

7—ANALYTICAL CHEMISTRY

W. T. HALL

Some forgotten tests in analytical practice. O. SCHMATOLLA. *Chem.-Ztg* **54**, 831 (1930).—The flame test for Sn with HCl vapors was described by S in 1901. A test for benzoyl compds. with Fe^{++} and H_2O_2 was described by S. in 1912. These tests are discussed briefly. W. T. H

Simple and accurate methods for colorimetric analysis. FRIEDRICH L. HAHN AND RUDOLF KLOCKMANN. *Z. angew. Chem.* **43**, 993–5(1930).—The exact matching of shades is difficult but it is comparatively easy to estimate whether a soln. is lighter or darker than another. Instead of making the colorimetric comparison depend upon a single, final reading, it is recommended to compare the unknown soln. with standards at some 8 or 10 different dilns. This is accomplished easily in about 5 min. by having the soln. to be tested in a buret and adding more water from another buret after each comparison until finally the soln. is so dil. that a satisfactory comparison cannot be made. The method is described in detail and illustrated by data obtained in the colorimetric detn. of Cr. W. T. H

Use of a zinc wire spiral as a Jones reductor. G. FREDERICK SMITH AND JOSEPH RICH. *J. Chem. Education* **7**, 2948–52(1930).—Zn wire, approx. 3 mm. in diam. and coiled into a spiral, can be amalgamated and used in place of the Jones reductor, especially for the detn. of Fe. The reduction is complete in 30 min. in the presence of 6–10% concd. H_2SO_4 by vol. W. T. H

Quantitative application of the analytical quartz lamp, especially in wine analysis. A. HEIDUSCHKA AND E. MÖHLAU. *Pharm. Zentralh.* **71**, 689–91(1930).—A new comparative scale is suggested involving the use of the Na deriv. of saccharin, for which the following advantages are claimed: convenient and exact prepn. by direct weighing of the powd. substance; abs. freedom from the hygroscopicity and variability possessed by different brands of glycerol; better agreement in the luminescence tone of the saccharin scale as compared with that of the wine filtrate; no change in luminescence intensity of the saccharin types during a 4-month period of observation. The data obtained in 2 series of expts. are reported. W. O. E.

Importance of particle size in samples of certain metallurgical materials. J. A SCHERRER AND G. E. F. LUNDELL. *Bur. Standards J. Research* **5**, 891–5(1930).—The experience of the Bur. of Standards in prepg. uniform standard samples of metals and alloys has shown very clearly that the small- and large-sized particles often differ in compn. It is frequently necessary to separate the sample into 3 or more parts by sieving without loss by dusting, to weigh each portion and to take a proportionate part of each for the analysis. Some data are given to illustrate the errors likely to result from improper sampling. W. T. H.

Determination of carbon in high-sulfur steels by direct combustion. H. A. BRIGHT AND G. E. F. LUNDELL. *Bur. Standards J. Research* **5**, 943–9(1930).—If a steel contains 0.13–0.33% S, from 2 to 10% is obtained as SO_2 by burning the steel in O_2 and the remainder as SO_3. Both of these gases will be absorbed and weighed with the CO_2 unless precautions are taken to remove them. The various ways by which chemists have attempted to remove SO_2 and SO_3 were subjected to critical study and as a result of the study a modified combustion train is recommended. It consists of a porce-

lain combustion tube about 48 cm. long with an internal diam. of 2.5 cm. but with the exit end sharply reduced to 6–8 mm. outside diam. No asbestos packing is used, but a 3–4 cm. roll of oxidized Cu gauze is placed in the 700–800 zone of the exit. The gauze becomes coated with Fe_2O_3 and $CuSO_4$ and must be renewed occasionally. The gas from the tube is passed through a specially designed absorption tube contg. 8–10 ml. of 50% aq. CrO_3 soln. in one arm and a 9–10-cm. column of closely packed asbestos in the other. All the SO_2 is removed by the CrO_3 and some, but not all, of the SO_3, is condensed during the passage through the tube. The gas then passes to a similar tube contg. 97% H_2SO_4 in the first arm and asbestos in the other. The gas next passes through a 12-cm. U-tube contg. anhydrone, which serves to finish the drying of the gas and also to remove the last traces of SO_3. The CO_2 is then absorbed in a Fleming tube contg. ascarite and anhydrone. W. T. H.

Electrometric titration of chromium in steel and in ferro-chrome. FRITZ SPINDECK. *Chem.-Ztg.* **54**, 890(1930).—The potentiometric detn. of the end point for the reduction of CrO_4^{--}, after oxidation with persulfate and reduction of MnO_4^- with HCl, is recommended. Complete directions are given for carrying out the titration with Mohr's salt. W. T. H.

Determination of silicon in steel and iron. H. WOLF AND R. HEILINGÖTTER. *Chem.-Ztg.* **54**, 878–9(1930).—Some 18 expts. are described which show that the SiO_2 obtained by a single evapn. is always a little low when either H_2SO_4 or HCl is used. With the former, the purity of the SiO_2 is usually higher and with the latter treatment with HF to det. the impurities is more important. W. T. H.

Occlusion of lead and copper in non-ferrous alloys by metastannic and metantimonic acids. SALVADOR DEL MUNDO. *Philippine J. Sci.* **43**, 403–7(1930).—A study of the adsorption or occlusion of Pb by $(H_2SnO_3)x$ and $(HSbO_3)x$ shows that 1–3% of Pb is occluded in the analysis of white metals rich in Pb and 0.1–0.5% in alloys rich in Sn. A given method of attack gives const. results. To avoid such errors, the following method is advised for the detn. of Pb in white metals: Treat 0.5 g. of sawings with 10 cc. of concd. H_2SO_4. When decompn. is complete, cool, dil. with 50 cc. of cold water, filter and wash. Dissolve the impure $PbSO_4$ ppt. in hot NH_4OAc soln. and det. Pb as $PbCrO_4$ in the usual way. W. T. H.

Separation and determination of lead and mercury or lead and copper. H. FUNK AND J. SCHORMÜLLER. *Z. anal. Chem.* **82**, 361–5(1930).—Because of the slight ionization of $HgCl_2$, a soln. of $Hg(NO_3)_2$, which of itself gives a ppt. when treated with $K_2Cr_2O_7$ soln., will not do so if some alkali chloride is first added. The following procedure, therefore, serves for the detn. of Pb in the presence of Hg. To the soln. contg. a little HCl or HNO_3 add NaOAc and a little dil. HOAc. To the clear soln. add 50 cc. of 5% NaCl soln. and dil., if necessary, to 100 cc. Heat nearly to boiling and ppt. the Pb as $PbCrO_4$ by adding 5 cc. of hot, 5% $K_2Cr_2O_7$ soln. Cool, filter and either weigh the $PbCrO_4$ ppt. or det. the CrO_4 content iodometrically. Wash the ppt. with cold, 1–2% HOAc, add 5–10 cc. of alc. to the filtrate and boil till the excess chromate is reduced completely. Cool and det. the Hg as sulfide. If the soln. to be analyzed contains mercurous salt, it will be pptd. as Hg_2Cl_2 upon the addn. of NaCl. In such a case add Br water until the ppt. dissolves and then continue as above. A procedure similar to the above can serve for the sepn. of Pb and Cu. The Cu can be detd. in the filtrate, after reduction of excess chromate, by pptn. as $Cu_2(CNS)_2$ and bromometric analysis of the ppt. W. T. H.

Determination of zinc present as oxide, silicate, ferrite, sulfate and sulfide. V TAFEL AND G. SILLE. *Z. angew. Chem.* **43**, 948–51(1930).—In the by-products obtained in the production of Zn in the dry way, the element is present as ZnO, $ZnSO_4$, Zn_2SiO_4, $ZnFe_2O_4$ and ZnS and the problem discussed in this paper concerns the detn. of Zn in each of these forms. As a result of many expts. concerning the soly. of these constituents, the following scheme of analysis is recommended: *I. Preliminary assay.*—(*a*) Det. the total Zn content in the usual way (Galetti). (*b*) Det. the total S after Na_2O_2 fusion. *II. Sepn. of various constituents.*—Of Zn blende take at least 2 g., of flue dust 4 g., all of which should pass through bolting cloth. (*a*) *Detn. of water-sol. Zn* ($ZnSO_4$). Mix the sample with 500 cc. of water, stir 1 hr. at room temp. and 1 hr. at the b. p. Filter and det. both Zn and SO_4 in the aq. ext. (*b*) *Detn. of metallic Zn and ZnO.*—Treat the residue from (*a*) with 400 cc. of Muspratt's soln. (320 g. NH_4Cl, 640 cc. concd. NH_4OH and 1040 cc. water), stir, let stand 8 hrs. and filter. Stir the residue for 2 hrs. with 300 cc. of boiling Muspratt soln. Filter, unite the 2 filtrates and det. the Zn content in the usual way. (*c*) *Detn. of Zn present as silicate.*—Treat the residue from (*b*) at the b. p. for 1 hr. with 500 cc. of 6% AcOH, filter and det. both Zn and SiO_2. For the former detn., take an aliquot part of the soln., evap. to dryness with

HCl, take up in HCl, filter off SiO_2 and det. the Zn after removing the Fe. (*d*) *Detn. of Zn in* $ZnFe_2O_4$.—Remove the residue from (*c*) from the filter, ash the filter and add to the residue; mix it in a Ni crucible with 4 g. of carbonate-free NaOH, cover with 4 g. more of NaOH add 10 cc. of alc., cover the crucible and heat very slowly over an asbestos plate, finally raising the temp. to redness and maintaining this temp. for 10 min. Digest the melt with 400 cc. of hot water, filter and det. the Zn in the water ext. (*e*) *Detn. of Zn present as ZnS.*—Treat the residue from (*d*) with HCl and det. the Zn in the usual way, taking care to remove all foreign elements that interfere. W. T. H.

Colorimetric micro determinations. I. Determination of bismuth, aluminum and zinc. M. Teitelbaum. *Z. anal. Chem.* **82**, 366–74(1930).—The following method gives good results in the detn. of 0.05–0.5 mg. of Bi in the presence of as much as 80 mg. of Cd or Zn. Measure out the soln. to be analyzed from a microburet or pipet into a small centrifuge tube and add 3–4 mg. of solid pyrogallol or 2–3 drops of a freshly prepd. 4% soln. Heat to about 70° and add 0.33 *N* NH_4OH until a distinct turbidity is noticeable. Now heat just to boiling, add 1–2 drops of thymol blue (0.1% soln. in 20% alc.) and treat with NH_4OH until the soln. is alk. to this indicator. The soln. should now have a vol. of about 1.5 cc. Heat 10 min. in a boiling water bath, which causes the ppt. of $BiO_3C_6H_3$ to settle. Allow to cool, dil. to about 5 cc. and centrifuge for 10 min. at 2000–2500 r. p. m. Decant off the clear liquid, stir up the ppt with 5 cc. of water and centrifuge again, repeating the process, if necessary, with 2 cc. of water. Dissolve the ppt. in 1 cc. of 4 *N* HCl and rinse into a small flask with 15–20 cc. of water. Add 0.5–1 cc. of Folin's reagent (4 g. phosphomolybdic acid and 20 g. Na tungstate heated with 10 cc. of 85% H_3PO_4 and 150 cc. water for 2 hrs. with reflux condensation; after the boiling, cool, dil. to 200 cc. and filter if necessary) and about 6 cc. of cold satd. Na_2CO_3 soln. Dil. to 30 cc. and after 25 min. compare the color with that similarly produced with known quantities of Bi. *Detn. of Bi as hydroxyquinoline derivative.*—Treat the Bi soln. in a centrifuge tube with 2 drops of 0.5% Na tartrate soln., add 2 drops of phenolphthalein soln. (0.1% in alc.) and 0.33 *N* NH_4OH until alk. to this indicator. Then add 1 drop of 3% HOAc. Heat the soln. (about 1 cc. in vol.) to about 70° and add 4 drops of 0.5% oxine acetate soln. Heat just to boiling and neutralize with 0.2–0.3 cc. of satd. NaOAc soln. Heat 10 min. on the water bath and continue as described in the previous method, eventually dissolving the oxine ppt. in 0.5 cc. of 2 *N* HCl and treating with Folin's reagent. The method is sensitive and serves for the detn. of 0.005–0.05 mg. of Bi. *Detn. of Al or Zn with hydroxyquinoline* (*oxine*).—Treat the slightly acid soln. (p_H = about 3) with 0.3–0.5 cc of satd. NaOAc soln. and with 3–4 drops of 0.5% oxine acetate soln. Heat 15 min. in the water bath and proceed as above described. Excellent results were obtained with 0.0018–0.32 mg. of Al and with 0.0081–0.083 mg. of Zn. With the Zn detn. use methyl orange as indicator and add the oxine acetate soln. after heating to 70°. W. T. H.

Volumetric estimation of mercury. O. Pročke. *Collection Czechoslov. Chem. Comm.* **2**, 593–608(1930).—The various methods which have been proposed for the volumetric detn. of Hg are discussed and the method of Denigès is studied and improved. The soln. of mercuric salt, at a vol. not greater than 50 cc. and contg. less than 0.5 g. Hg, is made alk. by adding an excess of 10% NH_3 soln., 25 cc. of 0.2 *M* KCN and 1 cc. of 0.1 *N* KI. The soln. is titrated with 0.1 *N* $AgNO_3$ to the beginning of turbidity and then dild. to 100 cc. and more $AgNO_3$ is added until a permanent turbidity results. At the final equil. $Hg(CN)_3^-$ is formed and not $Hg(CN)_4^{--}$ as assumed by Denigès. W. T. H.

A new colorimetric micro method for determination of sulfur in sulfides, sulfates, etc. I. St. Lorant. *Z. physiol. Chem.* **193**, 56–8(1930); cf. *C. A.* **24**, 1402.—The method is discussed in the light of an addnl. year's experience. The reagents were found to be unaltered and still serviceable. The S value of the K_2SO_4 test soln., however, decreases if the glass of the container is not sufficiently resistant. In the prepn. of the "acid mixt." it was noted that red P varies considerably in its S content and in its behavior on boiling. The boiling of this mixt. need not be continued until all S is removed but may be interrupted when 2 successive Caro tests, 1 hr. apart, give the same intensity of light blue. The wash liquid is good for 60 detns. instead of 10 as previously stated. Porcelain beads may be dispensed with in the distn. since the red P serves their purpose. Low results, due to decompn. of HI adhering to the walls of the app. from the previous day, especially in the presence of sunlight, may be avoided by bubbling the N gas more rapidly. The numerical factor should be increased from 116 to 130, corresponding to a higher blank value. Aside from nitrates, which are abundantly present, no other substance appears to influence the detn. With a 10

cc. receiver a minimum of 0.0005 mg. S may be detd. by this method. The error does not exceed 5%. A. W. Dox

Method for a determination of helium and neon simultaneously present in gases. V. A. Sokolov. *Neftyanoe Khozyaistvo* 19, 292–7(1930).—The app. for gas detns. by Moureux, Mac Lennan, Cady and Mac Fralan, and Khlopin and A. A. Lukashuk are described in detail, also their application. The detn. of each component in a Ne-He mixt. by the difference in their sp. gravities and a new balance constructed by the authors is explained. A. A. Boehtlingk

Gas analysis and the different absorbers. A. Noel. *Ing. chim.* 13, 223–6 (1929).—N. describes the advantages of the Hankus, Heinz and Nowicky absorbers for gas analysis. P. Thomasset

Gas-analytical determination of carbon monoxide. Egbert Dittrich. *Z. angew. Chem.* 43, 979–80(1930).—The method of detg. CO by treating the gas with oleum and I_2O_5 applies essentially only to gases which do not contain higher paraffins and even then the SO_3 content of the oleum should not exceed 10% if the absorption of H_2 is to be prevented. On the other hand, the presence of higher paraffins does not have appreciable effect upon the detn. of CO by ammoniacal Cu_2Cl_2 soln. The I_2O_5-oleum method does not seem to have any advantages with respect to either time or accuracy W. T. H.

New volumetric determination of orthophosphoric anions. Angel del Campo. *Anales soc. españ. fis. quim.* 28, 1153–8(1930).—In dil. AcOH, benzidine phosphate is sufficiently insol. to allow detn. of P_2O_5. The white, silky ppt. is washed immediately on the filter paper until neutral, the whole placed in water, and titrated with 0.1*N* Na_2CO_3 and phenolphthalein. Other P anions, or saccharose, do not interfere, permitting analysis of sirups. E. M. Symmes

Titrimetric determination of primary arsonic acids. Harold King and Geo. V. Rutherford. *J. Chem. Soc.* 1930, 2138–43.—Since the arsonic acids do not usually possess characteristic sharp m. ps., there is need for some simple and rapid means of identifying these compds. A study is reported of titrations of 17 acids with thymol blue in the presence of an equal vol. of satd. NaCl and with thymolphthalein with satd. and half-satd. NaCl. Without the NaCl the end point is reached too early and is not sharp. Thymol blue is not satisfactory because the color change at the turning point is not as clear and as brilliant as with thymolphthalein and certain arsonic acids exert a sp. action of the thymol blue, resulting in an abnormally low titer. Thymolphthalein gives values slightly above the theoretical. C. J. West

Oxidation of various gases by means of copper oxide, lead chromate and cobalt oxide. John R. Campbell and Thomas Gray. *J. Soc. Chem. Ind.* 49, 450–3T (1930).—When H_2 or C_2H_4 is present together with CH_4 in a gas mixt., the external temp. to which the furnace must be raised is lower, probably on account of the heat generated by the burning of the more readily oxidizable gas. The expts. with CH_4 indicate the undesirability of using fused $PbCrO_4$ because of the danger of not burning the CH_4 completely; it is less effective than CuO and cannot be regenerated by merely heating in O_2. Although C_2H_4 is often a negative catalyst, this is not the case with respect to the combustion of CH_4. CoO alone is only about as efficient as CuO. W. T. H.

Combustion of methane by means of copper oxide. John R. Campbell and Thomas Gray. *J. Soc. Chem. Ind.* 49, 432–7T(1930).—The results of many expts. show that at temps. below 400° with sufficiently long contact, CH_4 and CuO react to give an appreciable quantity of CO_2. Below 525°, the reaction proceeds very slowly. Above 525°, the time of contact has considerable effect upon the quantity of CO_2 formed and reaches a max. at about 600°, above which temp. the effect of varying times of contact is much less marked. At temps. above 700° the rate of oxidation is very rapid and complete combustion is effected in 7 min. W. T. H.

Influence of various catalysts in promoting the oxidation of methane by means of copper oxide. John R. Campbell and Thomas Gray. *J. Soc. Chem. Ind.* 49, 447–50T (1930).—For oxidizing CH_4 at temps. from 475 to 600° the following reagents were used: CuO alone, activated by alternate reduction with H_2 and reoxidization immediately before each expt., CuO mixed with a suspension of Cu_2Cl_2 and water and dried, the Cu_2Cl_2 content of the mixt. being 13.8%, CuO similarly treated with a suspension of NH_4VO_3 and water, CuO with 2% CoO made by heating CuO and $Co(NO_3)_2$, CuO impregnated with 2% MnO_2. The graphs plotted with temp. as abscissas and % CH_4 burned as ordinates are straight lines with CuO alone or with CuO impregnated with Cu_2Cl_2, but are curves for the mixts. contg. oxides of V, Co or Mn; this indicates that the mechanism in the case of the Cu_2Cl_2 as catalyst is different from that

of the oxide catalysts. Cu_2Cl_2 proves to be the most efficient catalyst but becomes less effective when it is heated above its m. p. (430°). At temps. above 650°, free H_2 reduces the chloride so that it is inadvisable to exceed this temp. in combustion analyses for C and H with this catalyst unless care is taken to make sure that all HCl is oxidized. For the detn. of N by the Dumas method, no such precaution is necessary and Cu_2Cl_2 can be regarded as an ideal catalyst for these detns Of the other catalysts, CoO is the most efficient and the others can be arranged in the following order: MnO_2, NiO, V_2O_5. The effectiveness of V_2O_5 proved to be a function of the amt. present and the same probably holds for the other catalysts. W. T. H.

New method for the volumetric determination of the methoxyl and ethoxyl groups. FRANZ VIEBÖCK AND ADOLF SCHWAPPACH. *Ber.* **63B**, 2818–23(1930).—A smaller app. than that usually employed is shown. The decompn. flask of 6 cc. capacity is 8 cm. tall with a bulb of 28 mm. diam. and a neck of 10 mm. It has a narrow side arm to serve for the introduction of CO_2. The flask is connected with a condenser about 10 cm. long with a top piece which is 5.6 cm. high and 20 mm. wide. From a side arm in the top piece connection is made with an absorption tube which is about 20 mm. wide and 10 cm. tall. The latter is connected to a second absorption tube which in turn leads to an open absorption tube. For washing the gas the top piece is provided with 5 cm. of a dense layer of fine P. In the first absorption vessel are placed 6–7 drops of Br_2 and about 10 cc. of a soln. prepd. by dissolving 20 g. of KOAc in 200 cc. of glacial AcOH; about one-third is allowed to flow into the second absorption tube The open tube contains HCO_2H and a little NaOAc. At the start 5 cc. of HI and about 0.2 g. of coarse P powder are placed in the decompn. flask and 20–50 mg. of the org substance is introduced. The analysis is carried out in the usual way a heating bath at about 140° being used. At the end of an hr. all of the alkyl iodide will be driven off The absorbents are dild. with water and excess Br_2 is removed by treatment with HCO_2H The soln. is then made acid with H_2SO_4, a little KI is added and the liberated I_2 titrated with $Na_2S_2O_3$. The method depends upon the conversion of the methoxyl and ethoxyl groups to alkyl iodide, oxidation of the iodide to iodate and reduction of the iodate by iodide and acid. The results obtained in the analysis of some 15 org. compds. indicate that the method is excellent. W. T. H.

The bromo-potentiometric titration of β-naphtholsulfonic acids in presence of each other. II. Mixtures containing crocein acid. STANLEY D. FORRESTER AND DAVID BAIN. *J. Soc. Chem. Ind.* **49**, 423–5T(1930); cf. *C. A.* **25**, 55.—Detailed directions are given for the detn. of Schaeffer and R salts in the presence of croccin or G salts. The method depends on the fact that the presence of sufficient H_2SO_4 prevents the bromination of β-naphtholsulfonic acids contg. a sulfonic acid group in the 8-position. To 50 cc. of soln. to be titrated, add 20 cc. of concd. H_2SO_4, cool, add 10 cc of 20% KBr and titrate at 30° with a soln. contg. 5.567 g. of $KBrO_3$ per l. W. T. H.

Cupro-potassium carbonate solution in the determination of reducing sugars. H. A. SCHUETTE AND JENNETTE N. TERRILL. *J. Am. Chem. Soc.* **52**, 4960–4(1930) cf. *C. A.* **24**, 2402.—In a reinvestigation of the so-called cupro-K_2CO_3 soln. of Soldaini as modified by Ost and by Nyns, there have been obtained data on the dextrose equivs of 4 forms of this reagent of a Cu content lying between the limits of 19.1 and 39.3 mg per cc. These data are presented in the form of math. expressions and are pertinent to a temp. of 48.9° maintained for 2.5 hrs. It was also found that this sugar, under the above conditions, has a reducing action upon that modification by Beyersdorfer which contains but 0.8 mg. of Cu per cc. This observation casts some doubt upon the acceptance of this soln. as a selective reagent for levulose when both are present in the same soln. Math. expressions also have been derived for calcg. the levulose-Cu equivs. of another reagent of this type (Cu content 4.03 mg. per cc.) when either 1 of 3 modes of reduction is used, the relevant variants being time and temp. so adjusted as to bear to each other a relationship which is approx. an inverse one. It has been pointed out that no very material differences exist in the levulose equivs. of a given wt. of CuO when the latter is pptd. by either one of these procedures. C. J. WEST

Increase in the rotation of tartaric acid by Zr and Hf in alkaline solution (DEBOER, EMMENS) 6.

Detecting carbon monoxide. ALBERT WOLFF. Ger. 507,462, Jan. 15, 1927 In detecting CO in gas mixts. by bringing the mixt. into contact with I_2O_5 at a raised temp and then testing it for free I, the I_2O_5 is mixed with a catalyst, *e. g.*, Pt sponge, in order to reduce the reaction temp. App. including a steam-heated container for the I_2O_5 is shown.

8. MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

The Wood light in the identification of minerals. F. VIGNOLO LUTATI. *Industria chimica* **5**, 15–9, 1222–5(1930).—The Wood light has been tried on a large variety of minerals as a possible means of identification. In only a few instances, calcite, celestite, certain diamonds, fluorite, hydrozincite, ruby, both natural and synthetic, and zircon, was there any luminescence or fluorescence noted; this was not sufficiently characteristic to identify the mineral. A. W. CONTIERI

A study of the crystal structures of native copper. H. C. H. CARPENTER AND M. S. FISHER. *Bull. Inst. Mining Met.* No. **314**, 33–5(1930); cf. *C. A.* **24**, 2693.—Discussion. ALDEN H. EMERY

The ternary system: sodium silicate–ferric oxide–silica. N. L. BOWEN, J. F. SCHAIRER AND H. W. V. WILLEMS. *Am. J. Sci.* [5], **20**, 405–55(1930).—A study of the crystn. equil. in the system $Na_2O.SiO_2$–Fe_2O_3–SiO_2, obtained by the quenching method, is presented in detail. The equil. diagrams show the existence of 2 ternary compds. whose compns. lie within the triangle: acmite ($Na_2O.Fe_2O_3.4SiO_2$) and a new hexagonal compd. ($5Na_2O.Fe_2O_3.8SiO_2$). A third compd. ($6Na_2O.4Fe_2O_3.5SiO_2$) lies outside the triangle but overlaps somewhat with its field. Acmite melts incongruently with sepn. of hematite at 990°; the new hexagonal compd. melts congruently at 838°. Because of the incongruent melting of acmite there result some very interesting crystn. courses in mixts. rich in acmite. In certain mixts. hematite may be crystd., react with liquid and recrystallize. This introduces markedly different alternative courses of crystn. from the same original liquid. With strong fractionation the final liquid attains the lowermost eutectic, at which acmite, Na disilicate and quartz are formed. A discussion is given of the application of these results to petrology. Volatile components are not necessary for quartz crystn. The production of an Fe-rich residual liquid during crystn. of basaltic magma under certain conditions is no bar to the production of a siliceous-alkalic residual under other conditions. ALDEN H. EMERY

The mineral production of India during 1929. L. LEIGH FERMOR. *Records Geol. Survey India* **63**, pt. 3, 281–357(1930).—Accurate production figures for the following are given. Sb, chromite, coal, Cu, diamonds, Au, ilmenite, Fe, jadeite, Pb, magnesite, Mn, mica, monazite, Ni, petroleum, ruby, sapphire, spinel, salt, saltpeter, Ag, Sn, W, Zn, zircon. Less full particulars are given for agate, alum, amber, apatite, asbestos, barite, bauxite, Bi, borax, building materials, clays, copperas, corundum, fuller's earth, gypsum, kyanite, ocher, quartzite, refractory materials, serpentine, soda and steatite. ALDEN H. EMERY

The geology of the Mergui district. RAO BAHADUR S. SETHU RAMA RAU. *Memoirs Geol. Surv. India* **55**, Pt. 1, 62 pp.(1930).—After a description of the geology, the occurrence and origin of the Sn and wolfram ores are discussed. In addn. the following economic minerals occur: stibnite, arsenopyrite, Bi ores, chalcopyrite, molybdenite, galena, Au, monazite, salt and gas. ALDEN H. EMERY

Preliminary report on the Groundhog River area. A. R. GRAHAM. *Can. Mining J.* **51**, 1175–6(1930).—Au and Cu prospects in Keewatin rocks west of Kaniskotia are discussed, also geological features of the territory. W. H. BOYNTON

Preliminary report on the limestones of northern and western Ontario and of the Prairie Provinces. M. F. GOUDGE. Can. Dept. Mines, Mines Branch, *Rept.* **710**, 1–18 (1930). ALDEN H. EMERY

Preliminary report on molding sands in eastern Canada. C. H. FREEMAN. Can. Dept. Mines, Mines Branch, *Rept.* **710**, 47–52(1930). ALDEN H. EMERY

The gypsum industry of Canada. L. HEBER COLE. Can. Dept. Mines, Mines Branch, *Rept.* **714**, 164 pp.(1930); cf. *C. A.* **24**, 5944.—The following subjects are discussed: gypsum occurrences in 9 provinces; testing, technology and uses of gypsum and gypsum plasters; the gypsum industry; statistics of production; and the possibilities of export trade for Canadian gypsum. ALDEN H. EMERY

The salt industry of Canada. L. HEBER COLE. Can. Dept. Mines, Mines Branch, *Rept.* **716**, 116 pp.(1930).—The following subjects are discussed: salt occurrences in the Maritime Provinces, Ontario and Western Canada; mineralogy and technology of salt manuf.; the allied industries using salt (Na_2CO_3, Na_2SO_4, Cl, NaOH, H_2, HCl); and the salt industry of Canada. ALDEN H. EMERY

Chemical examination of lignite. W. FUCHS. *Brennstoff-Chem.* **11**, 205–8(1930); cf. *C. A.* **25**, 266.—A discussion of lignite formation, including a comparison of analytical data of lignite constituents. As the cellulose contents decrease, the contents of

—OCH_3 and of lignin increase, the lignic acids formed from the latter then changing into humic acids and humates. High bitumen content apparently retards these changes. Graphic trends of these progressive transformations of wood into brown coal are shown by plotting the constituents mentioned. Conclusion: Lignites are remains of woody parts of plants from which brown coal is formed; the inter-relations are shown graphically. F. W. JUNG

Biological investigation into occurrence of wood remains in an alluvial forest bog. R. LIESKE. *Brennstoff-Chem.* **11**, 350–2(1930).—A morphological and bacteriological study is made of tree and root remains found near Dortmund, showing extensive loss of org. substance and decompn. through anaerobic reaction without appreciable change in form or structure. Pressure effects were not found. Bacteria colonies of fluorescent groups similar to those of brown coal seams were present in interior sections. F. W. J.

Chemical investigation of anaerobically decomposed woods. W. FUCHS. *Brennstoff-Chem.* **11**, 352–4(1930); cf. preceding abstract.—A further investigation of material from Dortmund bog with analytical data to show gradual disappearance under anaerobic reaction of cellulose accompanied by increase in lignin. Recent literature on anaerobic decompn. is reviewed briefly. F. W. JUNG

Origin of petroleum. FRANZ FISHER. *Brennstoff-Chem.* **11**, 354–8(1930).—Recent work and its relation to theories of inorganic and org. origin, and secondary formation from fossil matter are discussed. F. W. JUNG

Transformation of fatty acids during geological periods. IV. G. L. STADNIKOV AND Z. I. VOZZHINSKA. *Brennstoff-Chem.* **11**, 414–6(1930); cf. *C. A.* **23**, 4426; **24**, 5261.—Extns. and chem. study of *balchaschite*, consisting of the alga *Botryococcus braunii*, shows its great similarity to coorongite, Siberian boghead and cannel coals. Microscopic comparisons with "pila rossica" from boghead coals, and "karpinskii" from Moscow cannel coal indicate little change in form from the original algae, but the relationship of the coals is not explained. F. W. JUNG

Hornfelses from Kenidjack, Cornwall. CECIL E. TILLEY AND JOHN S. FLETT *Summary of Progress Geol. Survey Gt. Brit.* 1929, Pt. II, 24–42.—The dominant rock types are dolerite hornfelses rich in green hornblende, and cordierite hornfelses rich in anthophyllite and frequently contg. abundant cummingtonite. Seven types including 2 of pneumatolytic origin are recognized, described fully, and compared with similar rocks of other regions. T. and F. discuss at some length the origin of these hornfelses, and present evidence in support of the hypothesis that the original dolerite intrusions have been subject to extensive decompn. by atm. weathering in which Ca and a large part of the alkalies, especially Na, have been removed. W. L. HILL

The presence of vanadium in Spanish rocks and minerals. S. PIÑA DE RUBIES. *Anales soc. españ. fis. quim.* **28**, 1110–6(1930).—V was found in peridotites, basalts, limburgites, pyroxenites, granites, labradorites, quartzites, schists, sea sand, clay and recent meteorites, and in many Bi, Mn, and Sn ores. If Ti is present, V is also, and *vice versa*. E. M. SYMMES

Some factors of solidification in relation to metallurgical and geological problems. S. W. SMITH. *J. Chem. Met. Mining Soc. S. Africa* **31**, 77–9(1930); cf. *C. A.* **24**, 3970, 5004, 5675.—Discussion. ALDEN H. EMERY

Iron ore, pig iron and steel in 1929. HUBERT W. DAVIS. Bur. Mines, *Mineral Resources of the U. S. 1929*, Pt. I, 5–44(preprint No. 2, published October 22, 1930). E. H.

Gold, silver, copper, lead and zinc in Colorado in 1928. CHAS. W. HENDERSON. Bur. Mines, *Mineral Resources of the U. S. 1928*, Pt. I, 817–72(preprint No. 26, published October 21, 1930). E. H.

Gold, silver, copper, lead and zinc in the eastern states in 1929. J. P. DUNLOP. Bur. Mines, *Mineral Resources of the U. S. 1929*, Pt. I, 73–8(preprint No. 5, published November 12, 1930). E. H.

Antimony in 1929. PAUL M. TYLER. Bur. Mines, *Mineral Resources of the U. S. 1929*, Pt. I, 45–56(preprint No. 3, published October 22, 1930). E. H.

Platinum and allied metals in 1929. HUBERT W. DAVIS. Bur. Mines, *Mineral Resources of the U. S. 1929*, Pt. I, 57–71(preprint No. 4, published October 28, 1930). E. H.

Trend of ore hunting in the United States. AUGUSTUS LOCKE AND PAUL BILLINGSLEY. *Eng. Mining J.* **130**, 609–12(1930); cf. *C. A.* **25**, 268.—Indicators of valuable outcrops are discussed under the headings of: (1) leached outcrop, (2) oxidation slump, (3) mineralization slump, (4) igneous slump, (5) the igneous mineralizer, (6) the ore pipe in bodies of disseminated sulfide, (7) mineral zoning, (8) impervious roof, (9) strong-rock or weak-rock boundary, (10) post-ore cover, and (11) the district backbone. W. H. BOYNTON

Preliminary report on Goudreau and Michipicoten areas. E. S. MOORE. *Canadian Mining J.* **51**, 1224(1930).—Gold developments of the season and drilling of iron ore deposits are very briefly outlined. W. H. BOYNTON

History of Rammelsberg mining. W. BORNHARDT. *Metall u. Erz* **27**, 581–5 (1930).—A short survey of the technical and economic development of Rammelsberg mining H. STOERTZ

The Aldermac mine, Rouyn, Quebec. W. P. ALDERSON AND A. A. MACKAY. *Canadian Mining J.* **51**, 1190–3(1930).—Cu, S and Fe are to be produced from the ores of this mine. The geology, type and grade of ore-bodies, tonnage, and the saving to Canada of using pyrite in place of S for acid are discussed. W. H. BOYNTON

Modern methods of concentrating minerals. CH. BERTHELOT. *Rev. métal.* **27**, 535–43(1930).—A review of flotation methods. H. S. v. K.

Concentration tests on tailings from the washing plants of the Mesabi Range, Minnesota. F. D. DEVANEY AND WILL H. COGHILL. Bur. Mines, *Rept. of Investigations* 3052, 23 pp.(1930).—The current tailings from western Mesabi washing plants contain about 20% Fe, but through natural concn. by wind and water the bulk of the tailings in the sludge ponds now contains 45–50% Fe. Roasting the sludge-pond tailings, followed by magnetic concn., yields a concentrate contg. about 64% Fe, 0.042% P, and 8% SiO_2 with an Fe recovery of 97%. The tenor of the non-magnetic tailing is about 5% Fe. By classification and tabling a concentrate was produced assaying Fe 61, P 0.0343 and SiO_2 8.85%, with Fe recovery 82%. Tailings contain about 30% Fe. ALDEN H. EMERY

The effect of dissolved substances on gravity concentration. F. J. TROMP AND E. BEYERS. *J. Chem. Met. Mining Soc. S. Africa* **31**, 77(1930); cf. *C. A.* **24**, 3200.—Discussion. ALDEN H. EMERY

Concentration of the Mesabi hematites. E. W. DAVIS. *Mining & Met.* **11**, 518–20(1950).—The following generalizations on the beneficiation of Mesabi ores are listed (1) The concentrate should contain no more than 9% SiO_2 and 60% or more Fe (2) Fe recovery should be over 85%. (3) At least half of the concentrate should require no sintering. (4) Radical changes in structure and analyses of the ores should not seriously affect the grade of concentrate produced. (5) The plant should be centrally located. (6) The plant should be capable of expansion to a capacity of 1,000,000 tons of concentrate during a shipping season. (7) Total treatment costs should not exceed $1 per ton of ore shipped, with present prices of Fe ore. High-grade low-silica ores are being depleted and conservation methods must soon receive careful consideration. A magnetic roasting and concn. flow sheet is shown and the cost of magnetic roasting discussed. W. H. BOYNTON

Laboratory concentration of the Missouri iron ores of Iron Mountain and Pilot Knob. F. D. DEVANEY AND S. R. B. COOKE. Bull. School of Mines and Metallurgy, Univ. of Mo., *Tech. Series* **11**, No. 3, 38 pp.(1930).—Iron Mt. ore is a complex mixt. of hematite, garnet, quartz, calcite and other minerals. Because of the high sp. gr. of the garnet, gravity concn. of this ore is difficult and yields, at best, only a medium-grade concentrate. Magnetic concn. of the roasted ore gives high recoveries and high-grade concentrates provided the ore treated is finer than 28-mesh. For satisfactory roasting, the ore must be crushed to a fine size and roasted at 600° or more. Pilot Knob ore is essentially an intimate mixt. of hematite and quartz. It does not conc. readily and apparently the only means of producing a satisfactory product is magnetically to conc. the magnetically roasted ore. This requires grinding to 150-mesh or finer in order to eliminate the SiO_2. ALDEN H. EMERY

Chemistry of leaching covellite. JOHN D. SULLIVAN. Bur. Mines, *Tech. Paper* 487, 18 pp.(1930).—Covellite can be leached with $Fe_2(SO_4)_3$. The rate of soln. was virtually the same for −100 +200 mesh covellite in solns. contg. 1 and 2% of Fe^{+++};

also for —10 +28 mesh material in 0.5–2% Fe^{+++} soln. The rate was practically independent of acid strength for the first 8 days, when the Fe^{+++} concn. remained const. at 1%. H_2SO_4 in the presence of air attacked covellite at $^1/_2$ the rate of $Fe_2(SO_4)_3$. Increased temp. markedly increased soln. rate. Artificial covellite produced by leaching chalcocite dissolved at a much faster rate than natural covellite. A. H. E.

Agglomeration and leaching of slimes and other finely divided ores. JOHN D. SULLIVAN AND ALFRED P. TOWNE. Bur. Mines, *Bull.* **329**, 60 pp.(1930).—Cu in concentrator tailings can be recovered by agglomerating the ore and leaching by the open-drainage trickle method. Coarse material must be added to the sand and slimes to act as a nucleus upon which the fine material can build. About 10% moisture is necessary. Solns. percolated freely through agglomerated ore contg. up to 30% —200-mesh material with 90% extn. of acid-sol. Cu and 80% of total Cu when the ratio of oxidized to sulfide Cu was approx. 1:1. By recirculation, Cu concn. was built up to 61 g. per l. Expts. were conducted on all scales up to 12 tons. ALDEN H. EMERY

Use of thermodynamical data to study the chemical reactions of metallurgical processes. R. S. DEAN. Bur. Mines, *Information Circ.* **6395**, 12 pp.(1930).—Examples are given to show how, by the application of thermodynamic results, new methods are proposed for deoxidation of Cu, production of Zn and sepn. of Zn and Cd. A. H. E.

Oxidation of copper in reverberatory furnace refining and the significance of the oxide test. P. SIEBE. *Metall u. Erz* **27**, 549–57(1930).—Operating conditions are followed by a photomicrographic study. During the oxidation and at the beginning of the reduction period long dendrites in the eutectic ground mass indicate a high degree of purity while short dendrites and round Cu_2O inclusions indicate an impure melt with high Sn content as well as Sb, As and Pb as impurities. In a hypereutectic exptl. melt Sb and As cause a balling together of the eutectic and a shortening of the dendrites. Strong overheating causes larger dendrites and high cooling velocity produces a finer sepn. of the eutectic. Microscopic study of the oxide specimen indicates the type of impurities and the Cu_2O content. H. STOERTZ

Care and maintenance of fuel-fired furnace linings in the non-ferrous foundry. H. E. WHITE. *Trans. & Bull. Am. Foundrymen's Assoc.* **1**, 644–53(1930).—Causes of failure, types of linings available and proper installation are discussed. SiC appears to be the most popular plastic lining. Mullite and other alumina-silica materials are finding increased favor. B. A. SOULE

Refractory-maintenance cements in the non-ferrous foundry. H. E. WHITE. *Trans. & Bull. Am. Foundrymen's Assoc.* **1**, 654–65(1930).—W. briefly considers various types of cements, their application, proper use and effect on power cost. A graph for computing economical limits of lining maintenance is given. The desirable properties of a cement are elasticity, mech. strength, high softening point, resistance to abrasion, disintegration, slagging and spalling, low shrinkage, long vitrification range and workability. B. A. SOULE

Theory of Cowper's recuperative furnace. L. THIBAUDIER. *Rev. métal.* **27**, 544–59 (1930). H. S. v. K.

Gas mixtures for multi-fuel-fired furnaces. JOSEPH F. SHADGEN. *Iron Age* **126**, 1374–5, 1436(1930).—A discussion of the mixing of blast-furnace, producer, coke-oven and natural gases and the application of the mixts. to metallurgical processes. C. L. READ

Blast-furnace gas as a metallurgical fuel. JOSEPH F. SHADGEN. *Iron Age* **126**, 1287–9(1930).—A discussion of the application of blast-furnace gas to such metallurgical furnaces as coke ovens, open-hearth furnaces, soaking pits and annealing and drying furnaces. C. L. READ

Presidential address. J. HENDERSON. *J. Chem. Met. Mining Soc. S. Africa* **31**, 58–63(1930).—A broad survey of *rationalization on the Fe, steel and coal industries of S. Africa.* ALDEN H. EMERY

Fundamental and applied research on the physical chemistry of steel making. C. H. HERTY, JR. Bur. Mines, *Rept. of Investigations* 3054, 12 pp.(1930).—H. gives a summary of the work of the Bureau of Mines on deoxidation of steel with Si, Al, Mn, Mn-Al, Al-Si and Mn-Si; slag viscosity; equil. between C and Fe oxide; effect of inclusions on rolling steel; deoxidation of steel in the open-hearth; research on acid open-hearth steel; and analytical methods developed. ALDEN H. EMERY

Some factors of solidification in relation to metallurgical and geological problems (SMITH) **8.** Preliminary report on molding sands in eastern Canada (FREEMAN) **8.** Discharge device for rotary furnaces for burning cement, etc., or smelting ores (Ger. pat. 504,966) **20.**

Ore treatment. FRANZ REUTER. Ger. 506,949, Jan. 19, 1924. App. for the disintegration of mineral mixts. into their components by a current of water is described.

Ore flotation. STUART P. MILLER (to Barrett Co.). U. S. 1,785,742, Dec. 23. As a flotation reagent there is employed a mother liquor comprising α-naphthylamine and other constituents of crude α-naphthylamine, obtained by forming a soln. of crude α-naphthylamine in an org. solvent, partially crystg. the α-naphthylamine content of the soln. and sepg. the crystals.

Apparatus for ore classification. THOMAS A. DICKSON (to Colorado Iron Works Co.). U. S. 1,785,302, Dec. 16. Structural features.

Ore-roasting apparatus. BERZELIUS METALLHÜTTEN GES. Brit. 333,461, March 27, 1929. The grate bars of a circular Dwight-Lloyd type blast-roasting app. are replaced by pervious receptacles contg. agglomerate so arranged that the agglomerate remains in the receptacles during the normal operation of the app.

Apparatus for mineral classification by currents of water. ANTOINE FRANCE. U. S. 1,785,679, Dec. 16. Structural features.

Roasting ores. METALLGESELLSCHAFT A.-G. (Hans Klencke, inventor). Ger. 502,586, June 5, 1929. Sulfide ores, especially Zn blende, are thoroughly roasted in two stages, loam being mixed with the ore before or during the first stage.

Reducing ores. HERBERT WITTEK. Ger. 502,197, July 28, 1926. Addn. to 487,560 (*C. A.* **24**, 1836). Ores are reduced by using the heat evolved in the prepn. of cyanides or nitrides and optionally using the residual materials therefrom as reducing agents.

Apparatus for combined ore-reduction and hydrocarbon refining. WM. H. SMITH. U. S. 1,785,427, Dec. 16. An elec. resistance heater is positioned intermediate the ends of a retort for receiving one or more streams of continually moving ore such as iron oxide ore and oil. U. S. 1,785,428 describes a process in which metallic oxides such as Fe oxides are reduced and hydrocarbons are cracked without melting the charge, by adding heavy hydrocarbon to the charge, continuously feeding it through a fixed temp. zone under cracking conditions and removing the cracked hydrocarbon products at a suitable point of the app. and reducing the ore without melting. Catalysts may be used.

Treating titanium ores. I. G. FARBENIND. A.-G. (Johannes Brode and Carl Wurster, inventors). Ger. 507,151, Dec. 17, 1925. In working up Ti ores by treatment with concd. HCl in the warm in the presence or absence of a catalyst, the HCl consumed in the reaction is replaced by continuous or intermittent introduction of HCl gas, which may or may not contain a small quantity of H_2O. The mother liquors obtained, after sepg. the hydrated $FeCl_2$ that is pptd. on cooling, may be used to treat a further amt. of ore, and HCl may be recovered from the Fe salt in known manner.

Treating manganiferous materials. KURT E. DITTMANN and KARL FAERBER. Ger. 505,584, Jan. 20, 1928. Finely divided moistened Mn-contg. ores, waste, slime, etc., are subjected to the action of SO_2, the heat developed by the reaction only being employed. The $MnSO_4$ so formed is obtained by evapn. and roasted with C, and the SO_2 resulting is used to treat further manganiferous material. The process may be carried out in a closed continuously operating system.

Tin from ores, etc. EDGAR A. ASHCROFT. U. S. 1,786,386, Dec. 23. In the reduction of Sn oxide, carbon and finely divided Fe are used together, the Fe serving as a reducing agent. Use of Zn, Al, Mg, Ni and Sn alloys, etc., is also mentioned. Cf. *C. A.* **24**, 2100.

Metallic material with fibrous structure. KAISER-WILHELM-INSTITUT FÜR EISENFORSCHUNG E. V. Ger. 506,477, May 19, 1928. Addn. to 493,905. Part only, *e. g.*, the surface, of the material (*e. g.*, wood) is metallized by the method of 493,905 (*C. A.* **24**, 2711), instead of the whole, by localized heating.

Mixture of metallic with non-metallic materials. BRAUNSCHWEIGER HÜTTENWERK G. M. B. H. Fr. 686,493, Dec. 12, 1929. See Ger. 483,604 (*C. A.* **24**, 693).

Cementation of metals. AMERICAN CYANAMID CO. Fr. 686,628, Dec. 13, 1929. A bath of molten materials for the cementation of metals contains a halide of an alk. earth metal, a halide of an alkali metal and a minor proportion of an alk. earth cyanide. The alk. earth halide is preferably at least 50% of the wt. of the mixt.

Metal founding. HIRSCH, KUPFER- UND MESSINGWERKE A.-G. (Otto Götze, inventor). Ger. 505,511, Dec. 22, 1927. A water-cooled ingot mold formed of thin plates, for casting metal plates for subsequent rolling, is described.

Ladle suitable for use in casting aluminum and magnesium. W. T. COLLYER. Brit. 333,384, Aug. 1, 1929. A special partition is provided to prevent pouring out of the scum.

Casting metals such as iron and steel. J. E. FLETCHER. Brit. 333,494, Jan. 10, 1930. Molds are sufficiently preheated that when the iron or steel has been poured and has cooled to the recalescence temp., the sand or other surface of the mold will have been heated to the same temp.

Mold for casting metals such as copper billets. WM. F. EPPENSTEINER (to American Metal Co.). U. S. 1,785,941, Dec. 23. Structural features.

Foundry cores. K. MICHAELIS (to A. Stahn). Brit. 333,385, April 16, 1929. Cores of porous material such as sand are rendered superficially gas-tight by impregnation or coating with an inorg. material which will melt at the casting temp. (and preferably at the drying temp.), such as boric or phosphoric acid or borax and $Na_2S_2O_3$.

Molding hollow articles of metal. CLINTON B. PIKE. Ger. 505,576, Dec. 28, 1928.

Molding metal tubes and rods. WARSTEINER UND HERZOGLICH SCHLESWIG-HOLSTEINISCHE EISENWERKE A.-G. and KURT MÜHLBRADT. Ger. 505,526, Nov. 23, 1928. Details of the app.

Recovery of copper. I. G. FARBENIND A.-G (Werner Busch, inventor). Ger. 505,826, April 26, 1928. See Fr. 673,921 (*C. A.* 24, 2415).

Copper and zinc recovery from waste alloy materials. HARVEY M. BURKEY and DANIEL L. OGDEN (to American Metal Co., Ltd.). U. S. 1,785,247, Dec. 16. Alloy material such as brass or bronze is smelted and resulting Zn-bearing fume is sepd. from the gases produced, the fume is leached with a solvent for Zn such as a carbonated ammoniacal liquor and the Zn is recovered from the soln. thus formed. The Cu and other metals may be recovered electrolytically.

Refining copper. ÉTABLISSEMENTS MÉTALLURGIQUES DE RIS-ORANGIS. Fr. 686,641, Dec. 14, 1929. The oxide of Cu necessary for the refining of Cu is obtained outside the refining bath by treating the dross from a previous refining operation with a mixt. of a sulfide and an alkali salt, and roasting the sulfide formed.

Cadmium. HANSON H. MONROE (to Grasselli Chemical Co.). U. S. 1,785,139, Dec. 16. Material contg. Cd and Zn such as "Cd sponge" is treated with molten caustic alkali in the presence of a carbonaceous reducing agent such as coke in order to recover the Cd largely sepd from Zn.

Titanium, etc. W. MATHESIUS and H. MATHESIUS. Brit. 333,816, Nov. 1, 1928. In producing homogeneous Ti or ferro-Ti melts by an alumino-thermic process, regular deposition of the regulus is facilitated by addn. of chromates, tungstates, manganates, permanganates or uranates either of light metals such as the alkali metals or alk. earth metals or of heavy metals such as Fe, Ni, Co, Mn, U, W, Mo or V (in which latter instances the metal passes into the Ti or ferro-Ti regulus produced).

Titanium dioxide. I. G. FARBNIND. A.-G. (Friedrich Raspe and Paul Weise, inventors). Ger. 504,843, Sept. 2, 1928. Ti ores are treated with H_2SO_4 to separate TiO_2. The residue is subjected to a mech. flotation and returned to the H_2SO_4 treatment.

Ferromolybdenum and ferrotungsten. PAUL SCHWARZKOPF. U. S. 1,786,393, Dec. 23. Molybdic acid or tungstic acid of very fine grain and "maximum surface" development is evapd. from molten ore and the acid vapors are introduced directly into a bath of iron contg. a reducing agent.

Lamelliform metal powder such as that for bronze paints. EMIL PODSZUS (to Hartstoff-Metall A.-G. (Hametag)). U. S. 1,785,283, Dec. 16. A lustrous metal product suitable for use in the manuf. of bronze paints is prepd. by subjecting the finely comminuted metal to continual impact between a large number of tiny steel balls by imparting to the latter a revolving motion, as in a drum provided with internal partitions.

Furnaces for treating ores, etc. EUGENIO SOMOZA Fr. 686,519, Nov. 21, 1929. In furnaces for treating or fusing ores, metals, slags, etc., condensing galleries and chimneys are replaced by aspirators to which the gases and smoke are led by pipes and which pump them to purifiers. Cf. *C. A.* 24, 3746.

Metallurgical roasting furnace. BALZ-ERZRÖSTUNG G. M. B. H. Ger. 505,583, Nov. 24, 1927. Details of the air supply and air cooling.

Cupola furnace. J. E. FLETCHER and BRITISH CAST IRON RESEARCH ASSOCIATION. Brit. 333,322, May 24, 1929. Various details are described of a furnace with main and supplementary tuyères, with air-supply control effected at the main tuyères only.

Apparatus (associated with a cupola) for desulfurizing cast iron. LAVERNE W. SPRING (to CRANE CO.). U. S. 1,785,503, Dec. 16. Structural features.

Blast furnaces. VEREINIGTE STAHLWERKE A.-G. Ger. 505,962, Nov. 28, 1929. Details of rendering the outlet airtight.

Blast-furnace operation. F. HEYD. Ger. 507,321, June 6, 1928. Steam is supplied at a point above the fusion zone of the furnace, to react with the CO in the furnace. Gases contg. H may be supplied at the same time in the region of the hearth.

Blast-furnace tuyère. F. D. BROWN, G. B. RICHARDS and T. J. ROBERTS. Brit. 333,095, Oct. 1, 1929.

Apparatus for raising the pressure of the air blast in blast furnaces, etc. ASKANIA-WERKE A.-G. VORMALS CENTRALWERKSTATT DESSAU and CARL BAMBERG-FRIEDENAU. Ger. 486,651, Feb. 1, 1929.

Continuously moving lower delivery device for blast furnaces. FIRMA E. SCHWENK. Ger. 504,989, Sept. 28, 1927.

Device for holding back dust in blast furnaces. JULIUS STOECKER. Ger. 471,885, Oct. 11, 1927.

Apparatus for separating dust from blast- and shaft-furnace gases. VEREINIGTE STAHLWERKE A.-G. and HEINRICH RÖSENER. Fr. 686,477, Dec. 12, 1929.

Dust collection from gases such as blast-furnace gas. CLARK T. MORSE and EDWARD L. HOGAN (to American Blower Corp.). U. S. 1,785,453, Dec. 16. Dust-laden gas is subjected to centrifugal action in an app. at successively lower levels in paths of successively smaller diam. and moisture-laden dust is then discharged by gravity downwardly through the center of the stream, with upward discharge of the gas. App. is described.

Port construction and gas burner or open-hearth furnaces. GEORGE F. DOWNS and HERBERT F. MILLER, JR. U. S. 1,786,293, Dec. 23.

Fusion furnace for the production of steel. HERMANN MOLL. Fr. 686,436, Dec. 11, 1929.

Furnace for heating metals, etc. H. SCHAEFER. Brit. 333,192, Feb. 1, 1929. A combustible gas or a supporter of combustion, which has been raised to a high temp. in one element of a reversible heater, is passed through a chamber contg. the materials or articles to be heated, and after this is mixed either with a supporter of combustion or with a combustible gas, resp., and burned in the other element of the heater. Various details of construction are described.

Furnace suitable for heat-treating articles such as steel sheets moved through the furnace on a conveyor. RALF S. COCHRAN (to Surface Combustion Co.). U. S. 1,784-812, Dec. 16.

Furnace for the continuous thermal treatment of metal wires or bands. SELAS A.-G. Ger. 507,332, Feb. 15, 1928.

Hearth furnace for treating metals. MILTON W. ARROWOOD (to Universal Engineers, Inc.). U. S. reissue 17,908, Dec. 23. Reissue of original pat. No. 1,617,510, (*C. A.* **21**, 1093).

Rotary case-hardening furnace, with feeding screw. HEINRICH GESSLEIN. Ger. 507,423, Aug. 13, 1927.

Annealing furnace for metals. RUST FURNACE CO. Fr. 686,624, Dec. 13, 1929.

Rolling and annealing sheet metal such as steel. ALEXANDER PATERSON. U. S. 1,785,786, Dec. 23. The metal is reduced while at a temp. within the "blue short" zone and then annealed at a temp. within the growth range.

Apparatus for sintering metals. JOHN E. GREENAWALT. Ger. 506,582, Dec. 15, 1928. Details are given.

Iron. I. G. FARBENIND. A.-G. (Alwin Mittasch, Carl Müller and Eduard Linckh, inventors). Ger. 493,874, July 6, 1926. Addn. to 485,639 (following abstr.). In the prepn. of pure Fe by the thermic decompn. of $Fe(CO)_4$, the undiluted $Fe(CO)_4$ in liquid or vapor form is brought into contact with hot liquids or fused substances. Thus liquid $Fe(CO)_4$ is dropped into paraffin oil heated to 270°. The Fe liberated forms a fine powder suspended in the oil.

Iron. I. G. FARBENIND. A.-G. (Alwin Mittasch, Carl Müller and Eduard Linckh, inventors). Ger. 485,639, Dec. 16, 1924. Pure Fe is prepd. by the thermic decompn. of $Fe(CO)_4$ vapor diluted with other gases. The $Fe(CO)_4$-contg. gases are led over small heated metal bodies or through heated liquids. In the example, a mixt. contg. N and 40% $Fe(CO)_4$ vapor is led over iron turnings at 250–300°.

Iron. I. G. FARBENIND. A.-G. (Alwin Mittasch, Walther Schubardt and Carl Müller, inventors). Ger. 500,692, May 24, 1925. Addn. to 485,639. The method of producing pure Fe by the thermic decompn. of $Fe(CO)_4$ described in 485,639 (preceding abstr.) is modified by using a chamber heated to 400–900° without the heated metal or liquid. The decompn. of the $Fe(CO)_4$ takes place at the walls of the chamber where pure Fe is deposited.

Case-hardening iron. CARL HUMMEL. Ger. 507,206, Aug. 19, 1926. See Brit. 312,759 (*C. A.* **24**, 817).

Etching iron objects. WERK ROTHAU DER EISENWERKE A.-G. and FRITZ EISEN-

KOLB. Ger. 497,942, Feb. 28, 1926. Fe and its alloys are etched by a HCl or H_2SO_4 bath contg. a small quantity of albumin decompn. products.

Applying cast iron heads to steel stems in the manufacture of articles such as internal-combustion engine poppet valves. CLARENCE W. MILLER and RICHARD E. BISSELL (to Thompson Products, Inc.). U. S. 1,785,137, Dec. 16. The steel member is recessed and preheated while rotating and a flux is applied to the recess during preheating and prior to oxidation, and molten cast iron is deposited on the fluxed preheated recess while continuing the rotation, and the article is then quenched while the rotating is continued. App. is described.

Chilling cast steel and other alloys by the introduction of air into the annealing chamber at the end of the annealing process. HERMANN & SOHNE G. M. B. H. Ger. 498,813, Jan. 26, 1928. Details of the app.

Steel purification. LUSIFER PRODUCTS CO. Brit. 332,890, Jan. 21, 1929. Subsequent to the main finishing reactions, steel is purified by admixt. with the molten mass (preferably after removal of the main finishing slag but before solidification) of less than 1% of finely divided slag-forming materials consisting mainly of alumina, *e. g.*, a mixt. of Al_2O_3 80, SiO_2 4 and Fe_2O_3 16 parts. The purifying materials may be added in the ingot mold. Cf. *C. A.* 24, 1612

Rolling alloy steel. HOWARD M. GIVENS, FRANCIS B. FOLEY and JOHN L. COX. U. S. 1,786,297, Dec. 23. In rolling alloy steels that are strongly martensitic in character, rolling is effected within a range of temp., the upper limit of which is substantially above its crit. temp. on heating and the lower limit of which is substantially above its crit. temp. on cooling, and this is followed by cooling, without rolling, to a temp. below its crit. temp. on cooling, then reheating to a temp. not above its crit. temp. on heating, and the rolling is completed while cooling from the reheating temp.

Low-carbon chrome steel. FRANK O. KICHLINE (to Bethlehem Steel Co.). U. S. 1,785,199, Dec. 16. Comminuted pig iron contg. C is intimately mixed with crushed chrome ore and slag-forming material, and the mixt. is fused in an elec. furnace to effect reduction of Cr from the ore by the action of C in the pig iron.

Nickel-chromium steels. W. H. HATFIELD and H. GREEN. Brit. 333,237, Feb. 5, 1929. Austenitic Ni-Cr steels contg. Cr 10–25% and Ni 25–5% are rendered incorrodible by heating, after polishing and grinding or other suitable treatment, to 100–400° (200° in an example given) and then cooling either quickly or slowly. The alloys may also contain addnl. metals such as Mo, W, Cu, Al, Zr, V and Ti.

Strain hardening manganese steel. FRANK A. FAHRENWALD (to American Manganese Steel Co.). U. S. 1,784,865, Dec. 16. Spaced conchoidal elevations are formed upon a surface of the steel, and after heat treatment of the steel, and while the steel is cool, these elevations are depressed into the body of the casting.

Work-hardened manganese steel castings. FRANK A. FAHRENWALD (to American Manganese Steel Co.). U. S. 1,784,866, Dec. 16. A tool with a rounded end is pressed at spaced intervals into a cool casting after the latter has been heat treated.

Silicon steel. VERE B. BROWNE. U. S. 1,784,811, Dec. 16. By treatment such as refining with Al under a special Ca aluminate slag, silicon steel is prepd. contg. at least about 3% Si and having a watt loss value exclusive of cutting strains of less than 0.5 watts per lb. as indicated by the standard Epstein test and also having a relatively high permeability.

Alloys. ABRAHAM BIELINKI and JEAN J. COOMANNS. Ger. 484,557, May 8, 1929. In the prepn. of Cu-Zn-Ni alloys, especially those contg. about 56% Cu, 30% Zn and 14% Ni, small quantities of H_3BO_3, K_2CO_3, NaH_2BO_3, $NaHCO_3$, $K_2Cr_2O_7$, Al_2O_3 dust, pitch and $K_4Sb_2O_7$ are added to the molten metal. A small quantity of Bi may also be added.

Alloy. OTTO KAMPS. Fr. 686,475, Dec. 12, 1929. An Al alloy suitable for pistons contains Al, Th, Ni and Mn. An example contains Ni 0.3–1.5, Th 0.05–0.9, Ce up to 6.8, Cu 90, Mn 0.4–0.8 and Al the rest. The alloy is refined by tempering it from a temp. of 480–535° in a bath of $BaCl_2$ and afterward heating to a temp. of 50–300°.

Ductile heat-treated aluminum alloy. NOAK V. HYBINETTE (to Hybinette Patents Corp.). U. S. 1,785,774, Dec. 23. A highly ductile fully heat-treated Al alloy "commercially free" from inter-cryst. corrosion and suitable for stamping from sheet form contains Zn 0.5–1.0, Mg 0.5–1.0, Cd 0.05–0.15 and Cu, Ni, Co, Mn, Cr, W and Mo not exceeding 0.25% each or a total of 0.50%.

Coloring aluminum and alloys. ALADAR PACZ. Ger. 487,754, Jan. 19, 1929. Objects of Al and its alloys, especially Al-Si, are colored by using solns. of molybdates in the presence of Sb compds. Salts of HF or H_2SiF_6 or $(COOH)_2$ or mixts. may be used.

Thus, an Al piece is colored by immersion in a hot soln. of Sb_2O_3, $(NH_4)_2MoO_4$, Na_2SiF_6 and $(COONH_4)_2$.

Coating aluminum or its alloys. ALADAR PACZ. Ger. 508,207, May 13, 1928. Addn. to 480,995. In giving Al and its alloys a fast coating of color by the method of 480,995 (*C. A.* **23**, 4924), Zn salt is added to the non-ammoniacal color bath, contg. also molybdates and salts of HF and H_2SiF_6.

Bronze alloys. G. BÄRTGES. Brit. 333,442, Oct. 2, 1929. Alloys contg. Al 7–13 and Fe 2–6%, the remainder being Cu, are formed by melting the metals with slag-forming materials such as alkalies or borax and deoxidizing agents such as Na, K or Mg, pouring the melt, and, after solidification, remelting under a covering of the slag produced in the first melting, with further addn. of deoxidizing agents such as Mg.

Bronze. GERHARD STRATENWERTH. Ger. 505,963, April 21, 1928. Bronze suitable for machine bearings consists of 97% Cu, 2% W and 1% V.

Alloy of copper, manganese and zinc. JONATHAN N. WHITE. U. S. 1,785,372, Dec. 16. An alloy which is suitable for thermostatic bellows, etc., comprises Cu 93–95, Mn 1.00–1.25%, the remainder being Zn.

Alloys of copper, nickel and iron. W. P. DIGBY. Brit. 333,774, May 30, 1929. In forming an alloy contg. Cu 25–45 and Ni 5–15%, the remainder being Fe with or without addn. of Cr up to 20% the quantity of the Fe, the constituents may be melted in a gas, coke or oil-fired furnace and the product finished in an induction furnace or the entire manuf. may be carried out in an induction furnace. Mn may be added 5 min. before pouring and Mg may be added just before pouring. Cf. *C. A.* **24**, 2714.

Magnesium or its alloys. THE DOW CHEMICAL CO. Fr. 686,335, Dec. 9, 1929. Mg or its alloys are freed from non-metallic impurities such as those obtained in the electrolytic vat by heating in a large bath with a convenient flux such as $MgCl_2$ to which NaCl is added to lower its m. p. The metal is partially melted and is agitated in the bath to reunite the particles of metal, which is then cleaned with the flux. Cf. *C. A.* **24**, 2714.

Molding magnesium and its alloys. I. G. FARBENIND. A.-G. Fr. 686,642, Dec. 14, 1929. In making molded objects from Mg or its alloys in sand molds, the protective substances used are composed of substances or mixts. of substances which contain NH_4F fixed in a complex form or conjointly with a substance of acid reaction. Thus, a mixt. of NH_4F or $(NH_4)_2SiF_6$ with a substance fixing NH_3, such as oxalic acid, may be used.

Nickel-iron alloys. JOHN H. WHITE (to Bell Telephone Laboratories, Inc.). U. S. 1,785,060, Dec. 16. There is added to an alloy of Fe and Ni, while it is molten, an amount of another alloy of Ni and a substance such as Ta or (Cb in smaller quantity than the Ni) such that the Ta or Cb will have a mass less than 1% of the total Ni-Fe content of the resulting alloy. The product may be readily forged without impairing its permeability.

Thorium alloys. KEMET LABORATORIES CO. Ger. 505,964, Dec. 23, 1926. See U. S. 1,732,326 (*C. A.* **24**, 51).

Inhibitors for use with pickling solutions in treating metals. WM. S. CALCOTT and IRA E. LEE (to E. I. du Pont de Nemours & Co.). U. S. 1,785,513, Dec. 16. In processes such as the treatment of steel with a dil. H_2SO_4 soln., attack of the soln. on the free metal is inhibited by a very small proportion of a compd. such as thiophenol, thio-β-naphthol, benzylmercaptan, isoamylmercaptan or isopropylmercaptan. An addn. of only 0.03% of the inhibitor may suffice.

Coating materials. OTTO SPRENGER PATENTVERWERTUNG JIROTKA M. B. H. Ger. 492,707, Mar. 16, 1928. Addn. to 442,766. The method of coating objects made of Al or Al alloys described in 442,766 (*i. e.*, by immersion in a bath of heavy metal salt soln. to which alkali carbonate alone or with alkali chromate is added) is modified for giving Zn coatings to Al or Mg-free Al alloys, by adding borax to the soln. of Zn salt.

Coating metals. EUGEN VOPEL. Ger. 505,728, July 17, 1927. Holes in Fe articles to be coated, *e. g.*, zinced, are covered with paper treated with a soln. of alc., gelatin, NaCl and $K_3FeC_6N_6$.

Cadmium coatings. LEOPOLD ROSTOSKY and ERICH LÜDER. Ger. 504,888, Oct. 18, 1928. In producing a Cd coating on metals and alloys in a molten bath, a flux is used consisting of a mixt. of heavy metal halides with halides of light metals or their related elements in the first, second and third groups of the periodic table. An example mentions a flux consisting of KCl 25, $MgCl_2$ 20, NaCl 20, $ZnCl_2$ 33 and NH_4Cl 2%.

Lead shot plated with other metal such as copper. EDWIN PUGSLEY (to Winchester Repeating Arms Co.). U. S. 1,785,493, Dec. 16. Globules of molten Pb are dropped

into a soln. of a metallic salt such as $CuSO_4$ contg. a metal such as Fe adapted to replace the metal of the salt when Pb is dipped in the soln., to effect formation of Pb shot and plating of the shot with the metal of the salt used.

Tinning apparatus suitable for tinning the edges of strip stock. HARRY W. BUNDY (to Bundy Tubing Co.). U. S. 1,785,762, Dec. 23. Structural features.

Galvanizing wire, etc. SPEZIALFABRIK FÜR ALUMINIUMSPULEN UND -LEITUNGEN G. M. B. H. Ger. 497,943, Oct. 23, 1927. Details of app. for coating wire, etc., with Al or Al alloys.

Galvanizing hollow bodies. METALLWARENFABRIK JOHANN JÄCKLE. G. M. B. H. Ger. 505,979, Feb. 20, 1929. Details of the app.

Arrangement for galvanizing the insides of long hollow bodies. WILHELM A. F. PFANHAUSER. Ger. 497,941, Mar. 15, 1929.

Iron zincing pans. OTTO MIDDERMANN. Ger. 505,678, Dec. 13, 1928. The sheet Fe walls of the pans are rendered non-porous, *e. g.*, by an C_2H_2 burner.

Removing lead coatings from articles such as cold-drawn steel rods or tubes. KIEL B. BOWMAN (to Republic Steel Corp.). U. S. 1,785,245, Dec. 16. The Pb coating is oxidized (suitably by the action of $NaNO_3$ at 410°) and the oxidized coating is then removed with an acid such as HCl or HNO_3.

Metal coatings on wood, stone, etc. HERMANN MAYR. Ger. 505,508, Aug. 4, 1928. The objects are coated with a prepn. made by fusing and cooling metal powder 40–70, wax 60–90, powd. graphite 60–90, pptd. chalk 100–150, water glass 180–220 and casein 40–70 parts.

Welding copper. W. ANDREWS and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 333,466, Nov. 2, 1929. A welding rod suitable for use in welding Cu by the C_2H_2 or similar gas-welding process is formed of Cu together with a small proportion of Ag (suitably 0.5%) and deoxidant such as P, coated with a deoxidant and a flux such as a mixt. of feldspar with a deoxidant alloy contg. Mg, Mn and Si. Various details and examples are given with formulas of mixts. used.

Welding steel pipes or tubes. AIR REDUCTION CO. Brit. 332,869, Dec. 10, 1928. Strip metal or open-seamed tubes are heated to a relatively high temp., above redness, in a furnace and the edges are then progressively welded together while supplying reducing gas to remove scale or oxide and protect the tube from reoxidation until it cools. App. and various details of procedure are described.

Welded chemical apparatus, etc. W. ANDREWS and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 332,894, Jan. 29, 1929. Welded app. is made from Cu contg. a small proportion of a deoxidant such as P, Si, B or Cd, and welding may be effected electrically or by gas with a composite welding rod contg. Cu alloyed with Ag and a deoxidant (suitably with use of a flux which may be formed of microcosmic salt 45, powd. borax glass 35–45, H_3BO_3 up to 10, Mg silicate 6, PbO 3 and LiF 1%).

Plant for utilizing and vaporizing liquid oxygen for welding, etc. PETITS FILS DE F. DE WENDEL ET CIE. Brit. 332,833, June 7, 1929. Structural features.

Soldering flux. HAROLD J. BARRETT (to Grasselli Chemical Co.). U. S. 1,785,173, Dec. 16. A polymerized org. ester of vinyl alc. such as polymerized vinyl acetate is used in soft soldering.

Soldering flux. HARRY P. CORSON (to Grasselli Chemical Co.). U. S. 1,785,180, Dec. 16. A sulfonated vegetable oil is used in soft soldering, *e. g.*, sulfonated corn, castor or cotton-seed oils or their Na and NH_4 salts. U. S. 1,785,181 relates to a flux comprising $ZnCl_2$ and an aldehyde such as CH_2O, acetaldehyde, butyraldehyde, propionaldehyde, α-ethyl-β-prophylacrolein, aldol or benzaldehyde.

Soldering flux. HARRY B. DYKSTRA (to Grasselli Chemical Co.). U. S. 1,785,115, Dec. 16. A chlorinated resin is used as a flux in soft soldering.

Soldering flux. GEORGE LUTZ (to Grasselli Chemical Co.). U. S. 1,785,131, Dec. 16. $ZnCl_2$ is used with a sulfonated vegetable oil compd. such as sulfonated castor oil in soft soldering.

Soldering flux. HOWARD S. MCQUAID (to Grasselli Chemical Co.). U. S. 1,785,134, Dec. 16. An ethanolamine is used in soft soldering of tin plate, etc. U. S. 1,785,135 specifies the use of an org. amine soap such as an ethanolamine oleate or aniline oleate as a soldering flux in soft soldering.

Soldering flux. WM. SCHWEITZER (to Grasselli Chemical Co.). U. S. 1,785,147, Dec. 16. $ZnCl_2$ is used with a sulfonated mineral oil.

Soldering flux. EDWARD A. TAYLOR (to Grasselli Chemical Co.). U. S. 1,785,155, Dec. 16. $ZnCl_2$ is used with an alkyl naphthalenesulfonic acid compd. such as propyl- or butyl-naphthalenesulfonic acids or their salts or the corresponding benzyl- or cyclohexyl naphthalenesulfonic compds.

10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

An introduction to the practice of organic chemistry. GARFIELD POWELL. *J. Chem. Education* **8**, 107–14(1931). E. H.

New laboratory preparations for the course in organic chemistry. II. Decane from amyl bromide by the Wurtz reaction. HARRY F. LEWIS AND MARTHA TRYON. *J. Chem. Education* **7**, 2712–4(1930); cf. *C. A.* **24**, 2424.—Details of the reaction $AmBr + 2Na = Am_2 + 2NaBr$ are given, the yield being 55–65% of a product b. 170–4° (cor.). C. J. WEST

Polymerization and ring formation. VII. Normal paraffin hydrocarbons of high molecular weight prepared by the action of sodium on decamethylene bromide. WALLACE H. CAROTHERS, JULIAN W. HILL, JAMES E. KIRBY AND RALPH A. JACOBSON. *J. Am. Chem. Soc.* **52**, 5279–88(1930); cf. *C. A.* **24**, 5725.—The action of Na on $Br(CH_2)_{10}Br$ in Et_2O gives a mixt. of paraffins of the general formula $H[(CH_2)_{10}]_nH$; by fractional distn. in the mol. still and by crystn., the following individuals have been isolated from this mixt.: eicosane, triacontane, *tetracontane* (I), *pentacontane* (II), *hexacontane* (III), *heptacontane* (IV). I, $C_{40}H_{82}$, m. 80.5–1°, b. 150° at 10^{-3} mm.; II, $C_{50}H_{102}$, m. 91.9–2.3°, b. 200°; III, $C_{60}H_{122}$, m. 98.5–9.3°, b. 250°; IV, $C_{70}H_{142}$, m. 105–5.5°, b. 300°. The residue remaining from the sepn. of the hydrocarbons named amounts to about 25% of the total and is composed of still higher members of the same series which it has not yet been possible to sep. The mechanism of the reaction is discussed. **VIII. Amides from ε-aminocaproic acid.** W. H. CAROTHERS AND GERARD J. BERCHET. *Ibid* 5289–91.—$(H_2N)(CH_2)_5CO_2H$, heated at 210–20°, or its Et ester, heated to 160–200°, reacts with itself both intra- and intermolecularly and yields the 7-ring *lactam* (I) (about 30%) and a *polyamide* (II) (about 70%); II is a hard gray wax, sol. in $HCONH_2$, m. 212–4°; II is quant. hydrolyzed in 6 hrs. by boiling concd. HCl to the original acid; partial hydrolysis of II gives polyaminocaproylaminocaproic acids; boiling II with concd. HCl for 1 hr. gives 50% unchanged II and a sol. product, yielding a *p*-$MeC_6H_4SO_2$ deriv. corresponding with the formula $C_7H_7SO_2[NH(CH_2)_5CO]_3NH(CH_2)_5CO_2H$. Mol.-wt. detns. in PhOH gave values from 800–1200 and it may be assumed that II contains at least 10 mols. of the acid. No I can be obtained from II by heating to a high temp. in high vacuum. C. J. WEST

The chemical constitution of the hydrocarbons of Echinacea angustifolia. ESLI LONGWORTH WOODS. *Am. J. Pharm.* **102**, 611–30(1930).—The oil was found to be optically inactive, d_{15} 0.801 and n^{20} 1.4480, yellow in color. Distn. of 100 cc. of oil gave 5 cc. below 260°, 77 cc. from 260–8° and 15 cc. from 268–306°. Tables show the b. p. range and the consts. of each fraction and also the b. p., vol. and d. of each refractionation under reduced pressure. The unsatd. hydrocarbon was found to absorb but little O with the formation of a peroxide. The reaction of BzO_2H with the oil followed by hydration with dil. H_2SO_4 was found to result in the formation of at least 3 different products. (1) Erythrol (C 64.86 and 64.57%, H 11.52 and 11.36%; theory for $C_{15}H_{28}(OH)_4$ 65.21% C and 11.59% H). (2) Solid m. 135–6° and resembling the erythrol closely in general phys. properties. It differs in being insol. in hot $CHCl_3$ and in hot C_6H_6. Analysis: C 66.4 and 65.86%, H 10.36 and 10.87%. (3) A viscid brown oil obtained as the main product of the reaction, showed a proportion of C and H corresponding to the erythrol less one mol. of H_2O. Acid value 24.8 and sapon. value 134.8. Analysis: C 69.37 and 69.17%, H 11.48 and 11.39%; theory for $C_{15}H_{27}(OH)_3$ 69.76% C and 11.62% H. Following is a summary of the degradation products obtained in both the aq. and the acetone $KMnO_4$ oxidations (quantities are based on 100 g. of oil): with 300 g. $KMnO_4$ in H_2O (reaction became very slow after addn. of this proportion of $KMnO_4$), unchanged oil recovered 15–20 g., CO_2 trace, AcOH appreciable, hexoic and heptoic acids 10–15, myristic acid 1–1.5, unsatd. acid $C_{13}H_{24}O_2$ none, dihydroxytridecylic acid 0–1, adipic acid 3–4, pimelic acid 1–2, brown viscid acid trace, oxalic acid none; with 570 g. $KMnO_4$ in acetone, unchanged oil recovered 3–5, CO_2 large amount (from oxidation of acetone itself), AcOH large amt. (from oxidation of acetone itself), hexoic and heptoic acids 33–35, myristic acid 5–6, unsatd. acid $C_{13}H_{24}O_2$ 5, dihydroxytridecylic acid 3, adipic acid 6–7, pimelic acid 16–20, brown viscid acid 16, oxalic acid trace. In the light of the various products which have now been obtained, the structure for the hydrocarbons of oil of echinacea suggested by Bischoff (*C. A.* **19**, 874), $C_{15}H_{28}$, an aliphatic tetrahydrosesquiterpene with 2 double bonds (a possible structure $C_5H_{11}CH{:}CHCH_2CH{:}CHC_5H_{11}$ in which the pentyl groups are of an iso character was suggested, although the evidence was insufficient to establish this formula), must be modified with respect to the

positions of the double bonds. The following formula might be accepted as satisfactorily accounting for the four main degradation products, hexoic, heptoic, adipic and pimelic acids: $Me_2CH[CH_2]_3CH{:}CH[CH_2]_5CH{:}CH_2$. Heptoic and pimelic acids would result from the complete oxidation of the double bonds, and hexoic and adipic acids, resp., might be formed by the further oxidation of these primary products. On the other hand, it may be assumed that all 4 of these acids are primary oxidation products of the oil, resulting from 2 isomeric hydrocarbons which differ in the position of one double bond: $Me_2CH[CH_2]_2CH{:}CH[CH_2]_5CH{:}CHMe$ and $Me_2CH[CH_2]_3CH{:}CH[CH_2]_4CH{:}CHMe$. The 1st compd. would yield hexoic and pimelic acids on oxidation and the 2nd compd., heptoic and adipic acids. The unsatd. acid obtained from the reaction in acetone may be regarded as derived from either of the above formulas by complete oxidation of the double bond nearest the end of the chain: $Me_2CH[CH_2]_3CH{:}CH[CH_2]_6CO_2H + HOAc$. The dihydroxytridecyclic acid would represent the next step in the oxidation: $Me_2CH[CH_2]_2CH(OH)CH(OH)(CH_2)_6CO_2H$. The presence of these 2 intermediate compds., and the apparent absence of any 8- or 9-C compds. of a similar nature, among the degradation products, may be taken as indicating to some extent the mechanism of the reaction. The double bond nearer the end of the chain in the original compd. would appear to be more readily attacked by the oxidizing agent, and to be completely oxidized before the second double bond is affected. Since myristic acid could not be obtained by oxidation from a hydrocarbon $C_{15}H_{28}$ with 2 double bonds, its presence among the degradation products necessitates the assumption of a more satd. compd. in the original oil, a straight chain compd. with one double bond, $Me[CH_2]_{12}CH{:}CH_2$. The myristic acid could be isolated quantitatively from the reaction mixt. with a fair degree of accuracy, and was obtained in practically the same proportion in all reactions. From the amt. of this acid obtained it would appear that the original oil contains from 5 to 10% of the more satd. hydrocarbon. It is further evident from this study that the hydrocarbons of oil of echinacea are not to be regarded as polymerization products of isoprene. Ruzicka (*Ueber Konstitution und Zusammenhange in der Sesquiterpenreihe*, Monograph, 1928) has pointed out that the structures of certain aliphatic as well as the cyclic sesquiterpenes may be regarded as derived from the polymerization of 3 isoprene mols. The chain of an aliphatic sesquiterpene formed by the polymerization of 3 isoprene mols. would necessarily have 3 branches: $CH_2{:}CMe{-}CH_2CH_2CH{:}CMeCH_2CH_2CH{:}CMeCH{:}CH_2$. Such a structure cannot be harmonized with the results of the present investigation. To explain the formation of these hydrocarbons in the plant by the decarboxylation of fatty acids, according to the generally accepted view for non-terpene hydrocarbons, the preëxistence of branched-chain acids must be presumed. The straight-chain hydrocarbon, of which the myristic acid is the oxidation product, might be formed by the decarboxylation of β-tridecylacrylic acid, $Me[CH_2]_{12}CH{:}CH\boxed{COO}H$. The acids from which the other hydrocarbon or hydrocarbons, mentioned above, could be obtained in the same manner must be of an iso character, $Me_2CH[CH_2]_2CH{:}CH[CH_2]_6CH{:}CHCH_2\boxed{COO}H$. The brown viscid acid from the $KMnO_4$ oxidation closely resembles the oil from the BzO_2H reaction in phys. character, and probably bears a close structural relationship to it. W. G. G.

Pyrolysis of propylene. Charles D. Hurd and Richard N. Meinert. *J. Am. Chem. Soc.* **52**, 4978–90(1930).—$MeCH{:}CH_2$ is rapidly decompd. at temps. above 600° in pyrex or quartz. The gaseous products are largely H, CH_4 and C_2H_4 with smaller amts. of C_2H_2 and C_2H_6. Aromatic liquids (C_6H_6, PhMe, etc.), comprise approx. 25% of the total reaction products. The reaction has been shown to be predominantly homogeneous and unimol. A mechanism for the reaction is suggested. Under comparable conditions in monel metal, decompn. of $MeCH{:}CH_2$ begins at a much lower temp., namely, 350°. The products are largely C and H and the reaction is autocatalytic. As compared with isobutylene, $MeCH{:}CH_2$ has been shown to undergo an almost identical type of pyrolysis. C. J. West

Hexa-*ω-tert*-butylpropinylethane and some new acetylenic compounds. I. L. Ozanne and C. S. Marvel. *J. Am. Chem. Soc.* **52**, 5267–72(1930); cf. Gillespie and Marvel, *C. A.* **24**, 4756.—$BrCH_2CBr{:}CH_2$ and Me_2CMgCl (1.33 mols.) in Et_2O give 45–62% of *4,4-dimethyl-2-bromo-1-pentene* (I), b. 135–8°, d_4^{20} 1.030, n_D^{20} 1.4630. With $NaNH_2$ in a mineral oil and $C_6H_4Me_2$ at 160–5°, there results 37–45% of *4,4-dimethyl-1-pentine* (II), b. 73–5°, d_4^{20} 0.7154, n_D^{20} 1.4028; *Hg compd.*, $C_{14}H_{22}Hg$, m. 125–6.5°. II and EtMgBr, followed by $CO(OEt)_2$ give 68% of *tri-ω-tert-butylpropinylcarbinol* (III), m. 50–1°. The action of AcBr on III, followed by mol. Ag, gives 24% of *hexa-ω-tert-butylpropinylethane* (IV), m. 127.5–8.5°; IV turns yellow on standing in the air for a few hrs.;

at 0° it remains colorless for over 1 week. A dry Et_2O soln. reacts almost instantly with KNa to give a red metal alkyl; IV does not react with 1% Na-Hg and the results with 40% Na-Hg were inconclusive. The metal alkyl could not be converted to a cryst. acid with CO_2 followed by a mineral acid. I on ozonization gives $Me_3CCH_2CO_2H$, whose *p-bromophenacyl ester* m. 81–1.5°. IV and O_2 give the same acid (28% yield). II and EtMgBr, followed by Ph_2CO, give 85% of *ω-tert-butylpropinylbiphenylcarbinol*, $b_{0.4}$ 135°, m. 55–6°; PCl_5 in petr. ether gives the *bromide*, light brown liquid, yielding with mol. Ag *sym-di-ω-tert-butylpropinyltetraphenylethane*, m. 116–8°; this gives a red color with KNa, but the metal alkyl could not be converted into the corresponding acid. II, EtMgBr and BzOEt give *di-ω-tert-butylpropinylphenylcarbinol*, $b_{0.4}$ 135–7°, d_4^{20} 0.9325, n_D^{20} 1.5080. Cyclohexylpropine, EtMgBr and Ph_2CO give *diphenyl-ω-cyclohexylpropinylcarbinol*, $b_{1.1}$ 210–5°, d_4^{20} 1.058, a_D^{20} 1.5750. *Phenyl-di-ω-cyclohexylpropinylcarbinol*, $b_{0.017}$ 180–5°, d_4^{20} 1.014, n_D^{20} 1.5390. C. J. WEST

Synthesis of 1,4-pentadiene. PAUL N. KOGERMAN. *J. Am. Chem. Soc.* **52**, 5060–5(1930).—An improved method and app. are described for the prepn. of CH_2:CHBr in 85% yield from $(CH_2Br)_2$ and EtOH-KOH. $CH_2(CH{:}CH_2)_2$ was prepd. by the action of Mg upon CH_2:$CHCH_2Br$ and CH_2:CHBr at atm. pressure and under a pressure of 260–270 mm. The yield of the tetra-Br deriv. is about 22%; best results are obtained with the use of a Mg-Cu alloy, finely ground. Regeneration of $CH_2(CH{:}CH_2)_2$ was effected by Mg, about 73% being obtained; the pure product b_{756} 25.8–6.2°, d_4^{20} 0.6594, n_D^{20} 1.3883. The supposed liquid tetrabromide is formed in comparatively small quantities or it may isomerize on distn. C. J. WEST

Highly polymerized compounds. XLIV. Polyvinyl bromide. H. STAUDINGER, M. BRUNNER AND W. FEISST. *Helv. Chim. Acta* **13**, 805–32(1930); cf. *C. A.* **24**, 5717.—Vinyl bromide, pure or in PhH, was polymerized in 12–35 days by sunlight and very rapidly by ultra-violet rays. In an atm. of pure H_2 polymerization does not readily occur. The polymerized product is a mixt. of several compds. Heated with $ZnEt_2$ in xylene it yielded ethane and a somewhat unsatd. hydrocarbon sol. in org. solvents, mol. wt. between 1890 and 3100. The same product and CH_4 are obtained when $ZnMe_2$ is used. It is thought that the hydrocarbon has a structure similar to rubber but with only about half as many double bonds. Polyvinyl bromide reduced with Zn and AcOH in xylene gives a mixt. of products, one of which is a satd. hydrocarbon with a mol. wt. of about 220. Reduction with HI and red P gives a mixt. of what are apparently paraffins contg. from 40 to 100 or more C atoms. **XLV. Asymmetric polydichloroethylenes.** H. STAUDINGER AND W. FEISST. *Ibid* **13**, 832–42.—The polymerized substance is a mixt of compds. which are fully satd. chains built up of from about 50 to 100 mols. of CH_2:CCl_2. Reduction with HI and red P gives a mixt. of paraffins contg. 36–160 C atoms. Reduction with Zn dust, glacial AcOH and HCl gas yields an insol. substance contg. about half as much Cl as the original polymer. Heated with $PhNH_2$, HCl splits off and a brown substance sol. in PhH is obtained which consists possibly of long chains of $-CH_2—C(:NC_6H_5)—$ units. L. E. GILSON

Cacodylates and methylarsonates. G. C. GUALDONI. *Giorn. farm. chim.* **79**, 78–9, 82–3(1930).—The usual methods of prepn. and of qual. and quant. analysis of Na cacodylate and Na methylarsonate are described. G. SCHWOCH

Electrolysis of Grignard solutions. H. E. FRENCH AND MARY DRANE. *J. Am. Chem. Soc.* **52**, 4904–6(1930).—Et_2O solns. of iso-AmMgCl were subjected to electrolysis with anodes of various metals and cathodes of Pt. Anodes of Al, Zn and Cd were dissolved off as the result of electrolytic action. Those of Bi, Au, Ni, Ag and Sn were not attacked. The amt. of Al which went into soln. was approx. equiv. to the quantity of current passing through the cell. In several cases where the anode was not attacked, an amt. of iso-AmMgCl equiv. to the amt. of current passing through the cell was decompd. C. J. WEST

Magnesium dialkyls. An historical note on the first preparation of an alkylmagnesium halide. HENRY GILMAN AND ROBERT E. BROWN. *J. Am. Chem. Soc.* **52**, 5045–8(1930).—A description is given of some general properties of Mg dialkyls prepd. from Mg and Hg dialkyls and RMgX prepd. from alkyl iodides and Mg (with no solvent). The first RMgX or its equiv. was prepd. by Hallwachs and Schafarik in 1859 in the absence of Et_2O but the use of Et_2O by Grignard first made possible the extensive applications of these compds. C. J. WEST

Morphology of substances of high molecular weight. I. Fiber formation with polyoxymethylenes. HANS W. KOHLSCHÜTTER. *Ann.* **482**, 75–104(1930).—The sublimates of certain polyoxymethylene prepns. are found to be composed of fibers which,

formerly regarded as relatively simply built up, being oriented along the length of the mol., are actually very diverse in nature; they are classified as complicated structural forms the character of which depends on a fine gradation of chem. differences. Polyoxymethylene (I), when heated with a trace of H_2SO_4, dissoc. into gaseous HCHO and trioxymethylene (II); the latter accelerates the repolymerization of HCHO. Moreover, supercooled II (m. 64°) dissolves HCHO and when the soln. crystallizes the meanwhile polymerized product seps. in a definitely oriented way and an aggregate of more or less pronounced "fiber structure" results. II may also sep. from the gaseous phase in needle crystals; the I formed by the condensation of HCHO on the surface will then also possess an orientation. In either case the II occupies the role of framework, a macroscopic fiber consisting of a pseudomorph of I on a II crystal II can itself undergo a kind of lattice conversion, by which it approximates in its properties to complex I and then forms an integral part of the fiber structure This change occurs under the influence of the polymerizing HCHO even during crystal growth and leads to particularly stable I fibers of stable uniform inner structure By systematic variation of the sublimation conditions it has been possible to reproduce all degrees of phys., chem. and morphological differences. C. J. West

Polymerization and condensation. VI. 5,6-Dihydroxyhexanone. P. A. Levene and A. Walti. *J. Biol. Chem.* **88**, 771-98(1930); cf. *C. A.* **22**, 274, **24**, 341.—The condensations of 5,6-dihydroxy-2-hexanone (I) are comparable to those of dihydroxyacetone previously studied. It probably consists of cylic and straight-chain forms in equil. The di-Ac deriv. is a straight chain, the Me deriv. is cyclic. It readily yields an unstable desoxydisaccharide on standing. The polymerization compd. of Hibbert and Timm (*C. A.* **17**, 3861) is probably produced by the anhydride formation giving rise to a double bond which causes the substance to polymerize, and the polymerization of the desoxyglucoses may be analogous, since I is a model of a desoxy sugar. I was prepd. via α-acetyl-δ-chloro-γ-valerolactone by Traube and Lehmann's method (*Ber.* **34**, 1971(1901)) (yield 70%), $b_{0.3}$ 120°, $[M]_D$ 32.81; calcd for cyclic form 32.40, for chain 32.97. The diacetate (II) $b_{0.6}$ 112–4°, $[M]_D$ 52.00; calcd. for cyclic form 51.13, for chain 51.7. From 1 g. II was obtained 1.3 g. *semicarbazone*, m. 112° (decompn.), confirming the straight-chain formula. To a soln. of 10 g. I in 100 g. dry MeOH contg. 0.5% HCl, dry Ag_2CO_3 was added after 4 hrs. and 10 g. *methylcyclo-5,6-dihydroxy-2-hexanone* (III) distd. off, $b_{1.5}$ 66–9°, $[M]_D$ 36.97; calcd. for cyclic form 37.13; *acetate* b_{16} 102–4°. To 18 g. III were added 50 g. Ag_2O and 150 g. MeI in 4 portions; the mixt. was heated 5 hrs., extd. with Et_2O and fractionated, giving 9.4 g. *dimethylcyclodihydroxy-2-hexanone*, b_{17} 74°, $[M]_D$ 41.72 (calcd. 41.87), and 1.2 g. of an *anhydrodihydroxyhexanone*. From I, on standing, was obtained 33 g. of a *dihydroxyhexanonyldihydroxyhexanone* (IV), $b_{0.3}$ 175 80°. Acetylation of IV gave *diacetyldi(dihydroxyhexanone)anhydride*, $b_{0.2}$ 170–80°. From 1.7 g. was obtained 1.2 g. of *methylcyclodihydroxyhexanone*, like III, b_{15} 101–3°. *Hibbert and Timm's compd.*; 9 g I and 0.009 g. H_2SO_4 were heated 4 min. at 155° and the resin kept at 100° under reduced pressure. It had the compn. of an anhydride but gave a monoacetate, not distillable. By heating 40 g. I 4 hrs. at 150°, cooling every 2–3 hrs., and distg. at 1 mm. into a freezing mixt., extn. with Et_2O and fractionation, the *monomol. anhydride* was obtained, b_{20} 40°, mol. wt. 121.7, $[M]_D$ 28.57; calcd. for two O rings 28.79, for double bond 30.41 The double ring was confirmed by the parachor. By acetylation of the reaction mixt. before distg., the monoacetate (V) was obtained, b_2 58°, $[M]_D$ 39.55; calcd. for double bond 39.77. From the receiver was also isolated an *anhydrodihydroxyhexanone acetate*, b_1 50–53°. Reduction of 1 g. V with 35 cc. H_2 by means of 0.05 g. Adams catalyst gave 0.5 cc. of *dihydro deriv.*, b_{12} 95°. On heating 20 g. I 3 times for 3.5 hrs. at 150°, and distg. at 230°, a *polymerized anhydride* was obtained. The acetate was not distillable. MeOH contg. 0.5% of HCl gave a *MeO deriv.* Hydrogenation of 7 g. I in 40 cc AcOH with 1800 cc. H_2 in presence of 0.12 g. Adams catalyst, evapn. of the acid, extn. with Et_2O and fractionation, gave 3 g. of a *monohydroxyhexanone*, b_{14} 70–3°. The monoacetate b_{11} 88°, $[M]_D$ 40.32; calcd. for cyclic form 40.24, for chain 40.81. K. V. Thimann

Urotropine. S. Akai and H. Kataoka. *J. Pharm. Soc. Japan* **50**, 850–63(1930).—A general review on the prepn. and use of urotropine including exptl. data. F. I. N.

The action of organomagnesium compounds upon crotonic anilides, substituted in the nitrogen. N. N. Maxim and N. Ioanid. *Bul. soc. chim. Romania* **12**, 28–32 (1930).—M. and I. allowed substituted anilides of crotonic acid to react with organomagnesium compds. and obtained anilides of the corresponding satd. acid with a yield of about 50–60% according to the equation: $MeCH{:}CHCONRPh \xrightarrow{R'MgX} MeCHR'\text{-}CH_2CONPhR$ and if these were treated with 40% HBr, the corresponding satd. acids

were obtained: $MeCHR'CH_2CONPhR \xrightarrow[H_2O]{HBr} MeCHR'CH_2CO_2H$. As starting materials, M. and I. used the methyl- and the ethylanilide of crotonic acid, which were obtained by allowing PhNHMe and PhNHEt to react upon crotonyl chloride. Ethyl- and phenylmagnesium bromide were the Grignard reagents used. In this way, M. and I. prepd. and described MeCH:CHCONMePh, the ethylanilide, and, by the action of EtMgBr upon the methylanilide, the methylanilide of β-methylvaleric acid. 40% HBr transforms this into the $MeCHEtCH_2CO_2H$. The action of PhMgBr upon the $MeCH:CH_2CONMePh$ gave the methylanilide of β-phenylbutyric acid and this with 40% HBr furnished $MeCHPhCH_2CO_2H$ and finally they allowed EtMgBr to act upon the MeCH:CHCONEtPh, giving the ethylanilide of β-methylvaleric acid which through hydrolysis with 40% HBr furnished $MeCHEtCH_2CO_2H$.

F. R. GREENBAUM

A substance contained in the expressed liquid from olives. F. TRAETTA-MOSCA AND M. VENEZIA. *Ann. chim. applicata* 20, 449–51(1930).—A cryst. product has been obtained by extg. the expressed liquid from olives, after freeing from oil, with EtOH. It is sol. in water, insol. in org. solvents, m. 164°. The mol. wt., Ac deriv. and phenylhydrazone (of the product after oxidation with HNO_3) indicate a product $C_8H_{14}O_8$ + H_2O (crystn.). It is optically inactive, and is not a reducing agent. A. W. C.

The α-oxidation of acetaldehyde and the mechanism of the oxidation of lactic acid. JAMES B. CONANT AND CARL O. TONGBERG. *J. Biol. Chem.* 88, 701–8(1930); cf. *C. A.* 24, 1080.—From the oxidation of HAc by 0.2 *M* $Ce_2(SO_4)_3$ in 0.5 *N* H_2SO_4 at 80° about 10% of glycolaldehyde *p*-nitrophenylosazone was isolated, together with traces of $(CHO)_2$, the bulk of the products being HCO_2H and CO_2. Oxidation of lactic acid under similar conditions yielded 8% of the osazone, together with $OHCCO_2H$, HCO_2H and HCHO. The first step in the oxidation of HAc, whether produced from lactic acid or not, is considered to be introduction of O in the α-position. A similarity to *in vivo* processes and the possible polymerization of the intermediate compds. to carbohydrates are suggested. K. V. THIMANN

Photochemical oxidation of lactic acid. G. RICHARD BURNS. *J. Am. Chem. Soc.* 52, 5272–8(1930).—When lactic acid is decompd. by ultra-violet radiations in a soln. contg. dissolved O the chief products are CO_2, AcH, a peroxide and AcOH. Neither EtOH nor $AcCO_2H$ is formed. On the basis of the CO_2 evolved the O used was 118%, peroxide formed 32%, $AcCO_2H$ 0, CO 0.4%. As the oxidation was continued for longer periods the CO_2 given off equaled the O used. The amt. of peroxide in the soln. remained const. after the 1st hr. of oxidation but the aldehyde concn. increased. The products isolated by distn. were AcOH 75% (on CO_2), AcH 28%, HCHO 1%, HCO_2H not more than 0.4%. When the soln. was allowed to stand for 48 hrs. before analysis, an additional 12% of CO_2 was evolved, the peroxide content dropped to 10% and the aldehyde to 12%. The quantum yield in this reaction is several times that of the decompn. reaction without O. C. J. WEST

The behavior of polyhydroxy acids upon heating. K. H. BAUER AND A. EBERLE. *Z. angew. Chem.* 43, 902–4(1930).—The 2 dihydroxystearic acids, m. 133° and 98°, $CH_3(CH_2)_7CH(OH)CH(OH)(CH_2)_7CO_2H$, yield estolides on heating to 200° and at 300° again are split into dihydroxystearic acid and ι-hydroxyoleic acid, which as enol rearranges to form ι-ketostearic acid. The low acid no. of the estolide indicates that 5 or more mols. of dihydroxystearic acid are involved in its formation. Sativic and linusinic acids do not form the corresponding di- and triketostearic acids, but form products of lower acid and ester no. and a higher I no. Expt. details are given.

P. ESCHER

Preparation of ω-amino acids. I. Benzenesulfonylmethyl-ι,κ-aminoundecylic acid from ι,κ-undecylenic acid. BONIFAZ FLASCHENTRÄGER. *Z. physiol. Chem.* 192, 245–8(1930).—Normal aliphatic acids with a terminal unsatn. are well adapted to the prepn. of ω-amino acids. Undecylenic acid in petroleum ether was satd. at 0° with dry HBr to a yield of 86% of κ-bromoundecylic acid, m. 57°. This was dissolved in abs. EtOH and heated 5 hrs. under pressure at 90–110° with 37.5% alc. $MeNH_2$, yielding 74–6% of *κ-methylaminoundecylic acid*, m. 136–7°. Treatment of the latter with $PhSO_2Cl$ and NaOH gave 71–6% of *κ-benzenesulfonylmethylaminoundecylic acid*, m. 47–8°. **II. The one-sided breakdown of sebacic acid to θ-aminopelargonic acid according to Jeffrey-Hofmann.** BONIFAZ FLASCHENTRÄGER AND FRITZ GEBHARDT. *Ibid* 249–52.—The Hofmann reaction for converting an amide into an amine is applicable to the amide grouping of an "amic" acid. Sebacamic acid in MeOH was treated slowly in the cold with Br and MeONa, then the mixt. was refluxed 15 min., cooled and acidi-

fied with HCl. Diln. with H_2O pptd. *θ-carbomethoxyaminononylic acid*, m. 77°, in 74% yield. Hydrolysis of this urethan acid was effected by refluxing with concd. HCl until no turbidity appeared on cooling. The crude HCl salt of the amino acid was converted, by treatment with NaOH and $PhSO_2Cl$, into 99% of *θ-benzenesulfonylaminononylic acid* ($PhSO_2$ deriv. of θ-aminopelargonic acid), m. 85°. **III. The one-sided breakdown of higher normal dicarboxylic acids to ω-amino acids according to Naegeli-Curtius. Breakdown of sebacic acid to θ-aminopelargonic acid.** BONIFAZ FLASCHENTRÄGER AND FRIEDRICH HALLE. *Ibid* 253–7.—Another method of converting a dibasic acid to an ω-amino acid consists in treating the monoester monochloride with NaN_3, decompg. the azide into the isocyanate and hydrolyzing the latter to the amino acid ester HCl salt. $EtO_2C(CH_2)_8COCl$ was heated with NaN_3 in dry xylene until the evolution of N had ceased. The product was 94% of crude *Et θ-carbonimidopelargonate*, a yellow oil which was not purified or analyzed. By hydrolysis with 37% HCl this isocyanate yielded 85% of crude *Et θ-aminopelargonate-HCl*. In sapong. the ester with 0.2 *N* NaOH a by-product obtained was *carbonylbis(θ-aminopelargonic acid)*, $CO[NH(CH_2)_8CO_2H]_2$, m. 158°. The aminopelargonic acid was converted into the $PhSO_2$ deriv., m. 85°, identical with that described in the preceding paper. **IV. The one-sided breakdown of higher normal dicarboxylic acids to ω-amino acids according to Naegeli-Curtius. Breakdown of 1,21-heneicosanedicarboxylic acid to φ-aminobehenic acid.** BONIFAZ FLASCHENTRÄGER, BEN BLECHMAN AND FRIEDRICH HALLE. *Ibid* 257–63.—The 2nd of the above methods was applied to the C_{23}-dibasic acid obtained from Japan wax (*C. A.* **24**, 5725). By partial sapon. with the calcd. amt. of 0.2 *N* alc. NaOH, the di-Et ester $(CH_2)_{21}(CO_2Et)_2$ was converted into *mono-Et heneicosanedicarboxylate*, m. 83.3°. The yield of 38.6% was increased to 64% by reworking the residues. Treatment with $SOCl_2$ converted the acid ester into the acid chloride ester, *1-carbethoxyheneicosane-21-carboxylyl chloride*, m. 59.9° (yield 100%). This was treated in xylene with NaN_3, and the resulting isocyanate hydrolyzed by HCl to 65.8% of *φ-aminobehenic acid-HCl*, from which the *free amino acid*, m. 167°, was obtained by treatment with alc. NaOH. Its *$PhSO_2$ deriv.*, prepd. in 55.3% yield, m. 114.5°. A by-product of the azide decompn. was 18.5% of *carbonylbis(φ-aminobehenic acid)*, $CO[NH(CH_2)_{21}CO_2H]_2$, m. 110°.

A. W. DOX

Physicochemical investigation of amino acids. IV. V. VI. TOKUZO YAGINUMA. *J. Soc. Chem. Ind., Japan* **33**, Suppl. binding 372–4, 374–5, 376–7(1930) (In German); cf. *C. A.* **24**, 4762.—Et *α-l*-leucine-HCl m. 119°, *d*-rotary, long plates, b[010], m[110], 1[160] shape of the 3 crystal faces varying, rhombic, bisphenoidal, $a:b:c = 0.5263:1:2.8433$, $\alpha = 1.4962$, $\beta = 1.4978$, $\gamma = 1.5318$, $2V = 26.25'$, axial plane *c*[001], bisectorix *a*-axis, double refraction positive. Et *β-l*-leucine-HCl m. 134°, *d*-rotary, crystals usually thin plates whose end surfaces are right angles or derivs. thereof, optical extinction with both edges of right angle parallel, axis- and interference figures sym. in relation to diameter parallel to above edges, in oil immersion both axis apexes near the end of this diameter transparent, double refraction negative. Pr *l*-leucine-HCl is isodimorphous, conversion temp. below 52°, as shown by direct observation of *α-* and *β*-crystals in winter by polariscope and by soly. in C_3H_7OH. Pr *α-l*-leucine-HCl m. 108°, *d*-rotary, smooth plates, rectangular, 3-sides, trapezoid-shaped or 5-sided, all derivs. of the rectangular, or smooth prisms, *r*[101], rhombic, bisphenoidal, $a:b:c = 0.6963:1:0.6332$, double refraction negative, axis angle $V = 32°38'$, 1 middle line (?) *c*-axis, axial plane *a*[100], $\alpha = 1.4919$, $\beta = 1.4978$, $\gamma = 1.5128$. Pr *β-l*-leucine-HCl m. 136°, *d*-rotary, generally similar to the *α*-deriv., crystals flat rectangles, or triangular, trapezoidal, 5-sides or parallel 6-sided derivs. thereof, always developed from the *r*[101] surfaces, rhombic, bisphenoidal, $a:b:c = 0.9428:1:0.8880$, double refraction negative, axial angle $V = 5°54'$, axial plane *a*[100], 1 middle line (?) *c*-axis, axial dispersion $\gamma<\rho$, $\alpha = 1.4964$, $\beta = 1.4966$, $\gamma = 1.5021$.

E. M. SYMMES

The rotatory power of configuratively related substances. WERNER KUHN, KARL FREUDENBERG AND IRENE WOLF. *Ber.* **63B**, 2367–79(1930).—Rotation dispersion curves for related substances are analyzed in the ultra-violet portion of the spectrum. The substances studied are derivs. of halo fatty acids, such as N_2CMeCO_2Me and the dimethylamide. It is established that the optical rotation of a compd. is the sum of the amts. of rotation of the individual bands of the substituents but special wt. is to be given the weak and medium strong bands lying nearest the visible. Varying a substituent changes the rotation in its anisotropic bands and its vicinal effect, modifying the amts. of rotation of the other substituents. The vicinal effect is the disturbance in rotation caused by the presence of other atoms in the mol. A method for detg. the configuration of a compd. by comparison of optical displacements in steric series is explained. The compds. must be very closely related.

MARY E. LEAR

Bromine chloride; the action of mixtures of chlorine and bromine on aliphatic diazo compounds. THOMAS W. J. TAYLOR AND LANCELOT A. FORSCEY. *J. Chem. Soc.* **1930**, 2272–7.—Cl and Br react very rapidly and energetically with aliphatic diazo compds., a mol. of N being expelled and a mol. of the halogen taking its place. N_2CHCO_2Et and the equiv. of an equimol. mixt. of Cl and Br give a mixt. of dihalogen esters, the fraction b_{30} 80–5° yielding with NH_4OH $ClBrCHCONH_2$, m. 129°; that this was not a mixt. of $Br_2CHCONH_2$ and $Cl_2CHCONH_2$ was shown by the behavior of mixts. of these on melting. The results indicate that the equil. $Br_2 + Cl_2 \rightleftharpoons 2BrCl$ lies over the right-hand side. $PhCN_2Bz$, m. 81.8° (decompn.), with Cl and Br, resp., gives $PhCCl_2Bz$, m. 60°, and $PhCBr_2Bz$, m. 111°; *chlorobromodeoxybenzoin*, m. 85°, results from desyl chloride and Br in AcOH; m.-p. curves are given for the 2 halogen derivs. and for an equimol. mixt. of these 2 with varying amts. of the ClBr deriv. $PhCN_2Bz$ and Br + Cl give a mixt. of about 80 mol. % of the ClBr deriv. and 10 mol. % of each of the Cl_2 and Br_2 derivs. The same figures express the proportions of the mols. in the equil. $Br_2 + Cl_2 \rightleftharpoons 2BrCl$. C. J. WEST

Comparative investigations on the cleavage of the CONH linkage in polypeptides and related compounds, in which the NH_2 or COOH group is variously substituted, by dilute alkali, erepsin and trypsin-kinase. EMIL ABDERHALDEN AND EUGEN RIESZ. *Fermentforschung* **12**, 180–222(1930).—The study of the influence of substitution in the NH_2 or CO_2H of amino acids and peptides on their rate of hydrolysis by alkali and by proteolytic enzymes has been extended to include a greater variety of substituents. In general the derivs. were prepd. by well-known reactions, but in some cases the desired product was not obtained owing to secondary reactions which yielded other products, which, however, were identified and included in the tests. The amide linkages present in these substances include the following types: SO_2-NH, S-NH, CO-NH, ArCO-NH, Ar-NH, CO-NHAr, SO_2-NH-CO, and CO-NH-CO. *p-Cresoldisulfonyl-dl-leucylglycine*, m. 140°, was prepd. by shaking *p*-cresoldisulfonyl chloride in Et_2O with 2 mols. of *dl*-leucylglycine in dil. Na_2CO_3. In the reaction between *m*-cresoltrisulfonyl chloride and *dl*-leucylglycyl Me ester the product, instead of having a dipeptide on all 3 SO_2 groups, was *m-cresoldi(sulfonyl-dl-leucine)mono(sulfonyl-dl-leucylglycine)* (I), m. 117–20°, *i. e.*, 2 of the dipeptide mols. had undergone hydrolysis. A similar condensation of *m*-cresoltrisulfonyl chloride with *dl*-leucine Et ester yielded *m-cresoltrisulfonyl-dl-leucine Et ester*, m. 60°. Hydrolysis of this ester and also of I yielded the same product, *m-cresoltrisulfonyl-dl-leucine*, m. 80–120°. *o*-Cresoldisulfonyl chloride and glycine Et ester in Et_2O condensed to form *o*-cresoldisulfonylglycine Et ester, an oil which on sapon. yielded *o-cresoldisulfonylglycine*, m. 128°. *m*-$HO_2CC_6H_4SO_2Cl$ in MeAc condensed with glycine in *N* NaOH to form *m-glycinesulfonylbenzoic acid*, m. 178°; with *dl*-leucine to form *m-dl-leucinesulfonylbenzoic acid*, m. 187°, and with *dl*-leucylglycine to form *m-dl-leucylglycinesulfonylbenzoic acid*, m. 190°. Condensation of $EtSO_2Cl$ with *dl*-leucylglycine by shaking in Na_2CO_3 soln. yielded, instead of the expected ethanesulfonyldipeptide, the corresponding anhydride, *viz.*, *bis(ethanesulfonyl-dl-leucyl)-N-diketopiperazine*, m. 140°. In the reaction between leucylglycine Me ester and $BrCH_2CH_2SO_2Cl$, the usual coupling was accompanied by a ring formation in which HBr was split off, yielding a halogen-free ester, $C_{11}H_{20}O_5N_2S$, m. 117°. Aspartic acid in *N* NaOH condensed readily with hippuryl chloride to *benzoylglycylaspartic acid*, m. 191°. *o*-$O_2NC_6H_4SCl$ in Et_2O condensed with glycine Et ester to *o-nitrophenylthioglycine Et ester*, m. 83°, and with *dl*-leucine Et ester to *o-nitrophenylthioleucine Et ester*, m. 90°. 1,3,4-$Cl(NO_2)C_6H_3SCl$ in Et_2O condensed with leucine Et ester to *chloronitrophenylthio-dl-leucine Et ester*, m. 99°; in $CHCl_3$ with *dl*-leucylglycine Me ester to *4-chloro-2-nitrophenylthio-dl-leucylglycine*, m. 128–30°, and its *Me ester*, m. 97–100°; while in aq. NaOH with *dl*-leucylglycine the products isolated were $[Cl(NO_2)C_6H_3S]_2O$, $[Cl(NO_2)C_6H_3S]_2$, $Cl(NO_2)C_6H_3SONa$ and leucylglycine; with *dl*-leucine in aq. Na_2CO_3 the product was *chloronitrophenylthio-dl-leucine*, m. 126°. *dl*-α-Bromoisocaproylglycine was condensed with $PhNH_2$ in the presence of NaOAc to *phenyl-dl-leucylglycine*, m. 139°. *dl*-Leucylglycine in aq. $NaHCO_3$ and $(O_2N)_2C_6H_3Cl$ in EtOH yielded *dinitrophenyl-dl-leucylglycine*, m. 150–2°, and *dinitrophenetole*, m. 87°. Cystine-HCl and $(O_2N)_2C_6H_3Cl$ with *N* NaOH yielded *dinitrophenylcystine*, m. 156°, and dinitrophenetole. *p*-$H_2NC_6H_4COCl$ and *dl*-leucylglycine gave *p-aminobenzoyl-dl-leucylglycine*, decomps. above 250°. This formed a red dye when diazotized and coupled with 2,3,6-$C_{10}H_4(OH)(SO_3H)_2$. In the prepn. of the above *p*-$H_2NC_6H_4COCl$ from the amino acid and $SOCl_2$ a by-product was *p-aminobenzoyl-p-aminobenzoic acid*, m. above 300° (decompn.). This also yielded a red dye with HNO_2 and 2,3,6-$C_{10}H_4(OH)(SO_3H)_2$. Treatment of *dl*-leucylglycine Me ester in $CHCl_3$ with *p*-$H_2NC_6H_4COCl$ gave *p-aminobenzoyl-dl-leucylglycine Me ester*, m. 60°. Analogous derivs. obtained by similar condensations were *o-chlorobenzoyl-dl-leucylglycine*, m. 208–

10°, from the dipeptide and *o*-ClC_6H_4COCl; *o-nitrobenzoyl-dl-leucylglycine*, m. 231°, from the dipeptide and *o*-$O_2NC_6H_4COCl$; and *o-nitrobenzoyl-dl-leucine*, m. 145°, from leucine and *o*-$O_2NC_6H_4COCl$. Reduction of both of these $C_6H_4NO_2$ derivs. with Zn dust and AcOH yielded the same *o-aminobenzoyl-dl-leucine anhydride*, m. 255°; an attempt to methylate the latter with CH_2N_2 was unsuccessful. *o-Nitrobenzoylglycine*, m. 190°, was obtained from *o*-$O_2NC_6H_4COCl$ and glycine in *N* NaOH, and reduced by Zn dust and AcOH to *o-aminobenzoylglycine anhydride*, m. 320° (decompn.). *dl-α-Bromoisocaproyl-o-aminobenzoic acid*, m. 110°, was similarly prepd. from $Me_2CHCH_2CHBrCOBr$ and *o*-$H_2NC_6H_4CO_2H$, and aminated by NH_4OH to *dl-leucyl-o-aminobenzoic acid anhydride*, m. 185° (HCl salt decomps. 215–20°). Methylation of the latter by CH_2N_2 gave a *N-Me deriv.*, m. 105°, for which 4 isomeric formulas are possible. A by-product of the amination was *α-hydroxyisocaproyl-o-aminobenzoic acid*, m. 146°. Both of the anhydrides above named contain 7-membered rings. The 2nd anhydride was condensed with $ClCH_2COCl$ to *chloroacetyl-dl-leucyl-o-aminobenzoic acid*, m. 176°. Other derivs. obtained by direct condensation with *o-* or *p*-$H_2NC_6H_4CO_2H$ were: *chloroacetyl-o-aminobenzoic acid*, m. 185°, aminated to *glycyl-o-aminobenzoic acid*, m. 215–20° (decompn.); *dl-α-bromoisocaproyl-p-aminobenzoic acid*, m. 173°, aminated to *dl-leucyl-p-aminobenzoic acid*, m. 220°, and a by-product, *α-hydroxyisocaproyl-p-aminobenzoic acid*, m. 193–5°. *dl*-Leucyl-*p*-aminobenzoic acid was condensed with $ClCH_2COCl$ to *chloroacetyl-dl-leucyl-p-aminobenzoic acid*, m. 217°. *p*-$MeC_6H_4SO_2NH_2$ was condensed with $ClCH_2COCl$ to *p-toluene-N-chloroacetylsulfonamide*, m. 88–9°, and the latter aminated to *p-toluene-N-glycylsulfonamide*, m. 207°. This was condensed with *dl*-$Me_2CHCH_2CHBrCOBr$ to *p-toluene-N-bromoisocaproylglycylsulfonamide*, m. 137°. *m*-$HO_2CC_6H_4SO_2NH_2$ and $(ClCH_2CO)_2O$ gave *m-chloroacetylsulfamidobenzoic acid*, m. 212° (decompn.). This was aminated with NH_4OH and the crude glycyl deriv. was coupled with *dl*-$Me_2CHCH_2CHBrCOBr$ to *m-(dl-α-bromoisocaproylglycylsulfamido)benzoic acid*, m. 174°. An attempt to couple 2-nitro-4-chlorophenylthioamide with $ClCH_2COCl$ yielded the sulfoxide and disulfide of the former, and di(chloroacet)imide, m. 195°. The latter was aminated to *diglycineimide*, isolated as the HCl salt. $BzNH_2$ and $ClCH_2COCl$ gave *N-chloroacetylbenzamide*, m. 157°, which could not be aminated. Urea and $ClCH_2COCl$ gave *chloroacetylurea*, m. 180°, which on treatment with NH_4OH yielded hydantoin. Condensation of taurine with *dl*-$Me_2CHCH_2CHBrCOBr$ and amination of the crude oily intermediate gave *dl-leucyltaurine*, m. 285°. In general the hydrolysis of a polypeptide by *N* NaOH is impeded by the introduction of a SO_2R into the NH_2, whether the R is aromatic or aliphatic. The *m*-cresoltrisulfonyl deriv. is an exception in this respect. On the other hand, the thio derivs. are more readily hydrolyzed than the parent peptides. Ph on the NH_2 impedes hydrolysis, but if the Ph carries NO_2 groups the hydrolysis is accelerated. If the SO_2 is substituted in the CO_2H instead of the NH_2 no inhibition occurs. In such derivs. there is cleavage of both peptide and sulfonamide linkages. Compds. which contain a CONHCO grouping (chloroacetylbenzamide, chloroacetylurea, diglycineimide) are very labile toward alkali. The stability of compds. contg. both SO_2NH and CO_2H is not due wholly to the presence of 2 acid groups, since benzoylglycylaspartic acid is readily hydrolyzed. Erepsin hydrolyzed both leucyl-*p*-aminobenzoic acid and leucyltaurine, showing that exotic components do not inhibit hydrolysis if the natural component carries a free NH_2. Substitution in the CO_2H, even if the substituent carries a free CO_2H (BzOH derivs.) inhibits polypeptide hydrolysis by trypsin-kinase. Factors which influence the alkali cleavage of polypeptides are not only the nature of the substituent group, but also its state of oxidation (difference between SO_2NH and SNH), its place of entrance (NH_2 or CO_2H), its acidity or basicity as detd., *e. g.*, by NO_2 groups, and finally multisubstitution as illustrated in the cresoltrisulfonyl deriv. A. W. Dox

The configuration of the halopropionic acids and the alanines. Karl Freudenberg, Werner Kuhn and Ilse Bumann. *Ber.* 63B, 2380–90(1930).—The optical displacement principle is formulated as follows: Derivs. of α-substituted fatty acids or other compds. with a center of asymmetry (which are analogous among themselves, contain no labile H and can be observed without solvents) undergo a change of rotation in the same direction if the substituents corresponding to each other are varied in such manner as to produce a great change in direction of rotation. The rotations $[M]_{578}^{20}$ of the Me esters, chlorides and dimethylamides of α-azido-, α-chloro-, α-bromo- and α-iodopropionic acids and of benzoyl-, acetyl- and toluenesulfonyl-lactic acids are tabulated. The directions and amts. of the rotation of the substituent groups are compared and the vicinal rule is applied. Mary E. Lear

The splitting off of halogen by dilute alkali from stereoisomeric haloacylamino acids and their behavior toward erepsin and trypsin-kinase. Emil Abderhalden and

FRIEDRICH SCHWEITZER. *Fermentforschung* 12, 231–43(1930); cf. *C. A.* 24, 3024.—The 2 racemic pairs *A* and *B* from *dl*-α-bromopropionyl-*dl*-norvaline have previously been shown (*C. A.* 24, 3024) to split off Br at different rates under the influence of dil. alkali. The 4 individual isomers have now been prepd. and their rate of Br cleavage detd. *dl*-Norvaline was converted into the formyl deriv. by 4 treatments with HCO_2H, the brucine salt sepd. into its isomers, the brucine removed by treatment with *N* NaOH and extn. with $CHCl_3$ and Et_2O, and the formyl group split off by 10% HCl. *l*-Norvaline was coupled with $BrCH_2COBr$ to *bromoacetyl-l-norvaline*, m. 92°, $[\alpha]_D^{20}$ 9.2°, and *d*-norvaline to *bromoacetyl-d-norvaline*, m. 95°, $[\alpha]_D^{20}$ —8.6°. In a similar manner *l*-α-*bromopropionyl-l-norvaline*, m. 110°, $[\alpha]_D^{22}$ —9.0°, *l*-α-*bromopropionyl-d-norvaline*, m. 105°, $[\alpha]_D^{20}$ — 18°, *d*-α-*bromopropionyl-d-norvaline*, $[\alpha]_D^{22}$ 8.5°, and *d*-α-*bromopropionyl-l-norvaline*, $[\alpha]_D^{22}$ 15°, were prepd. *dl*-α-*Bromopropionyl-dl-leucine* was also prepd. from *dl*-MeCHBrCOCl and *dl*-leucine and sepd. by crystn. into its isomeric pairs *A*, m. 149–50°, and *B*, m. 118–9°. *dl*-α-*Bromoisocaproyl-dl-valine* was likewise sepd. into *A*, m. 130–2°, and *B*, m. 173–4°. The rate of Br cleavage at p_H 8.4 was detd. for all of these prepns. The interesting observation is that the *dd*- and the *ll*-forms of bromopropionylnorvaline undergo cleavage at the same rate, as also the *ld*- and the *dl*- forms. The last 2, however, have a much higher rate of cleavage than the 1st 2 These rates correspond exactly with those of the *A* and *B* pairs of isomers. The different rates of cleavage by trypsin-kinase, previously reported, are now shown to be in error. The detns were made by titration and represent merely the splitting off of Br by the alkali. Detns. by the Van Slyke method show that no other hydrolysis occurs. The 2 isomers of bromoacetylnorvaline, in which only 1 asym. C is present, showed no difference in rate of Br cleavage by NaOH From the bromopropionylleucines the rate of Br cleavage was greater with *B* than with *A*. On the other hand, trypsin-kinase hydrolyzed *A* more rapidly than *B*. Br was split off more rapidly from bromoisocaproylvaline *A* than from *B*, while trypsin-kinase attacked neither. A new method is thus presented for detg. the identity of isomeric racemic pairs of haloacylamino acids. The *dd*-, *ll*-pair splits off halogen more rapidly than the *dl*-, *ld*-pair. A. W. DOX

The optical rotation of *l*-cystine. Determination of its value for the sodium and mercury lines and of the temperature factor. GERRIT TOENNIES AND THEODORE F. LAVINE. *J. Biol. Chem.* 89, 153–66(1930).—An apparently pure sample of *l*-cystine can be prepd. by systematic fractionated repptn. from acid soln. at different H-ion concns. For identification purposes the Hg line is more convenient and accurate and gives the value $[\alpha]_{Hg}^{29} - 241.87 \pm 0.15°$. The value $[\alpha]_D^{29} - 205.1 \pm 0.2°$ is 10° lower than the one recently reported by Andrews (*C. A.* 20, 3158) but is in agreement with observations of several of the earlier investigators. The av. temp. coeff. between 20–30° was found to be —2.06° $[\alpha]_D$ for —1° against 1.7° $[\alpha]_D$ found by Andrews. This temp. factor is unusually large. An apparently straight line relation between temp. and rotation was found. A. P. LOTHROP

Sugar degradation in alkaline medium with and without the simultaneous action of oxidative reagents. F. FISCHLER AND J. REIL. *Biochem. Z.* 227, 140–56(1930).—An attempt has been made to find the stoichiometric relation between the degradation of sugar and the reducing power of the Cu salts, by adjusting the method to avoid the results of extreme sensitivity of AcCHO to alkali. This, however, was not successful, partly because the AcCHO production is not uniform and partly because of various disturbing circumstances, like caramel formation. By diminishing the OH-concn. the degradation of the sugar may be more simplified but now the distillate contains AcHO and HCHO instead of AcCHO and the residue H_2CO_3, AcH and HCO_2H. AcCHO distd. under similar conditions gives the same products as hexose. The oxidative destruction of sugar in alk. medium with the aid of H_2O_2, $KMnO_4$, etc., proceeds through 3-C chain compds., of which AcCHO is the one of primary significance. S. M.

A simple procedure for obtaining methylglyoxal solutions. EDUARD HOFMANN AND CARL NEUBERG. *Biochem. Z.* 226, 489–91(1930).—To 3 g. of AcCH : NOH in 50 cc. H_2O, at 0°; 4.4 g. of HSO_3NO_2 crystals is gradually added so that the temp. does not exceed +3°. The soln. is now carefully warmed to about 40°, when N_2O escapes violently. When the gas evolution has ceased the soln. is shaken several times with ether to remove any residual AcCH:NOH, the ether is evapd. and the AcCHO is distd. off on a paraffin bath at 140–50°. As concn. of the soln. is to be avoided 20 cc. H_2O is added before the distn. has progressed too far. The concn. of the first 0.2 of the distillate is about 2%, that of the next 0.4 1.4% and of the remaining portion 0.4%. S. MORGULIS

The transformation of acetoacetic acid by methylglyoxal. II. M. HENZE AND R. MÜLLER. *Z. physiol. Chem.* **193**, 88–96(1930); cf. *C. A.* **24**, 4267.—The Ba salt of $AcCH_2CO_2H$ reacts with AcCHO, forming probably an aldol of the formula $AcCH(OH)\text{-}CHAcCO_2H$, and this when acidified loses CO_2 and yields a hydroxydiketone, *2,5-diketo-3-hexanol*, b_{12} 113.5°, which partially rearranges to an isomeric form m. 95°. This ketol possesses the properties of a 1,4-diketone (pyrrole reaction) and of an α-ketol (easy oxidation). Ag_2O oxidizes it to AcOH, while NaOBr removes the terminal Me groups, leaving malic acid. It forms a *p-bromophenylhydrazone*, m. 181°, a *p-nitrophenylhydrazone* (I), m. 198°, and a *semicarbazone* (II), m. 210° (decompn.). I and II readily lose H_2O and undergo ring closure to the corresponding pyrazole derivs. which m. 254° and 254° (decompn.), resp. Of biol. interest is the fact that this ketol represents the synthesis of a 6-C chain contg. 1 less H_2O and 2 less O than glucose. A. W. DOX

Halogenated derivatives of pyruvic acid. M. GARINO, A. CERESETO, M. BERNI AND M. BRAMBILLA. *Gazz. chim. ital.* **60**, 582–92(1930).—In view of the peculiar instability of $AcCO_2H$ (I) and its halogen derivs., already discovered by G. (cf. *C. A.* **17**, 1624, 1625), a systematic study of all the halogen derivs. which could be obtained in a state of purity was begun. It was found that 1 H atom of the Me in I was easily replaced by Cl, that a 2nd H atom of the Me group was replaced only with difficulty, and that it was impossible to replace the 3rd H atom by Cl in the latter case, even with the aid of catalysts, sunlight and ultra-violet radiation. Following the directions of Schreder (cf. *Ann.* **177**, 282(1875)) $Cl_3CC(OH)_2CO_2H$ was obtained instead of Cl_3CCOCO_2H. On the other hand, Br can replace 2 or 3 H atoms and I 3 H atoms of the Me group of I. Mono-Br derivs. in the early literature (*Ber.* **1**, 265(1868-9); *Ann.* **177**, 282(1875)) were found to be erroneously described. The halogen derivs. of I form stable condensation products, except in the case of the mono-Cl and tri-I derivs., which hydrolyze. The tri-substituted derivs. hydrolyze most easily, forming with hot water derivs. of $CHCl_3$ and $(CO_2H)_2$, and the higher the at. wt. of the halogen involved the more pronounced is this tendency to hydrolyze. In a dry atm. or *in vacuo*, free Br and I are liberated. $ClCH_2COCO_2H$ (II), prepd. by the method already described (*C. A.* **17**, 1624, 1625), crystallizes either as such or with 1 H_2O. With H_2O it is very stable when solid below 15°, decomps. very slowly at 25° (formation of HCl and CO_2) and decomps. in a few days at 40°. The anhyd. form is less stable and can be kept only below 15°. Its aq. soln. is the most stable of any of the halogen derivs., but nevertheless decomps. slowly. Data show the quantity of HCl formed in this soln. as a function of the time and temp. for 5 and 40% solns. at 0°, 25° and 40°. Freshly prepd. II can be dild. greatly with water without its undergoing hydrolysis. The dissocn. const. K is 0.00626. After some time hydrolysis begins and increases progressively. This hydrolysis may be explained by reference to the explanation of Wolff for I (cf. *Ann.* **317**, 6(1901)); 2 II $\longrightarrow$ $ClCH_2C(CO_2H)(OH)CHClCOCO_2H \longrightarrow ClCH_2\text{-}\overline{C(CO_2H).CHCl.CO.CO.O}$ + $H_2O \longrightarrow CH_2(OH)\overline{C(CO_2H).CHCl.CO.CO.O}$ + HCl, and $\overline{CH_2.C(CO_2H):CCl.CHOH}$ + CO_2, which explains the evolution of HCl and CO_2. The prepn. of $CHCl_2COCO_2H$ (III) has also been described (*loc. cit.*). The yield varies greatly (10–100%) with the freshness of the I used. III is unstable even when freshly prepd., and when dry evolves HCl at 30–5°, and in water it hydrolyzes immediately if concd. and if the temp. is above 20°. It may therefore be lost in part or completely during attempts to crystallize it. When kept 10–5 days at 10–2° in a dry condition from the time it is first crystd., it becomes stable and it can then be dissolved in water and recrystd. repeatedly even at 20–5° without much loss. Five % solns. begin to hydrolyze after 3 days at 25° and after 18 hrs. at 40° Solns. of 5–50% are more stable, evolve HCl after 5 days at 25° and after 30 hrs. at 40°. The stabilized form showed a dissocn. const. of 0.0078. $CHBr_2COCO_2H$ (VI) was prepd. by the method of Grimaux (*Bull. soc. Ann.* (1) **21**, 390(1874)). Freshly prepd., it is very stable and showed evidence of hydrolysis only after a considerable time (5% soln. after 24 hrs. at 25° and after 6 hrs. at 40°, and 5–50% solns. after 3 days at 25° and after 45 hrs. at 40°). It is stable when solid and shows no change in acidity or test for HBr, but the elec. cond. changes in such a way as to give evidence of slow decompn. which is confirmed by the fact that the older it is the lower the yields of products in which it is used as a starting material in the syntheses. When freshly prepd., the dissocn. const. is 0.1527, but this diminishes so that after 1 hr. it became 0.00737–0.00256 (depending upon the diln). $CHClBrCOCO_2H$ (V), prepd. as described in the earlier expts. (*loc. cit.*), has properties intermediate between those of III and IV. When freshly prepd., its dissocn. const. is 0.01076, but this changes with time, and low yields are obtained in syntheses in which it is used as a starting ma-

terial. Fresh solns. are stable even when very dil. and do not hydrolyze after several days. When kept below 50%, III, IV and V do not liberate the hydrohalogen acid or CO_2, so the changes which these compds. undergo are a result of simple condensation. On the other hand, in soln. they decomp. like II, except that the evolution of CO_2 takes place long after the beginning of hydrolysis and therefore represents an advanced state of decompn. CBr_3COCO_2H (VI), prepd by the method of Grimaux (*loc. cit.*), is difficult to obtain free of hydro acids because of the tendency to hydrolyze in soln., but once purified and crystd. it is stable, and in the solid state it does not undergo condensation. On the other hand, its solns. hydrolyze readily, and this hydrolysis increases with the diln. and with the temp. Above 60–5°, it is decompd. by water thus: $VI + H_2O \longrightarrow CHBr_3 + (CO_2H)_2$. Br (105 g.) added during 24 hrs. to II (50 g. in 50 cc. of water) at 50–60°, the soln. filtered through glass wool, the filtrate evapd. *in vacuo* to 0.5 its vol., the crystd. ppt. combined with the original residue, yields 80% of crude product from which only 5–6 g. of pure *chlorodibromopyruvic acid*, $CClBr_2COCO_2H$ (VII), can be obtained. Its solns. begin to decomp. at approx. 80° with the odor of $CHClBr_2$, while at higher temps. lachrymatory substances are evolved. It has no m. p. and decomps. when heated. It is sol. in its own wt of water at 15° and in about $^2/_3$ its wt. at 50°. It is quickly decompd. by alkalies, with formation of $CHClBr_2$. With KOH and thymol it gives a violet color In concd. soln. with $AgNO_3$ it ppts. the *Ag salt*, but in dil. soln. AgCl and AgBr are slowly formed. *In vacuo* and even in a desiccator, Br and then HBr and HCl are liberated, after a few hrs. when VII is freshly prepd. and after several days when it is old. VII remains in soln. several hrs. without hydrolyzing, but in boiling water it decomps. into $CHClBr_2$ and $(CO_2H)_2$. It can be heated in the dry state to 140–5° without decompn The various properties described apply to VII freshly prepd., but after a yr. or so it becomes highly resistant. $CCl_2BrCOCO_2H$ (VIII) has been described by Hantzsch (cf. *Ber.* **22**, 2851(1889)). To obtain a quantity sufficient for purification 50% aq. III at 80–90° is treated dropwise with Br. The yield of crude VIII is high, but most of it is lost in repeated crystns. Its m. p. is not well defined because fusion it decomps. partially at temps. which depend upon the rate of heating. With $AgNO_3$ VIII ppts. slowly AgCl and AgBr and in concd. soln. it forms the *Ag salt*, $CCl_2BrCOCO_2Ag$. When heated at 95–100° in concd. soln., VIII decomps. into $(CO_2H)_2$ and $CHCl_2Br$, and this decompn. is accelerated greatly by alkalies. It becomes more stable with age when kept in a fairly dry atm. In general the trihalogenated pyruvic acids are characterized by their perfect stability when kept in the solid state at room temp. (analyses after 1 yr. were exactly the same), but an increase in the resistance to hydrolysis as a function of the diln. and the temp. indicates some sort of change in the mols Solns. of the acids undergo 2 different decompns.: (1) one at moderate temps. which first forms hydro acids followed by further decompn. to CO_2 and hydro acids, and (2) one at higher temps. which forms $(CO_2H)_2$ and a halogenated deriv. of CH_4. Cl replaces 1 or 2 H atoms in I, but upon replacement of the 3rd H atom the mol. becomes extremely unstable. On the other hand, Br replaces 2 or 3 H atoms, and if only 1 H atom is replaced the mol. remains very unstable. I replaces all 3 H atoms, but it has been impossible to replace only 1 or 2 H atoms. All halogen derivs. of I in the solid state form more stable condensation products, except II (*loc. cit.*) and VI. Water decomps these halogen derivs. in a way which varies with the no. of H atoms substituted by halogen, and of the derivs. the trisubstituted derivs. hydrolyze most readily, and the greater the no. of halogen atoms present the greater the tendency to hydrolyze. In a dry atm. or *in vacuo* all Br derivs. liberate Br, and VI liberates I. C. C. Davis

Hydrogenation of acetoacetic ester and certain of its derivatives over nickel. Homer Adkins, Ralph Connor and Howard Cramer. *J. Am. Chem. Soc.* **52**, 5192–8(1930); cf. *C. A.* **25**, 89.—$AcCH_2CO_2Et$ (I) readily takes up 1 mol. equiv. of H over a Ni catalyst at temps. from 100–50°; if the hydrogenation is carried out in EtOH, $MeCH(OH)CH_2CO_2Et$ is formed practically quant.; in the absence of solvent or in Et_2O or methylcyclohexane, there is formed along with 2 parts of the ester, 1 part of a deriv., *Et β-(β'-hydroxybutyryloxy)butyrate* (II), b_{18} 154–6°, d_{28}^{25} 1.0678, n_D^{25} 1.4360; despite the fact that II is the ester of a sec. alc., it did not undergo alcoholysis at the temp. used for the reduction of I or in a boiling EtOH soln. of EtONa. II did undergo alcoholysis at 190° in the presence of a Ni catalyst. II appears to be formed through the reduction of 2 mols. of I with the elimination of 1 mol. of EtOH. This was postulated by Arndt and Nachtway as an intermediate in the formation of dehydroacetic acid (III) from I, so that the results here reported support their hypothesis. The Me deriv. of I behaved similarly, giving about 26% of *Et α-methyl-β-(α'-methyl-β'-hydroxybutyryloxy)butyrate*, b_{11} 155–8°, d_{28}^{25} 1.0332, n_D^{25} 1.4393. The α,α-di-Me and α-Me α-Et esters reduced

smoothly to the corresponding simple HO esters either with or without a solvent since there was no possibility of the formation of a complex ester analogous to that formed from the β-ketonic esters capable of enolization. III appears to give 4-heptanone as the chief product in hydrogenation over Ni (heptan-4-ol forms a 3,5-dinitrobenzoate, m. 64°; *α-naphthylurethan*, m. 79–80°). The use of H pressure in excess of 300 atms. appears not only very greatly to accelerate the rate of hydrogenation but to favor the formation of the ketone with a decrease in the products formed by hydrolysis and alcoholysis of the III. III undergoes a smooth alcoholysis to I at 190°. C. J. West

Decomposition of ethyl butylacetoacetate into caproic acid and methyl amyl ketone. Nathan L. Drake and R. W. Riemenschneider. *J. Am. Chem. Soc.* **52**, 5005–8 (1930).—Formation of $C_6H_{11}CO_2H$ from $AcCHBuCO_2Et$ in satisfactory yield is possible only in very concd. alkali. Increase in the alkali concn. from 51 to 59.5% of NaOH per 100 g. of soln. causes an increase in yield of acid from 30.5 to 57.7%; best yields of ketones were obtained in the more dil. solns. The optimum temp. for acid production is about 75°. At 75° and 59.5 g. of hydroxide per 100 g. of soln., little increase in yield of acid was obtained by using more than 8 mols. of hydroxide per mol. of ester but a decrease below 8 resulted in a very considerable drop in acid yield with a simultaneous rise in the yield of ketone. C. J. West

Levulinic acid and its esters. Peter P. T. Sah and Shao-Yuan Ma. *J. Am. Chem. Soc.* **52**, 4880–3(1930).—Details are given for the prepn. of levulinic acid from sucrose, the yield being about 150 g. from 1 kg. sucrose; the acid b_4 145°, b. 245–6°, m. 33–5°. The esters were prepd. by using an excess of the abs. alc. and a small amt. of HCl. Me, b. 191–3°, d_4^{20} 1.05113, n_D^{20} 1.4231, mol. refraction (Gladstone and Dale), 52.36, (Lorenz and Lorenz) 31.52 (this order will be followed for other esters); Et, 199–201°, 1.01336, 1.4225, 60.08, 36.17; *iso-Pr*, 203–5°, 0.98422, 1.4220, 67.79, 40.83; Pr, 214–6°, 0.98988, 1.4255, 67.96, 40.88; *iso-Bu*, 222–4°, 0.97047, 1.4264, 75.63, 45.48; *Bu*, 229–31°, 0.97452, 1.4290, 75.77, 45.53; *iso-Am*, 238–40°, 0.95921, 1.4310, 83.64, 50.23. *Semicarbazones: Me*, m. 142–3°; *Et*, m. 147–8°; *Pr*, m. 129–30°; *iso-Pr*, m. 141–2°; *Bu*, m. 102–3°; *iso-Eu*, m. 112–3°; *iso-Am*, m. 91–2° *Phenylhydrazones: Me*, m. 94–6°; *Et*, m. 103–4°; *Pr*, m. 88–90°; *iso-Pr*, m. 108–9°; *Bu*, m. 79–81°; *iso-Bu*, m. 84–6°; *iso-Am*, m. 70–2°. The phenylhydrazones are unstable toward O. C. J. West

Reactivity of atoms and groups in organic compounds. XI. The influence of the structure of the substituent on the temperature of decomposition of certain derivatives of malonic acid. James F. Norris and Ralph C. Young. *J. Am. Chem. Soc.* **52**, 5066–9(1930); cf. *C. A.* **24**, 1637.—The temps. have been detd. at which $CH_2(CO_2H)_2$ and certain of its alkyl derivs. break down into CO_2 and monobasic acids. The influence of the radicals studied on the decompn. temps is of the same order of magnitude as that found in the earlier study of the pyrolysis of Ph_3C alkyl ethers; the temp. is lowered in the 2 series as the radical is changed from Me to Et to Pr but rises when Bu is present. The Me_2CH radical derivs. in the 2 series decomp. at lower temps. than the Pr compds. In both series of compds. the decompn. temps. fall in the same order, with varying alkyl radicals, as the rates at which alcs. contg. the same radicals react with an acyl chloride. There appears to be a relationship between the effect of a radical on the lability of a bond as measured by the temp. of pyrolysis and the rate at which the bond is broken in a chem. reaction. C. J. West

Oxidation of some dibasic acids. W. H. Hatcher and W. H. Mueller. *Can. J. Research* **3**, 291–305(1930); cf. *C. A.* **23**, 1877.—The oxidation products when H_2O_2 reacts with malonic, tartronic, succinic, malic, tartaric, maleic and fumaric acids and the mode of oxidation are given in this paper. The rates of reaction indicate the comparability of satd. acids having the same no. of C atoms, the constancy of monohydroxylization in its velocity influence and the diverse effects of $[H^+]$. The mode of oxidation suggests in each case a complex through which decompn. occurs. The effects of geometrical isomerism and the ethylenic linkage are well marked. Peracid formation is considered to be a side reaction. Conclusion: Oxidizability is due to 2 or more of the following 3 factors: susceptibility to oxidation of the org. compd., reactivity of H_2O_2 to the kind of structure presented to it and ionic condition of the medium. J. W. S.

Catalytic reduction of carbon monoxide under ordinary pressure. VI. The hydrocarbon-forming action of iron catalysts. Shinjiro Kodama. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) **14**, No. 269, 169–83(1930)(in German); cf. *C. A.* **24**, 4376.—Fe catalysts for synthetic hydrocarbons are of greater com. importance than those contg. Co. No exptl. details on Fe catalysts have yet appeared. Fe catalysts produce no H_2O; Co catalysts always, sometimes several times as much as hydrocarbon.

The CO_2 content of the reaction gas is about 20% when using Fe catalysts; with Co 5–10%. The unconverted reaction gas with Fe catalyst contains more CO than H_2; with Co the opposite. Fe catalysts give a colored oil; Co seldom a yellow, never a colored benzine. Fe catalysts require higher temp. than Co. Catalysts contg. mostly Fe withdraw O of the CO in the form of CO_2. Since CO is more decompd. than H_2, the H_2 content of the final gas is always greater than the CO content; with Co, *vice versa*. A catalyst contg. Fe 1, Cu 1, Na_2CO_3 0.02, gives the best yield, 1.8 cc. kerosene and 1.4 cc. benzine from 157.0 l. of gas, which is lower than that from Co-Cu catalysts contg. MgO or ZrO_2. Addn. of MgO to the Fe catalyst injured it. Without addn. of alkali an Fe-Cu catalyst forms only lower hydrocarbons. E. M. SYMMES

Some technical applications of aliphatic acids. FREDERICK CHALLENGER. *Ind. Chemist* **6**, 390-2(1930).—In this review of the literature, work concerning the following is discussed: adipic acid and its uses; acetonedicarboxylic acid; maleic and fumaric acids, their manuf. and conversion to malic acid; the production of certain aliphatic acids by molds. A bibliography is included. E. G. R. ARDAGH

Heptadecyladipamic acid and heptadecylsebacamic acid. BONIFAZ FLASCHENTRAGER AND HEINZ LACHMANN. *Z. physiol. Chem.* **192**, 268-73(1930).—The derivs. here described were prepd. with a view to detg. the mode of biol. oxidation of acylated amino acids with long hydrocarbon chain. Heptadecylamine-HCl was obtained from stearic acid by the Naegeli-Curtius and by the Jeffreys-Hofmann reactions (*vide supra*) and found to m. 163° instead of 158° (Naegeli *et al.*, *C. A.* **23**, 2418). It seps. from dil. aq. soln. as a gel. This when injected into the ventral lymph sac was fatal to frogs. Subcutaneous injection in rabbits and guinea pigs caused local necrosis, while intravenous injection was fatal, with symptoms of embolism. In Et_2O soln the free base takes up CO_2 to form a carbamic acid and this unites with the excess of base and a salt seps., *viz.*, *heptadecylamine heptadecylcarbamate*, $C_{17}H_{35}NH_2.C_{17}H_{35}NHCO_2H$, m. 99.5–102.5°. The $PhSO_2$-*deriv. of heptadecylamine*, m. 64.7°, was prepd. in 61.4% yield by the customary procedure. *Heptadecylamine gluconate*, $C_{17}H_{35}NH_2.CH_2(OH)(CHOH)_4CO_2H$, sinters 105° and m. 140°, was obtained in 55.4% yield by shaking an Et_2O soln. of the base with the calcd. quantity of 50% aq. gluconic acid. The base was coupled with $ClOC(CH_2)_4CO_2Et$ in Et_2O, forming 45.5% of *Et N-heptadecyladipamate*, m. 77–7.5°; the *free acid*, m. 120°, was obtained from the ester through the *Ba salt*, decomps. 198°. A similar coupling with $ClOC(CH_2)_8CO_2Et$ gave 40% of *Et N-heptadecylsebacamate*, m. 82°; *free acid*, m. 115°; *Ba salt*, decomps. 204°. All of these derivs. were very little sol. in H_2O and therefore not suitable for feeding expts. with animals. A. W. DOX

Synthesis of the *i*-hydroxyasparagines. A note on their dissociation constants. ROBERT K. CANNON. *Biochem. J.* **24**, 945-53(1930).—*i*-*para*- and *i*-*anti*-Hydroxyaspartic acids were synthesized from maleic acid by Dakin's method (*J. Biol. Chem.* **16**, 241) and reacted with NH_3 to give the diamide. When the diamide was allowed to stand with baryta partial hydrolysis occurred, with the formation of both α-acid *i*-hydroxyasparagines. These 2 last substances are differentiated by their Cu salts. The dissocn. consts. of the substances are summarized. BENJAMIN HARROW

A new synthesis of aspartic acid. MAX S. DUNN AND B. W. SMART. *J. Biol. Chem.* **89**, 41–50(1930).—Aspartic acid has been synthesized through the following reactions: Phthalimidomalonic ester ⟶ *Na phthalimidomalonic ester* (I) ⟶ *tri-Et ethane-α-phthalimido-α,α,β-tricarboxylate* (II) ⟶ aspartic acid-HCl ⟶ aspartic acid. II was obtained in 92% yield by the action of CH_2ClCO_2Et on I. I reacts readily with various org. halogen compds. but only with CH_2ClCO_2Et and $(CH_2Br)_2CH_2$ were stable addn. products formed. A. P. LOTHROP

The biuret reaction. II. The biuret reaction of di-acid amides. MARY M. RISING, JOSEPH S. HICKS AND GEORGINE A. MORRE. *J. Biol. Chem.* **89**, 1–25(1930); cf. *C. A.* **23**, 1115. —Reaction of a mol. with alkali and Cu ion to give the biuret reaction involves salt and complex ion formation and in a di-acid amide there must be 2 acid H atoms in each mol. for salt formation and 1 or more amine N atoms for complex ion formation. In addn. if substitution has been made in such a way as to render the amide so weakly basic that complex ion formation is prevented, or so weakly acid that salt formation is prevented, no biuret reaction can occur. An increase in the no. of C or N atoms sepg. the amide groups ("separation factor") also weakens the strength of the amides as acids so that salt formation is ultimately hindered. Thus, biuret, oxamide and malonamide readily show the reaction; mono- and sym. dialkylated oxamides show the reaction but unsym. and trialkylated oxamides do not; *N*-monoalkylated malonamides show the reaction while further alkylation of the malonamide mol. prevents it. The prepn. and properties of the following compds. are described: *Na Cu biuret, Na Cu malonamide, N-ethylmalonamide, Na Cu monoethyloxamide, Na Ni monoethyloxamide,*

Na Cu (sym.) diethyloxamide. Structural formulas for certain of these complexes are proposed. A. P. LOTHROP

Oxidation. III. Behavior of formyl-, acetyl- and benzoyl-thiosemicarbazide towards lead oxide. SATISH CHANDRA DE. *J. Indian Chem. Soc.* **7**, 651–4(1930); cf. *C. A.* **22**, 4123.—Formylthiosemicarbazide boiled with excess PbO in EtOH 1 day gives *2-amino-1,3,4-furodiazole* (I), m. 155°, in "very poor yield." The *5-Ph deriv.* (II) of I, prepd. in an analogous manner in "good yield," m. 245° (decompn.), and the *5-Me deriv.* (III), m. 183°. The *Ac deriv.* of III m. 180°, and the *Ac* and *Bz deriv.* of II, m. 223° and 203°, resp. No diazonium compds. can be isolated from I or III, but II yields *2-nitrosoamino-5-phenyl-1,3,4-furodiazole* (IV) which blackens at 103°. Reduction of IV with Zn in HOAc gives *2-hydrazino-5-phenyl-1,3,4-furodiazole*, isolated as its *benzylidene deriv.*, m. 243° (decompn.). II and $Ca(OCl)_2$ give *5,5'-diphenyl-2,2'-azo-1,3,4-furodiazole*, orange, m. 329–30°, which on reduction with $(NH_4)_2S$ yields *5,5'-diphenyl-2,2'-hydrazo-1,3,4-furodiazole*, m. 233°. A. F. SHEPARD

Reactions relating to carbohydrates and polysaccharides. XXXII. Constitution of sedosan (anhydrosedoheptose). HAROLD HIBBERT AND C. G. ANDERSON. *Can. J. Research* **3**, 306–17(1930); cf. *C. A.* **22**, 2141; **24**, 4628.—Methylation of sedosan gives a tetramethylsedosan which oxidized by HNO_3 yields an optically inactive trimethoxyglutaric acid. Esterification of the latter followed by treatment with anhyd. $MeNH_2$ gave an optically inactive methylamide, presumably trimethoxyriboglutarodimethylamide. No trace of the methylamide of inactive dimethoxysuccinic acid could be found. H. and A. conclude that sedose possesses a 2,6-O_2 ring and that sedose is an anhydrosedopyranose. The isolation of monotritylsedosan showed that sedosan has but one primary alc. group. Sedosan is therefore 2,7-anhydrosedopyranose. The epimerization of trimethyl-δ-arabonolactone into trimethyl-δ-ribonolactone apparently takes place only with great difficulty. The structure of sedosan is in harmony with its lack of tendency towards polymerization and this is in accord with the views of H. on the relation of structure to polymerization. J. W. SHIPLEY

The ring structure of methyl glucodesoside. P. A. LEVENE AND L. A. MIKESKA. *J. Biol. Chem.* **88**, 791–8(1930).—The assignment of a 1,5-ring structure to Me glucodesoside by Bergmann and Breuers (*C. A.* **23**, 3670) is confirmed by the prepn. of 2 different lactones, one from glucodesonic acid, and the other from Me glucodesoside. Since the former has the normal 1,4-structure, the latter is considered to be 1,5, and its instability is due to the reduced C atom. 2-Desoxyglucose was oxidized by $Ba(IO_3)_2$ (Goebel, *C. A.* **21**, 1967) to the Ba salt of *2-desoxy-d-gluconic acid*, (6.14 g. from 4 g. desoxy sugar); the free acid (I), m. 145° (uncor.). By heating a 2% soln. of I in a sealed tube 24 hrs. at 100°, concg. under reduced pressure, and extg. with C_6H_6 and then with acetone, was obtained *glucodesonic lactone* (II), m. 95–7° (uncor.), $[\alpha]^{25}_D = 68°$ (H_2O). From II by methylation, first in acetone and then in MeI, was obtained *trimethyl-d-glucodesonic lactone* (1,4), m. 62° (uncor.) $[\alpha]^{25}_D$ 21.5° (C_6H_6). Me 2-desoxyglucoside was prepd. according to Bergmann, Schotte, and Lechinsky (*C. A.* **16**, 2118), methylated at 50–60° with Me_2SO_4 and NaOH, extd. with $CHCl_3$ and the *trimethyl-d-methylglucodesoside* (III) distd., $b_{0.35}$ 86–90°. Treatment of III with excess Ag_2SO_4 in hot 0.1 *N* HCl, and extn. with Et_2O yielded *trimethyl-d-glucodesose*, m. 58–61°, $[\alpha]^{25}_D$ 59.5° at first (H_2O) and 33.1° at equil. (H_2O). From this, *Ba trimethyl-d-glucodesonate* was prepd. as I, $[\alpha]^{25}_D$ 18.1° (H_2O). The Ba was removed, and the soln. concd. under reduced pressure, and further concd. in acetone at 0.02 mm., and extd. with alc. to yield *trimethyl-d-glucodesonic lactone* (1,5), b. 137° (approx.), $[\alpha]^{25}_D$ 87.5° ($CHCl_3$), 88.2° (C_6H_6). K. V. THIMANN

Hexose monophosphates. Glucose 3-phosphate, glucose 6-phosphate and their bearing on the structure of Robison's ester. P. A. LEVENE AND ALBERT L. RAYMOND. *J. Biol. Chem.* **89**, 479–99(1930); cf. *C. A.* **23**, 1885.—The synthetic glucose monophosphate prepd. through diacetoneglucose is glucose 3-phosphate. It is not identical with Robison's ester (*C. A.* **17**, 1036) and therefore the latter cannot be glucose 3-phosphate. Through monoacetoneglucose it is possible to prep. an ester similar in many of its properties to the Robison ester and this ester is presumably glucose 6-phosphate. The m. p. of its osazone does not agree with that from the Robison ester but it is suggested that the latter ester may not have been prepd. in an entirely pure state. Further purification of the Robison's ester is now in progress in order to permit the comparison of its osazone and other derivs. with those of the synthetic 6-phosphate. A. P. LOTHROP

Chemical examination of the glucomannan obtained from "Konjak." KITSUJI NISHIDA AND HIDEO HASHIMA. *J. Dept. Agr. Kyushu Imp. Univ.* **2**, 277–360(1930).—The constitution of the glucomannan from "Konjak" is in dispute. According to

various investigators it consists of glucose, mannose and fructose in the relationships 1:2:0, 2:5:0, 2:3:1. The mannan studied by N. and H. was prepd. by 2 methods: (1) Hydrolysis of the powder from Konjak tubers with water under a pressure of 1–1.5 atm., pptn. of Cu mannan with Fehling soln., and decompn. of the Cu compd. with HCl, after which the glucomannan was filtered off, washed with alc. and ether and dried *in vacuo* over P_2O_5. (2) Hydrolysis by means of a 10% pancreatic soln. with PhMe at 35° over a period of 2 weeks, followed by the same treatment as in (1). The product was a finely divided white powder which did not reduce Fehling soln. The procedures employed in studying the constitution of this glucomannan were: quant. hydrolysis, acetylation, acetolysis and methylation. The hydrolysis was carried out with concd. HCl (d. 1.21–1.223) at 0–15° for 24 hrs. and with 1, 2, 5 and 10% HCl and H_2SO_4 at the temp. of boiling water. The sugar formed was detd. as glucose by the method of Bertrand. The % glucose varied from 102 to 108% (theoretical 111.1%), the best sugar yield being obtained with 2% HCl heated on a boiling-water bath for 25 hrs. It was concluded that fructose was not present on the basis of a neg. resorcinol test, a trace only of blue color with $(NH_4)_2MoO_4$ soln., and a detn. of aldose sugars (according to the method of Kolthoff (cf. *Z. f. Untersuch. d. Nahr. u. Genussmittel* 45, 131(1923). That the mannan is glucomannan, *i. e.*, that it consists of 2 mols. mannose and 1 mol. glucose, was concluded from the pptn. of mannose phenylhydrazone with $PhNHNH_2$ and from rotation data calcd. on the basis of the sp. rotation of glucose and mannose as compared with the total sugar as detd. by Bertrand's method. The acetylation of the mannan with Ac_2O in the presence of pyridine gave as chief product the monoacetate, while in the presence of $SnCl_2$ and $ZnCl_2$ it gave the triacetate (m. 187–90°, $[\alpha]^{15}_D$—21.5°, AcOH content 60.33–63.65%, and mol. wt. detd. in freezing $CHBr_3$ 2299–2382, indicating the probable formula $[C_6H_7O_2(OAc)_3]_9$). The acetolysis was carried out most satisfactorily when the proportions were as follows: 8 g. glucomannan, 40 g. Ac_2O, 46 g. glacial AcOH and 4 g. concd. H_2SO_4. The reaction mixt. was kept at 22–26.5° for 8–20 days. The course of the reaction may be represented as follows: Glucomannan acetolyzed ⟶ $C_{18}H_{21}O_5(OAc)_{11}$, (m. 95-110°, $[\alpha]^{20}$ 18°) which on sapon. with NH_3 in abs. MeOH ⟶ glucomannotrihexose (m. 217°, $[\alpha]^{20}_D$ —16°) ⟶ 2 disaccharides, glucomannobiose (m. 150-60°, $[\alpha]^{20}_D$ 10.5°), and mannobiose (m. 125–40°, $[\alpha]^{20}_D$ —7.9°), ⟶ mannose and glucose. Repeated methylation gave as high value 41.6% OMe. On hydrolysis of the methylated glucomannan with 1% HCl in MeOH and then oxidation with HNO_3 (d. 1.2) trimethylsaccharic acid lactone was obtained, indicating that 2,3,4- and not 2,3,6-trimethylglucose was the intermediate product. Other products found to be present were 2,3,6-trimethylmannonic acid lactone and 2,3,4-trimethylmannosaccharic acid lactone. Assuming a 5-membered ring for glucose and mannose, N. and H. postulated a nucleus with mannose linked through a 1,6-linkage to a 2nd mannose which in turn is linked to glucose, again through a 1,6-linkage, with the linkage to other groups probably through C 4 of the first mannose and C 1 of the glucose.

A. WIEBEN

Combination of sucrose with boric acid. Considerations based upon variations of acidity of boric acid in the presence of sugar. JULIU VOICU AND EUGENIA AXENTE. *Bul. soc chim. Romania* **12**, 61–70(1930).—A soln. of boric acid in the presence of sucrose (0.9 *M*) (30.78%) varies considerably in acidity, and one is forced to assume that this bisaccharide combines with boric acid. The existence of this combination is more apparent in more moderate dilns. of boric acid. The max. increase of acidity appears at $^1/_8$ mol. (1.03%) of H_3BO_3. At a concn. of $^2/_3$ mol. (4.13%) H_3BO_3 this increase of acidity hardly exists any more. In view of the fact that the boric acid exists in concd. solns. in the "tetra" form, in dil. soln. in the "ortho" form and in view of the weak tendency of sucrose to combine with H_3BO_3, one can explain satisfactorily this behavior of H_3BO_3 and sucrose. Every time when dealing with a boric acid-sugar combination which corresponds to an increase in acidity, one has to do with very moderate concns. of H_3BO_3. It seems from the graphic representations of these results that the boric acid in the presence of sucrose exists in the "orthoboric acid" form, which combines with the sugar. One is forced to assume that there is an influence which disturbs the tetraboric acid. This influence manifests itself the more as the compd. sugar-boric acid possesses a less acid character. The diagrams show us the acidity of the boric acids in various concns. and the acidity of the combination of boric acid-sugar, the concn. of which is unknown.

F. R. GREENBAUM

Synthesis of a carbon chain by means of enzymes. II. The study of carboligases. A. STEPANOV AND A. KUZIN. *Ber.* **63B**, 2473–6(1930); cf. *C. A.* **24**, 3600.—A series of expts. to make a suitable dry prepn. from beer yeast to use as a synthesizing agent is

described. A ppt. with alc. and acetone, dissolved in $(NH_4)_2SO_4$, adsorbed in $Al(OH)_3$ is chosen for measurement. Its activity does not diminish in 4 months, increases with its concn., increases with time of standing, decreases in the presence of $CHCl_3$ and is optimum at a temp. of 25–30°. The activity is measured by the synthesis of methyl-acetyl-carbinol from pyroracemic acid. MARY E. LEAR

Catalytic action at high temperature and under high pressure. II. Catalytic hydrogenation of aromatic nitro compounds. SHIGERU KOMATSU AND RYODO AMATATSU *Mem. Coll. Sci. Kyoto Imp. Univ.*, Ser. A, **13**, 329-36(1930); cf. *C. A.* **24**, 5718.—Pure $PhNO_2$, shaken 3.5 hrs. with a reduced Ni catalyst in an autoclave filled with H_2 at 50 atm. and heated to 100°, was quantitatively reduced to $PhNH_2$ Repeating at 200° and a H_2 pressure of 100 atm. at 15°, the products were $PhNH_2$ 5%, *cyclohexylamine* 78%, and dicyclohexylamine 7%; and substantially the same result was obtained by using $PhNH_2$ in place of $PhNO_2$. At 100° and 50 or 100 atm. *p*-nitrophenol gave a quant. yield of *p*-$H_2NC_6H_4OH$; at 160° the principal product was the aminocyclohexanol. At 50° under 30 or 100 atm. H_2 α-$C_{10}H_7NO_2$ was quantitatively reduced to α-$C_{10}H_7NH_2$; at 160° the product was mostly *α-aci*-tetrahydronaphthylamine. The latter compd. was also obtained from α-$C_{10}H_7NH_2$ at 150° and 30 or 100 atm. L. E. GILSON

Carbithioic acid studies. II. Cyclohexylcarbithioic acid and various derivatives. R. W. BOST AND W. W. WILLIAMS *J. Am. Chem. Soc.* **52**, 4991-2(1930); cf. B and Mattox, *C. A.* **24**, 1099.—*Cyclohexylcarbithioic acid*, from cyclohexyl bromide, Mg and CS_2, is a reddish brown liquid with a putrid odor, slowly decompg on exposure to air; it distils with decompn. *Ag salt*, brick-red, m. 163°; *p-toluidide*, m. 160°; *Me ester*, orange-red, b_3 90°; *Et ester*, orange-red, b_5 106°; *Pr ester*, orange red, b_5 106°; *Bu ester*, orange red, b_5 145°. Oxidation of the acid gives hexahydrobenzoic acid. The acid chloride and thioamide could not be prepd. C. J. WEST

Cymene. A preliminary study. J. ALFTHAN. *Finska Kemistsamfundets Medd* **36**, 90–108(1927).—2-Nitrocymenesulfonic acid had not before been prepd. from 2-nitrocymene. The nitro group directs, in general, the new substituents principally to the *m*-position, and the main product is 2-nitrocymene-6-sulfonic acid The best yield (70–80%) was obtained with 1.83 H_2SO_4 at 130°, blood charcoal being used to aid the sulfonation The 2-nitrocymenesulfonic acid was nitrated, but instead of the iso-Pr group being substituted with formation of trinitrotoluenesulfonic acid, dinitrocymene sulfonic acid was obtained. The sulfonation of 2,6-dinitrocymene gave neg. results. JOHN RYSELIN

Organic compounds of molybdenum. SIEGFRIED L. MALOWAN. *Arch. Pharm* **268**, 537–9(1930).—A series of expts with $MoCl_5$ and $PhNH_2$ (and *o*-$MeC_6H_4NH_2$, resp.) are described leading apparently to the formation of org. Mo derivs. of relatively stable (in the air) character, but as yet of undetd. constitution. W. O. E.

Derivatives of di- and tri-arylamines. RUDOLF JOSZT AND WACŁAW LEŚNIAŃSKI *Roczniki Chem.* **10**, 523–9(539–40 German)(1930). - The condensation of 2-phenyl amino-5-nitrobenzoic acid (I) and its salts and Et ester with PhI was studied and it was found that the phenylation of I with PhI gives only the decarboxylated compd., *p*-nitro-triphenylamine. The *4-nitrotriphenylamine-2-carboxylic acid* (II) sought could not be obtained by the condensation of *2-iodo-5-nitrobenzoic acid* (III) with Ph_2NH and, therefore, *2-methyl-4-nitrotriphenylamine* (IV) was prepd and subjected to oxidation. The following compds. were prepd.: III was synthesized from $Cl(O_2N)C_6H_3CO_2H$ which was heated with 5 parts aq. 25% NH_4OH at 150° in an autoclave giving nitroanthranilic acid (m. 274°, decompn.) in 95% yield. On diazotization and treatment with KI III (m. 197–8° (cor.)) was obtained in 92% yield. IV is formed by heating the correspond ing nitrotoluidine with an excess of PhI with the addn of K_2CO_3, $PhNO_2$ and Cu brass for 48 hrs., yield 83%; orange-yellow plates from AcOH, EtOH, m. 130.5–1.5°. II is formed in small amt. by oxidation of IV with CrO_3 in boiling AcOH soln. It crystallizes with 1 mol. EtOH, m. 100° with effervescence Besides the triarylamine deriv., *2-methyl-4-nitrodiphenylamine* (V) is formed on heating PhI with an excess of nitrotoluidine, in the presence of K_2CO_3, $PhNO_2$ and Cu for 12 hrs. Yield 50%, gold-yellow plates from benzene, m. 140–1°. On heating the nitro compd. in alc. with Sn and HCl *2-methyl-4-aminotriphenylamine* is formed, colorless needles from alc., m. 94–9°, b_4 227°. The HCl salt forms silvery shining white flakes, m. 217°. *Mono-Ac deriv.* is formed by short heating with Ac_2O at room temp., colorless crystals, m. 144–5.5°. The azo dye prepd. from diazotized V and β-naphthol is dark red, thick crystals with metallic luster, m. 186–8° (toluene). On coupling the diazotized base with chromotropic acid a violet-blue dye is formed. *2-Methyl-5-aminodiphenylamine* is formed by the reduction of the nitro compd. with Sn + HCl in alc., white needles from petroleum ether, m. 49–50°, b_4 196–9°.

HCl salt, m. 185–7°. *Mono-Ac deriv.* prepd. similarly as the triaryl compd., crystallizes from hot water in colorless needles, m. 139–40°. Characteristic color reactions with concd. H_2SO_4 were observed in all di- and tri-arylamine derivs. described. A green-blue color appears in the triaryl compds. exclusively; on the other hand, the yellow di-arylamine derivs. give red-violet solns. These color reactions can serve as a control for purity. J. KUČERA

Formation of a complex mixture of many RMgX compounds from the reaction between a simple RX compound and magnesium. HENRY GILMAN AND NINA B. ST. JOHN. *J. Am. Chem. Soc.* **52**, 5017–23(1930).—The carbonation of PhMgBr and of PhMgCl, each prepd. in the absence of Et_2O, gave in addn. to BzOH very small quantities of *p*-$PhC_6H_4CO_2H$. The formation of the latter acid is almost certainly due to free Ph radicals initially developed in the prepn. of PhMgX. Attention is directed to the theoretical and in some cases practical formation of a large and complex variety of Grignard reagents starting with a single and simple RX compd. Although the degree of these side reactions is fortunately very limited and in most cases insignificant, it emphasizes the difficulty or impossibility of prepg. absolutely pure compds. C. J. WEST

Valency problems of the quinquevalent electronegative phosphorus atom. I. LUDWIG ANSCHÜTZ AND FRITZ WENGER. *Ann.* **482**, 25–35(1930).—To throw light on the orientation and nature of the valencies of the quinquevalent electroneg. P atom (*i. e.*, as in compds. derived from P oxyacids with a quinquevalent central atom) an attempt has been made to resolve the compd. $[MeC_6H_3(O)_2P(O)_2C_6H_3Me]Cl$(I), which should exist in 2 forms if 4 of the valencies are disposed tetrahedrally. Homocatechol (II) and PCl_5 in dry Et_2O give *dihomocatechylphosphorus chloride* (I), very sensitive to moisture. With *l*-menthol in Et_2O I gives *l-di(4-methyl-1,2-phenylene)menthyl orthophosphate*, m. 65–70°; attempts to resolve the latter by fractional extn. were unsuccessful. Preliminary expts. with other substituted catechols have so far also been unsuccessful. II and $POCl_3$ in Et_2O give *homocatechylphosphorus chloride* (III), b_{11} 102°, m. 22–4°, a by-product is *4-methyl-1,2-phenylene phosphite*, b_{11} 265°. Chlorination of III gives the corresponding *trichloride*, b_{11} 158°, not obtained directly from II and PCl_5. Heating III with S at 190° gives *homocatechylphosphorus chlorosulfide*, $MeC_6H_3O_2PClS$, b_{11} 142–3°. C. J. WEST

The action of Grignard reagents on sulfonyl chlorides. RENÉ TRUCHET. *Compt. rend.* **191**, 206–9(1930). —Arylsulfonyl chlorides and RMgX give RCl together with sulfides, sulfoxides and sulfinic acids (cf. Gilman and Fothergill, *C. A.* **24**, 85). Apparently sulfones are only formed when R is aryl. Sulfones are not reduced by RMgX and T. explains the formation of sulfoxides by the interaction of RMgX with the sulfinate first formed. EtMgBr (22 g.) and $PhSO_2H$ (14 g.) give 5 g. of a mixt. of PhSOEt and PhSEt. A. F. SHEPARD

Orthanilic acid. V. V. SHARVIN, G. I. ARBUZOV AND S. L. VARSHAVSKII. *J. Chem. Ind.* (Moscow) **6**, 1409–12(1929).—The literature on *orthanilic acid* (*o*-$H_2NC_6H_4SO_3H$) is scant compared to that on sulfanilic and metanilic acids. The authors review the available literature and supplement it by the results of their own investigations. They selected for prepn. of the acid those methods which exclude the formation of isomers. Kreis's method (Ger. pat. 84,141; *Ann.* **286**, 377), involving the following steps: *PhNHAc* ⟶ *p-BrC₆H₄NHAc* ⟶ *5,2-Br(H₂N)C₆H₃SO₃H* ⟶ *orthanilic acid*, gave satisfactory results only after introduction of certain modifications into the published process. Thus, the sulfonation was carried out *in vacuo* at 168–170° with 93% H_2SO_4, however, about 10–12% of the initial *p*-bromoanilide remained unsulfonated. The elimination of Br by means of Zn dust in alkali soln. takes 15 hrs. instead of the prescribed 6. The yield of orthanilic acid is not less than 60%. Wohlfart's method (*J. prakt. Chem.* **66**, 551(1902)) involving the steps *o-O₂NC₆H₄Cl* ⟶ (*o-O₂NC₆H₄S*)₂ ⟶ *o-O₂NC₆H₄SO₃H* ⟶ *orthanilic acid*, also had to be modified. In the reduction step, the prescribed use of Zn dust had to be replaced by the common neutral reduction with Fe filings. The yield was 75%. Wohlfart's method is preferable to Kreis's because it requires fewer intermediate products and a shorter time (11 hrs. as against 30 hrs.). The method of Fierz-David, Schlittler and Waldmann (*C. A.* **23**, 4680) is also discussed. *Detn. of orthanilic acid* in a mixt. of its isomers is also discussed in detail. One method is conversion into the resp. *chlorosulfonamides* ($ClC_6H_4SO_2NH_2$) whose characteristic m. ps. are known. A visual test discovered by the authors is as follows: The orthanilic acid is diazotized and coupled to salicylic acid in alk. soln. If to the brown soln. is added, after 5–10 min., an excess of concd. HCl, a bright red ppt. is formed. A similar test on sulfanilic acid gives a pale yellow ppt.; on metanilic, a light brown. This test is applicable even to a mixt. of the isomers. The explanation is that

the HCl apparently dehydrates the azo compd. according to the equation: *p*-$HO_3SC_6H_4N{:}NC_6H_3(OH)CO_2H \longrightarrow SO_2.C_6H_4.NN{:}C_6H_2(CO_2H){:}O$. Concd. H_2SO_4 may be used instead of HCl, but is less desirable because of the heat developed. Glacial AcOH does not produce this result. Another test is to diazotize and couple to γ-acid (2,8,6-$C_{10}H_5(NH_2)(OH)SO_3H$). Under similar conditions of coupling, the dyestuff derived from orthanilic acid is readily salted out; the one from sulfanilic acid does not salt out, but ppts. upon acidification with HCl. This method may be used for *sepg.* the 2 isomers. The diazo compds. themselves differ in *o*- and *p*-$H_2NC_6H_4SO_3H$. Diazoörthanilic acid is somewhat more sol. and settles less readily to the bottom than diazosulfanilic. Also, the former has a tinge of yellow while the latter is pure white. *Phenylhydrazine-o-sulfonic acid* is not described in the literature. The authors prepd. it by reducing diazoörthanilic acid with $SnCl_2$ at about −8° to 0°; yield 68%. *1-o-Sulfophenyl-3-methyl-5-pyrazolone* is obtained from this by condensation with $AcCH_2CO_2Et$. The latter should be taken in excess, and the mass should be heated to about 120°. The resulting pyrazolone was coupled to *diazobenzene*. The dyestuff obtained possesses an exceptionally pure yellow shade, with a slight greenish tinge. Its fastness to light is considerably greater than that of tartrazine or fast-yellow. The dyestuff corresponding to tartrazine and derived from *o*-$H_2NNHC_6H_4SO_3H$ and hydroxytartaric acid is not fast to light. Sixteen azo dyes were prepd. with *orthanilic acid* (I) as component. These were as follows: (1) I ⟶ resorcinol; (2) I ⟶ resorcinol ⟵ *m*-xylidine; (3) I ⟶ resorcinol ⟵ benzidine ⟶ salicylic acid; (4) I ⟶ salicylic acid; (5) I ⟶ α-naphthol; (6) I ⟶ β-naphthol; (7) I ⟶ *p*-xylidine; (8) I ⟶ *p*-xylidine ⟶ β-acid; (9) I ⟶ dimethylaniline; (10) I ⟶ diphenylamine; (11) I ⟶ S-acid; (12) I ⟶ γ-acid; (13) I ⟶ Chicago acid ⟵ α-naphthylamine; (14) I ⟶ Chicago acid ⟵ benzidine ⟶ salicylic acid; (15) 2 mols I ⟶ terephthalyldi(5-hydroxy-7-sulfo-2-naphthylamide); (16) I ⟵ benzidine ⟶ naphthionic acid. Their colors do not differ much from the corresponding dyestuffs with sulfanilic acid. Their fastness to light is not great. Conclusion: About the only practical utility of I is in the prepn. of pyrazolone dyestuffs of the type of fast-yellow G; in this case the dyestuffs are more beautiful in shade and quite fast to light. The other azo dyes from I have hardly any technical value. DAVID KATZ

Potentials of some unstable oxidation-reduction systems. LOUIS F. FIESER. *J. Am. Chem. Soc.* 52, 4915–40(1930).—By means of a "discontinuous titration" method it has been possible to det. the oxidation-reduction potentials of systems which are so unstable that the half-life period for the decompn. of the oxidant is of the order of 0.1 0.5 min. With the systems formed by *p*-$H_2NC_6H_4OH$ and 2 of its *N* alkyl derivs. the variation of the potential with the H-ion concn. has been studied in the p_H range 1–8 and the basic dissocn. consts. have been detd. from the results. The term normal potential is defined as the p. d. between a dil. soln. of equimol. quantities of the oxidant and the reductant, when neither is ionized, and a H electrode in the same solvent.

Rounded Average Values

System named as reductant	Normal potential, E_0 Alc. v.	Water v.	Half-life (neutral soln.) Alc. v.	Water v.

p,p'-Dihydroxybiphenyl	.954	.....	1.6	...
p,p'-Dihydroxystilbene	.854	.....	1.1	...
p-Phenylenediamine	.783	(.801)	0.5	0.1
N-Methyl-*p*-phenylenediamine	.751	..	.5	

The potential of $O{:}C_6H_4{:}C_6H_4{:}O$ and its reduction product is the highest yet recorded for an org. system. The substitution of the NH group for the ketonic O progressively increases the affinity of the quinonoid substance for *H*. The $O{:}C_6H_4{:}NMe$ and $HN{:}C_6H_4{:}NMe$ are lower in potential than the parent substances by about the same amt.; a $PhCH_2$ group has much the same effect as Me. The ionization consts. for *p*-$H_2NC_6H_4OH$ and $NH{:}C_6H_4{:}O$ are not appreciably affected by the substitution of Me for H but they are both decreased by the substitution of a $PhCH_2$ group. The quinonimine in each case has a smaller dissocn. const. than its reduction product. There appears to be

System, named as reductant	First Basic Dissocn. Consts. Reductant K_r	pK_r	Oxidant K_o	pK_o

p-Aminodimethylaniline	3.9×10^{-8}	7.4	5.0×10^{-7}	6.3
o-Tolidine	6.2×10^{-10}	9.2	2.7×10^{-8}	7.6

little correlation between the velocity of decompn. and the acidity of the soln.; the only marked effect noted is that $O:C_6H_4:NH$ is decidedly more stable at p_H 7–8 than in more acidic solns. It is evident that the rate of reaction often varies considerably according to the nature of the soln. and the relative concns. of oxidant and reductant and that there is often a great difference in the behavior of closely related compds. The original should be consulted for the details of the method of procedure and for the data for the 7 systems studied. C. J. WEST

Indirect method of studying the oxidation-reduction potentials of unstable systems, including those from the phenols and amines. LOUIS F. FIESER. *J. Am. Chem. Soc.* 52, 5204–41 (1930).—The unstable systems formed by phenols or amines and the free radicals formed as their immediate oxidation products have been characterized by a new term called the crit. oxidation potential. This is the potential of some oxidizing soln. which will cause a certain small quantity of the amine or phenol to become oxidized in 5 min. when equiv. amts. of the sample and of the oxidizing agent are employed. This value, which may be detd. with reasonable accuracy, represents the potential at which the velocity of oxidation becomes vanishingly small and hence the result is influenced by the reaction rate to an extent which is insignificant. This has been demonstrated experimentally, for the crit. oxidation potential bears a definite relationship to the normal potential and it is influenced no more by temp. changes than is the latter quantity. The crit. oxidation potentials of over 70 compds. have been detd. and many relationships, conclusions and deductions pointed out in discussing the results. The following values for E_c (v.) at 25° are reported: PhOH 1.089, *o*-MeC_6H_4OH 1.040, *p*-MeC_6H_4OH 1.038, *m*-MeC_6H_4OH 1.080, 2,4-$Me_2C_6H_3OH$ 0.895, *p*-$HOC_6H_4CH_2CO_2H$ 1.051, *p*-$HOC_6H_4CH_2Ph$ 1.052, $(p\text{-}HOC_6H_4)_2CH_2$ 1.038, saligenin 1.052, *o*-HOC_6H_4Ph 1.038, *p*-HOC_6H_4Ph 1.036, *o*-$MeOC_6H_4OH$ 0.868, *p*-$MeOC_6H_4OH$ 0.848, *m*-$MeOC_6H_4OH$ 1.052, $(MeO)_2C_6H_3OH$ 0.760, *p*-HOC_6H_4OPh 1.030, cresol 0.825, eugenol 0.831, isoeugenol 0.757, *m*-$H_2NC_6H_4OH$ 0.894, *p*-$Me_2NC_6H_4OH$ 0.718, 2,4,6-$Cl_3C_6H_2OH$ 1.103, vanillin 1.080, pyrocatechol 0.742, *m*-$C_6H_4(OH)_2$ 1.043, nitrohydroquinone 0.697, esculetin 0.759, 1,3,5-$C_6H_3(OH)_3$ 0.799, 1,2,3-$C_6H_3(OH)_3$ 0.609, β-$C_{10}H_7OH$ 1.017, 2-$O_2NC_{10}H_7OH$ 1.141, 2-$HO_2CC_{10}H_6OH$ 1.065, 2-$NaO_3SC_{10}H_6OH$ 0.881, 5-$MeOC_{10}H_6OH$ 0.792, 1,3-$C_{10}H_6(OH)_2$ 0.754, 1,5-$C_{10}H_6(OH)_2$ 0.673, 2,3-$C_{10}H_6(OH)_2$ 0.812, 2,6-$C_{10}H_6(OH)_2$ 0.690, 2,7-$C_{10}H_6(OH)_2$ 1.007, anthranol 0.693, α-anthrol 0.602, β-anthrol 0.820, 1-phenanthrol 0.848, 2-phenanthrol 1.057, 3-phenanthrol 1.013, 9-phenanthrol 0.798, 2,6-dihydroxyphenanthrene 1.010, 3,6-isomer 0.832, $(p\text{-}HOC_6H_4)_2$ 0.882, *p,p'*-dihydroxystilbene 0.786, dioxindole 0.745, $PhNH_2$ 1.135, PhNHMe 1.053, PhNHEt 1.038, $PhNHCH_2Ph$ 1.057, Ph_2NH 1.008, $(p\text{-}EtOC_6H_4)_2NH$ 0.836, *p*-$MeC_6H_4NH_2$ 1.077, *p*-$MeOC_6H_4NH_2$ 0.892, *m*-tolylenediamine 0.864, PhCH:NHNHPh 0.791, PhN:NHNPh 1.058, $PhCH(NH_2)CO_2H$ 0.833, β-$C_{10}H_7NH_2$ 1.064, *p*-$H_2NC_6H_4OH$ 0.673, *p*-$C_6H_4(NH_2)_2$ 0.710, *p*-$H_2NC_6H_4NHPh$ 0.696, *p*-$HOC_6H_4CH(NH_2)CO_2H$ 0.603, PhSH 0.812, Me_2CHSH 0.819, mercaptobenzothiazole 0.785. C. J. WEST

Action of hydrogen sulfide on acid chlorides. I. Hydrogen sulfide and benzoyl chloride. LUDWIK SZPERL. *Roczniki Chem.* 10, 510–21 (521–2 French) (1930).—It has been found that H_2S reacts with BzCl at high temp. H_2S was passed through BzCl without using any solvent (*a*) as well as dissolved in decalin (*b*) and xylene (*c*) at 180–5° and 145°, resp. The following products were isolated in the reaction (*a*): HCl, S, BzOH, Bz_2S_2 (m. 135–6°), $PhCH(SBz)_2$ (I) and a small amt. of sulfurated substance, m. 28–30°; in the reaction (*b*): HCl, Bz_2S_2, smaller amt. of S, BzOH and I which was not isolated, however; in the reaction (*c*): HCl, Bz_2S_2, Bz_2S (m. 47–8°) and BzOH. These compds. are presumably formed by the direct action of H_2S on BzCl, by the reaction between BzCl and BzSH formed and by the reducing action of H_2S as well as BzSH. It has been observed that the m. p. found for Bz_2S_2 is higher than that given in the literature. It does not become red on heating as is the case in the presence of impurities as Na_2SiO_3, acid and normal alkali carbonates. By the action of $CdCO_3$ and $AgCO_3$ the sulfides of these metals are obtained. The colored substance formed in minute quantities could not be isolated. Prolonged heating of Bz_2S_2 with Na_2CO_3 gives

a profound change. No corresponding salts of BzSH were obtained by heating Bz_2S_2 in xylene with Mg, Ni, Al, Cu and Ag, only Hg giving a salt, white needles, decompg. at 90°. Bz_2S is obtained in a good yield by the action of dry BzSNa on BzCl in Et_2O. On heating with salt, Bz_2S becomes violet and changes to rose-orange after some time.
J. KUČERA

Chemical and physicochemical studies on methylglyoxal and its relation to the alkaline degradation of glucose. F. FISCHLER, H. HAUSS AND K. TÄUFEL. *Biochem. Z.* **227**, 156–70(1930).—Methylglyoxal can be purified by distn. over $BaCO_3$ under diminished pressure. The pure substance shows max. absorption in the ultraspectroscope at 2840 A. U. and a min. at 2400 A. U. Purest prepns. of glucose do not show any selective absorption, but under the influence of very dil. alkali after a while the absorption consts. of pure AcCHO appear. This absorption can be dissipated practically completely by the addn. of acid to a weak litmus reaction. Under the influence of alk. caramel quickly appears in the pure AcCHO solns. even in the cold and with a relatively low OH-concn., and at the same time lactic, acetic and formic acids are produced. The quant. production of these acids with different OH and AcCHO concns. was more or less proportional. So far attempts to obtain AcCHO from various lactates by dehydration have not succeeded.
S. MORGULIS

Some halogen derivatives of acyl- and alkylresorcinols. C. M. BREWSTER AND J. C. HARRIS. *J. Am. Chem. Soc.* **52**, 4866–72(1930).—This study was undertaken because of the germicidal and other properties of resorcinol derivs. Resacetophenone and Br in AcOH give *ω-dibromo-3,5-dibromo-2,4-dihydroxyacetophenone*, yellow, m. 110–10.5°; $FeCl_3$ gives a wine-red color; reduction gives 3,5,2,4-$Br_2(HO)_2C_6HEt$. Details are given of the prepn. of 2,4-dihydroxypropiophenone (I) and its 3,5-Br_2 deriv.; a *tri-Br deriv.* was also obtained with 2 5 times the amt. of Br required for a di-Br deriv.; it is yellow, m. 157–8°. I yields a *di-Cl deriv.*, m. 146 7°, when Cl is passed into an AcOH soln. In the prepn. of 2,4-dihydroxybutyrophenone (II), m. 68–70°, there is also obtained in some cases 20% of a compd. m. 111–2°; the *di-Cl deriv.* of II m. 110.5–1°. *3,5-Dibromo-2,4-dihydroxy-1-ethylbenzene*, m. 74°, was obtained by reduction of dibromoresacetophenone or by bromination of 2,4-$(HO)_2C_6H_3Et$; the *di-Cl deriv.*, m. 78–9°, could not be obtained pure by the chlorination method
C. J. WEST

A multivalent alcohol present in the seeds of Castanea vesca. F. TRAETTA-MOSCA AND M. VENEZIA. *Ann. chim. applicata* **20**, 445 8(1930).—By means of dialysis to remove all electrolytes, and then extg. with boiling EtOH, a crystallizable ext. was obtained from powd. dry chestnuts, *Castanea vesca*, sol. in water, insol. in common org. solvents, m. 164°, inactive to polarized light, and which does not reduce Fehling soln., or NH_3-$AgNO_3$. The ultimate analysis indicates polyhydric, 8-C alc. Acetylation yields a product m. 121°, whose analysis agrees for a product $C_8H_{11}Ac_7$; this is also confirmed by the analysis of the iodide, and by N_2 detn. on the phenylhydrazone, m. 195°, formed by oxidizing the alc. with HNO_3 and then adding $PhNHNH_2$. The same product, $C_8H_{14}O_5(PhNHN)_2$, is finally obtained if Br_2 is used as oxidizing agent.
A. W. C.

Kakishibu. VI. Potash fusion of methylshibuol. SHIGERU KOMATSU AND MASAO KURATA. *Mem. Coll. Sci. Kyoto Imp. Univ.*, Ser. A, **13**, 323-7(1930); cf. *C. A.* **23**, 2175.—Tetramethylshibuol (I) boiled with alc. KOH yielded gallic acid tri-Me ether and destetramethylshibuol (II), m. 299°. I fused with KOH at 200° yielded 10% of gallic acid 3,5-di-Me ether, small quantities of volatile acids, and 2 unidentified amorphous compds. II fused with KOH yielded gallic acid 3-Me ether, phloroglucinol, formic, acetic and butyric acids, and an amorphous substance insol. in alkali.
L. E. GILSON

The hydrogenation of methylphenyl- and methylbenzylcarbinols. With a note on the reduction of phenylated carbinols. P. A. LEVENE AND P. G. STEVENS. *J. Biol. Chem.* **89**, 471–7(1930); cf. *C. A.* **24**, 4008.—MeCH(OH)Ph on reduction undergoes a change in sign and so behaves like iso-PrCH(OH)Ph rather than EtCH(OH)Ph to which it seems more closely related. The reduction product of $MeCH(OH)CH_2Ph$, however, has the same sign of rotation. If the rule of Levene and Haller can be applied to cyclohexyl compds., then *d*-methyl- and *l*-ethylphenylcarbinols are configurationally related. Not only do secondary phenylated carbinols undergo reduction to hydrocarbons but primary and tertiary as well. If the hydrogenation of the Ph group is accomplished prior to the reduction of the OH, the latter then cannot be brought about by further treatment. With Ph_3COH, the hydrogenation stops after 1 Ph group has been hydrogenated but with Ph_2CHOH both Ph groups are reduced. Adam's Pt oxide catalyst was used, the solvent being glacial AcOH and the pressure of H_2 20–30 lb.
A. P. LOTHROP

Some esters of tribromomethylphenylcarbinol. J. W. HOWARD. *J. Am. Chem. Soc.* **52**, 5059–60(1930).—Freshly distd. BzH (37 g.) and 130 g. dry $CHBr_3$, treated with 4 g. powd. KOH during 0.5 hr., allowed to stand 2 hrs., treated with Et_2O and filtered and steam-distd., give 16–8 g. of $Br_3CC(OH)HPh$, m. 72.5–3.0°; acetate, m. 133°; *propionate*, m. 70.5°; *butyrate*, b_{220} 205–7°, d_{20}^{20} 1.779; *benzoate*, m. 146°.

C. J. WEST

α,β-Diphenylethyl ether and α-(*p*-methoxyphenyl)-β-phenylethyl ether. CORLISS R KINNEY AND W. GLEN BYWATER. *J. Am. Chem. Soc.* **52**, 4893-5(1930).—The action of N_2O_3 or of dry HCl on *p*-$MeOC_6H_4(PhCH_2)CHOH$ or the decompn. of the reaction product of $PhCH_2MgBr$ and *p*-$MeOC_6H_4CHO$ with concd. HCl gives *α-(p-methoxyphenyl)-β-phenylethyl ether*, m. 148-9°; oxidation gives BzOH and *p*-$MeOC_6H_4CO_2H$; distn. gives a compd., m. 107–8°, whose bromide m. 174–5°. *α,β-Diphenylethyl ether*, m. 130.5°, was similarly prepd. from $Ph(PhCH_2)CHOH$.

C. J. WEST

Oxidation of benzaldehyde. E. RAYMOND. *Compt. rend.* **191**, 616-8(1930).—Very pure BzH does not oxidize in an O atm., but traces of salts of Cu, Ag, Ni, Co and especially Mn catalyze the reaction enormously.

R. CHESTER ROBERTS

Reaction between the binary system magnesium + magnesium iodide and aromatic aldehydes. M. GOMBERG AND W. E. BACHMANN. *J. Am. Chem. Soc.* **52**, 4967-72 (1930).—BzH is reduced by a mixt. of Mg and MgI_2 to $PhCH(OMgI)(IMgO)HCPh$, thus using up 2 mols. of the aldehyde. The compd. so produced reacts immediately with a 3rd mol. of the aldehyde, with formation of the salts of benzoin and $PhCH_2OH$, $BzCH(OMgI)Ph$ and $PhCH_2OMgI$. The benzoinate salt suffers further partial, or complete, reduction by the binary system to tetraphenylerythritol and a polymer, or condensation product, of the latter. Other aromatic aldehydes are affected by the binary system, *i. e.*, by MgI, in a manner essentially similar to that in which BzH is affected.

Aldehyde reduced	Moles	g.	Alc. obtained	g.	Benzoin isolated as	g.
α-Naphth-	0.1	15.6	α-Naphthenyl	4.1	α-Naphthil	5.3

ω,ω-Dihalogen derivatives of aryl aliphatic ketones of the type $ArCOCHX_2$, especially ω,ω-chlorobromo derivatives of the type $ArCOCHClBr$. I. RABCEWICZ-ZUBKOWSKI AND H. KAPLIŃSKA. *Roczniki Chem.* **10**, 541-68 (568-9 English)(1930).—By the action of KCN on $ArCOCH_2Cl$(Ar = aryl) and $ArCOCH_2Br$, resp., the following ketocyanides of the type $ArCOCH_2CN$ were obtained: *p*-$BrC_6H_4COCH_2CN$, m. 162.4–3.4° (pale pink); *p*-$IC_6H_4COCH_2CN$, m. 187.4–8.4° (pale green); *m*-$NO_2C_6H_4COCH_2CN$, m. 152.0–3.0° (pale yellow); *p*-$MeC_6H_4COCH_2CN$, m. 104.6–5.2° (colorless); 2,4-$Me_2C_6H_3COCH_2CN$, m. 80.1–81° (colorless); β-$C_{10}H_7COCH_2CN$, m. 127.6–8.2° (colorless); *p*-$ClC_6H_4COCH_2CN$, m. 129.5–130° (colorless). *Benzoyldibromoacetamide*, $PhCOCBr_2CONH_2$, m. 181.6–2.4° (colorless crystals), was isolated from the products formed during the bromination of $BzCH_2CN$. The following ketothiocyanates were obtained by the action of KSCN on $ArCOCH_2Cl$ and $ArCOCH_2Br$, resp.: $PhCOCH_2SCN$, m. 74.1–4.6° (colorless); *p*-$ClC_6H_4COCH_2SCN$, m. 138.6–9.2° (colorless); *p*-$BrC_6H_4COCH_2SCN$, m. 148.8–9.2° (pale pink); *p*-$IC_6H_4COCH_2SCN$, m. 154.0–5.0° (pale green); *m*-$NO_2C_6H_4COCH_2SCN$, m. 123.6–4.2° (pale yellow); *p*-$MeC_6H_4COCH_2SCN$, m. 106.2–6.8° (colorless); 2,4-$Me_2C_6H_3COCH_2SCN$, m. 80.8–1.0° (colorless); *p*-$MeOC_6H_4COCH_2SCN$, m. 124.2–4.8° (colorless); β-$C_{10}H_7COCH_2SCN$, m. 109.4–10.0° (colorless). All m. ps. are corrected. During the bromination of ω-$BzCH_2SCN$ a Br addn. product, $PhCOCH_2SCNBr_2$, is formed, a very unstable compd. crystg. from alc. and forming $(C_9H_6ONS)_x$.

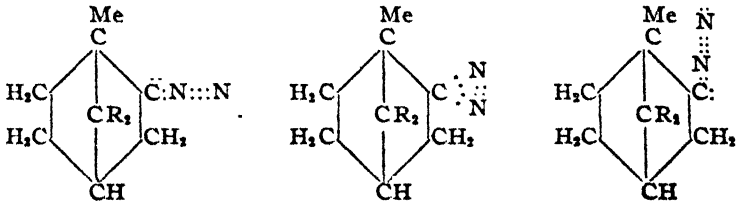
J. KUČERA

Replacement of halogen by hydrogen in α-halo ketones under the influence of the Grignard reagent. C. HAROLD FISHER, THOMAS S. OAKWOOD AND REYNOLD C. FUSON. *J. Am. Chem. Soc.* **52**, 5036–40(1930).—$Me_2CBrCOBr$ and 1,3,5-$C_6H_3Me_3$ with $AlCl_3$ in CS_2 give 69.5% of *α-bromoisobutyrylmesitylene* (I), b_{24} 160–70°, m. 27°; bromination gives nearly quant. *α,3,5-tribromo-2,4,6-trimethylisobutyrophenone* (II), m. 106–7° (cor.) Nitration of I gives the *3,5-di-NO_2 deriv.*, m. 117.8–8.5°. II was also prepd. by direct bromination of 2,4,6-$Me_3C_6H_2COCHMe_2$. II and MeMgCl in Et_2O give 71% of *3,5-dibromo-2,4,6-trimethylisobutyrophenone* (III), m. 70–1° (cor.). Bromination of III gives II, which is again reduced to III by Zn and AcOH. II and EtMgBr also give III.

In the Grignard reaction the enolate $Br_2Me_3C_6C(OMgBr):CMe_2$ is assumed to be formed. Treatment of this enolate with CO_2 did not give an acid. C. J. WEST

Some γ-nitro-β-furylbutyrophenones. NATHAN L. DRAKE AND H. W. GILBERT. *J. Am. Chem. Soc.* **52**, 4965–7(1930).—Condensation of furfural (I) and BzMe by 10% NaOH gives furfuralacetophenone (I), b_7 179°, b_{764} 319° (considerable decompn.), m. 26°. *Furfural-p-bromoacetophenone*, b_{16-18} 210–7°, m. 80–1°. Condensation of $MeNO_2$ and I with MeONa gives *γ-nitro-β-furylbutyrophenone*, m. 49.5–50°; *p-Br deriv.*, m. 72–3° (75% yield). $PhCH_2NO_2$ and I give *β-phenyl-γ-nitro-β-furylbutyrophenone*, m. 153–3.5°; *p-Br deriv.*, m. 87–8.5° (29% yield). C. J. WEST

ω-Alkylalkoxyaminopropiophenones. RANDOLPH T. MAJOR. *J. Am. Chem. Soc.* **52**, 5294(1930).—ω-Alkylalkoxyaminopropiophenones exhibit only slight anesthetic action, at least when they are applied to the mucous membrane of the tongue. These were prepd. by refluxing 1 mol. equiv. each of BzMe and *O,N*-dialkylhydroxylammonium chloride, 2 mol. equivs. of trioxymethylene and 10 mol. equivs. of abs. EtOH for 24 hrs. *ω-Methylmethoxyaminopropiophenone*, b_{23} 159° (50% yield); HCl salt, m. 155°; *ω-ethylethoxy deriv.*, b_9 151–3° (18% yield). C. J. WEST



The action of benzoic peracid on substituted glucals. P. A. LEVENE AND ALBERT L. RAYMOND. *J. Biol. Chem.* **88**, 513–8(1930).—When 3-methylglucal and triacetylglucal are acted upon by BzO_2H, glucose derivs. are obtained and glucals substituted in position 4 treated likewise yield mannose derivs. It seems that addn. of hydroxyls to C atoms is directed by the character of groups attached to C atom 3. Results of expts. are given. W. H. TIFFANY

The action of several organic acids on *d*-α-pinene. MARCEL DELÉPINE, JEAN REISMAN AND EDOUARD SUAU. *Bull. soc. chim.* [4], **47**, 966–86(1930); cf. *C. A.* **19**, 648.—A continuation of research on the origin of fenchol in the reaction of org. acids with oil of turpentine. The repetition of previous investigations of others, using salicylic, oxalic and *o*-benzoylbenzoic acid with *d*-α-pinene from *Pinus halepensis*, $[\alpha]_D$ +48.3°, showed the invariable formation of fenchol. To test the relation existing between dissocn. const. and the reactivity of the acid with pinene, the action of mono- and dichloroacetic acids was investigated, their dissocn consts. being intermediate between those of salicylic and tetrachlorophthalic, and those of oxalic and picric acids. In general, after heating the acid chosen and the pinene together for some 50 hrs. in the neighborhood of 140°, the uncombined acid was titrated and then neutralized with NaOH. The hydrocarbons were removed by steam distn. and the remaining crude esters fractionally distd. when possible. After sapon., generally in the presence of EtOH, the solid and liquid alcs. were sepd. by centrifuging and recrystn. of the solid fractions from petr. ether (70°). The liquid alcs. may contain the 2 borneols (α and β), and the fenchols (α and β), each of them being in one predominant active form accompanied by a little of its optical antipode. The fenchol found was characterized by transformation into β-fenchone oxime, m. 123°, $[\alpha]_D$ 129.3° (in abs. alc.). The solid alc. was invariably a mixt. of borneol and isoborneol, the proportion of the latter being calcd. from observations of rotatory power in alc. and in toluene, and also by transformation into camphor by oxidation with a mixt. of 0.75 part of fuming HNO_3 and 2.25 parts of 36° Bé. HNO_3. The hydrocarbons obtained consisted of a mixt. of pinene, camphene, limonene and terpinolene and in a special case contained terpinene. When $ClCH_2CO_2H$ was used a fenchene was found. The pinene was transformed into pinonic acid; the pinene-camphene fraction was converted into HCl salts whose rotatory power could be examd. and then elevated by treatment with AcONa; limonene or the dipentene, recognized by their odor, were transformed into the tetrabromides; terpinolene was characterized by its b. p. and its inactive tetrabromide, m. 116–7°, and terpinene by its nitrosite m. 155°. From 100 g. of *d*-pinene heated with 40 g. salicylic, or 12.5 g. oxalic, or 50 g. *o*-benzoylbenzoic, or 25 g. chloroacetic, or 50 g. of dichloroacetic acid, 25.3, 26.0, 21.0, 16.0, 20.0 g. of purified alcs. were obtained. Conclusion: There are formed always, under given conditions, bornyl, isobornyl and fenchyl esters together with unaltered pinene, camphene, limonene, and the inversion products of the latter. Unusual quantities of fenchylic ester were obtained by the use of $ClCH_2CO_2H$ and in addn. it was possible to isolate a hydrocarbon considered to be a fenchene, attesting that the ester of α-fenchol is accompanied by the unstable ester of β-fenchol. C. R. ADDINALL

Pinene derivatives. G. GALLAS AND JOSÉ Mª. MONTAÑÉS. *Anales soc. españ. fís. quím.* **28**, 1163–1213(1930).—Pinene gave no camphene on heating to 150–200° with silex, active C, kieselguhr or Mn oxide, but dipentene was formed. Dichloropinane was prepd. in good yields by the action of Cl, and dibromopinane and pinene iodide similarly. Attempts to oxidize the latter sepd. I. Oxidation of pinene chloride

either failed or gave camphoric and ketopinic acids. Methods of prepn. of bornyl esters from pinene are reviewed. Pinene was oxidized to pinonic acid, which gave pinonic acid oxime, reduction gave the amine and HCl salt; the Bz deriv., when dehydrated, formed a new cyclic compd. which was not identified. In all reactions, alkalies increase resinification and impurities reduce yields. E. M. SYMMES

Optically active diazo compounds. Diazocamphane. ULRICH HEUBAUM AND WM. ALBERT NOYES. *J. Am. Chem. Soc.* **52**, 5070–8(1930).—This work was undertaken in order to get further evidence of the behavior of alicylic diazo compds. Diazocamphane (I) contains, besides the C atom which is connected with the diazo group, the 2 asym. C atoms of the camphor. It, therefore, can be expected to exist in 4 optically active modifications which give 2 pairs of optical antipodes and 2 pairs of stereoisomers I has been prepd. in Et_2O from the normal (II) and neobornylamines (III); the Et_2O solns. of both are deep red and extremely unstable and even below 0° decomp. with the evolution of N and the formation of the inactive tricyclene. The I is also very sensitive to H ions, even CO_2 favoring its decompn. Bornylurea from II yields a *NO deriv.*, yellow, m. 73–5° (decompn.), quite stable at 0° over P_2O_5; in forming the diazo compd. only 50% of the amine is used; the urethan was therefore used, whose NO deriv. is more unstable than that of the urea; with MeONa this yields the normal I, the reaction being carried out at —20°; a concn. of 0.56% in Et_2O showed α_{5440} 350°; values are given for λ from 6150 to 5300. III yields a neobornylurethan, m. 37°, α_D —28.0° (abs. EtOH), —31.2° (abs. Et_2O); NO deriv., α_D —18.5° (Et_2O); the neo-I obtained from this had, for a 0.44% soln., α_{5720} 466°; other values are given. The sp. rotation varies from 60° to 450° in various parts of the spectrum. The anomaly of the rotation in the green light is due to an absorption band located at about 5650 A. U., caused by the :CN_2 group. The shapes of the dispersion curves of the I prepd. from II and III are different, thus indicating a difference in structure of the diazo compds. concerned. Studying the decompn. of the I with HCl, a new *l*-bornyl chloride of $[\alpha]_D$ —33.2° has been prepd. from the normal I. The neo-I gave small amts. of a *d*-bornyl chloride. Both diazo compds., however, give mainly tricyclene, which indicates that they have partly the same structure. Their behavior is explained by the following formulas:

C. J. WEST

The magnesium compound of pinene hydrochloride. Action of ethyl formate. RENE BOUSSET AND MLLE. M. VAUGIN. *Bull. soc. chim.* [4], **47**, 986–1003(1930).—Solid pinene-HCl, $C_{10}H_{17}Cl$, m. 130°, considered as a mixt. of two 2-chlorocamphanes or as one of them, yields easily a Mg deriv. which gives the normally expected products with O_2, CO_2, SO_2, but which leads to complex mixts. with aldehydes, ketones, acid chlorides, etc. In particular, with BzPh, AcH, AcCl, bornylene was found, attesting to a remarkable reducing power of this Mg compd. To investigate this exceptional property of such an easily obtained optically active substance, having first verified that bornylene does not appear in the prepn. of the compd. on its hydrolysis, nor in the products of its oxidation or carbonation, the action of HCO_2Et on the compd. was studied. One mol. of pinene-HCl was converted into an ethereal Grignard soln. in a N atm. To this soln., cooled to —20°, 0.6 mol. of HCO_2Et was gradually added and the mixt. agitated for 24 hrs. at room temp. The hydrolysis was made in the usual manner and the excess Mg dissolved in dil. AcOH. The crude product (147 g.) yielded 49 g. of esters, 15 g. free alc., 36 g. bornylene, 15 g. camphane and 32 g. dibornyl. Under the operating conditions chosen the action of 1 mol. of HCO_2Et on 2 mols. $C_{10}H_{17}MgCl$ (I) may be considered as yielding 1 mol. $C_{10}H_{16}$, and 1 mol. $C_{10}H_{17}CH_2OMgCl$, a reaction using 68% of the initial HCl salt and giving an alc. $C_{10}H_{17}CH_2OH$ (II) with yields of 34%. II may be prepd. by the action of CO on I and reduction of the Et ester of the camphanecarboxylic acid (III) so formed, by the action of trioxymethylene on I, and by the use of HCO_2Et as above, and is termed camphanecarbinol. II is a white solid, m. 89°. *Phthalate*, m. 160–1°; *formate*, $n^{14.5}$ 1.475; *acetate*, b_{18} 127.5°, n^{18} 1.470; *p-nitrobenzoate*,

m. 126°. On oxidation in alk. $KMnO_4$ II gives camphanecarboxylic acid (III), m. 69–70°, the further oxidation of III to camphor, m. 178°, by alk. $KMnO_4$ being possible with poor yields. With the exception of the simple addns. of CO_2 and O_2, etc., to I, the action of HCONMePh and that of HCO_2Et seem the simplest and most fruitful, the action of HCONMePh and that of HCO_2Et seem the simplest and most fruitful, other reactions described previously only giving traces of terpene derivs. other than the hydrocarbons bornylene, camphane and dibornyl. C. R. ADDINALL

Production of synthetic borneol and camphor. J. SCHWYZER. *Pharm. Ztg.* **75**, 1275–6(1930).—The various operations involved in the production of the above products synthetically from α-pinene through its salicylate to borneol and camphor are discussed in detail, inclusive of the quant. yields. W. O. E.

Condensation of cyclanones. III. The abnormal condensation of dihydrocamphorone with benzaldehyde. R. CORNUBERT AND CHR. BORREL. *Bull. soc. chim.* [4], **47**, 958–66(1930); cf. *C. A.* **24**, 3997.—Dihydrocamphorone (α-methyl-α′-isopropylcyclopentanone) condenses with BzH under the influence of HCl to form a substance (V) having the compn. of a benzylidene compd. of methylisopropylcyclopentanone. This compd. is not identical with benzylidene-α,α-methylisopropylcyclopentanone. Me_2CO (125 g.) was dissolved in 500 cc. H_2O, contg. 30 g. NaOH to which soln. 50 g cyclopentanone was added and the mixt. stirred for 10 hrs. The soln. was dild., acidified with AcOH, and extd. with benzene. On removal of solvent and fractionation *in vacuo*, 26–7 g. isopropylidenecyclopentanone (I), b_{12} 80–82°, was obtained. Hydrogenation of I by $(HCO_2)_2Ni$ at 60° in alc., gave isopropylcyclopentanone (II), b_{40} 86°, $d_{15.5}$ 0.9044, $n_D^{16.6}$ 1.4451. By the use of $NaNH_2$ and MeI II was converted into methylisopropylcyclopentanone (III), b_{45} 97.5°, $d_{16.5}$ 0.9067, $n_D^{16.5}$ 1.4495. The condensation of III with BzH in the presence of HCl forms benzylidene-α,α-methylisopropylcyclopentanone (IV), m. 61°. The mixt. of IV and V, m. 61.5°, m. 46–7°. C. and B. discuss stereoisomeric modifications, enlargement of the ring, and ω,ω′(β or β′)-condensations to account for the non-identity of the 2 condensation products. C. R. ADDINALL

Stereochemistry of biphenyl compounds. XI. Preparation and resolution of 2-methyl-6-nitro-2′-carboxybiphenyl. R. W. STOUGHTON AND ROGER ADAMS. *J. Am. Chem. Soc.* **52**, 5263–7(1930), cf. *C. A.* **25**, 105.—2,3-$Br(O_2N)C_6H_3Me$ and *o*-$IC_6H_4CO_2Me$, heated with Cu bronze at 270–80° for 45 min. and at 300° for 15 min. and the resulting product sapond. by heating with 10% NaOH for 4 hrs., give 27% of *2-methyl-6-nitro-2′-carboxybiphenyl* (I), pale yellow, m. 171–2°. I was resolved by brucine. *l*-I, m. 174–5°, $[\alpha]_D^{20}$ 67.7°, *brucine salt*, crystals with 1 mol. H_2O, m. 169–75; anhyd., m. 173–5°, $[\alpha]_D^{20}$ 30.4° (hydrated form); this salt is less sol. than that of the *d*-I. *d*-I, m. 171–3°, $[\alpha]_D^{20}$ 63.1°, *brucine salt*, crystals with 1.5 mols. H_2O, m. 145–55°; anhyd., m. 172°; $[\alpha]_D^{20}$ −57.3° (hydrated form). In boiling BuOH or in AcOH, racemization took place partially over a period of 30–40 hrs.; in boiling NaOH partial racemization occurs in 4 hrs. The half-life period is calcd. to be: BuOH, 117°, 42 hrs.; AcOH, 118°, 34 hrs.; 0.1 *N* NaOH, 100°, 4.5 hrs. The acid is stable to racemization at room temp in any of these solvents. The properties are essentially in accord with what had been predicted from the x-ray data. C. J. WEST

Nitration of *sym*-diphenylethane. WM. H. RINKENBACH AND H. A. AARONSON. *J. Am. Chem. Soc.* **52**, 5040–5(1930).—$(4\text{-}O_2NC_6H_4CH_2)_2$ is obtained in 95% yields by slowly heating 35 g. $(PhCH_2)_2$ and 105 g. HNO_3 (d 1.42) to 70–80° and holding the temp. for 6 hrs.; the product m. 180.5° (cor.). $[2,4\text{-}(O_2N)_2C_6H_3CH_2]_2$ (I) is obtained in 90–5% yields by slowly adding 50 g. $(PhCH_2)_2$ to 500 g. 95% HNO_3 at a temp. below 30°, slowly raising the temp. to 70° during 2.5 hrs. and heating at this temp. for 4 hrs.; it m. 170.9° (cor.), is non-hygroscopic and explodes in 5 sec. at 380°; it is not detonated by the impact of a 2-kg. wt. falling 34 in. or by 0.4 g. Hg fulminate or by 0.4 g. tetryl with 0.23 g. Hg fulminate in the sand test; it is detonated with 0.40 g. cyclotrimethylenetrinitramine and 0.23 g. Hg fulminate and it crushes 21 g. sand as compared with 30 g by the same wt. of $(O_2N)_2C_6H_2Me$. Further nitration after a preliminary sulfonation (142 g. I and 100 g. 103% H_2SO_4, heated 4 days at 85°, 500 g. 95% HNO_3 added and heated at 85° for 2 days) gives *α-2,4,5-trinitrophenyl-β-2,4-dinitrophenylhydroxyethane*, pale cream, m. 187.3°; *Bz deriv.*, brown, m. about 200° (decompn.); oxidation with CrO_3 in AcOH gives 2,4,5-$(O_2N)_3C_6H_2CO_2H$ and 2,4-$(O_2N)_2C_6H_3CH_2OAc$. $[2,4,6\text{-}(NO_2)_3C_6H_2CH_2]_2$ is formed in very small amts. under even the most favorable conditions of nitration. C. J. WEST

Fluorene series. CH. COURTOT. *Ann. Chim.* [10], **14**, 5–146(1930).—C. reviews the work of C. and Geoffroy (*C. A.* **18**, 3186; **19**, 2657), of C. and Vignati (*C. A.* **21**, 1643, 1810, 3616) and C. and Bonnet (*C. A.* **20**, 2153), and extends the work in the

fluorene series. $NaNH_2$ and organomagnesium compds. react with fluorene so that an atom of H of the CH_2 group between 2 double bonds is replaced by Na or MgBr but Cl_2, Br_2, HNO_3 and H_2SO_4 react with a H on C atom 2. When substitution is continued in the fluorene or fluorenone mol. the 2,7-disubstituents are formed. The only exception observed was when 2,5- and 2,7-dinitrofluorene are formed simultaneously but the latter in 60% yield and the former in 23% yield. C. has more completely sepd. and purified the 2,7-dinitrofluorene than Morgan and Thomason (cf. *C. A.* **21**, 238) and finds it m. 334° instead of 269° as they report. The 2,6,7-trinitrofluorenone of Schmidt (*Ber.* **38**, 3760 (1905)) appears to have 2 nitro groups ortho to each other and is apparently an anomaly to the rule of substitution in benzene and naphthalene series but other examples are needed. Numerous attempts, however, to det. the orientation of trisubstituents, *e. g.*, *x*-nitro-2,7-disulfofluorene (I), and *x*-nitro-2,7-dibromofluorene (II), failed. The *Ba salt* (III) of I, was obtained as an orange-red powder in 60% yield by sulfonating 30 g. of fluorene with 120 g. 92% H_2SO_4 at 80°; adding 80 g. concd. H_2SO_4 and at 30° dropping in 10% excess of a mixt contg. 38% HNO_3, 12% H_2O and 50% H_2SO_4, shaking well at 50°, letting stand overnight and neutralizing with $BaCO_3$, filtering, concg. *in vacuo* to 100 cc. and pptg. with 95% alc. The *K salt* of I was obtained as an orange powder by treating III in H_2O with aq. K_2CO_3. The *Ba salt* of *x-amino-2,7-disulfofluorene* (white) was obtained by reducing III with Sn in acid soln. and with Fe in neutral soln. *2,7-Dibromo-x-nitrofluorene* (IV), obtained in 8.5 g. yield by adding 10 g. 2,7-dibromofluorene to a mixt. of 100 cc. glacial AcOH and 100 cc. HNO_3 (d. 1.5), yellow needles, m. 196°. *2,7-Dibromo-x-aminofluorene* (V), obtained in 80% yield by reducing 5 g. of IV in 200 cc. 95% alc. with 20 g. powd. Zn and 30 cc. 22% NH_4OH, m. 190°. *2,7-Dibromo-x-nitrofluorenone* (VI), obtained in 90% yield by dissolving 10 g. of IV in 400 cc. boiling glacial AcOH and adding 15 g. CrO_3, canary-yellow, m. 192°. *2,7-Dibromo-x-aminofluorenone* (VII), obtained in 66% yield by dissolving 5 g. of VI in 250 cc. of 95% alc. and 30 cc. 22% NH_4OH and passing a stream of H_2S into the hot soln., orange red, m. 255°. The *HCl salt* of VII was obtained as a yellow crystal by adding concd. HCl to VII in ether. *2,7-Dibromo-x-aminofluorenol*, obtained by dissolving 5 g. of VI in 250 cc. 95% alc., adding 30 cc. 22% NH_4OH and 25 g. powd. Zn and heating until colorless, m. 199°. The diazo compd. of 2-aminofluorene acts normally in the Sandmeyer reaction and enabled the prepn. of 2-chloro- (m. 97°), 2-bromo- (m. 111.5°), and 2 iodofluorenes (m. 128°) of certain constitution which were used as reference compds. in studying the products of direct halogenation. The halogen of fluorene derivs. may be replaced by NH_2 by the action of aq. NH_3 in presence of cuprous salts. This new method of prepg. amines in this series was used in proving that the above mentioned Sandmeyer reaction is normal. 2-bromofluorene (0.5 g.), prepd. from 2-aminofluorene, was heated with 20 cc. of 22% NH_4OH in presence of Cu_2Cl_2 in a sealed tube at 240° for 30 hrs., yielding 2-aminofluorene. Oxidation of fluorene derivs. with $KMnO_4$ at room temp. gives practically quant. yields of fluorenone derivs. Reduction of a substituted (either by halogen or sulfo group) nitrofluorenone yields aminofluorenones or aminofluorenols, depending on the reducing agent. 2-Aminofluorenones are more colored than with the amino group elsewhere. Other things being equal the 2,7-derivs. are the most intensely colored. The colored derivs. of aminofluorenols are more intensely colored than *corresponding* derivs. of aminofluorenones. The fluorenols with a substituent in the 2-position or different groups in the 2- and 7-position react with halogen acids to form halogen ethers. This generalizes the method of Kliegl (cf. *C. A.* **4**, 3232) and corrects the error of Schmidt and Bauer (*Ber.* **38**, 3751(1905)) who obtained 2-bromo-9-chlorofluorene on hydrolyzing the Ac deriv. of 2-bromofluorenol with concd. HCl but thought they obtained 2-bromofluorenol. Since direct nitration of fluorene or fluorenone gives only the 2-nitro derivs. an indirect method was necessary to prep. 4-nitrofluorenone. 4-Nitrophenanthrenequinone (VIII) was required as an intermediate and so much contradiction exists in regard to the mononitration of phenanthrenequinone (IX), that it was necessary to study this problem using various concns. of HNO_3 and different periods of reaction. Best yields of mononitro substituents were obtained by boiling IX for 3 min. with 69.8% HNO_3 but best yields of VIII were obtained by boiling 30 g. of IX with 900 cc. of 65.3% HNO_3 for 20 min., then pouring into 3 l. of ice water and treating the ppt. with 600 cc. of boiling alc. VIII goes into soln. and leaves the insol. 2-nitrophenanthrenequinone (X). The filtrate is evapd. to crystn. and the crystals purified by recrystn. from AcOH, m. 174–6°. VIII (7 g. (20%)) and 22 g. (61%) of X were obtained. VIII was used to prep. *4-nitrofluorenone* (XI), with some improvements on the method of Schmidt and Bauer (*Ber.* **38**, 3741(1905)). A 50% yield of 4-aminofluorenone (XII) was obtained by dissolving 5 g. of XI in 250 cc. alc., adding 30 cc. of 22% NH_4OH and passing in H_2S; purified as the HCl salt it m. 135–6°. *4-Amino-*

fluorenol was obtained by adding 25 g. powd. Zn and 30 cc. 22% NH_4OH to 5 g. of **XII** in 200 cc. alc. and refluxing until the soln. was colorless, pale yellow, m. 183–4°. C. has fixed the influence which different substituent groups in the fluorene and fluorenone mol. exert on the facility of opening the nucleus and passing to corresponding derivs. of Ph_2. With the mol. contg. a nitro group as a substituent the passage is impossible by alk. fusion. It is realizable fairly well but with bad yields with halogenofluorenones and is easily effected with the aminofluorenones. By alk. fusion of sulfofluorenes it is not possible to replace a sulfo group with a HO group without affecting, at the same time, the fluorene skeleton which is oxidized at the methylene group and yields substituted biphenylcarboxylic acids to a similar extent as it yields hydroxyfluorenes with HO groups in the same position as the sulfo groups were. The same thing happens in the case of fluorenone derivs. but the yield of biphenylcarboxylic acid is good whereas it is poor with fluorene derivs. This transformation into Ph_2 derivs. is positively a general property of the fluorene series and the apparent exceptions noted by Matthews and Hodgkinson (*J. Chem. Soc.* **43**, 166) and Schmidt, Retzlaff and Haid (cf. *C. A.* **6**, 2753) were due, in the first case to using impure fluorene and in the second to an erroneous interpretation of the products of reaction. The fluorenone nucleus is easily reconstructed by the action of dehydrants on the hydroxybiphenylcarboxylic acids. *Na* and *K salts* of *2-sulfofluorene* were prepared from aq. solns. of the acid and the carbonate. The soly. of K salt (**XIII**) is 6 g. per l. at 15° and 40 g. per l. at 78°; the aq. soln. fluoresces. The *K salt* of *2-sulfofluorenone* (**XIV**) was obtained in 103 g. yield by oxidizing 100 g. of **XIII** with aq. $KMnO_4$ at 25°, yellow plates from water. The *K salt* of *2-sulfofluorenone oxime* was obtained as citron-yellow plates. *2-Chlorofluorenone* was obtained in 7 g. yield from 10.7 g. of 2-aminofluorenone by the Sandmeyer reaction, orange-yellow crystals from alc., m. 123°. Schmidt and collaborators obtained 3 isomers of 2,7-disulfofluorene but C. has shown by formation of the sulfonyl chlorides that 2 of these are identical. The sulfonyl chlorides of two m. 225° alone or mixed and their sulfonamides m. 315° alone or mixed, whereas the *sulfonyl chloride of the third* m. 219° (or at 190° when mixed with either of the others) and an attempt to prep. its sulfonamide failed. The *K salt* of *2,7-disulfofluorenone*, citron-yellow, was obtained by oxidizing 2,7-disulfofluorene with $KMnO_4$ at 25° and characterized by formation of its citron-yellow *oxime*, and its *disulfonyl chloride*, citron-yellow, m. 221°. The *acid anhydride* of the *dibenzoate* of *4,4'-dihydroxy-2-carboxybiphenyl* with BzOH, $BzOC_6H_3(CO_2Bz)C_6H_4OBz$, was prepd. from the alk. fusion product of disulfofluorene and disulfofluorenone. These were found to be identical but both m. 153° and at 287° and appear to each contain space isomers, the stable form m. 287° and the less stable 153°. *x,2,7-Trisulfofluorene* was obtained in 95% yield as the *Ba salt* by treating 2,7-disulfofluorene with oleum. The *K salt* (**XV**) was prepd. from the Ba salt by double decompn. with K_2CO_3; its alk. soln. is intense green and the acid soln. is red. *x,2,7-Trichlorosulfonyl chloride*, obtained in 6.5 g. yield by treating 7.5 g. **XV** with 12 g. PCl_5, m. 214°. *x,2,7-Trisulfofluorenone* was obtained as the *K salt* by oxidizing **XV** with $KMnO_4$ in the cold, orange-yellow crystals from hot water. *2-Chlorofluorenol*, obtained by reducing the fluorenone with Zn and NH_4OH in alc. soln., m. 142°. *2,7-Diaminofluorenol*, obtained by reducing 2,7-dinitrofluorenone with Zn and NH_4OH in alc., m. 216°. *2,5-Diaminofluorenone*, obtained in 62% yield by reducing the dinitro compd. with H_2S in NH_4OH and alc., brownish red needles, m. 260–1°. *2,5-Diaminofluorenol*, obtained by reducing 2,5-dinitrofluorenone with Zn and NH_4OH in alc., m. 201°. *2,7-Dihydroxynitrosofluorenone* (**XVI**), obtained by diazotizing 2,7-diaminofluorenone and heating the product with water, dark red, m. 304–5°. Schmidt, Retzlaff and Haid (cf. *C. A.* **6**, 2753) thought they obtained *2,7-dihydroxyfluorenone* (**XVII**) by this method. C. prepd. **XVII** by dehydration of 4,4'-dihydroxy-2-carboxybiphenyl with $ZnCl_2$, m. 338°, easily sol. in alc. and in 0.1 *N* NaOH with blue color whereas **XVI** is almost completely insol. in alc. but sol. in 0.1 *N* NaOH with deep red color. C. treated **XVII** with HCl and $NaNO_2$ and succeeded in prepg. **XVI**, thus showing their relationship. *2,7-Dibromo-9-chlorofluorene*, was obtained by boiling 2,7-dibromofluorenol with concd. HCl, m. 154–5°. *2-Nitro-7-sulfofluorene* (**XVIII**), obtained in quant. yield by sulfonating 2-nitrofluorene with $H_2SO_4.H_2O$ at 20°, pale yellow, m. 250°. **XVIII** was characterized by its *Ca Na*, and *K salt* and by its *sulfonyl chloride*, m. 230°. The K salt is sol. in water to form the remarkably stable diazo salt from which the diazo group was eliminated to prove the position of the sulfo group. The *K salt* of *2-sulfo-7-nitrofluorenone* (**XX**) was obtained in 70 g. yield by sulfonating 60 g. of 2-nitrofluorene and oxidizing the product with $KMnO_4$. The *7-nitrofluorenone-2-sulfonyl chloride*, prepd. from [illegible] m. 240°.

Reduction of **XX** with H_2S in aq. NH_4OH yields *2-sulfo-7-aminofluorenone.* Alk. fusion of 2-bromofluorenone at 135–40° gives 20–5% of *4-bromo-2-carboxybiphenyl*, m. 165°. ODEN E. SHEPPARD

Fluorene series. KEIZO NAKAMURA. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) **14**, 184–8(1930).—Having discovered the local anesthetic action of the 9-aminofluorenes, the first case of pharmacol. effect noted in the fluorene series, the synthesis of 9-methyl-, 9-ethyl- and 9-propylaminofluorenes was effected. In order to obtain more sol. compds., reduction of the nucleus of fluorene was attempted. With Adam's catalyst at atm. pressure, fluorenone oxime dissolved in AcOH took up 5 mols. electrolytic H_2, and gave, in addn. to hexahydrofluorene, 2 stereoisomeric amines, $\dot{C}_6H_4.CH.NH_2.\dot{C}_6H_{10}$, the more sol., *α*, m. 147–8°, b_8 130–1°, d_4^{18} 1.026, n_D^{18} 1.54108, and a less sol., *β*, m. 170–80°, b_{11} 134–5°, d_4^{24} 1.044, n_D^{24} 1.56189. Both compds. are oxidized by alk. $KMnO_4$ to phthalic acid, oxalic acid, CO_2 and NH_3; both absorb CO_2 from the air, and neither decolorizes Br solns. Their derivs. have different properties but have the same constitutions. By benzoylation with BzCl, *α-hexahydroaminofluorene* (I) gave two products, *α-N-benzoylhexahydroaminofluorene*, m. 170–1°, and *β-N-benzoylhexahydroaminofluorene*, m. 222–3°, whereas the latter was the only product on benzoylation of *β-hexahydroaminofluorene* (II). Both I and II give the same compd., m. 202–3°, on acetylation with AcCl. The conversion of hexahydroaminofluorene hydrohalides into perhydroaminofluorene hydrohalides on heating for 6 hrs. in a bomb tube at 150–60° is considered explicable in light of the above arrangement and is a convenient method of prepn. By crystn. of the bitartrates of I from dil. MeOH the base was resolved. Salts of I, *d*-I, *l*-I and II, and also those of the perhydro-9-aminofluorene are more sol. in H_2O than those of 9-aminofluorene and its homologs, and possess excellent local anesthetic properties. By the addn. of 8 mols. of H_2 to fluorenone oxime, with the aid of PtO_2-Pt as catalyst, and the addn. of dil. HCl, the HCl salt of *perhydroaminofluorene* was prepd., m. 323–4°; *acetate*, m. 189–90°; *picrate*, m. 210°; *d-bitartrate* (+*MeOH*), m. 191°; *chloroplatinate*, m. 238–9°; *N-benzoyl base*, m. 203–4°; *N-acetyl base*, m. 168–9°. Although 2 hexahydroaminofluorenes and a dodecahydroaminofluorene have been isolated in cryst. form by N., he notes the absence of the decahydrofluorene indicated by others. N. has prepd. 9-bromo-9-methylfluorene which when treated with Br gives the 9-bromo-9-bromomethylfluorene previously made by Wieland by the addn. of Br to biphenyleneethylene. C. R. ADDINALL

New series of halogenated sulfonephthaleins. WM. C. BOYD AND ALLAN W. ROWE. *J. Am. Chem. Soc.* **52**, 4954–9(1930).—*o*-Sulfobenzoic anhydride (108 g.) and 300 g. I, treated with 500 cc. fuming H_2SO_4 (50% SO_3) and heated at 110–20° for 5–10 hrs. and then at 175–80° for 30 min., gives 88% of the *tetra-I deriv.* (I), crystd. from EtOH-AcOH, decomps. 305–10°; $CHCl_3$ appears to form a compd., since crystals from this solvent m. 132°; the toxic dose for rabbits is 0.2 g. per kg. body wt. when injected intravenously; it is not bacteriocidal for *B. coli* except in very high concn. The *tetra-Br deriv.*, brown, m. 219°, was prepd. in a similar manner, the Br being added in portions at 80–170°. I, PhOH and $SnCl_4$, heated 8 hrs., give *phenoltetraiodosulfonephthalein*, reddish black, decomps. about 210°, changes in color from brownish yellow to wine-purple over a p_H range of 7.0–8.2; *tetra-I deriv.*, reddish brown, p_H range 6.2–7.0 but the color change is only from 1 shade of green to another; *tetra-NO_2 deriv.*, brown, decomps. 190°, p_H range between 6–7 but it is unsuitable for an indicator, *di-Ac deriv.*, light brown, m. 136°; *tetra-Br deriv.*, brown; the di-Na salt is practically insol. in H_2O. *o-Cresoltetraiodosulfonephthalein*, similar to the PhOH deriv., p_H range 8.8–9.6; *resorcinol deriv.*, black, alk. soln., red with splendid green fluoresence, p_H range 8–10 but it is of no value as an indicator; *salicylic acid deriv.*, rose-beige, p_H range 7.2–8.0; color change from yellow-brown to pink. Phenoltetrabromosulfonephthalein, reddish black, p_H range 7.2–8.0 with color change from light brown to purple quite sharp at 7.4; tetra-Br deriv., p_H range 5.6–7.0 but the color change is a series of shades of bluish green; *resorcinol deriv.*, black with greenish sheen, p_H range about 8–10. *Tetraiodosaccharin*, greenish yellow, does not m. 345°. C. J. WEST

Reducing action of compounds containing the group >CHOMgI. R. V. SHANKLAND AND M. GOMBERG. *J. Am. Chem. Soc.* **52**, 4973–8(1930).—To a still greater extent than the IMg salts of mono-HO alcs., the similar salts of hydrobenzoin and of substituted hydrobenzoins have been found effective in reducing satd. and unsatd., aromatic and aliphatic aldehydes to their corresponding primary alcs. Only 1 of the 2 alc. groups in the hydrobenzoins is involved in this reaction, the hydrobenzoins becoming oxidized by the aldehydes to benzoins, just as sec. alcs. become oxidized to

ketones. The mechanism of this oxidation-reduction reaction consists in the transfer of a H and MgI from the group :CHOMgI in the alc. to the CO group of the aldehyde. The results of this investigation supply further evidence in favor of Marshall's explanation in regard to the apparently anomalous formation of primary alcs. and ketones in the course of the Grignard reaction on aldehydes: *viz.*, the normally produced addn. product, RR'CHOMgI, is liable to become oxidized by the excess of aldehyde to the ketone RCOR' and the aldehyde reduced to RCH_2OMgI. Results are given for about 25 compds. C. J. WEST

Structure of *p*-dimethylaminobenzoin. SANFORD S. JENKINS, LUCIUS A. BIGELOW AND JOHANNES S. BUCK. *J. Am. Chem. Soc.* **52**, 5198–204(1930); cf. *C. A.* **25**, 100.—*p*-$Me_2NC_6H_4CH(OH)CONH_2$ and PhMgBr in Et_2O give 45% of *α-p-dimethylaminobenzoin*, m. 159–60° (cor.); oxidation gives the known *p*-dimethylaminobenzil, m. 115–6°; reduction gives the *α*-desoxybenzoin, m. 127–8°. *p*-$BrMgC_6H_4NMe_2$ and PhCH(OH)$CONH_2$ give 25% of the *β-p*-dimethylaminobenzoin (I), identical with the product obtained by the condensation of *p*-$Me_2NC_6H_4CHO$ with BzH in the presence of KCN; it, therefore, has the structure *p*-$Me_2NC_6H_4COCH(OH)Ph$. Reduction gives a mixt. of *α*- and *β*-desoxybenzoins; oxidation gives I. C. J. WEST

Naphthol studies. I. Bromination of 1,5-dihydroxynaphthalene. ALVIN S. WHEELER AND DAVID R. ERGLE. *J. Am. Chem. Soc.* **52**, 4872–80(1930).—1,5-$C_{10}H_6(OH)_2$ (I), m. 258°, and 2 mols. Br in AcOH at 80° give 76% of the *2,6-Br₂ deriv.* (II), does not m. 300°; *diacetate*, straw-yellow, m. 228°; *dibenzoate*, m. 262°; *di-Me ether*, m. 161°; *di-Et ether*, m. 148°. Oxidation of II with CrO_3 in AcOH gives *2,6-dibromo-5-hydroxy-1,4-naphthoquinone* (III), rich red, m. 202°; *acetate*, golden yellow, m. 148°; the pyroboroacetate could not be isolated; HNO_3 gives a yellow product, explodes 243°, which contains N but no Br. Reduction of III with Zn in AcOH gives *2,6-dibromo-1,4,5-trihydroxynaphthalene*, decomps. 157°, readily oxidized to III by $FeCl_3$. III and $PhNH_2$ give the *2-anilino deriv.*, m. 249°, needles of gun-metal luster, red by transmitted light. I (20 g.) and 19.5 g. Br in AcOH give a *2,6,8-Br₃ deriv.* (IV), m. 189° (decompn.) (70% yield); HNO_3 gives a Br-free compd., explodes 249°; *diacetate*, yellow, m. 174°; *dibenzoate*, m. 185°, clear 189°; di-Me ether, m. 149°; *di-Et ether*, m. 125°. Oxidation of IV gives *2,6,8-tribromo-5-hydroxy-1,4-naphthoquinone* (V), rich red, m. 196°; *monoacetate*, golden brown, m. 234°. 1,5-$C_{10}H_6(OAc)_2$ (10 g.) and 14 cc. Br give 19.5 g. *2,4,6,8-tetrabromo-1,5-dihydroxynaphthalene* (VI), does not m. 300°; 90 cc. boiling C_6H_6 dissolves 0.5 g.; it decomps. in solvents of higher b. p.; *di-Me ether*, m. 226°; *dibenzoate*, m. 268°; oxidation with CrO_3 gives V; HNO_3 gives a Br-free compd., chrome-yellow, m. 232° (decompn.). V and $PhNH_2$ in AcOH give the *6,8-dibromo-2-anilino deriv.*, dark red, m. 206°; reduction of V with Zn and dil. H_2SO_4 gives *2,6,8-tribromo-1,4,5-trihydroxynaphthalene*, flesh-colored, decomps. 140°; *triacetate*, m. 185°. V yields a *pyroboroacetate*, hexagonal plates with a green metallic luster, does not m. 300°. $C_{10}H_6(OAc)_2$ on bromination with 5 mols. Br in AcOH gives a mixt. of 5 g. of *2,6-dibromo-5-acetoxy-1-naphthol*, m. 173°, and 13 g. VI. *2,6-Dibromo-5-acetoxy-1-benzoyloxynaphthalene*, m. 164°. These naphthoquinones are isomeric with certain halogenated juglones but not identical with any. C. J. WEST

Resolution of 1-(α-1-piperidylbenzyl)-2-naphthol. WALLACE R. BRODE AND JOSEPH B. LITTMAN. *J. Am. Chem. Soc.* **52**, 5056–8(1930); cf. *C. A.* **24**, 2455.—1-(α-1-Piperidylbenzyl)-2-naphthol (I) may be resolved by *d*-camphorsulfonic acid (II). *l*-I, m. 201–2° (cor.), $[\alpha]_D^{27}$ —211° (0.2151 g. in 10 cc. C_6H_6), $[\alpha]_D^{28}$ —192° (0.2036 g. in 10 cc. $CHCl_3$); *d*-II *salt*, m. 184·5° (cor.), $[\alpha]_D^{28}$ 4.7° (0.9385 g. in 10 cc. $CHCl_3$); this salt seps. first from AcOEt. *d*-I, m. 199–200° (cor.), $[\alpha]_D^{31}$ 189° (0.2148 g. in 10 cc. C_6H_6). C. J. WEST

Anthrone series. I. The condensation of phthalide with aromatic compounds. AL STEYERMARK AND JOHN H. GARDNER. *J. Am. Chem. Soc.* **52**, 4884–7(1930).—Phthalide and C_6H_6 with $AlCl_3$, heated on the H_2O bath for 10 hrs., give 28% of anthrone, m. 152–4°. PhMe gives an oily mass from which no pure compd. could be isolated; oxidation of the crude product with AcOH and CrO_3 gives 2-methylanthraquinone; with $C_3H_5(OH)_3$ and 82% H_2SO_4 there results 2-methylbenzanthrone. The condensation takes place through the CH_2 and CO residues of phthalide resulting in the formation of a mixt. of isomers and rendering the method unsuitable for the synthesis of anthrones of definite structure. **II. Synthesis of some hydroxymethylanthrones.** *Ibid* 4887–92.—The reduction of 1-hydroxyanthraquinone and its homologs yields only the corresponding 1-hydroxy-9-anthrone. *α-(2-Hydroxyphenyl)benzoic acid*, m. 133.8–4.5°, results in 98% yield on reducing the corresponding Bz deriv. with Zn dust and NH_4OH; *2-hydroxy-3-methylbenzyl deriv.*, m. 158.2–9° (88%); *4-Me isomer*, m. 123–4° (77.6%);

5-Me isomer, m. 129–30° (84.5%). Dehydration with concd. H_2SO_4 gives the corresponding 1-hydroxy-10-anthrone, m. 241–2°, and the *2-*, *3-* and *4-Me derivs.*, m. 207.2–8°, 258–9° and 226.2–7°, resp. (yields, 82, 93, 66 and 97.5%, resp.). Reduction of the hydroxyanthraquinones with Sn and AcOH give 1-hydroxy-9-anthrone, m. 137.5–8°, and the *2-*, *3-* and *4-Me derivs.*, m. 136.2–7°, 158.2–9° and 167.4–8.2°, resp. (yields, 89, 94, 85 and 94%, resp.). Since the 9-anthrone derivs. are bright yellow and the 10-anthrone derivs. are colorless, the former may show benzenoid-quinoid tautomerism. Reduction of 2-methylanthraquinone gives 8.8% of 2-methyl-10-anthrone; the 9-isomer shows approx. the same soly. in many solvents. C. J. West

Synthesis of glucosidoferulic acid. Raymond M. Hann. *J. Am. Chem. Soc.*, **52**, 5049–51(1930).—Me ferulate in abs. EtOH, neutralized with KOH and treated at 0° with acetobromoglucose in Et_2O, gives 64% of *Me tetraacetyl-β-d-glucosidoferulate*, m. 142.3° (cor.), $[\alpha]_D^{20}$ —32.3° (0.2408 g. in 25 cc. $CHCl_3$); $Ba(OH)_2$ gives *β-d-glucosidoferulic acid* (*3-methoxy-4-β-d-glucosidocinnamic acid*), m. 198–9° (cor.), $[\alpha]_D^{21}$ —36.6° (0.2433 g. in 10 cc. abs. EtOH). C. J. West

Some new monosubstitution derivatives of retene. Gust. Komppa and Eric Wahlforss. *J. Am. Chem. Soc.* **52**, 5009–17(1930).—Attempts to chlorinate retene (I) at 120–30° and 170–80° and to brominate I in CCl_4 with or without I gave a mixt. of products but no definite product could be isolated. I and Cl in CCl_4 at 0° give 79.5% of a *mono-Cl deriv.*, $b_{747.6}$ 350–1°, d_4^{20} 1.1359; oxidation with CrO_3 in AcOH gives retenequinone. Boiling with EtOH-KOH and with quinoline did not split off HCl, nor was it replaced by NaI in Me_2CO or AcOH; no cryst. product was obtained on nitration or sulfonation. The Grignard reaction gave an oil, sol. in aq. NaOH. Attempts to prep. the Me deriv. with MeI were unsuccessful. I, $(COCl)_2$, $AlCl_3$ and CS_2 give a retenecarboxylic acid, m. 229–31° (Liebermann and Zsuffa, *C. A.* **5**, 2251, give 121–3°); the *Na salt* crystallizes with 5 mols. H_2O; *Me ester*, pale yellow, m. 96–7°; *amide*, m. 224–6°; oxidation with CrO_3 gives *retenequinonecarboxylic acid*, dark red, m. 237–40°. Attempts to prep. a cryst. NO_2 deriv. were unsuccessful. I (10 g.) and 10 g. H_2SO_4 (d. 1.84) at 99° for 5 min. give *A-retenesulfonic acid* (II), m. 188–9°; *NH_4 salt*; *Me ester*, m. 164–6°; oxidation with CrO_3 and neutralization with KOH gives *K A-retenequinonesulfonate*, red. The KOH fusion of II gives *A-retenol*, $C_{18}H_{17}OH$, yellow, m. 200–2°; *picrate*, ruby-red, m. 151–2°. $FeCl_3$ gives a slightly green color. If the sulfonation is carried out at 200° there results the *B isomer*, m. 121.3°; *NH_4 salt*, 0.1082 g. dissolve in 100 g. H_2O at 17°; *Na salt*, crystals with 3 mols. H_2O, 2 of which are lost at 110°; soly. of anhyd. salt, 0.0726 g. in 100 cc. H_2O at 17°; *K salt*, soly. 0.0824 g.; *Ba salt*, crystals with 2 mols. H_2O, soly. 0.0848 g.; *Sr salt*, crystals with 4 mols. H_2O, soly. 0.1016 g.; *Ca salt*, crystals with 4 mols. H_2O, soly. 0.1166 g.; *Cu salt*, light green crystals with 5 mols. H_2O, soly. 0.1572 g.; *chloride*, m. 146.5–8°; *amide*, m. 206–7.5°; *Me ester*, m. 117–9°; *K B-retenequinonesulfonate*, orange. *B-Retenol*, orange red, m. 145–6°; *Ac deriv.*, m. 132–4°. The *Na azobenzenesulfonate* is red, *dyeing wool and silk* a cherry-red. Attempts to acetylate I with AcCl with $AlCl_3$ gave no pos. results. C. J. West

The dissociable organic oxides. A dibromorubrene. Charles Dufraisse and Nicolas Drisch. *Compt. rend.* **191**, 619–20(1930).—$Ph_2C(OH)C:CC_6H_4Br$ was prepd. to obtain a brominated deriv. of rubrene, $C_{42}H_{28}$. Br_2. It was found to be quite similar to rubrene itself in color, absorption spectra, fluorescence, etc. It is also oxidized when irradiated in air to $C_{42}H_{26}Br_2O_2$, which is dissociable like oxyrubrene itself. R. C. R.

Furfural and its industrial applications. T. Hedley Barry. *Ind. Chemist* **6**, 479–81(1930). E. H.

The preparation of some ketones in the furan ring. N. N. Maxim. *Bul. soc. chim. Romania* **12**, 33–5(1930).—M. prepd. several ketones of the furan ring in the following way: The diethylamide of the pyromucic acid was prepd. from the acid chloride and $NHEt_2$. EtMgBr and PrMgBr were allowed to react upon the diethylamide, giving 80–85% of the corresponding ketones O.CH:CH.CH:CCOR. The Et and Pr furyl ketones so formed were found to be identical with those prepd. by Asahina and Murayama. The pyromucyl chloride was prepd. by treating the acid with $SOCl_2$ (yield 40%) or better with PCl_5 (yield 70–80%). F. R. Greenbaum

Influence of acid chlorides and of pyrrole on the color test for reactive organometallic compounds. Constitution of pyrrylmagnesium halides. Henry Gilman and Lloyd L. Heck. *J. Am. Chem. Soc.* **52**, 4949–54(1930).—Of the compds. studied only BzBr, $COCl_2$, $(COCl)_2$ and PCl_5 appear to interfere with the color test; in this connection evidence is presented for the attachment of the —MgX group to N in pyrrole-

magnesium halides. The ultimate disposition of substituents on the α-C atom is accordingly no proof for a —CMgX linkage. C. J. WEST

Synthesis of indolylbutyric acid and some of its derivatives. RICHARD W. JACKSON AND RICHARD H. MANSKE. *J. Am. Chem. Soc.* **52**, 5029–35(1930).—This work was undertaken to prep. indole derivs. for metabolism studies. Et cyclohexan-1-one-2-carboxylate and PhN_2Cl in KOH give a good yield of the mono-Et ester of the phenylhydrazone of α-ketopimelic acid, $HO_2CCH_2CH_2CH_2CH_2C(:NNHPh)CO_2Et$, orange, m. 142–3°; refluxing with EtOH-H_2SO_4 gives 38% (based on cyclic ester used) of the *Et ester*, m. 76°, of *γ-(2-carboxy-3-indolyl)butyric acid*, m. 193–4° (decompn.); *Me ester*, m. 64°; heating at 220–30° splits off CO_2, giving *γ-3-indolylbutyric acid*, m. 124°; *Me ester*, m. 73–4°; the acid is best prepd. through the Me ester; in its hydrolysis there is formed a small amt. of 2-keto-2,3,4,5-tetrahydrocarbazole, *hydrazide*, m. 112°; $NaNO_2$ in AcOH gives *di(γ-3-indolylpropyl)urea*, pale yellow, m. 124°; Me γ-3-indolylpropylcarbamate could not be crystd. but its structure was proved by its conversion into *γ-3-indolylpropylphthalimide*, pale yellow, m. 132°; hydrolysis gives γ-3-indolylpropylamine, whose HCl salt m. 170°. Reduction of Me β-3-indolylpropionate with Na and EtOH gives *γ-3-indolylpropyl alc.*, m. about 0°; *phenylurethan*, m. 94°; *picrate*, brick-red, m. 101°. *δ-3-Indolylbutyl alc.*, m. 32.3°; *phenylurethan*, m. 88°; *picrate*, ruby colored, m. 102°. A C_6H_6 soln. of the above azide, heated until the evolution of N was complete and then treated with gaseous HCl, gives 5% of *2-keto-2,3,4,5-tetrahydrohomo-3-carboline*, m. 220°. *δ-3-Indolylbutylmalonic acid*, m. 177°; the main product is tetrahydrocarbazole. The reactivity of the 2-H atom in the indole ring is emphasized in light of the formation of 2-ketotetrahydrocarbazole and tetrahydrocarbazole as by-products of certain reactions employed. C. J. WEST

A synthesis of tryptophol. RICHARD W. JACKSON. *J. Biol. Chem.* **88**, 659–62 (1930).—From indoleacetic acid (Majima and Hoshino, *C. A.* **20**, 758) the Me and Et esters were obtained, and reduced with Na (1) in MeOH according to Marvel and Tannenbaum (*C. A.* **17**, 260), followed by conversion to the picrate, alk. decompn. and extn. with Et_2O, and (2) in very carefully dried EtOH (Smith, *C. A.* **21**, 3345). The 2nd method gave an 81% yield. The product is identical with that obtained by Ehrlich's method from the action of yeast on tryptophan (*C. A.* **6**, 2427), and m. 58–9°. The *picrate* m. 100–1°, the *phenylurethan* m. 130–1° (all cor.). K. V. T.

Pseudo bases in the isoxazole series. III. E. P. KOHLER AND C. L. BICKEL. *J. Am. Chem. Soc.* **52**, 4943–9(1930); cf. *C. A.* **23**, 141.—The pseudo bases previously described have been derived from isoxazoles in which all available positions are filled with hydrocarbon residues; in all these cases the rearrangement of the true base resulted in a pseudo base in which the HO group occupies the 5-position. In order to det. whether this mode of rearrangement is altered by an acidic group in this position, ketonic isoxazole has been ethylated and the behavior of the resulting salts toward bases has been studied. $PhCH(CHPhNO_2)CHBrCOC_6H_4Cl$ (100 g.) and 100 g. AcOK in 500 cc. MeOH, boiled until bumping became serious, the product filtered and the operation repeated until no more isoxazole sepd., gave 98% of Ph C·C(COC$_6$H$_4$Cl).O.N:C-Ph, m. 165–6°; Et_2SO_4 at 125–30° for 2.5 hrs. gives the *N*-Et deriv., the soln. of which, heated with concd. HCl and an equal vol. of H_2O, gives the *acid sulfate*, $C_{24}H_{26}O_8NClS$, m. 192–3°; the *$FeCl_3$ salt* (I), $C_{24}H_{19}O_2NCl_4Fe$, yellow, m. 130.5° and 139.5°; only the higher-melting form could be obtained in later prepns. The *pseudo base* (II), Ph-C:CPh.C(OH)(COC$_6$H$_4$Cl).O.NEt, decomps. spontaneously but was obtained in small amts., m. 128° (decompn.), by treating I with $NaHCO_3$ in Et_2O-H_2O; HCl and $FeCl_3$ give I. Spontaneous decompn. of II gives ethyldiphenylisoxazolone. O_3 gives EtBr, BzOH, *p*-ClC$_6$H$_4$CO$_2$H and a yellow solid, m. 120–30°, which could not be purified. MeOH contg. a trace of KOH had no action on II and MeONa was too destructive. The action of $NaHCO_3$ on I in MeOH-Et_2O gives *p* ClC$_6$H$_4$CO$_2$H and 90% of *Me α,β-diphenyl-β-ethylaminocinnamate* (III), m. 102°; MeOH-NaOH gives the same products. The structure of III was established by the action of O_3, the products being BzOH and BzNHEt, m. 68–9°. Hydrolysis of III by concd. HCl gives desoxybenzoin and Bz-ether or whether cleavage precedes methylation, 3,4-diphenylisoxazole was ethylated, the *N-Et deriv.* yielding a *$FeCl_3$ salt*, pale yellow, m. 75–6°. The salt, shaken with C_6H_6 and NaOH until decompn. is complete, gives the *dimol. anhydride*, (O.NEt.CPh:CPh.CH-)$_2$O, m. 148°; neither the pseudo base nor its Me ether could be isolated. The anhydride or the salts with MeOH-NaOH give III. The formation of the open-chain ester represents

a novel transformation of pseudo bases in the isoxazole series, a transformation which can occur only when the 5-position is unoccupied or is occupied by a group that is easily removed by bases. C. J. WEST

Constitution of the so-called dithiourazole of Martin Freund. IV. Isomerism of hydrazodithiodicarboxamides, iminothiolthiobiazoles and iminothiobiazolones. SHAHA L. JANNIAH AND P. C. GUHA. *J. Am. Chem. Soc.* **52**, 4860–66(1930); cf. *C. A.* **19**, 988.—$H_2NCSNHNHC(SH):NH$ (I), m. 233° (5 g.), in 100 cc. 2 *N* HCl, boiled 10 min., gives the *isomer* [NHC(SH):NH] (II), m. 203°; both forms give the same compd. with Me_2SO_4. I with 2 *N* NaOH, allowed to stand 24 hrs. and then acidified, gives II; II is converted into I by heating at 120° for 4 hrs. Either I or II, boiled with concd. HCl for 10 min., gives *iminothioldihydrothiobiazole*, pale yellow, m. 234°; further heating with concd. HCl gives endoiminothiolthiobiazole, m. 244°, identical with the so-called dithiourazole of Freund (*Ber.* **28**, 946(1895)). The latter compd. is also formed from I or II by heating with 5 *N* HCl for 15 min. or by Ac_2O treatment of the thiobiazole with subsequent deacetylation. Similar cases of isomerism have been observed with the alkyl- and aryl-substituted mono- and dithiohydrazides. Absorption spectra curves are given for these compds. C. J. WEST

Absorption spectra of the γ-pyrones and pyroxonium salts. R. C. GIBBS, JOHN R. JOHNSON AND E. C. HUGHES. *J. Am. Chem. Soc.* **52**, 4895–904(1930).—The ultraviolet absorption spectra of γ-pyrone, dimethylpyrone, benzopyrone and xanthone in acid solns. are very similar to the spectra in neutral soln. These data lead to the conclusion that the formation of oxonium compds. in this series does not result in any profound change in the structure of the mol. The identity of the absorption spectra curves of dimethylpyrone in neutral and alk. media and their similarity to the curve in acid soln. preclude the possibility of an equil. existing between 2 different types of structure of the ring. A resemblance between the absorption spectra of dimethylpyrone and its salts and 1,2,6-trimethylpyridone, a compd. in which only the ketone structure is possible, and between those of xanthone and of xanthene and xanthydrol has been observed. On the other hand, it is noted that the spectrum of dimethylpyrone differs greatly from that of 4-methoxy-2,6-dimethylpyridine, an analogous compd. which has the benzenoid type of structure. From these observations the conclusion has been drawn that the structure of the pyrone and pyroxonium rings is best represented by a ketonic formula. The formulation of the salts of xanthydrol and of trimethylpyroxonium perchlorate as compds. of an oxonium type is open to question. C. J. WEST

Anthocyan and anthocyanidin. IV. Synthesis of 2-phenylbenzopyrylium salts. K. KONDO AND K. NAKAGAWA. *J. Pharm. Soc. Japan* **50**, 928–32(1930); German abstract 121–2; cf. *C. A.* **24**, 4038.—By using the method of Noller and Adams (cf. *C. A.* **18**, 2879) K. and N. prepd. *p-methoxyacetophenone* (I) from anisole and anhyd. AcOH. *ω-Bromo-p-methoxyacetophenone*, prepd. by brominating I, gave with $MeCO_2K$ *ω-acetoxy-p-methoxyacetophenone* (II). Methylation of *resacetophenone* (9 g.) with Me_2SO_4 gave the *di-Me ether* (III), m. 40° (yield 4.5 g.). *Resacetophenone* (1.1 g.) in alc. with EtI (3 g.) and KOH (1 g.) gave the *di-Et ether* (IV), m. 74° (yield 0.8 g.). I (2 g.) in AcOEt (50 cc.) dried over P_2O_5, when treated for 2 hrs. with salicylaldehyde (V) (1.2 g.) in the presence of dry HCl gave *4'-methoxy-2-phenylbenzopyrylium chloride*, $C_{16}H_{13}O_2Cl.2H_2O$, m. 86° (yield 1.6 g.). II (0.6 g.) with V (0.8 g.) as above gave *3-hydroxy-4-methoxy-2-phenylbenzopyrylium chloride*, $C_{16}H_{13}O_3Cl.2H_2O$, (yield 0.5 g.). III (1.45 g.) with V (1.1 g.) as above gave *2',4'-dimethoxy-2-phenylbenzopyrylium chloride*, $C_{17}H_{15}O_2Cl.2H_2O$, m. 116°. IV (0.46 g.) with V (0.3 g.) as above gave *2',4'-diethoxy-2-phenylbenzopyrylium chloride*, m. 91°. F. I. NAKAMURA

Dynamic stereochemistry. I, II. HANS ERLENMEYER. *Helv. Chim. Acta* **13**, 731–47(1930).—Part I reviews the literature and discusses the idea that a mol. formed within the "field of force" of another mol. is influenced in structure. Part II, "on the theory of asym. synthesis and the dependence of chem. structure on the state of aggregation," deals with the possible effect of asym. C atoms on each other. The cinnamic acid salts of optically active bases were prepd. and brominated, then the dibromocinnamic acid was liberated, purified, and its optical activity detd. When the salt of *d*-α-pipecoline was used the acid obtained was optically inactive as is the case when cinnamic acid is brominated alone, but using the salt of *d*-cinchotine (prepd. by hydrogenation of *d*-cinchonine) or glucamine, and repeating several times, the Br acid obtained showed an optical activity corresponding to a mixt. contg. 51.3 to 58.3% of the *d*-rotatory form. L. E. GILSON

Isoquinoline derivatives. II. Synthesis of 4-hydroxy-5-methoxytetrahydroisoquinoline and its derivatives. T. KONDO AND S. TANAKA. *J. Pharm. Soc. Japan* **50**, 923–8(1930); cf. *C. A.* **23**, 4227.—*o-Methoxybenzaldehyde* (20 g.) on treating with Me-

NO_2 (12 g.) and 20% $NaHCO_3$ (12 g.) for 15 hrs. gave *o-methoxyphenylnitroethanol* (I) (yield 25 g.). Reduction of I (20 g.) in alc. (80 cc.) (cf. *C. A.* **24**, 1631) gave *o-methoxyphenylethanolamine*, $C_9H_{13}O_2N$ (II), m. 119 20° (yield 13 g.), and a neutral compd., $C_{17}H_{19}O_4N$ (III), m. 146–6.5° (yield 1–1.5 g.). II forms the following salts: HCl salt (IV), m. 183°, Pt double salt, does not decomp. 350°. IV (5 g.) when treated with 30% HCl (30 cc.) and methylal (5 g.) at 60° for 4 hrs. gave *4-hydroxy-5-methoxytetrahydroisoquinoline*, $C_{10}H_{13}O_2N$; HCl salt, decomps. 140°; Pt double salt, decomps. gradually on heating; *methiodide*, decomps. 125°; *methochloride*, decomps. 160°. II is probably *1-(o-methoxyphenyl)-2-(o-methoxybenzylidene)oximino-1-ethanol* and on reduction gave *1-(o-methoxyphenyl)-2-(o-methoxybenzylamino)-1-ethanol*, m. 175°. F. I. NAKAMURA

Pseudo bases. I. Certain *N*-methylpyrazinium salts and their corresponding bases. JOHN G. ASTON. *J. Am. Chem. Soc.* **52**, 5254–62(1930).—In order to study the effect of ring conjugation certain pyrazine derivs. were prepd. in which a pseudo basic system formed a part of the pyrazine nucleus; the effect of reduced conjugation caused by partial hydrogenation of the nucleus was also studied. 2,2,5,5-Tetramethyldihydropyrazine and MeI in abs. Et_2O, allowed to stand 13 days at room temp., give 80.4% of *1,2,2,5,5-pentamethyldihydropyrazinium iodide* (I), m. 204° (decompn.); recrystn. from MeOH caused a drop in m. p. to 194° (decompn.). Similarly, hexamethyldihydropyrazine (II), heated with MeI at 85–100° for 3 days, gives 78% of *1,2,2,3,5,5,6-heptamethyldihydropyrazinium iodide* (III), m. 249° (decompn.). In each case the MeOH-BuOH mother liquor from the crystn. was red. At room temp. the yield of III is only 26%. I and KOH give 83% of the pseudo base, *1,2,2,5,5-pentamethyl-6-hydroxytetrahydropyrazine* (IV), m. 108–10°; IV is assocd. in C_6H_6 but shows normal mol. wts. in H_2O. IV liberates 1 mol. of CH_4 from 2 mols. MeMgI Measurement of the cond showed that there was no strong base present even at 0° immediately after mixing I and NaOH, the base formed having $K_b < 3 \times 10^{-5}$. In the pseudo basic system from I the equil. between the hydroxide form and IV is evidently established quite rapidly and is in the direction of IV. The behavior of I and IV on titration with acid is described. IV yields a *chloroplatinate*, m. 282° (decompn.) (63% yield); this was also obtained in 10% yield by shaking I with AgCl and adding H_2PtCl_6. III and KOH in H_2O give 79% of *1,2,2,3,5,5-hexamethyl-6-methylenetetrahydropyrazine* (V), $b_{6.5}$ 78–8.2°, which shows a normal mol. wt. in C_6H_6 and in H_2O gives a strongly basic soln whose elec cond. corresponds to a base with a basic dissocn. const. of $K_B = 4 \times 10^{-}$, the 2nd basic N in III is too weak to be titrated using Me orange as indicator Its behavior with acid indicates cleavage of the ring in alk. soln. The *chloroplatinate* of V m. 285° (decompn.), the large yield of the salt from III seems to indicate that it is a hydrated form of the salt of the quaternary base. Possible tautomeric systems arising from these bases are discussed and related to their behavior on titration and salt-forming properties No base corresponding to 1,2,5-trimethylpyrazinium iodide could be isolated.

C. J. WEST

Pyrimidines. CXIX. Determination of the constitution of alkylation products of phenyluracil and phenylhydrouracil. JANET EVANS AND TREAT B. JOHNSON. *J. Am. Chem. Soc.* **52**, 4993–5005(1930).—6-Phenyluracil (I) and MeI in MeONa give a mixt. of the *N-3-Me* (II) and the *N-1,3-Me_2 derivs.* (III), sepd. by extn. with $CHCl_3$. I, m. 228–30°, was also obtained by treating *N-3-methyl-6-phenyl-5,6-dihydrouracil* (IV), m. 149–50.5°, with Br in AcOH in a sealed tube. III, m. 122–2.5°. I and KOH give the *K salt*, decomps. above 300°. I and $ClCH_2CO_2Et$ with EtONa give *Et 6-phenyluracil-N-3-acetate*, m. 205–6°. Dil. KOH hydrolyzes this to the free *acid* (V), m. 304–5°; this also results from *Et 6-phenyl-5,6-dihydrouracil-3-acetate* (VI), m. 154.5–6°, and Br in a sealed tube. V and Me_2SO_4 give the *N-1-Me deriv.* (VII), m. 261 3°; *Me ester*, m. 157 7.5°; *Et ester*, m. 109–10°; this also results from *N-1-methyl-6-phenyluracil* (VIII), m. 194–5°, with $ClCH_2CO_2Et$ and EtONa. VII or its Me ester could not be reduced by catalytic methods or by HI. 6-Phenyl-5,6-dihydrouracil, m. 216–7°, was prepd. from $PhCH{:}CHCO_2H$ and $CO(NH_2)_2$ by heating 6 hrs. at 190° or from $PhCH(NH_2)CH_2CO_2H$, m. 215–6°, and KCNO; the Na salt with MeI gives IV. Hydrolysis of IV with $Ba(OH)_2$ in dil. MeOH for 100 hrs. gives *$MeNHCONHCHPhCH_2CO_2H$*, m. 178° (decompn.); hydrolysis at 150° for 72 hrs. causes complete degeneration of the mol. The main product of the action of $ClCH_2CO_2Et$ on the Na salt is VI. VI and Br in AcOH in a sealed tube give the *5-Br deriv.*, m. 259–61° (decompn.); prolonged heating with Br gives V. *6-Phenyl-5,6-dihydrouracil-N-3-acetic acid* m. 228–31°. *β-(α-Methylamino benzyl)-malonic acid*, decomps. 147°, is formed from PhCH:NMe and $CH_2(CO_2H)_2$; heating above the m. p. or warming the reaction mixt. on the H_2O bath gives *β-methyl-amino-β-phenylpropionic acid*, m. 168.5–9°; KCNO gives *β-phenyl-β-N-1-methylureido-propionic acid*, m. 165–7°, transformed by 10% HCl into *N-1-methyl-6-phenyl-5,6-*

dihydrouracil, m. 158–9.5°; *5-Br deriv.*, m. 214–5°; heating this at its decompn. point (215°) gives quant. **VIII**. *Et N-1-methyl-6-phenyl-5,6-dihydrouracil-N-3-acetate*, m. 70–1°.
C. J. WEST

Two new series of local anesthetics derived from piperazine. E. FOURNEAU AND B. SAMDAHL. *Bull. soc. chim.* **47**, 1003–16(1930).—Knowing that certain isocyclic amino alcs. of piperazine have very distinct anesthetic properties, two new series of analogous amino alcs. contg. aliphatic radicals have been prepd., and the stage at which the anesthetic action commences has been determined. Both series, one of the type $RMeC(OH)CH_2N.CH_2.CH_2.CH_2.CH_2.NCH_2C(OH)MeR$ and the other of the type

$ROCH_2CH(OH)CH_2N.CH_2.CH_2.CH_2.CH_2.NCH_2CH(OH)CH_2OR$, R = Pr to heptyl, have

been obtained in almost theoretical yields by heating 2 mols. of ethylene oxides of the

types $RR\overset{\frown}{C}.O.\overset{\frown}{C}H_2$ and $ROCH_2\overset{\frown}{C}H.O.\overset{\frown}{C}H_2$ with a mol. of piperazine and transformation of the products into di-HCl salts, the corresponding bases being liberated by the addn. of alkali. With litmus paper and congo red paper it has been possible to show the dibasic function of these bases. The sym. amino alcs. of piperazine should exist in 2 stereoisomeric forms, and the ethylene oxide ring should open in 2 ways, but in practice, in spite of repeated crystns. of the di-HCl salts and the picrates, only 1 form has been found save in the case of **IX** which may exist in 2 isomeric modifications. Series I. *Piperazinebis(propyldimethylcarbinol)-2HCl* (**I**). $PrMeC(OH)CH_2Cl$ prepd. by the action of

$MeCOCH_2Cl$ on PrMgBr was transformed into the ethylene oxide $PrMe\overset{\frown}{C}.O.\overset{\frown}{C}H_2$, b.108–10°, by agitation with strong NaOH. Twelve g. of the oxide was added gradually to 11.6 g. of fused piperazine hydrate, and the mixt. refluxed with stirring for 4 hrs. at 120–30°. The product was dissolved in ether, washed with water and acidified with 10% HCl, the aq. layer then being concd. *in vacuo*. Recrystd. from abs. alc., it m. 220–1° (decompn.). *Free base*, b_{13} 171. *Picrate*, m. 206° (decompn.). Anesthetic action of I on tongue—none. *Piperazinebis(butyldimethylcarbinol)-2HCl* (**II**). $BuMeC(OH)CH_2Cl$, b_{20} 84–6°,

transformed into $BuMe\overset{\frown}{C}.O.\overset{\frown}{C}H_2$, b_{20} 45–50°, as in the preceding case, combines with piperazine to form **II**, m. 221-2° (decompn.). *Free base*, b_{25} 188°. *Picrate*, m. 202°. II is slightly anesthetic. *Piperazinebis(isobutyldimethylcarbinol)-2HCl* (**III**), m. 221–2°,

formed from iso-$BuMe\overset{\frown}{C}.O.\overset{\frown}{C}H_2$, b_{754} 120–5°, is distinctly anesthetic on the tongue. *Free base*, b_3 181–3°. *Picrate*, m. 206 7° (decompn.). *Piperazinebis(isoamyldimethylcarbinol)-2HCl* (**IV**). iso-$AmMeC(OH)CH_2Cl$ was transformed into the ethylene oxide, b_{17} 62–4°, by agitation with alc. NaOH. After heating with piperazine the product was converted directly to **IV**, m. 228° (decompn.), strongly anesthetic. *Free base*, m. 57–8°. *Picrate*, m. 208–9°. *Piperazinebis(hexyldimethylcarbinol)-2HCl* (**V**), m. 230° (decompn.), from $Me(C_6H_{13})\overset{\frown}{C}.O.\overset{\frown}{C}H_2$, b_{20} 77–80°, is anesthetic on the tongue. *Free base*,

m. 36–8°. *Picrate*, m. 190–1° (decompn.). *Piperazinebis(heptyldimethylcarbinol)-2HCl* (**VI**), m. 228–9° (decompn.), from $Me(C_7H_{15})C.O.CH_2$, b_{18} 90–5°, is strongly

anesthetic. *Free base*, m. 40–1° Series II. *Piperazinebis(propylhydroxymethylmethylcarbinol)-2HCl* (**VII**). Propylhydroxychloropropanol, b_{13} 92–5°, prepd. by refluxing a mixt. of 2 mols. of PrOH and 1 of epichlorohydrin with the addn. of a little concd. H_2SO_4 was transformed by concd. NaOH into the ethylene oxide, b_{20} 75–7°. Two mols of the oxide were added little by little to 1 mol. of fused piperazine hydrate, and refluxed for 4 hrs. at 120–30° with stirring. After the removal of unreactive reagents by distn., the residue was dissolved in Me_2CO and gaseous HCl passed in to crystn. VII commences to decomp. 213°, m. completely 223°, not anesthetic on the tongue. *Free base*, b_{2-3} 209–11°. *Picrate*, m. 172–4° (decompn.). *Piperazinebis(butylhydroxymethylmethylcarbinol)-2HCl* (**VIII**), m. 227°, was similarly prepd. from the oxide, Bu-

$CH(OH)\overset{\frown}{C}H.O.\overset{\frown}{C}H_2$, b_{20} 79–80°, and was found to be distinctly anesthetic. *Free base*, b_{2-7} 226–8°. *Picrate*, m. 176–7°. *Piperazinebis(isobutylhydroxymethylmethylcarbinol)-2HCl* (**IX**). The isobutylhydroxychloropropanol, b_{20} 100–2°, and its corresponding ethylene oxide, b_{20} 58–60°, were prepd. as before. **IX**, m. 240°, is distinctly anesthetic. *Free base*, b_3 210–4°. *Picrate*, m. 177–9°. A less sol. modification of **IX** was isolated, m. 245°, whose picrate showed a different cryst. form, m. 238°, and which may be isomeric with **IX**. *Piperazinebis(isoamylhydroxymethylmethylcarbinol)-2HCl* (**X**), m.

220° (decompn.), is anesthetic, and was prepd. from the ethylene oxide $C_6H_{11}CH(OH)$-$\overline{CH.O.CH_2}$, b_{15} 78–82°, from the corresponding isoamylhydroxychloropropanol. *Free base*, m. 40–2°, *picrate*, m. 186° (decompn.). *Piperazinebis(hexylhydroxymethylmethyl-carbinol)-2HCl* (XI), m. 233° (decompn.), anesthetic, from $C_6H_{13}CH(OH)\overline{CH.O.CH_2}$, b_{20} 98–105°. *Picrate*, m. 181–2° (decompn.). *Piperazinebis(heptylhydroxymethyl-methylcarbinol)-2HCl* (XII), m. 238° (decompn.), from $C_7H_{15}CH(OH)\overline{CH.O.CH_2}$, b_{14} 125–30°, is very anesthetic on the tongue. *Picrate*, m. 180–1°. The physiol. tests show that the anesthetic value rises with the increase of mol. wt., having values compared to cocaine, of 0.05, 0.79 (iso) 0.08, 1.60, 10.0, 9.1, for Series I, and 0.00, 0.45 (iso) 0.05, 1.74, 8.3, 22.5, for Series II. All the substances irritate the mucous membranes and particularly the cornea. C. R. ADDINALL

The formation of a heterocyclic ring containing mercury atoms. LUIGI VECCHIOTTI. *Nature* **126**, 313(1930); cf. *C. A.* 23, 3447.—*o*-$C_6H_4Br_2$ and 2% Na-Hg, in the presence of EtOAc, give $C_6H_4\langle{}^{Hg}_{Hg}\rangle C_6H_4$ (I). Boiled with HOAc, I yields C_6H_6 and *o*-$C_6H_4(HgOAc)_2$. A. F. SHEPARD

The constituents of the Korean corydalis tuber. IV. J. Go. *J. Pharm. Soc. Japan* **50**, 933–40(1930); German abstract 122–4; cf. *C. A.* **24**, 620.—Five alkaloids of the Korean corydalis tuber have been reported (*loc. cit.*). The present paper deals with the 2 new compds. which have been isolated from the non-phenolic fraction. The compd., $C_{21}H_{25}NO_4$ (I), m. 124–5°, sol. in many org. solvents, insol. in petr. ether and water. I contains 4 MeO and 1 MeN groups. I is *l-glaucine*. The following salts are reported: $C_{21}H_{25}NO_4.HCl.3H_2O$, decomps. 243–6°, $[\alpha]_D^{22}$ −57.10°; $C_{21}H_{25}NO_4.HBr$, decomps. 241°, $[\alpha]_D^{17}$ −98.04°; *methiodide*, m. 224–5°, $[\alpha]_D^{17}$ −72.46°; *d-bitartrate*, m. 216–7°, $[\alpha]_D^{18}$ −44.12°; and *l-bitartrate*, m. 165°. I (1.5 g.) when treated with Bz_2O (7.5 g.) at 80–100° for 5 hrs. gave a Bz deriv., $C_{21}H_{24}O_4NBz$, m. 180–1°, $[\alpha]_D^{16}$ −99.46°; this cannot be hydrolyzed by 5% alc. KOH. I (2 g.) when treated with I_2 (4 g.) and alc. (60 g.) gave *dehydroglaucine iodide* (II), decomps. 187°. II on reduction with Zn and H_2SO_4 gave *l-glaucine iodohydroxide*, m. 125–6°, $[\alpha]_D^{18}$ −119.41°. G. suggests that I and *l-corydine Me ether* are isomers just as *glaucine* and *dimethycorytuberine* are isomers. **V.** *Ibid* 940–4; German abstract 124–5.—G. also isolated a compd., $C_{19}H_{17}NO_4$ (I), m. 201–2°, $[\alpha]_D^{17}$ −315. I contains a dioxymethylene group, but neither MeO nor MeN groups. *Methiodide*, m. 248–52°; *ethiodide*, m. 255–7°. In many respects I resembles *tetrahydrocoptisine*. I when treated with the Gaebel's reagent, followed by methylation with CH_2N_2, gave a compd. m. 141–2° which did not depress the m. p. of *l-tetrahydropalmatine*, obtained from *l-canadine* on similar treatment. G. suggests I is *l-tetrahydrocoptisine* (stylopine). F. I. NAKAMURA

Constitution of cannabinol, the active principle of hashish. I. FRANZ GERGEL AND R. WAGNER. *Ann.* **482**, 55–74(1930).—The residue from the extn. with EtOH or light petroleum of African hemp (*Cannabis africana*) after removal of acids and the hydrocarbon cannabene is distd. in a high vacuum. The pharmacologically active fraction (cannabinol (I)) $b_{0.05}$ 156°, $[\alpha]_D^{18}$ −108.5°, $n_{He}^{19.5}$ 1.547, d^{18} 1.0311. Neither the Ac deriv. (II), $b_{0.05}$ 180°, $n_{He}^{19.5}$ 1.529, nor the *Bz deriv.*, $b_{0.4}$ 170–80°, could be crystd. Dihydrocannabinol (III), $b_{0.25}$ 176–7 $n_{He}^{19.5}$ 1.54, closely resembles I; the *Ac deriv.* (IV), $b_{0.15}$ 162–4°, $n_{He}^{19.5}$ 1.5171 (obtained by reducing II or acetylating III), is pharmacologically active. I takes up 3 mols., III 2 mols. of Br, in each case with the formation of 2 mols. HBr. Reduction of I under pressure gives *perhydrocannabinol* (V), $b_{0.4}$ 145–55°, contains 8 H atoms more and 1 O less than I and is stable in the cold to oxidizing agents. With Millon reagent I and III give positive, II, IV and V negative reactions. Oxidation of I with $KMnO_4$ gives $C_5H_{11}CO_2H$ and isophthalic acid; oxidation of II gives C_5H_{11}-CO_2H; III also gives this acid and in addn., an *acid*, $C_{11}H_{10}O_4$, m. 202–3° (*Et ester*, m. 103–4°), possibly cannabinolactonic acid (cf. Wood, Spivey and Easterfield, *J. Chem. Soc.* **69**, 539(1896); **75**, 20(1899)), and a neutral substance, $C_{20}H_{30}O_2$, but with a mol. wt. of over 900; while the use of $KMnO_4$ in Me_2CO gives an acid, $Me(CH_2)_5\overline{CH.CH_2.CHCO_2H}$ (*anilide*, m. 148.5°), the structure being assigned because of the failure to reduce the anilide. Analyses indicate the formula $C_{20}H_{30}O_2$ for I but $C_{21}H_{30}O_3$ is not excluded. Attempts to account for the oxidation products lead to the following provisional struc-

tures for I, when 1 of Wood's suggested formulations of cannabinolactone is adopted, points of fission being indicated by dotted lines:

$$MeC_6H_4CH[CH_2]_3CH \,\vdots\, CH(OH)CH{-}\!\!-C: \,\vdots\, CH[CH_2]_4Me$$
$$\text{or } MeC_6H_4CH[CH_2]_2 \,\vdots\, C(OH)CH{-}\!\!-C: \,\vdots\, CH[CH_2]_4Me$$

The oxidation of I with HNO_3 in AcOH gives $C_6H_{11}CO_2H$ and nitrocannabinolactone, also obtained from II and III (cf. Wood). *γ-p-Tolylbutyrolactone*, m. 69°, results on reduction of *β*-toluylpropionic acid. Nitration gives a *nitrotoluylpropionic acid*, m. 149°, reduced to an *amino-p-tolylbutyrolactone*, m. 105°, not identical with aminocannabinolactone. C. J. WEST

Plant pigments. XXIII. Xanthophyll from dandelion petals. P. KARRER AND H. SALOMON. *Helv. Chim. Acta* **13**, 1063–7(1930); cf. *C. A.* **24**, 4789.—The dried dandelion petals (6 kg.) were extd. with petroleum ether at 30–50° for 24 hrs., the solvent removed, the residue hydrolyzed and extd. with Et_2O, the solvent removed, the residue taken up in MeOH, cooled in the refrigerator and filtered, the solvent removed, and the residual oil taken up in ligroin, from which upon cooling the pigment, assocd. with 4 g. of another *substance*, m. 247–8°, was obtained. The pigment (0.2 g.), m. 175–6°, shown to be xanthophyll by its absorption spectrum, was sepd. by its greater soly. in EtOH More could be obtained from the mother liquor. It had been previously found in the dandelion leaves (Schunck, *Proc. Roy. Soc. London* **72**, 165 (1903)). A carotenoid was also present in the petals but in such small amount that it was not isolated. **XXIV. The pigment in the forest and in the large garden blackberry.** P. KARRER AND B. PIEPER. *Ibid* 1067–70.—The pigment extd. from the forest blackberry with HCl in MeOH, pptd. with Et_2O and purified as the picrate (2.34 g. pure, 2–3 g. less pure from 10 kg. of berries), is identical with that obtained from the garden variety (4.67 g. pure and 2 g. less pure from 8 kg. of berries). It consists of a monoglucoside of a cyanidin, either identical to or an isomer of chrysanthemin or asterin (Robinson and Willstätter, *C. A.* **23**, 1645) found in asters and chrysanthemums. Hydrolysis of 0.5312 g. of the *pigment-HCl* prepd. from the *picrate* yields 0.3508 g. of the cyanidin, which is converted to 3,4-$(OH)_2C_6H_3CO_2H$ upon alkali fusion. **XXV. The constitution of lycopin and carotene.** P. KARRER, A. HELFENSTEIN, H. WEHRLI AND A. WETTSTEIN. *Ibid* 1084–99.—The structure of carotene (I) is $(Me_2C.CH_2.CH_2.CH_2.CMe{:}CCH{:}CHCMe{:}CHCH{:}\text{-}CHCMe{:}CHCH{:})_2$, and that of lycopin (II) is $(Me_2C{:}CHCH_2CH_2CMe{:}CHCH{:}CHCMe{:}\text{-}CHCH{:}CHCMe{:}CHCH{:})_2$. The facts in support of these formulas are: (1) Both compds. are optically inactive. (2) Oxidation of both with CrO_3 and $H_2Cr_2O_7$ yields 6 mols. of HOAc. (3) Oxidation of I with $KMnO_4$ gives 4.4 mols. of HOAc and $Me_2C(CO_2H)_2$ (III), $HO_2CCMe_2CH_2CO_2H$ (IV), $HO_2CCMe_2(CH_2)_2CO_2H$ (V), and $HO_2CCMe_2(CH_2)_2\text{-}Ac$ (VI). VI was isolated in very small yield, as the semicarbazone. II yields only IV besides 4.2–4.6 mols. of HOAc; it may be considered as being synthesized in the plant through a benzoin condensation of phytolaldehyde and dehydrogenation of the product. A suggested formula for I wherein the 2nd ring is given the structure $\text{-}CMe.CH_2.CH_2.CH_2.CMe{:}CMe$ is abandoned since its oxidation products, $MeC(CO_2H)_2\text{-}(CH_2)_3CO_2H$ and $MeC(CO_2H)_2(CH_2)_2CO_2H$ (VII) were not found although the oxidation of $HO_2C(CH_2)_2CMe(CO_2H)Ac$ led to a good yield of VII. A sym. formula, $(Me_2C{:}CH\text{-}CH_2CH_2CMe{:}CHCH_2CH_2CMe{:}CHCH_2)_2$ (VIII), is also suggested for *squalene* in contradistinction to the unsym. formula given by Heilbron, *et al.* (*C. A.* **23**, 3702). Not only does the formula VIII account for all the oxidation products found including the ketone $C_{19}H_{38}O$ (IX) which was given the structure of *3,7,11-trimethyl-15-hexadecanone* by H., without proof, but also accounted for the failure to find other products that should have been expected because of its unsym. constitution. K., H., W. and W. prove that the ketone is *2,6,10-trimethyl-15-hexadecanone* (X) (*semicarbasone*, m. 73–4°), which was synthesized from $Me_2CH(CH_2)_3CHMe(CH_2)_3CHMeCH_2CH_2OH$ (= ROH), through the compds. RBr, RMgBr, RCH_2OMe (with $ClCH_2OMe$), RCH_2Br and $RCH_2CH(CO_2R')Ac$ (with $R'O_2CCHNaAc$). Alkali splitting of the last compd. yields X. In the execution of the work, it was found that upon oxidation with $KMnO_4$ xanthophyll yields III and IV but no V, zeaxanthin IV, *α*-ionone 1.43 mols. of HOAc and *β*-ionone 1.25 of HOAc. With O_3, *β*-ionone gives V and equal proportions of VI and $AcCMe_2(CH_2)_2CO_2H$, the 2 latter isolated as the semicarbazones; with CrO_3, 1.71 mols. of HOAc were produced against 2 mols. from its isomer. **XXVI. More esters of xanthophyll.** P. KARRER AND SEICHI ISHIKAWA. *Ibid* 1099–1102.—The esters of xanthophyll are easily prepd. by treatment

of xanthophyll in pyridine with the acid chloride, and recrystn. from a MeOH-petroleum ether mixt. The *dipropionate* m. 138°, *dibutyrate* 156°, *divalerate* 128°, *dicaproate* 117°, *dienanthate* 111°, *dicaprylate* 108°, *dipalmitate* 89°. With the exception of the propionate (acetate m. 172°) the m. p. falls with increase in mol. wt. **XXVII. The methylation of xanthophyll.** P. KARRER AND BR. JIRGENSONS. *Ibid* 1102–3.—*Xanthophyll mono-Me ether*, m. 150°, is prepd. in a 30% yield by methylation of the *K salt* with MeI. The salt (not isolated) was obtained by addn. of xanthophyll (**XI**) in boiling PhMe to K and $EtC(Me)_2OH$ in PhMe. Attempts to prep. the *di-Me ether* failed. **XI** itself could not be methylated successfully with MeI mixed with Na_2CO_3, Ag_2CO_3 or Tl carbonate. **XXVIII. The pigment of the sand thorn berry (Sandorn-beere) (Hippophaes rhamnoides).** P. KARRER AND H. WEHRLI. *Ibid* 1104–5.—The pigment in the sand thorn berry was extd. with Et$_2$O after most of the H_2O had been removed by treatment with 90% alc., and pptd. with a MeOH-petroleum ether mixt. Upon hydrolysis, zeaxanthin was obtained in 0.1–0.2 g. yield from 6 kg. of berries, depending upon their ripeness. The ester itself could not be isolated. Zeaxanthin seems to be of common occurrence

I. M. LEVINE

Chlorophyll. XIII. Mesochlorin and oxymesoporphyrins. HANS FISCHER, HEINRICH GEBHARDT AND ALEXANDER ROTHHAAS. *Ann* **482**, 1–24(1930); cf. *C. A.* **24**, 5303.—Reduction of mesohemin or of the complex Fe salt of tetramethylhematoporphyrin (but not of mesoporphyrin, its di-Me ester or Cu salt) by Na and AmOH in H atm. affords, besides by-products (which include *mesohemin di-Am ester*, $C_{44}H_{56}O_4N_4$·FeCl), a perhydrochlorin (not purified), oxidized by FeCl$_3$ to *mesochlorin* (I), $C_{34}H_{40}N_4O_4$ or $C_{34}H_{42}N_4O_4$, m. above 300°; *di-Me ester*, m. 190–1° and depresses the m. p. of meso ester (**IX**). In acid or NH_4OH soln. I is stable to air but is converted in boiling MeOH-alkali into mesoporphyrin IX, the complex *Fe* and *Cu salts* of I are very sensitive to oxidation and on removal of the metal, mesoporphyrin (II) remains. Na-Hg converts I into a leuco compd., oxidized to the original substance and a trace of porphyrin; HI causes breakdown of the mol. Oleum converts I, according to the exptl. conditions, into mesorhodin or *anhydromesochlorin*, $C_{34}H_{38}O_3N_4$, m. above 280°, spectroscopically similar to phytochlorin *e*. Oxidation of II with $K_2S_2O_8$ in 75–80% H_2SO_4 gives a 3% yield of *dioxymesoporphyrin* (III), $C_{34}H_{38}O_6N_4$ or $C_{34}H_{40}O_6N_4$, blue violet prisms, m. above 275°, spectroscopically similar to the chlorins; *Fe salt*; *Cu salt*, bluish black, m. 278.5°; *di-Me ester*, bluish black, m. 188° (*Cu salt*, violet-blue, m. 203°); in 50% H_2SO_4 the reaction is more complex and 3 products have been isolated which are characterized by spectrographic data. Reduction of III with Na-Hg followed by reoxidation or treatment with HI or HBr in AcOH, yields only a trace of porphyrin and none is obtained by the use of MeOH-KOH or of HCO_2H. The latter reagent causes elimination of an O atom from III, with formation of *monooxymesoporphyrin* (IV), $C_{34}H_{38}O_5N_4$, spectrographically identical with III. IV also results on the sapon. of the di-Me ester of III; the Cu salt of III with concd. H_2SO_4 also gives IV. III and its ester with NH_2OH give the corresponding *derivs.* of IV, $C_{34}H_{39}O_5N_5$ and $C_{36}H_{43}O_5N_5$, m. 224.5°, resp. III contains 1.4 atoms of active H, decompn. of the Mg compds. from the detn. yields 2 substances differing in spectra from III (1 of these possibly corresponding with a by-product of the prepn. of IV in 50% H_2SO_4); the ester of IV gives an active H value of 1 and decompn. of the Mg compd. in this case gives yet a further spectroscopically distinct substance. NaOEt in a sealed tube converts both III and IV into I; the presence of O in the mol. thus has an activating effect on the porphyrin complex such as Fe has on the hemins. Oxidation of I by H_2O_2 gives not III but a porphyrin and a chlorin-like substance. The dioxyetioporphyrin, $C_{32}H_{38}O_2N_4$ (from etioporphyrin I and H_2O_2 in H_2SO_4), is spectroscopically identical with III. Protoporphyrin is reduced by the method of Busch to mesoporphyrin.

C. J. WEST

Clupein. II. K. FELIX AND A. LANG. *Z. physiol. chem.* **193**, 1–14(1930); cf. *C. A.* **24**, 376.—Clupein B, the product which was obtained in largest amt. in the fractionation of clupein into its 4 components A_1, A_2, B and C, was subjected to enzymic hydrolysis by trypsin-kinase and erepsin. It had previously been shown to consist of 8 mols. of arginine and 1 mol. each of alanine, serine, aminovaleric acid and proline. From the HCl salt of clupein B trypsin-kinase at p_H 8.4 split off 4 mols. of arginine, liberating 6 NH_2 and 6 CO_2H groups. Further hydrolysis by erepsin at p_H 7.8 then split off the remaining 4 arginine mols. and liberated 4 NH_2 and 5 CO_2H groups. Of the total 10 NH_2 and 11 CO_2H thus liberated, 8 of each are accounted for by the 8 arginine mols. The remainder belong to the monoamino acid residue. There is here 1 CO_2H in excess of the corresponding NH_2 groups, suggesting that a NH_2 is combined in non-peptide linkage. This remaining NH_2 is liberated by acid hydrolysis without further increase in the CO_2H.

A. W. DOX

Chemistry of the lipoids of tubercle bacilli. XXI. Polysaccharide occurring in the phosphatide from the human tubercle bacilli. R. J. ANDERSON AND E. GILMAN ROBERTS. *J. Am. Chem. Soc.* **52**, 5023–9(1930); cf. *C. A.* **25**, 128.—Hydrolysis of the phosphatide A-3 by hot dil. EtOH-KOH for 24 hrs. yields an alc. soap soln. of the fatty acids together with small amounts of free $C_3H_5(OH)_3$ and H_3PO_4, while an EtOH-insol. residue remains which consists of a mixt. contg. a complex org. H_3PO_4 and a neutral carbohydrate. The org. H_3PO_4, isolated as the Ba salt, analyzes for $C_9H_{20}O_{14}P_2Ba$, which might represent a mixt. of ordinary hexosemonophosphate (I) and glycerophosphate; that it does not contain I is evident from the fact that it does not reduce Fehling soln. until after it has been boiled for some time with an acid. The filtrate from the Pb ppt. of the phosphate yields an amorphous *maninositose*, has no definite m. p., $[\alpha]_D^{23}$ 57°, contains 2.33% P, which may or may not be an integral part of the carbohydrate. Hydrolysis yields mannose and inosite. C. J. WEST

Sterols. HÅKAN SANDQVIST AND JOHN GORTON. *Svensk Farm. Tids.* **34**, 457–62, 477–9(1930); cf. *C. A.* **24**, 5042; **25**, 113.—*o*-, *m*- and *p*-Cholesterol benzoates m. 150.9°, 141° and 189.9 192.8°, resp., becoming liquid crystals. These form clear to transparent melts at 156.2°, 174.6° and 261°, $[\alpha]_D^{21}$; *o*- 6°, *m*- 11.9°, *p*- 6.3°. The *o*-crystals are needles, the *m*- and *p*-crystals yellow plates. The purest of 9 prepns. of stigmasterol from the tetra-Br deriv. from soja bean crude sterols gave analysis indicating $C_{29}H_{48}O$. An acetate from this, m. 109°, $[\alpha]_D^{21}$ —51°, was sapond., and titrated and the mol. wt. calcd. as 452.3. A. R. ROSE

The addition power of cholic acid. STEFAN MINOVICI AND MIHAIL VANGHELOVICI. *Bul. soc. chim. Romania* **12**, 5-13(1930).—Cholic acid possesses the ability to form addn. compds. with certain org. substances, which addn. power is inferior to that of desoxycholic acid. M. and V. prepd. with quant. yields addn. compds. of cholic acid with nitrobenzene ($(C_{24}H_{40}O_5).PhNO_2$), aniline, amyl alc., benzaldehyde, *m* toluidine, benzyl alc., cholic acid triolein, and they also tried to prep. an addn. compd. of cholic acid with oleic acid, but failed to isolate this addn. compd. in pure form, while all the other compds. were isolated in pure form. All these compds., in contrast to the addn. compds. of desoxycholic acid, which are very stable, are very labile, are decompd. by water, alc. and NaOH, but they were obtained by washing out the excess of the org. compds. with a neutral solvent such as CCl_4, toluene, ligroin, etc. The soly. of these addn. compds. is greater than the free cholic acid, they usually are prismatic crystals, colorless and odorless. Exposed to air for only 12 hrs., decompn. will occur and, therefore, they must be kept *in vacuo*. F. R. GREENBAUM

d-α-Aminonorvaleric acid (norvaline) a building unit of proteins (ABDERHALDEN, REICH) **11A.** Asymmetric ester hydrolysis by enzymes. V. Configuration specificity of liver esterase in its relation to enzyme complexes (Bamann, *et al.*) **11A.** Crystal forms of mono-basic fatty acids (Tanaka, *et al.*) **2.** Phase-rule studies on the proteins. III. Quinquevalent N in organic compounds (BANCROFT, BARNETT) **2.** A new application of azeotropism (LECAT) **2.**

Cyclic hydrocarbon synthesis. IMPERIAL CHEMICAL INDUSTRIES, LTD., T. S. WHEELER and J. MACAULAY. Brit. 332,998, June 4, 1929. A gas contg. unsatd. hydrocarbons such as C_2H_4 and C_2H_2 is heated "at a space velocity above 50 reciprocal min." By heating C_2H_4 to 1100° at a space velocity of 6400 reciprocal min. 30% of the gas is converted into a light oil and the exit gas contains 8% C_2H_2.

Saturated from unsaturated hydrocarbons. I. G. FARBENIND. A.-G. Brit. 333,511, April 2, 1929. Crude unsatd. hydrocarbons are converted into satd. hydrocarbons by hydrogenation in 2 stages. In the first stage catalysts are used contg. oxides or sulfides of metals of the second to seventh groups (preferably together with metals of the eighth group or heavy metals of the first group) and the treatment is continued until O, S, N and halogen compds. and resinifying substances present are rendered non-injurious (with or without some hydrogenation of the hydrocarbons under treatment), and in the second stage at least most of the hydrogenation of the purified hydrocarbons is effected in the presence of hydrogenating catalysts. A temp. of 300–60° is suitable for the first stage and oxides or sulfides of Mo or W and Ni or Co may be used as catalysts. Various details are given, with examples of treatment of solvent naphtha, a fraction from the destructive distn. of brown coal, a gas oil, naphthalene and anthracene.

Desulfurizing liquid hydrocarbons. STADTBERGER HÜTTE A.-G. and G. FELD, Brit. 332,910, Feb. 26, 1929. Desulfurization of hydrocarbon materials such as toluene or benzene is effected by treating them, in the absence of steam or H, with finely divided

Cu prepd. by pptn. from solns. of Cu salts by Fe or other suitable basic metal and subsequently heating the pptd. metal to above 100° without oxidation (in a reducing atm. if necessary). The treatment with Cu may be preceded by a partial removal of S by other methods. App. and various details of procedure are described.

Oxidation of sulfurous organic compounds. SILESIA VEREIN CHEMISCHER FABRIKEN (Walter Flemming and Hans Klein, inventors). Ger. 490,716, Oct. 20, 1925. Org. compds. contg. S, with the exception of dithiocarbamide acids are oxidized by solns. of polythionic acids or their salts. Thus, *p*-thiocresol in NaOH is treated with $Na_2S_5O_6$.

Products of hydrocarbons and sulfur dioxide. HERMANN STAUDINGER. Ger. 506,839, July 13, 1929. Monomol. reaction products from unsatd. hydrocarbons of the butadiene series with SO_2 are prepd. by the action of SO_2 on the hydrocarbon in the presence of anticatalyzers. Thus, 1 mol. butadiene contg. 1% hydroquinone is treated with SO_2 to give a polymerized sulfone. Several other examples are given.

Compounds containing ethylene linkages. RICHARD KUHN and ALFRED WINTERSTEIN. Ger. 505,632, Oct. 4, 1928. See Fr. 661,471 (*C. A.* **24**, 379).

Esters from aldehydes. CHARLES O. YOUNG (to Carbide & Carbon Chemicals Corp.). U. S. 1,785,166, Dec. 16. Al butoxide is used as a catalyst in the production of esters from aldehydes, *e. g.*, in the production of EtOAc from anhyd. acetaldehyde at temps. of −10° to +10°.

Aromatic hydroxy aldehydes. J. D. RIEDEL E. DE HAËN A.-G. Brit. 333,313, May 18, 1929. The mixt. of alkoxyvanillin and 4-alkoxymethyl ether of 1-propenyl-3,4-pyrocatechol, obtained by the alk. oxidation with nitro compds. of the alk. decompn. product of safrole, is sepd. by fractional condensation. The unoxidized propenyl compd., which is pptd. first, is alkylated, treated with dil. acids to remove the alkoxymethyl group and the resulting isoeugenol or homolog is oxidized to vanillin or its higher homologs. Various auxiliary treatments and modifications of procedure are also described.

Aliphatic amines. I. G. FARBENIND. A.-G. Brit. 332,868, Nov. 27, 1928. See Fr. 685,345 (*C. A.* **24**, 5765).

Dialkyl aromatic amines. GEORG LOCKEMANN. Ger. 503,113, July 30, 1924. Addn. to 491,856 (*C. A.* **24**, 2469). *N*-Dialkyl aromatic amines are obtained by treating secondary aliphatic aromatic amines with the higher homologs of CH_2O. Thus, monoethylaniline in H_2SO_4 is treated with CH_3CHO and Zn dust to give a 93% yield of *N*-diethylaniline.

Secondary and tertiary amines. I. G. FARBENIND. A.-G. Brit. 333,349, June 28, 1929. Secondary and tertiary amines are sepd. by adding phthalic anhydride in quantity corresponding to the secondary amine present, in the absence of a solvent, and sepg. the phthalamic acid formed by extn. with alkali, and then converting into the secondary amine. Examples are given of the sepn. of (a) mono- and di-ethylaniline, (b) mono- and di-methylaniline, (c) mono- and di-benzylaniline, (d) ethyldiphenylamine and diphenylamine and (e) hydroxyethyl-*p*-cresidine and dimethylaniline.

Aminoazo compounds. PAUL DIETERLE (to National Aniline & Chemical Co.). U. S. 1,785,769, Dec. 23. In making an aromatic aminoazo compd., an aromatic diazo compd. such as diazotized 3-aminobenzenesulfonic acid is coupled with an aromatic amino compd. such as diphenylamine in the presence of water and of an org. solvent such as $C_2H_2Cl_4$ which is immiscible with water (one of the coupling components being relatively insol. in water but sol. in the org. solvent used). Monopol oil may be used as a dispersing agent.

Stable mixtures containing halosulfonamide salts. CHEMISCHE FABRIK VON HEYDEN A.-G. (Curt Philipp, inventor). Ger. 504,997, Jan. 24, 1926. Aromatic sulfonamides are treated with hypohalites in the presence of water, the water being taken up as water of crystn. by added salts. In an example, *p*-toluenesulfonamide is mixed to a paste with $Ca(OCl)_2$ and water. $NH_4CO_3.NaCO_3$ is added to take up the water as water of crystn. Other examples are given.

Double compounds of quaternary salts of 3,6-diamino-10-alkylacridine. I. G. FARBENIND. A.-G. Fr. 686,606, Dec. 13, 1929. Double compd. of the salts of 3,6-diamino-10-alkylacridine with salts of 3,6-diaminoacridine (tertiary) are made by the reaction of either the quaternary salt with the tertiary or the quaternary acid salts with the 3,6-diaminoacridine base, or the quaternary bases with the acid salts of 3,6-diaminoacridine, or the acid salt or the monosalt of the quaternary base with the monosalt or the acid salt of the tertiary base, afterward neutralizing excess of acid with a basic agent Thus, 3,6-diamino-10-methylacridine is heated with a soln. of 3,6-diaminoacridine chlorhydrate, a soln. of the double compd. being obtained. Other examples are given.

Condensation products. I. G. FARBENIND. A.-G. (Ernst Korten, inventor). Ger. 505,475, Sept. 23, 1927. Addn. to 497,628. The condensation products from hydroaromatic ring ketones of the cyclohexane series and aromatic amines described in 497,628 (*C. A.* **24**, 4056) are sepd. either by fractionating the crude product, sepd. from excess of base, in a high vacuum, or by fractional crystn. of their salts from org. solns. Examples are given.

Dialkyl ureas. TENNEY L. DAVIS. U. S. 1,785,730, Dec. 23. In the prepn. of *sym*-dialkyl ureas, urea is heated in the presence of an aliphatic primary amine such as Me, Et or Bu amine to a temp. which may be about 160°.

Hydrogenated derivatives of biphenyl. I. G. FARBENIND. A.-G. (Ernst Korten, inventor). Ger. 505,476, Mar. 3, 1928. Addn. to 501,853. The method of 501,853 (*C. A.* **24**, 4792) for producing hydrogenated derivs. of biphenyl may be modified by carrying out the reaction at ordinary or high pressure, or *in vacuo*, or in the presence of catalyzers or diluents. Examples are given.

Nitriles. I. G. FARBENIND. A.-G. Fr. 686,648, Dec. 14, 1929. See Brit. 323,948 (*C. A.* **24**, 3249).

Formaldehyde derivatives. KARL FUCHS and ERNST KATSCHER. Ger. 505,687, Oct. 18, 1928. CH_2O derivs. substituted by SO_3H or halogen are obtained by the reaction of halosulfonic acids, *e. g.*, $ClHSO_3$, or their salts, esters or mixts., upon CH_2O, its polymers or derivs. The CH_2O may be treated with hydrogen halide and then with SO_3, fuming H_2SO_4, or pyrosulfite. Many examples are given. In one, $CH_2O_3SCl_2$ is obtained by treating paraformaldehyde with $ClHSO_3$. Others describe the prepn. of CH_2O_4S, $C_2H_4O_4Cl_2S$, and $C_2H_4OCl_2$.

***N*-Hydroxyethyl derivatives of 2,4-diamino-1-hydroxybenzene and its derivatives.** I. G. FARBENIND. A.-G. (Gustav Reddelien and Werner Müller, inventors). Ger. 505,323, Apr. 14, 1929. Addn. to 484,996 (*C. A.* **24**, 1121). These compds. are prepd. by condensing halohydrins of $C_2H_4(OH)_2$ or C_2H_4O with the desired diamino compd., in which one amino group has been acylated. The reaction may take place at ordinary or raised temps. and in presence or absence of bases, diluents, solvents or catalyzers. The product is then treated with acid. Thus, 2-acetylamino-4-amino-1-hydroxybenzene is heated with C_2H_4ClOH to give 2-acetylamino-4-hydroxyethylamino-1-hydroxybenzene. Other examples are given.

Pyridine derivatives. SCHERING-KAHLBAUM A.-G. (Curt Rath, inventor). Ger. 511,451, May 29, 1925. Addn. to 491,681 (*C. A.* **24**, 2472). The 3- or 5-iodo substitution products of pyridine are prepd. by treating acid solns. of 3- or 5-aminopyridine or derivs. with alkali nitrite in the presence of iodides, and with or without catalyzers such as Cu. Thus, a HCl soln. of 2-hydroxy-5-aminopyridine is treated with KI and $NaNO_2$ to give 2-hydroxy-5-iodopyridine, m. 191–193°.

Pyrazolone derivatives. I. G. FARBENIND. A.-G. (Friedrich Stolz and Walter Kross, inventors). Ger. 500,521, Mar. 1, 1929. Addn. to 479,348 (*C. A.* **23**, 4952). 1-Phenyl-2,3-dimethyl-4-dimethylamino-5-pyrazolone is prepd. by the action of H and CH_2O on the 4-nitro deriv. in the presence of a metal catalyzer. Cf. *C. A.* **24**, 2243.

Hydrazine compounds of the pyrazolone series. I. G. FARBENIND. A.-G. (Walter Hermann, Karl Streitwolf and Alfred Fehrle, inventors). Ger. 505,799, Apr. 8, 1928. These are formed by converting amino compds. of the pyrazolone series into hydrazine compds. by the usual methods. Examples are given describing the prepn. of 1-(4′-semicarbazide)phenyl-2,3-dimethyl-5-pyrazolone, and 1-(4′-hydrazino)phenyl-2,3-dimethyl-5-pyrazolone. Cf. *C. A.* **24**, 5045.

Naphthostyril derivatives. I. G. FARBENIND. A.-G. (Werner Zerweck, inventor). Ger. 507,128, July 9, 1927. Addn. to 471,269 (*C. A.* **23**, 2190) and 505,321 (*C. A.* **24**, 5767). Nuclearly brominated monobromonaphthostyril is prepd. by treating naphthostyril with the necessary amt. of Br. An example is given.

Aryl thiazoles. LORIN B. SEBRELL and JAN TEPPEMA (to Goodyear Tire & Rubber Co.). U. S. 1,785,656, Dec. 16. In prepg. an aryl thiazole such as 2-mercaptobenzothiazole, an *o*-nitroaryl hydrosulfide such as di-*o*-dinitrodiphenyl disulfide is reduced in soln. to the corresponding amino compd. and the latter while still in soln. is caused to react with CS_2 to complete the thiazole ring.

Dithiocarbamates. I. G. FARBENIND. A.-G. (Wilhelm Lommel, Theodor Goost and Hermann Friedrich, inventors). Ger. 498,280, May 24, 1927. Addn. to 495,628 (*C. A.* **24**, 3519). Dithiocarbamates with alicyclic residues are produced by treating dithiocarbamic acid salts obtained from alicyclic secondary bases and CS_2 with other salts. Thus, Na ethylhexahydro-*o*-tolyldithiocarbamate is treated with $ZnCl_2$. Other examples are given. Cf. *C. A.* **24**, 129.

Triaryl phosphates. WILFRID GIBSON, CHARLES R. HENSHAW and JOSEPH B.

PAYMAN (to Imperial Chemical Industries, Ltd.). U. S. 1,785,951, Dec. 23. See Fr. 681,177 (*C. A.* **24**, 4305).

Compounds of sodium and nitrogen. DEUTSCHE GOLD- UND SILBER-SCHEIDEANSTALT VORM. ROESSLER. Ger. 507,996, July 2, 1927. N-compds., such as amino, imino, amido and imido compds., are acted upon by NaH to produce compds. contg. N and Na. Thus, $PhNH_2$ is warmed with NaH to give PhNHNa. Other examples are given.

Concentrating acetic and formic acids. IMPERIAL CHEMICAL INDUSTRIES, LTD., and F. D. LEICESTER. Brit. 332,983, May 17, 1929. Concn. is effected by adsorption of the vapor in active C, or, with HOAc, by selective adsorption of the acid from liquid soln. Examples with details of procedure are given.

Acetic acid. DESTILACIJA DRVA D. D. Ger. 507,416, Sept. 29, 1928. Dil. AcOH is extd. in the cold with a mixt. of (1) a cyclic base which boils above 150°, is insol. or difficultly sol. in water, and can be acetylated only with difficulty, if at all, and (2) a water-repellant hydrocarbon oil b. above 150°. A suitable extg. agent comprises quinoline 1 and anthracene oil 1 part. Concd. AcOH is recovered by distg. the ext.

Acrylic acid chloride. I. G. FARBENIND. A.-G. Brit. 333,079, Sept. 14, 1929. β-Chloropropionic acid chloride vapor (suitably at temps. of 140–300°) is brought into contact with catalysts splitting off HCl such as $BaCl_2$, Al_2O_3 or bauxite or sherds of burnt clay or similar highly porous materials.

2-Hydroxy-3-nitropyridine-5-arsonic acid. SCHERING KAHLBAUM A.-G. (Arthur Binz and Curt Räth, inventors). Ger. 504,829, Aug. 6, 1926. 2-Hydroxy-3-nitropyridine-5-arsonic acid is prepd. by treating pyridine-5-arsonic acid substituted in the 2-position by, *e. g.*, Cl or OH, with a powerful nitrating agent such as red fuming HNO_3. Examples are given.

1-ω-Aminomethylnaphthalenesulfonic acids. WILHELM HERZBERG and HANS LANGE (to General Aniline Works). U. S. 1,785,955, Dec. 23. By treatment with such sulfonating agents as strong H_2SO_4 or fuming sulfuric acid, 1-ω-aminomethylnaphthalene yields 1-ω-aminomethylnaphthalene-2,4-disulfonic acid. There is first formed a mixt. of the 2-sulfonic acid, which is insol. in water, and the 4-sulfonic acid, which is easily sol. in water; these acids are easily sepd. from each other, on further sulfonation, whether individually or mixed together, they yield the 2,4-disulfonic acid. These acids are colorless compds. which yield the corresponding naphthaldehydesulfonic acids, for instance by transforming the benzyl compds. into the benzal compds. and treating the benzal compds. with an inorg. acid.

Acetaldehyde from acetylene. I. G. FARBENIND. A.-G. (Bernhard C. Stuer and Walter Grob, inventors). Ger. 504,862, June 25, 1914. C_2H_2 and water vapor are led over an Fe catalyzer at high temps. and pressure. The catalyzer is a compd. of Fe with H_2CrO_4, H_2WO_4 or H_2SiO_3. Co or Ni compds. may be used instead of Fe. Cf. *C. A.* **24**, 2474.

Acetaldehyde. I. G. FARBENIND. A.-G. (Walter Daniel, inventor). Ger. 507,795, Aug. 28, 1928. AcH is prepd. from C_2H_2 or gases contg. C_2H_2 by treating the gas with salts of Hg and NH_4 in presence or absence of free S. Thus, a gas contg. 6% C_2H_2 is treated with a soln. contg. water, H_2SO_4, HgO and NH_3 to give a 78% yield of AcH. Other examples are given. Cf. *C. A.* **25**, 304.

Acetone. HOLZVERKOHLUNGS-INDUSTRIE A.-G. Ger. 505,112, Dec. 12, 1924. Addn. to 503,571. In the prepn. of acetone from AcH and steam by the method of 503,571 (*C. A.* **24**, 5769), the AcH addn. is interrupted from time to time and the steam is led alone to the catalyzer.

Methyl and ethyl acetates. HOLZVERKOHLUNGS-INDUSTRIE A.-G. (Koloman Roka and Otto Fuchs, inventors). Ger. 507,205, Nov. 16, 1926. A mixt. of AcOH and MeOH or EtOH is heated to 150–200° under pressure in the absence of a catalyst, the ester being continuously removed from the mixt. by distn.

Dioxane. I. G. FARBENIND. A.-G. Ger. 507,761, May 7, 1926. Addn. to 500,223. The method of Ger. 500,223 (*C. A.* **24**, 4307) is modified by using dihydroxydiethyl oxide or a monoether thereof as the initial material, alone or mixed with one another or with glycol.

Dimethylolurea. POLLOPAS, LTD. Ger. 504,863, June 20, 1928. See *C. A.* **23**, 3236 (Brit. 299,487).

Hydrogenating naphthalene. J. VARGA. Brit. 333,453, Oct. 13, 1928. See Fr. 683,070 (*C. A.* **24**, 4523).

Naphthalene purification. GES. FÜR TEERVERWERTUNG, A. SPILKER and G. SPILKER. Brit. 333,352, July 1, 1929. Purification is effected by melting, washing with caustic alkali soln. and then distg. (suitably after leaching several times with water before the distn.).

Purifying crude anthracene. ALPHONS O. JAEGER (to Selden Research & Engineering Corp.). U. S. reissue 17,902, Dec. 16. Reissue of original pat. No. 1,693,713 (*C. A.* **23**, 851).

Hydroxyanthraquinones. SCOTTISH DYES, LTD. Ger. 507,210, Jan. 9, 1925. See Brit. 246,529 (*C. A.* **21**, 414).

2,7-Dinitroanthraquinone. I. G. FARBENIND. A.-G. (Robert E. Schmidt and Berthold Stein, inventors). Ger. 497,503, June 26, 1925. 2,7-Dinitroanthraquinone is prepd. by treating anthrone with concd. HNO_3 of at least 90% strength at low temps., and heating the intermediate product so obtained with glacial AcOH. An example is given. Cf. *C. A.* **24**, 3251.

4,10-Diaminoperylene. FÉLICE BENSA. Fr. 686,233, Dec. 6, 1929. 4,10-Diaminoperylene is made by reducing with an alkali sulfide or hydrosulfide 4,10-dinitroperylene suspended in a mixt. of alc. and aq. alkali lye.

2,4-Dihydroxyquinoline. I. G. FARBENIND. A.-G. (Hans Kämmerer, inventor). Ger. 505,798, Feb. 5, 1929. Malonic acid esters are condensed with aromatic amines in a high-boiling solvent to produce 2,4 dihydroxyquinoline. Examples are given. In one, α naphthylamine and diethyl malonate are condensed in $PhNO_2$.

Dihydromorphine. C. H. BOEHRINGER SOHN. (C. Schöpf and L. Winterhalder, inventors). Ger. 504,830, Feb. 16 1927. This is obtained by treating tetrahydrothebaine (obtained by the hydrogenation of thebaine salts) with a powerful dealkylating agent, *e. g.*, HBr. A mixt. of hydrogenated products of thebaine including the tetrahydro deriv. may be used as the starting material. Examples are given.

Butadiene and its homologs. I. G. FARBENIND. A.-G Fr. 686,446, Dec. 11, 1929. Butadiene and its homologs are made by passing vapors of unsatd. alcs. having 4 or more C atoms, preferably mixed with steam, over a dehydrating catalyst at a temp. of 150°. Examples are given of the prepn. of butadiene from allylic carbinol, and dimethylbutadiene from 2-methyl 2-penten-4-ol.

Vanillin. J. D. RIEDEL-E. DE HAËN A.-G. Ger. 507,796, Nov. 26, 1925. Addn. to 505,404. The mixt. of propenylcatechol monoalkoxymethyl ethers obtained from safrole or isosafrole in the process of Ger. 505,404 (*C. A.* **24**, 5770) is acidulated and then treated with org. solvents, or cooled, to sep. the 4 acyl-3-alkoxymethoxy-1-propenylbenzene (I) from the 4-alkoxymethoxy-3 acyl-1-propenylbenzene. The latter is saponif. with alkali and worked up as in Ger. 505,404, while I is warmed with acid to split off the alkoxymethyl residue, the product is methylated, and the isoeugenol obtained by warming with alkali is converted into vanillin in known manner. Addnl. details and examples are given.

Phenylmercuric acetate. CARL TAUBE (to Winthrop Chemical Co.). U. S. 1,780,094, Dec 23. Hg acetate is boiled for several hrs. in benzene to which has been added such a quantity of a high-boiling inert org. solvent having a b. p. of at least 150°, such as $PhNO_2$ and 1,2 dichlorobenzene, that the b. p. of the mixt. is raised to about 120–140°.

Sodium *p*-hydroxyphenylarsonate. UNION CHIMIQUE BELGE SOC. ANON. Brit. 333,023, June 7, 1929. This compd. is obtained from the product of reaction between PhOH and arsenic acid by first prepg. the Ca salt and then converting it into the Na salt (suitably by successive use of $CaCl_2$ and Na_2CO_3).

Lead tetraethyl. E. I. DU PONT DE NEMOURS & Co. Ger. 504,827, July 22, 1927. Alloys of Pb with K and Na are treated with EtCl. The alloy Pb(KNa) may be heated to 50–60° with the EtCl. Another preferred alloy contains K and Na in the proportions 1:9.

Magnesium 1-methyl-4-isopropylbenzenesulfonate. CHEMISCHE FABRIK VON HEYDEN A.-G. (Curt Philipp, inventor). Ger. 504,998, Mar. 17, 1928. Addn. to 466,-400 (*C. A.* **23**, 2191). The above and its substitution products are prepd. by treating the sulfonic acid with sol. Mg salts such as MgO, $Mg(OH)_2$ or $MgCO_3$. An example is given.

11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

A—General

FRANK P. UNDERHILL

The extent of goiter in Hungary and its connection with the iodine content of the drinking water. JOHANN STRAUB. *Z. Hyg. Infektionskrankh.* **111**, 472–9(1930).—The prevalence of goiter in Hungary was not found to be related to the I content of the drinking waters. RACHEL BROWN

Hemin, hematin and protoporphyrin. H. Fischer, A. Treibs and K. Zeile. *Z. physiol. Chem.* **193**, 138–66(1930).—A crystallographic study was made of protoporphyrin prepns. obtained by various methods. The characteristic crystal forms are profusely illustrated by drawings and photomicrographs. All of the pure prepns., both natural and synthetic, showed complete identity. Similar studies were made of hemin obtained by the various procedures for introducing Fe into protoporphyrin, and of the characteristic Teichmann crystals. Hematin, obtained by dissolving hemin in KOH and pptg. with AcOH, crystallizes from pyridine with 2 pyridine of crystn. Heating with AcOH and NaCl converts it back to cryst. hemin. Tetramethylhematoporphyrin was prepd. from synthetic hematoporphyrin, and diacetyldeuteroporphyrin ester from diacetyldeuterohemin, and their crystallographic properties are described. Other prepns. described are bromohemin and iodohemin from beef blood, from chlorohemin, and from protoporphyrin, with crystallographic data which establish the identity of the several prepns. Hemin prepns. obtained by treatment of protoporphyrin with $FeCl_3$, or crystd. in the presence of protoporphyrin, contain considerable porphyrin as shown by colorimetric dets.

A. W. Dox

Cleavage products from hydrogenated proteins. I. N. Troensegaard and M. G. Mygind. *Z. physiol. Chem.* **193**, 171–80(1930).—The authors' theory that proteins contain heterocyclic nuclei which on hydrolysis yield amino acids finds further corroboration in the isolation of 2 new bases from the hydrogenation products of acylated proteins. Because of their low H content these bases are obviously cyclic. Two such bases were previously obtained from serum globulin, serum albumin, globin, fibrin and casein (*C. A.* **25**, 306). The new bases herein described were obtained from gliadin, casein and globin. The protein was acetylated and then hydrogenated by Na and AmOH. The bases were extd. from the AmOH soln. by shaking with 30% NaH_2PO_4, the soln. was treated with K_2CO_3 and extd. with Et_2O; and the bases were pptd. as HCl salts. A partial sepn. was effected by distn. of the free bases *in vacuo*. The lowest-boiling fraction contained piperidine; the fraction b_{14} 90–130° contained the base $C_{11}H_{22}N_2$, isolated as the picrate; and the fraction $b_{0.2}$ 100–35° contained the base $C_{14}H_{22}O_2$, isolated as the styphnate. The last 2 were isolated in amts. corresponding to 0.2–0.4% of the N present in the acetylprotein. Both contain only tertiary N and combine with 2 mols. of monobasic acid. The *base*, $C_{11}H_{22}N_2$, forms a *picrate* which sinters 220° and decomps. 231°, a *chloroaurate* decompg. 197°, and a *Reineckate* m. 185°. The *base*, $C_{14}H_{22}N_2$, forms a *styphnate* which sinters 225° and m. with decompn. 234°, a *chloroaurate* m. 197° (decompn.), a *chloroplatinate* m. 257° (decompn.) and a *picrate* sinters 230° and m. 242° (foaming). The piperidine is not derived from the lysine component of proteins, since no piperidine could be obtained by a similar treatment of lysine itself, but was obtained from gliadin from which lysine is absent.

A. W. D.

Activator Z. VI. Tore Philipson. *Z. physiol. Chem.* **193**, 181–92(1930); cf. *C. A.* **25**, 306.—The purification of activator Z was undertaken with a view to obtaining a prepn. of high activity in the promotion of yeast growth. If boiled yeast ext. was used at the beginning the activity was increased 1.5 times by dialysis. Pptn. with $Pb(OAc)_2$ and $HgCl_2$ then increased the activity 2.5 times. By autolysis of bottom yeast a prepn. with higher initial activity was obtained and purified 2.5–3.0 times, so that its final purity on an abs. basis was twice as great as that of the prepn. from boiled yeast. It contained 10% N. The favorable conditions under which an 8-fold purification was previously accomplished by means of $Hg(NO_3)_2$ could not be reproduced. Autolyzates from both bottom and top yeast possess Z activity, but the former are twice as active as the latter. Before treatment with Hg salts the activator is very stable to acids and alkalies; after such treatment it becomes sensitive to alkalies.

A. W. Dox

***d*-α-Aminonorvaleric acid (norvaline) a building unit of proteins.** Emil Abderhalden and Fritz Reich. *Z. physiol. Chem.* **193**, 198–200(1930).—The discovery of norvaline as a component of globin (*C. A.* **24**, 3254) suggested the probability of finding this amino acid in other proteins also. It has now been isolated in 0.2% yield from casein by hydrolyzing the protein with HCl, distn. of the amino acid esters *in vacuo* and fractional crystn. of the fraction b_{12-16} 85–95°. The substance was identified by its sp. rotation 21.94°, and by the rate of amination of the $PrCHBrCO_2H$ prepd. by treatment of the amino acid with NOBr. The norvaline content of casein probably exceeds 1%.

A. W. Dox

The formation of a substance with histamine-like action from histidine on ultraviolet ray treatment and the significance of this process for the light erythema. F. Ellinger. *Strahlentherapie* **38**, 521–42(1930); cf. *C. A.* **25**, 120.—E. demonstrated that histidine is decarboxylated to histamine on irradiation with ultra-violet rays. An irradiated histidine soln. will excite the intestine of a guinea pig and the active prin-

ciple can be extd. with hot $CHCl_3$; this ext. also lowers the blood pressure. This points to the formation of histamine from histidine. The substance, however, could not be identified chemically and spectroscopically because of the very small yield. With 2 hrs. irradiation the formation of the new substance increased directly with the exposure. Between 2 and 4 hrs. no further action occurred. E. gives the following conception of the formation of a light erythema: A histamin-like substance is formed from histidine in the upper layer of the epidermis (perhaps even in the horn cells). This histamine substance has a very slow diffusion. It causes the first reddening and the picture of an increase of leucocytes in the vessels. There can be no doubt that this histamine-like substance is responsible for the erythema. F. R. G.

Lipase and its action. I. The synthetic action of pancreatic lipase in the system: oleic acid–glycerol–water–dissolved lipase. ERNEST A. SYM. *Biochem. J.* **24**, 1265–81 (1930).—Lipase acts at the phase interface in the system lipase–glycerol ext.–olcic acid. When the 2 phases are in contact with one another, at the beginning of the reaction lipase disappears from the aq. phase and accumulates at the phase interface. This process takes place in 2 ways. The first of these is of the nature of adsorption; the second probably depends on the formation of a membrane at the phase surface. The synthesis of olein involves a bimolecular reaction. The initial velocity of the reaction, but not the equil. const., is directly proportional to the concn. of enzyme in the aq. phase. BENJAMIN HARROW

The invertase accelerator of serum, with observations on other enzyme accelerators reported in serum. JOSEPH FINE. *Biochem. J.* **24**, 1282–93(1930).—Serum does not normally contain invertase. By intraperitoneal injections of invertase, the enzyme appears in the serum. Serum possesses the power of accelerating yeast invertase. BENJAMIN HARROW

Enzymic synthesis of raffinose. A. V. BLAGOVESHCHENSKII. *Biochem. J.* **24**, 1337–9(1930).—17.9712 g. galactose and 34.1765 g. sucrose were dissolved in 1000 cc. 80% acetone. One g. emulsin was added and the mixt. placed in a thermostat at 35° for 5 months. The rotation changed from +5.40° to +5.68°. The acetone was distd. off *in vacuo*, the soln. concd. to a sirup and extd. with boiling 96% alc. After a few days crystals of sucrose and galactose sepd. out. The mother liquor was evapd. and again extd. with alc. After a new crystn. of sucrose and galactose, the mother liquor was decanted and, after standing for some time, deposited small crystals. These crystals were washed with alc. and dried. 0.4117 g. was dissolved in 25 cc. water and after 24 hrs. gave, in a 2 dm. tube, a rotation $\alpha_D = +3.15°$, corresponding to the specific rotation $[\alpha]_D = +95.66°$. (For raffinose $[\alpha]_D = +104°$, for galactose +81°, and for sucrose +66.5°.) To this soln. emulsin was added. The rotation changed to +2.81° and after 10 days decreased to $\alpha_D = +2.34$. "These results give us the right to conclude that the action of emulsin on a soln. of galactose and sucrose in 80% acetone produces a compd. with the properties of raffinose." BENJAMIN HARROW

Uricase and its action. II. Bacterial nature of the action of uricolytic extracts and dialyzates. RICHARD TRUSZKOWSKI. *Biochem. J.* **24**, 1340–8(1930); cf. *C. A.* 22, 2178.—With the exceptions of systems contg. $CHCl_3$ or toluene, or of aseptically taken tissue, all the prepns. examd. contain bacteria. Many of the conclusions drawn in the earlier papers (*C. A.* **23**, 162; **24**, 5314) are invalid. **III. Comparison with activated charcoal. Contact nature of the action of uricase.** *Ibid* 1349–58.—The activity of exts. (suspensions) is assocd. with the presence of macroscopic fragments of cell debris. The process of biological uricolysis is one of contact catalysis on certain sp. macroscopic surfaces. **IV. Preparation and properties of ox-kidney uricase.** *Ibid* 1359–70.—Mixed kidney tissue is shaken with water contg. $CHCl_3$ for 2–3 hrs. The suspension is filtered through cotton wool and the filtrate is centrifuged. The residue is suspended in water and the suspension again centrifuged. The residue can be kept for 2 weeks (and probably longer) in an atm. satd. with water and toluene vapors. BENJAMIN HARROW

Behavior of glutathione in yeast. NORMAN U. MELDRUM. *Biochem. J.* **24**, 1421–7(1930).—The respiration of yeast may be reduced by 60–90% by narcotics or by cyanide. Glutathione does not reduce cytochrome in yeast, nor is it directly concerned in carbohydrate oxidation by yeast. BENJAMIN HARROW

Mode of action of tyrosinase. CAECILIA ELIZABETH MARY PUGH. *Biochem. J.* **24**, 1442–55(1930).—There is no evidence that tyrosinase can be obtained in a form which does not act on monohydric phenols in absence of some coenzyme or activator. Attempts to sep. tyrosinase into 2 enzymes have failed. BENJAMIN HARROW

Asymmetric ester hydrolysis by enzymes. V. The configuration specificity of liver esterase in its relation to enzyme complexes. EUGEN BAMANN, PAUL LAEVERENZ,

R. WILLSTÄTTER AND R. W. KUHN. *Ber.* **63B**, 2939-48(1930); cf. *C. A.* **24**, 2153.—The stereochem. activity of the enzyme can be influenced by prétreatment as well as by adding optically active foreign substances. An ammoniacal ext. of human liver esterase from the untreated dry prepn. after AcOH pptn. and dialysis splits the 2 components of racemic mandelic acid ester to about the same extent, while the ext. from a prepn. dried at 60–65° for several days or treated with toluene before adding ammonia attacks the *d*-ester more than the *l*-ester. The enzyme complex has probably undergone a change in its constitution by the union of the catalyst group with specific bodies from the decompn. of the enzyme or of attendant substances.

MARY E. LEAR

The preparation and some properties of the crystalline methemoglobin of the horse. MILTON LEVY. *J. Biol. Chem.* **89**, 173-83(1930); cf. *C. A.* **22**, 1986.—Three methods are described for the prepn. of cryst methemoglobin from horse blood, in 2 of which the oxidation is accomplished by the use of $K_3Fe(CN)_6$ and in the 3rd autoxidation of oxyhemoglobin occurs in the presence of EtOH. The methods are modifications of procedures previously described. The soly. of methemoglobin in phosphate buffer solns. depends on the ionic strength of the buffer in the same manner as does the soly. of oxyhemoglobin. The p_H of min. soly. is 6.8 at a const. ionic strength of 0.25. Methemoglobin is of the same *apparent* valence type as oxyhemoglobin. Oxyhemoglobin is thermodynamically unstable with respect to the formation of methemoglobin and O_2 and any detectable amt. of oxyhemoglobin spontaneously appearing in methemoglobin owes its origin to unknown reducing agents and not to the appearance of an equil. with O_2.

A. P. LOTHROP

Plasma phosphatase. I. Method of determination. Some properties of the enzyme. H. D. KAY. *J. Biol. Chem.* **89**, 235-47(1930).—A simple method is described for the estn. of the phosphatase content of blood plasma in which Na β glycerophosphate is used as the substrate. A plasma sample contg. *one-unit* of phosphatase is one of which 1 cc. will liberate 1 mg. of inorg. phosphate (expressed as P) in 48 hrs. at 38° and a p_H of 7.6. The quantity of enzyme in blood plasma is very small compared with the quantity in an equal wt. of kidney (1/300), intestine or bone. Both red and white cells contain more phosphatase than the plasma so that both hemolysis and the presence of leucocytes must be avoided. Plasma phosphatase has the same p_H for activity, 8.8 to 9.2, as that of the phosphatases of other mammalian tissues. Mg ions are a powerful stimulant to its activity with an optimum p_{Mg} between 1 and 2. Ca ions are mild inhibitors. The enzyme has been found to hydrolyze the following phosphoric esters: hexosediphosphate, synthetic α- and β-glycerophosphates, pyrophosphate, glycophosphate and guanine nucleotide. **II. The enzyme in disease, particularly in bone disease.** *Ibid* 249-66.—In normal individuals the plasma phosphatase varies from 0.1 to 0.21 unit. In cases of generalized bone disease, such as osteitis deformans, generalized osteitis fibrosa, osteomalacia and rickets (infantile, adolescent and renal) the values are much increased, rising to above 3 units which is more than 20 times the normal value. The increase may be correlated in general with the severity of the disease. There is, thus, a 3rd variable in addn. to Ca and inorg. P (long known to be affected in bone diseases) which suffers still greater changes than the other 2. These findings indicate a strong correlation between bone maintenance and phosphatase and this enzyme must be accepted as playing a very important role in bone formation, maintenance and pathology. Bibliography of 25 references.

Glutelins. VI. The optical rotation of the glutelins of wheat, rye, barley, maize and rice. FRANK A. CSONKA, MILLARD J. HORN AND D. BREESE JONES. *J. Biol. Chem.* **89**, 267-73(1930); cf. *C. A.* **21**, 2718.—Values for the $[\alpha]^{20}$ of the following glutelins were obtained: wheat, α −85.1, wheat, β −76.6, rye −81.2, barley −111.1, corn, α −72.6, rice −65.1°. Racemization studies of the α- and β-glutelins of wheat and of gliadin indicated that they could all be referred to a hyperbolic curve, $y = ax^b + c$.

A. P. LOTHROP

Quantitative clinical and spectrophotometric comparison between natural and synthetic thyroxine. EGGERT MØLLER, CHR. N. J. GRAM AND S. A. SCHOU. *Acta Med. Scand.* **74**, 85-103(1930).—Synthetic thyroxine from Hoffmann-LaRoche and natural thyroxine from Harington were both found to give identical spectrophotometric curves, had the same I_2 content (65%) and produced the same rise in basal metabolism of a myxoedema patient. Abderhalden and Rossner's description of the spectrophotometric curve common to natural and synthetic thyroxine is confirmed. S. M.

The effect of short wave radiations on proteins. I. B. RAJEWSKY. *Biochem. Z.* **227**, 272-85(1930).—The effect of ultra-violet and Röntgen radiation on the protein

consists of a denaturing of the protein mol., a conglomeration of the denatured particles to large visible masses (coagulation) and finally a pptn. of the coarsely dispersed particles. The latent period of the reaction serves as a measure of the degree of reaction under definite conditions of intensity of radiation, temp. and protein concn. This relationship is expressed by $LZ = K(1 + (1/t))$, where K = const. and t is the duration of illumination. The active absorption takes place between 300 and 254 mμ. The reaction of the protein to ultra-violet radiation is essentially independent of the temp.; only the conglomeration of the denatured particles of the egg albumin is accelerated by a rise in temp., but the effect of the x-rays is greatly influenced by the temp., the increase in reaction velocity following an exponential curve, thus indicating a difference in the mechanism of the action of both types of radiation. **II. The relation between the radiation reaction of the protein and the radiation intensity of the ultra-violet rays.** WOLFGANG GENTNER AND KURT SCHWERIN. *Biochem. Z.* **227,** 286–303(1930).—The coagulating effect of ultra-violet radiation on a pure paraglobulin soln. was studied by detg. the no. of protein particles performing Brownian movements. The curves based upon the enumeration of these particles give the various characteristics of the reaction and thus serve as a relative measure of the radiation effect. Under the condition of equal total radiation energy the relationship between the radiation effect and radiation intensity is expressed by $I.\ T^{0.90}{}_4 = K$. S. M.

Studies on lactic acid fermentation of warm-blooded tissue. III. The fermentation of different sugars by rat liver. Its dependence on the nutritive condition of the experimental animal and of the season of the year. OTTO ROSENTHAL. *Biochem. Z.* 227, 354–84(1930); cf. *C. A.* **23,** 5478.—Although liver tissue may produce considerable quantities of lactic acid under anaerobic conditions, it ferments but poorly added glucose. The investigation was therefore undertaken to det. if other hexoses are fermented with greater speed, and for this purpose glycogen, sucrose, maltose, lactose, galactose mannose, glucose, fructose, Harden's hexosediphosphate, Neuberg's and Robison's monophosphate ester, glyceraldehyde and dihydroxyacetone were tested. Only fructose and the 2 trioses were fermented with greater velocity. Mannose is just barely fermented, but no more than glucose, while all other hexoses were practically ineffective. However, even with the 3 fermentable glucides the process occurred with any speed only with the liver of well-nourished animals, whereas with the livers from fasting animals the fermentation rate was not different from that of glucose. Furthermore, the fermentation capacity of the liver from both well-fed or starved rats varies with the season of the year, which is attributed to a different content of each liver of the fermentation activator. The dismutation of methylglyoxal was independent either of the nutritive condition of the animal or of the season, and is about fourfold the fermentability of either fructose or glyceraldehyde. S. MORGULIS

Demonstration and intensity of mitogenetic radiation. I. H. SCHREIBER AND W. FRIEDRICH. *Biochem. Z.* **227,** 386–400(1930).—By a special arrangement of app., capable of measuring the emission of one quantum in 200 sec., there has been complete failure to detect any radiation from multiplying yeast cells. S. M.

Studies on permeability. III. Cholesterol and lecithin in relation to the water and acid-base content. J. DAHMLOS AND A. SOLÉ. *Biochem. Z.* **227,** 401–28(1930); cf. *C. A.* **24,** 4063.—The idea is developed that lecithin + OH^- are the most potent synergistic factors in forming a water-permeable oil/water-dispersion system, while lecithin + H^+ are antagonistic to the formation of such a system. The lecithin + OH^- effect is greater than that of cholesterol + H^+. The idea is derived from the hypothesis that the action of the lipides on the penetration ability of water or water-sol. acids and bases depends upon the influence of these colloids together with the ions in detg. the oil/water or water/oil structure of the interfacial layer. Expts. were performed on rabbits with the view of testing this hypotheses, by injecting lecithin or cholesterol esters intravenously. Cholesterol-treated animals showed the largest urinary output, while the lecithin animals showed the lowest. Animals receiving twice an injection of 0.15 g. cholesterol in 40 cc. isotonic glucose soln. show hypercholesterolemia with most pronounced hydremia, while the administered water is thrown out through the kidneys. Both the serum and urine Cl reach a max. at that time. The exptl. hyperlecithinemia causes retention of water by the tissues, and a min. concn. of Cl in both urine and serum. If the rabbits are loaded with the same quantities of water contg. in addn. 0.8 g. NH_4Cl (= 0.53 g. Cl) per day, it is found that hypercholesterolemia under these conditions causes the tissues to throw off the excessive amt. of Cl together with water through the kidneys. Hyperlecithinemia, under similar conditions, leads to greater elimination through the kidneys than in expts. with water-loading alone, but still most of the water and Cl is retained in the tissues, and the blood is actually poorer in water than

in the control animals. Similar expts. were performed but the lecithin and cholesterol were not injected but the animals were given 1 g. daily of one or the other over a period of 3 months. When these rabbits were now loaded as before with water or with NH_4Cl solns. it was found that long-continued feeding of cholesterol causes a retention of water and Cl by the tissues, which is contrary to the effect of the parenterally administered cholesterol. Similarly, whereas the pareuterally administered lecithin caused a lowering of the serum and urine Cl concn. and a diminution of the water and Cl elimination through the kidney, the feeding of excessive amts. of lecithin resulted in a rise of the serum and urinary Cl concn. and in an increased Cl and water excretion. In fact, compared to the cholesterol-fed animals, the rabbits fed lecithin show that Cl and H_2O are thrown off by the tissues by way of the kidneys. Irradiated ergosterol has the same effect on the P concn. of serum and urine as cholesterol has on the Cl; only irradiated ergosterol acts the same way whether administered by intravenous injection or by feeding. The same effect can also be produced by non-radiated ergosterol, although the raising of the serum Ca follows the intravenous injection only of the radiated ergosterol

S. Morgulis

Unanswered questions in the biochemistry and geochemistry of iodine. Roe E Remington. *J. Chem. Education* **7**, 2590 9(1930).—By using available literature as a basis for the discussion, it is shown that there is need for further investigation of the relation of goiter prevalence to iodine consumption Some of the problems still unsolved relate to the biol. aspect, such as those concerned with the chem. nature of the thyroid hormone and its function in metabolism, those concerned with the biol requirement of I in nutrition, and those concerned with a comparison of the utilization by the body of iodine from different sources, such as org. I compds., milk and vegetables rich in I, and iodized salt. Other problems relate to the investigation of goiter prevalence with respect to seasonal variation of foods, the content of I in the soil and rocks of certain communities, and the possibility of obtaining I from sea spray. Many surveys of goiter prevalence with respect to certain conditions are inaccurate because of lack of control of diet, soil fertilization and other factors. N. M. Naylor

Molecular weight of egg albumin. II. In the presence of electrolytes. J. B. Nichols. *J. Am. Chem. Soc.* **52**, 5176 87(1930), cf. Svedberg and Nichols, *C. A.* **21**, 746.—Crystd. electrodialyzed egg albumin has a sedimentation const. of 4.06×10^{-13} cm./sec. at 30° but the diffusion const. is abnormal, approx. 0.6 of the required value on the basis of the sedimentation const and mol. wt The mol. is spherical and has a radius of 2.17 m.; it is practically identical in size and mass with that of Bence-Jones protein, although entirely different in chem. compn. The depression of the sedimentation const. arising from the Donnan effect in unbuffered solns. on either side of the isoelec. pt. of egg albumin is reported; the max depression occurs in the neighborhood of p_H 3. At a p_H of 1.16 in 0.1 *N* HCl, egg albumin is completely denatured and gradually forms a gel showing a distribution curve of gel clumps; the mean size corresponds to about 7 mols. per particle after 3 hrs. C. J. West

The p_H-stability region of egg albumin. Bertil Sjögren and The Svedberg. *J. Am. Chem. Soc.* **52**, 5187–92(1930). —By use of the ultracentrifugal methods in the study of the p_H-stability region of egg albumin, it is shown that in the p_H range 4–9 the protein is stable and homogeneous with regard to mol wt.; the mean value 34,200 is in good agreement with the previous detn. of Svedberg and Nichols, 34,500. Below p_H 4 and above 9 some of the mols. are split up into a non-centrifugible substance. The sedimentation const. of the centrifugible material is independent of p_H within the range 3–11 with a mean value of 3.54×10^{-13} at 20° The mol. frictional const. is 2.47×10^{-16} at 20°, which value is identical with the mol. frictional const. calcd. for a spherical mol. of the same mol. mass and density. The egg albumin mol., therefore, is spherical and has a radius of 2.17 mμ. At p_H values lower than 3, the sedimentation increases, indicating the formation of aggregates of denatured protein; at p_H values higher than 9 the sedimentation decreases, indicating the breaking up of the whole material. Both the acid and the alk. decompn. are accompanied by an increase in the light absorption. A comparison of egg albumin and Bence-Jones protein using the new value of the sedimentation const. for egg albumin shows a still closer agreement than was formerly found for the mol. consts. of these proteins. C. J. West

Soy-bean lecithin. I. The separation of α- and β-series. Bunsuke Suzuki and Yoshikuni Yokoyama. *Proc. Imp. Acad.* (Japan) **6**, 341–4(1930).—In the hydrolysis of 70 g. of the $CdCl_2$ salt of lecithin there were obtained 18.5 g. Ba glycerophosphate (35% of the β-acid), 16.3 g. of choline chloroplatinate (6.4 g. choline), 10.8 g. crude satd. acids and 14 g. crude unsatd. acids. The satd. acid was palmitic acid; the unsatd. acids contain about 47% oleic acid. Theoretically 70 varieties of lecithin are possible.

contg. 4 fatty acids. It is now found that the α- and β-lecithins may be sepd. by the greater soly. of the β-forms in warm Me_2CO. In the hydrolysis of the 2 forms the following % yields of acids were obtained, the value being for the α- and β-forms, resp.: palmitic 24.3, 20.1; dibromostearic 32.4, 53.8; tetrabromostearic 42.2, 24.8; hexabromostearic 1.1, 1.4. C. J. WEST

Bios (SUZUKI, *et al.*) **16.** Clupein (FELIX, LANG) **10.** The splitting off of halogen by dilute alkali from stereoisomeric haloacylamino acids and their behavior toward erepsin and trypsin-kinase (ABDERHALDEN, SCHWEITZER) **10.** Comparative investigations on the cleavage of the CONH linkage in polypeptides and related compounds, in which the NH_2 or COOH group is variously substituted, by dilute alkali, erepsin and trypsin-kinase (ABDERHALDEN, RIESZ) **10.** Sterols (SANDQVIST, GORTON) **10.** The influence of volume and buffer value of a solution on the buffer value of another solution (RUSSO) **2.**

Bile acids. CHEM. FAB. VORM. SANDOZ. Ger. 506,278, April 25, 1926. See Brit. 260,025 (*C. A.* **22**, 1375).

B—METHODS AND APPARATUS

STANLEY R. BENEDICT

The iodometric determination of homogentisic acid in urine. ERNST METZ. *Z. physiol. Chem.* **193**, 46-8(1930).—A discussion of the modifications of M.'s method (*C. A.* **22**, 4557) proposed by Lieb and Lanyar (*C. A.* **23**, 2998). The change from 0.1 *N* to 0.05 *N* soln. is unimportant, while detn. of homogentisic acid at higher dilns. requires a longer reaction time. The addn. of KI is, however, an actual improvement, and the correction for water of crystn. of the homogentisic acid used is conceded. A. W. DOX

Estimation of uric acid in urine by means of the absorption spectrum. J. EISENBRAND *Arch. Pharm* **268**, 520-36(1930).—The expts. described show that the quant. evaluation of the absorption spectrum with respect to urine lies in the ultra-violet between 250 and 400 mμ, constituting in all the cases examd., a reliable method for estg. uric acid in urine. The method involving pptn. of the uric acid via Hopkins fails in many cases. The approved method is; Treat 2 to 5 cc. of the sample in a 100-cc. flask with 10 cc 0.1 *N* NaOH soln., fill to the mark and filter (soln. I). Fill a like amt. of the sample into a 2nd 100-cc. flask, add 10 cc. 0.1 *N* HCl and fill to the mark (soln. II), then exam. both solns. spectrographically in suitable layers (0.5 cm.). For morning and noon urines a diln. of 1:20 suffices; for evening urines a diln. of 1:50 suffices. The difference of light absorption of the 2 solns. at 303 mμ, recalcd. to 1 cm. of undild. urine, gives the concn. of uric acid in accordance with the formula: c in mg./100 cc. = $D \cdot 2.58$, in which D represents the difference in light absorption of 1 cc. undild. urine in 0.01 *N* alkali and 0.01 *N* acid. W. O. E.

The application of the colorimetric determination of phosphoric acid in germinating plants by the method of Neubauer. K. PFEILSTICKER. *Z. anal. Chem.* **82**, 276-84 (1930). A careful study of the various factors influencing the colorimetric method of Denigès showed that if the directions concerning the prepn. of the reagents and the exact procedure in making the analysis are followed scrupulously, results can be obtained agreeing within 0.5 mg. of P_2O_5 when the solns. to be analyzed are prepd. by the Neubauer method Slight variations in the procedure cause errors so the original paper should be consulted for the exact details. The method is very rapid. W. T. H.

The gasometric determination of cysteine and cystine. HARRY D. BAERNSTEIN. *J. Biol. Chem.* **89**, 125-31(1930).—The method depends upon the specific oxidation of cysteine to cystine by a soln. of I in KI in the presence of 2 *N* acid. The excess of I is detd. gasometrically by a hydrazine titration in the app. of Van Slyke and Neill. The method is simple, rapid and accurate to about 4%. In the procedure for cystine, it is reduced to cysteine by treatment with Devarda's alloy in the presence of HCl. Colored or turbid solns. may be used and the method may be employed in enzyme studies as a partially hydrolyzed protein can be used with equal success. A. P. L.

Gasometric determination of oxygen and carbon monoxide in blood. JULIUS SENDROY, JR. AND S. H. LIU. *J. Biol. Chem.* **89**, 133-52(1930).—An improved technic is described for the detn. of O_2 and CO in a single blood sample by the use of the Van Slyke-Neill manometric app. The mixt. of $O_2 + CO + N_2$ extd. from blood is removed to a micro-Hempel pipet, where the O_2 is absorbed. The extn. chamber is then washed free of blood and the gases are returned for the completion of the analysis. The procedure equals in accuracy the Van Slyke-Robscheit-Robbins method (*C. A.* **21**,

2144), is less laborious and can be completed in 25 to 30 min. It also obviates the use of the special Harington-Van Slyke extn. chamber. A. P. LOTHROP

The specificity of the diazo reaction for the detection of bilirubin. EMILIO BECCARI. *Boll. soc. ital. biol. sper.* **5**, 671–4(1930).—Bilirubin, indole, scatole, tryptophan, tyrosine, adrenaline, pyrrole, dimethylethylpyrrole, adenine, guanine, xanthine, hypoxanthine, dihydroxyphenylalanine, histidine, proline, hydroxyproline and allantoin solns. in an acid and alk. reaction were treated with Ehrlich's reagent (*p*-diazobenzinesulfonic acid). Of these, pyrrole, tyrosine, histidine, adrenaline and dihydroxyphenylalanine gave color reactions which were indistinguishable from that given by bilirubin in an alk. medium. The diazo reaction for detg. bilirubin in blood may be of practical value clinically, but it is not sufficiently accurate for exact detns.. For more exact results, the oxidative methods should be used. PETER MASUCCI

Goria's method for determining the globulin-protein ratio in spinal fluids. GAETANO G. NOTO. *Boll. soc. ital biol. sper.* 5, 770 3(1930).—The method (*Riv. neurol.* 2, 199 (1929)) while simple is sufficiently accurate to give a clear idea on the condition of the fluid in question and on the relative amts. of globulin and albumin present. The values obtained by this method, however, are only relative. A ratio of 0/8 is obtained only in those fluids which present no pathol. characteristics. PETER MASUCCI

Method for decolorizing preparations impregnated by Cajal's photographic method. A. FRANCESCON AND R. CAMPOS. *Boll. soc. ital. biol. sper.* **5**, 780 1(1930).—The sections are freed from paraffin, passed through alc. and placed in Lugol's soln. for a few min. until the complete disappearance of Ag. The sections are washed in distd. water, and passed through a 5% soln of $Na_2S_2O_3$ until the brown coloration disappears; they are then washed thoroughly in tap water, stained with hematoxylin or Mallory and mounted in Canada balsam. The method is very rapid, easily applied and gives excellent results. PETER MASUCCI

A new color reaction of adrenaline and adrenalone. MARCEL PAGET. *Bull. sci. pharmacol.* **37**, 537–8(1930). Adrenaline-HCl in soln. 5:1000 gives with a 10% soln of NH_4 molybdate a reddish brown or amber color, that changes to a greenish fluorescence after addn. of NaOH. Adrenalone gives a yellow-orange pptn. or if less concd., a yellow color, that does not change to green with NaOH. A. E. MEYER

Determination of phosphatide-phosphorus in small quantities of serum by the gravimetric strychnine molybdate method. KÄTE KOCH. *Biochem. Z.* **227**, 334 9 (1930).—Solns. of Na_2HPO_4 with 3.6 0.36 mg. P_2O_5 were analyzed by the following procedure: The neutralized soln. was dild. to 60 cc. and treated with 20 cc. of the reagent. The latter is prepd. fresh by mixing 3 vols. of soln. I with 7 vols. of soln. II. Soln. I consists of 1 part of a soln. of 50 g. NH_4 molybdate in 150 cc. H_2O and 3 parts of HNO_3 made by dilg. 2 vols. of HNO_3, sp. gr. 1.4, with 7 vols. H_2O. Soln. II is made by dissolving 15 g. strychnine in 1 l. H_2O. The pptn. is allowed to proceed for 30 40 min., filtered off through an asbestos Gooch crucible, washed with ice cold pptg. reagent dild. 1:5 and finally with ice cold water until the wash water no longer reacts acid. The ppt. is dried at 105°; the wt. multiplied by 39 = P_2O_5. The soln. is best neutralized to phenolphthalein with 2 drops of a 1:400 soln. Perfect recovery resulted in these analyses. For the phosphatide-P_2O_5 detn. 2 cc. serum was measured into a beaker contg. a mixt. of 2 g. anhyd. $CaSO_4$ and 0.2 g. $CaCO_3$, and about 10 min. later 15 cc. anhyd. ether is added and after another 10 min. MeOH is added slowly and with stirring until no further pptn. of protein occurs. The mixt. is allowed to stand for a few min., when it is filtered into a small Kjeldahl flask, the ppt. being washed with about 100 cc. of a 4:1 ether-MeOH mixt. The ether MeOH mixt. is evapd. and the residue is digested with 1–2 cc. H_2SO_4 and perhydrol. The clear soln. neutralized with NH_4OH is acidified with 2 drops NH_4NO_3 and treated with 10 cc. of the pptg. reagent, the pptd. P_2O_5 being detd. as already described above. The wt. of the phosphatide-P_2O_5 from 2 cc. serum ranges between 12 and 25 mg. S. MORGULIS

Color reactions of thiolglyoxalines (thioliminazoles) with sodium diazobenzene-*p*-sulfonate. GEO. HUNTER. *J. Chem. Soc.* 1930, 2343-6; cf. *C. A.* **22**, 1985.—The previously described test for ergothioneine is a general one for the thiolglyoxaline ring provided it contains a free thiol group in the 2-position and has at least 1 of the 4- and 5-positions open or contg. a displaceable CO_2H group. A free iminic H may also be necessary. The presence of a thiol group in the 2-position alters the reaction of the glyoxaline ring with diazo compds. in such a way that its presence in soln. can no longer be detected by the glyoxaline diazo tests. That the thiol H plays a part in this interference and is responsible for the course of the reaction in this test is made evident. C. J. WEST

C—BACTERIOLOGY

CHARLES B. MORREY

Studies on Bacillus thermofibrinocolus N. sp. III. Production of volatile acid and alcohol. ARAO ITANO AND SATIYO ARAKAWA. *J. Agr. Chem. Soc. Japan* **6**, 248–56; *Bull. Agr. Chem. Soc. Japan* **6**, 17–18(1930); cf. *C. A.* **24**, 5327.—More cellulose is fermented in a test tube than in a 300 cc. flask although more volatile acid and alc. are produced in the latter. At 65°, the organism ferments 60–88% of cellulose supplied at the beginning, in 3–7 days, and produces 24–33% volatile acid, as AcOH and 3–12% alc., as EtOH of the cellulose fermented. The opt. temp. for the organism is 65°, and at 50° it ferments only 63% as much cellulose as is fermented at 65°. But the amt of volatile acid and alc. produced is rather large at 50°, compared to that at 65°. This may be due to the fact that some of the products are lost at the higher temp. or are used up in metabolism. Less cellulose is fermented under anaerobic conditions than under aerobic. A similar amt. of volatile acid is produced in both cases, but more than double the amt. of alc. under anaerobic conditions. The opt. concn. of peptone is 0.5%. The quantity of volatile acid produced parallels the quantity of peptone. The organism seems to require org. N for the production of both volatile acid and alc. With $CaCO_3$ added to the medium 64% of cellulose is fermented on the third day, while only 32% is fermented without $CaCO_3$; on the seventh day, 88% is fermented in the former and 46% in the latter. The production of both the volatile acid and alc. is greatest on the third day. **IV. Nitrogen metabolism.** *Ibid J. Agr. Chem. Soc. Japan* **6**, 257–60, *Bull. Agr. Chem. Soc. Japan* **6**, 18–19(1930).—In the presence of cellulose the quantity of ammonia N produced is irregular while the amino N increased steadily. In case no cellulose is present, both ammonia and amino N decreased after certain days. Consequently in the presence of cellulose, the quantity of amino acid can serve as an approx. index of proteolysis, and it seems to indicate that the organism contains a proteolytic enzyme. This confirms the expt. obtained by De Bord. Y. KIHARA

Quantitative determination of bacteriophage. ALBERT P. KRUEGER. *Science* **72**, 507–8(1930); cf. *C. A.* **24**, 3810. W. D. LANGLEY

The molecular size of the type III specific polysaccharide of pneumococcus. FRANK H. BABLES AND WALTHER F. GOEBEL. *J. Biol. Chem.* **89**, 387–94(1930).—The diffusion coeff. of the specific polysaccharide of Type III pneumococcus has been detd. and from this const. the mol. wt has been calcd. to be 118,000, a value as great as that of most proteins. This carbohydrate is a relatively strong acid so that if it were highly ionized in soln., the detd. mol. wt. would be too low; on the other hand if the mol. is highly hydrated, the value would be too large. A. P. LOTHROP

D—BOTANY

THOMAS G. PHILLIPS

The action of certain fungi on aldose solutions. I. A. ANGELETTI AND C. F. CERETTI. *Ann. chim. applicata* **20**, 424–33(1930).—The actions of (1) *Penicillium luteum* Wehmer, (2) *P. purpurogenum* Stoll, and (3) *P. luteum-purpurogenum* on *d*-glucose, *d*-mannose and *d*-galactose have been studied. *d*-Glucose forms 15.5 and 1.21% of gluconic acid with (1) and (2), resp. whereas (3) gives over 60%. *d*-Mannose show traces of acid with (1) and (2), and 9.35% with (3). *d*-Galactose is not acted upon by any of the 3 enzymes. A. W. CONTIERI

The estimation of the quality of seeds by their enzyme content. MARIA I. LISCHEWITSCH *Fermentforschung* **12**, 244–61(1930).—The catalase, amylase and protase contents of barley and wheat grown in Russia vary with the latitude of the locality where the crop is harvested. The enzyme content is greater in northern than in southern latitudes, except that higher elevation above sea level tends to counteract the effect of southern latitude. The difference is due to differences in the length of the growing season which det. the state of maturity of the seed. With the shorter season prevailing in northern latitudes and high elevations the enzymes of the seed have less time for conversion into their zymogenic or inactive forms. Peas and soy beans, on the other hand, showed no such variations in enzyme content. Possibly this fact has some connection with the more uniform chem. compn. of these seeds. The lipase content

as also the acid no. of ricinus seed is much higher for northern latitudes. Hemp seed shows a similar variation, while poppy, sunflower and mustard seeds are quite uniform in their lipase content. A. W. DOX

Carbon dioxide storage of fruits, vegetables and flowers. NORWOOD C. THORNTON. *Ind. Eng. Chem.* **22**, 1186–9(1930).—Fruits and vegetables held in storage for 3–7 days withstood, without apparent injury, concns. of CO_2 varying from 6 to 83% depending upon the variety tested. The concn. of CO_2 tolerated by each fruit and vegetable was detd. at 6 storage temps. varying from 0° to 25°. The tolerance of CO_2 was influenced by the ripeness, firmness and freshness of the plant organ. In general, the presence of an excess of moisture in the storage chamber was undesirable. The CO_2 treatment prolonged the life of the flowers by retarding the opening of the buds. Rosebuds when removed to warm air after a storage period in 15% CO_2 for 7 days at 3.3–10° lasted as well as untreated roses which had been in cold storage without CO_2 for 3 days. This treatment gave a possible gain of 4 days. The concns. of CO_2 tolerated by various varieties of flowers and ferns at 10° varied from 10% in Jersey's Beauty dahlia to 80% in *Asparagus plumosus*. C. R. FELLERS

The relative amounts of iodine-absorbing (reducing) material in various plants. DAVID MARINE, EMIL J. BAUMANN AND BRUCE WEBSTER. *J. Biol. Chem.* **89**, 213–9(1930); cf. *Proc. Soc. Exp. Biol. & Med.* **27**, 1029(1930).—Previous studies indicate that certain plants contain antigoitrous substances other than I and the antigoitrous effect seems to be proportional to the amt. of I-absorbing material in the plant. Approx. 30 plants have been investigated as possible sources of this material. To prevent oxidizing enzymes from destroying these reducing substances, they were destroyed by steaming at 97–100° for 30 min. "The relative amt of I-absorbing material in plants is highly variable in different species and in the same species at different stages of its growth and maturation. The reducing substances are present in greatest concn in the rapidly growing portions of the plant and fall off gradually or abruptly during maturation. There is some evidence of annual variations dependent upon climatic conditions. Of the plants included in the survey, skunk-cabbage and iris leaves have given high values, while garden vegetables in general have shown low values. Clover alfalfa and certain grasses also contain high concns. during the period of rapid growth. The I-absorbing material decreases slowly with storage and rapidly during drying. The physiol. importance of these reducing substances is still unknown and nothing is known of their fate in the plant." A. P. LOTHROP

The influence of monochromatic light on the action of Saccharomyces cerevisiae in the presence of glucose. GUIDO GUERRINI. *Boll. soc. ital. biol. sper.* **5**, 635–6(1930).—The yeast was innoculated into 5% glucose soln and the cultures were incubated in the dark, normal light and in light filtered through red, yellow, green and blue screens. The CO_2 liberated was greater in cultures exposed to the light than in cultures incubated in the dark; the CO_2 liberated varied according to the filtered light as shown in the table below:

	Light filtered across shield			
Time	Red c. c.	Yellow c. c.	Green c. c.	Blue c. c.
1 hr.	5.8	4.6	4.0	2.3
2 hr.	21.6	10.1	7.5	4.1
3 hr.	37.5	22.2	17.0	8.5
4 hr.	54.2	36.8	29.2	13.3

PETER MASUCCI

Biochemistry and histochemistry of fruits and seeds. II. Ripening and aging effects. ANNELIESE NIETHAMMER. *Biochem. Z.* **227**, 462–71(1930); cf. *C. A.* **24**, 4076.—CaC_2O_4 ppts. are frequently found in unripe fruits and seeds which generally disappear with the progress of ripening, being obviously utilized in the metabolism. In some fruits of certain families the cells become filled with inclusions in the event of overripening. The AcH content increases as the fruit ripens. Dry fruits and seeds show increasing amts. of AcH up to the time of their greatest germinating capacity. S. MORGULIS

The dry sickness of lemon trees and its causes. GUIDO AJON. *Riv. ital. essenze prof.* **12**, 226–36, 253–62(1930).—In the lemons from sound plants there is a large amt. of peroxidase and catalase, and little oxidase. A large amt. of peroxidase is present in the fresh wood and roots. The dry sickness is caused by an excess of oxidase and scarcity of org. compds. The excess is due to the fertilizers, irrigation and stronger oxidation. The moisture and ash content and the analyses of the ash of sound and

diseased plant parts are given. The compn. of the soil influences the sanitary conditions of the plants, and the disease is caused by a disturbance in their nutrition.
R. SANSONE

Physicochemical studies on the nature of drought resistance in crop plants. R. NEWTON AND W. M. MARTIN. *Can. J. Research* **3**, 336–83, 385–427(1930).—Factors affecting drought resistance include those concerned in absorption, transpiration, and wilt endurance. The colloidal properties of leaf-tissue fluids are believed to be important in water retention under drought conditions. These and other physicochem. properties have been detd. in a no. of cereals, grasses and other plants, in relation to known drought adaptations. Methods for the study of colloidal properties have also been investigated. Hydrophilic colloids bind water and increase the concn. of aq. solns., as shown by f.-p. detns. Dextrose is less effective than sucrose in demonstrating this phenomenon. Concn., quality, and state of dispersion or coagulation of colloids are factors affecting the degree of water binding. The extn. of plant-tissue fluids and the estn. of dry substance by a modification of the refractometric method are described. The hydrolysis of sucrose added to plant juice in the bound-water detn. is shown experimentally not to introduce serious errors. Storage of leaf tissue or press juice for a few hrs. even at 0° leads to changes in colloidal properties, but errors from this source are avoided by prompt handling. Cylindrical dialyzer sacs of 100 cc. capacity were found to require about 48 hrs. for dialysis of plant juice at 3°, with the water changed every hr. A gradual partial coagulation of colloids took place during dialysis, as shown by a decrease in refractive index, by an increase in gold no., and by sedimentation when centrifuged. Hydration and dispersion were not always related, though both were affected by H-ion concn. and by salts. Acid and alk. salts stimulated hydration less because of the opposing "salt effect." In the presence of the natural crystalloids, hydration was usually greater than in dialyzed juice. The osmotic pressure of the tissue fluids of crop plants has been found to vary with physiol. scarcity of water, but is not a reliable index of drought resistance. Bound-water content has been found more dependable; the cultivated wheats and several grasses have been satisfactorily arranged on this basis in the order of their drought resistance. The contrasting behavior of 2 poplar species, with reference to leaf fall and frost resistance, has also been explained. The sepn. of the colloids by dialysis and the detn. of their gold no. have been used as aids in interpreting the bound-water values. The method of measuring imbibition pressure by direct pressure on masses of leaves proved unsuitable. The rates of water loss by evapn. from cactus segments and detached leaves of 2 grasses, under controlled humidity conditions, proved the remarkable ability of the cactus to retain moisture, but in the grasses showed no relation to drought resistance.
J. W. SHIPLEY

Specific polysaccharides from fungi. H. D. KESTEN, D. H. COOK, E. MOTT AND J. W. JORLING. *J. Exptl. Med.* **52**, 813–22(1930).—From *Monilia psilosis*, Ashford, a monilia from crosio, one from intertrigo, a member of the genus *Willia*, obtained from an erosio interdigitalis, a stock strain of *Saccharomyces cerevisiae* and a strain of *Trichophyton gypseum* isolated from a trichophytosis of the hand a fraction has been obtained which appears to be essentially a polysaccharide. Tested by direct pptn. against the corresponding antisera the polysaccharides from the yeast-like fungi exhibit only partial specificity. Cross-precipitin reactions are frequent. By absorption of precipitin on the intact mycotic bodies, however, a relatively high degree of sp. precipitability can be demonstrated for the polysaccharides.

E—NUTRITION

PHILIP B. HAWK

Some factors involved in the experimental production of pellagra in rats. I. Preliminary. VIOLET RUBY LEADER. *Biochem. J.* **24**, 1172–80(1930).—On a synthetic diet contg. rice starch and cane sugar pellagra could be induced in 17–25 days if the rats were first "run out" of vitamin B and then given just enough marmite to prevent polyneuritis. In the absence of cane sugar from the diet pellagra did not appear, but all the rats developed polyneuritis. Rats suffering from polyneuritis developed pellagra after the marmite dose was raised sufficiently to protect them from polyneuritis.
BENJAMIN HARROW

The acid-base relation of the organism with special reference to the urine. IV. Experimental acidosis and alkalosis. Effect of different forms of diet on acid-base excretion in the urine. D. SATKE AND R. BARTOLOMEY. *Wiener Arch. inn. Med.* **20**,

223–30(1930); cf. *C. A.* **24**, 5821-2.—The no. of cc. 0.1 *N* NaOH needed to titrate 100 cc. urine to p_H 7.4 is called the acid excess. The no. of cc. 0.1 *N* NaOH needed to titrate the urine excreted in 24 hrs. is called the total acid excess. Repeated examns. of the urine were made with the individual on normal diets and on special diets. In trials lasting 3 days a diet rich in protein caused very slight alterations in p_H of the urine, acid excess and total acid excess in the directions of acidity. A diet rich in carbohydrate caused only slight changes in p_H values of the urine or none at all. The acid excess and total acid excess decreased in most cases. A diet rich in fat seemed to have no effect as regards the acidity of the urine excreted. **V. Daily variations.** *Ibid* 472–82.—The acidity of the urine shows considerable variation during 24 hrs. It is lowest during the night and from morning on rises to a max. in the early afternoon. Directly after the main meal there is often but not always a slight fall in acidity but 1/2–3 hrs. after the meal the p_H of the urine is almost always high, and then falls in the evening hrs. The alterations in acidity of the urine are due to, in part, the decreased excitability of the respiratory center during sleep, leading to an increase of alveolar CO_2 tension, and an increased acidity of the urine. The secretion by the stomach of the gastric juice is the cause of the decrease in acidity of the urine a certain time after meals. The variations during the day probably also follow a rhythmic course. In many pathol. conditions, such as fevers, decompensated cardiac conditions, stomach and kidney diseases, the daily variations in acidity are much less marked than in normal conditions. HARRIET F. HOLMES

Black-tongue-preventive value of Minot's liver extract. JOSEPH GOLDBERGER AND W. H. SEBRELL. *U. S. Pub. Health Repts.* **45**, 3064–70(1930).—It appears that Minot's liver ext., given to dogs on a basic black-tongue-producing diet, in a daily dose equiv. to 100 g. of fresh liver, has a very definite delaying effect on the occurrence of symptoms, and when fed to dogs in an attack of black tongue has a very definite curative effect. The most reasonable explanation for this action seems to be that the liver ext carries the antipellagric vitamin with it. In view of the evidence presented, it seems that Minot's liver ext. is a fairly good source of the antipellagric vitamin, and given in larger quantity would be of value as a temporary expedient in the treatment of pellagra. J. A. KENNEDY

Vitamin D. I. Action of ozone and ultra-violet light rays on cholesterol and oils. ETSUO TAKAMIYA. *Bull. Agr. Chem. Soc. Japan* **5**, 72(1929); cf. *C. A.* **25**, 123. Ozone activated ergosterol similarly to ultra-violet rays. **II. Rickets and ozone.** *Ibid* 72–3.—Rats maintained upon the McCollum diet No. 3143, and thus made rachitic, were cured of their rickets by ozonized air without treatment with vitamin D or ultra violet rays. The relationship ergosterol + ozone = vitamin D is thus established. W. D. LANGLEY

The relation between alkali deficit and glucose tolerance in the dog. HARRY J. DEUEL, JR. AND MARGARET GULICK. *J. Biol. Chem.* **89**, 93–5(1930).—The rate of the removal of glucose from the blood in a well-fed dog having a decreased alk. reserve has been compared with that of the same animal under a similar dietary régime but having a normal alk. reserve. The alkali deficit was produced by the administration of NH_4Cl. It was found that a compensated acidosis is not in itself a factor which prevents ready removal of glucose from the blood. This removal proceeds in a perfectly satisfactory manner if sufficient carbohydrate has been fed 14 to 18 hrs. before the glucose test is given. A. P. LOTHROP

Arginine metabolism. I. The relation of the arginine content of the diet to the increments in tissue arginine during growth. C. WESLER SCULL AND WM. C. ROSE. *J. Biol. Chem.* **89**, 109–23(1930).—"Comparative studies have been made of the increase in tissue arginine incidental to growth and the arginine intake of rats upon an arginine-low diet. The results show that under the conditions employed, the increments in tissue arginine are 2 to 3 times as large as may be accounted for by the arginine ingestion. Evidently arginine may be synthesized by the organism of the rat and in this species is not an essential component of the diet." A. P. LOTHROP

Soft pork studies. IV. The influence of a ration low in fat upon the composition of the body fat of hogs. N. R. ELLIS AND J. H. ZELLER. *J. Biol. Chem.* **89**, 185–97 (1930); cf. *C. A.* **20**, 3027.—Hogs raised on a ration low in fat (0.5%) synthesized and stored fat at a normal rate and the lack of dietary fat did not appear to exert material influence on the degree of fatness. Even in young pigs hard satd. fat was formed and there was a gradual increase in satn. up to a wt. of approx. 100 lb. above which the body fat was extremely hard. Oleic, palmitic and stearic acids were the acids mainly present but small quantities of linolic, myristic and arachidonic acids were also found. The max. amt. of linolic acid was found in the suckling pig and there was a steady de-

crease up to a weight of 170 lb., this change appearing to account for the observed increase in satn. of the fat accompanying increase in wt. A. P. LOTHROP

The stability of vitamin G as measured by its growth-stimulating effect. N. B. GUERRANT AND W. D. SALMON. *J. Biol. Chem.* **89**, 199–211(1930).—The effect of heat, p_H, oxidation, reduction, deamination and ultra-violet irradiation upon the growth-promoting activity of vitamin G in yeast or yeast ext. has been investigated. Autoclaving yeast or exts. at 20 lb. and heating dry yeast at 120° for 4 hrs. caused some loss of their growth-stimulating effect. The passing of O_2 or H_2S through a hot concd. ext. for 4 hrs. had little or no effect. The decreasing effect of partial deamination seemed to depend upon side reactions rather than upon deamination of the free NH_2 groups. Irradiation of exts. concd. to a thick sirup, at a distance of 20 cm. from a Hg arc, caused some decrease in the growth-promoting effect. The destruction was greater in alk than in acid soln., the result apparently being the combined effect of the scpg. action of alkali and irradiation. A. P. LOTHROP

The effect of crude fiber on calcium and phosphorus retention. MARGARET A. BLOOM. *J. Biol. Chem.* **89**, 221–33(1930).—A high retention of Ca and P was observed on the control diet contg. spinach ash and no added crude fiber and on the same diet after crude fiber in the form of ashless filter paper had been added in an amt. equal to that in spinach rations and in amts. many times as great. A smaller retention occurred on the spinach ration, an effect not due to any unsuitableness in the ash, nor to cellulose as such, but to some other characteristic of the spinach Ca and P, such as their state of combination, lowering their availability. The effect of raw and cooked spinach was approx. the same. Bibliography of 23 references. A. P. LOTHROP

The antimony trichloride color reaction for vitamin A. III. The effect of concentration of reagent used, and the stability of the chromogenic substance to light. EARL R. NORRIS AND ANNA E. CHURCH. *J. Biol. Chem.* **89**, 421–35(1930); cf. *C. A.* **24**, 1409. At low color values the variation of the observed color with concn. of $SbCl_3$ is slight but even with color values of 5 to 8 units as suggested by Drummond, *et al* the variation of color with slight variations in concn of reagent is large. It is impossible to make comparisons with solns. of 30–35% $SbCl_3$ giving colors of 12–15 units. With high concns. of oil the color at 30 sec. with diffused light reflected from a dull white surface is different from that observed with direct illumination of higher intensity. The chromogenic substance of cod-liver oil or vitamin A is rapidly destroyed by light of wave length less than 500 $m\mu$ but is practically unaffected by longer wave lengths. The rate of destruction by light is accelerated by the presence of O_2. A. P. L.

The calcium content of striated muscle of rachitic animals. VICTOR G. HAURY. *J. Biol. Chem.* **89**, 467–9(1930).—The av. Ca content for the striated muscles of all the rachitic rats was found to be 41.6 mg. per 100 g. of dry muscle as compared with 74.6 mg. (56% higher) in the muscle of normal rats. The rachitic rats were fed a low-P high-Ca diet for 63 days and the normal rats received the same diet plus 1% NaH_2PO_4 and 1% Na_2HPO_4. A. P. LOTHROP

The behavior of the testicles and ovaries in beriberi pigeons on a diet of polished rice and pumpkin seeds. GIUSEPPE SANFILIPPO. *Boll. soc. ital. biol. sper.* **5**, 765–8 (1930). PETER MASUCCI

The alimentary specific dynamic action of the liver. VIRGILIO CHINI. *Biochim. terap. sper.* **17**, 365–71(1930).—The dynamic action of liver is different from that of meat. Generally, it is neg. where the meat has a pos. effect and *vice versa*. Beef liver has no effect. A. E. MEYER

The influence of irradiated ergosterol and of water-soluble vitamins on the development of the larva of Bufo vulgaris. PIETRO COCCHERI. *Biochim. terap. sper.* **17**, 372–8 (1930). The growth and metamorphosis of larva of *Bufo vulgaris* were inhibited by large doses of irradiated ergosterol. The addn. of H_2O-sol. vitamins restored the development. A. E. MEYER

Sugar metabolism in obesity. PEDRO B. LANDABURE. *Semana méd.* (Buenos Aires) **1930**, II, 1479–81.—In consideration of the frequency of diabetes in obese persons, L. recommends a glucose tolerance test. There is no direct relation between the degree of obesity and the hyperglucemia. A. E. MEYER

Studies on the destruction of β-hydroxybutyric acid in the organism in connection with the carbohydrate metabolism. FRITZ ROSENTHAL. *Biochem. Z.* **227**, 472–81 (1930). —Expts. were carried out on mice which were kept on a uniform diet and fasted 24–48 hrs. before the expt. Three hrs. after they received an intraperitoneal injection of β-hydroxybutyric acid they were quickly killed, frozen solid in a mixt. of ether and CO_2 snow, finely powdered and extd. with 100 cc. of very cold 66% alc. for 24 hrs. The residue was again extd. 1 hr. with 30–50 cc. 66% alc. per mouse, this process being re-

peated. The alc. exts. were evapd. and, after reëxtn. with water and appropriate treatment, were used for the detn. of carbohydrates and lactic acid. The alc.-extd. residue were extd. with H_2O, and this was used for the detn of glycogen. The β-hydroxybutyric acid were detd. in an aq. suspension of the finely powd. mouse substance which was deproteinized with tungstic acid (Folin-Wu procedure) and freed of carbohydrate with $CuSO_4$-$Ca(OH)_2$ as usual. Mice tolerate even 40 mg. of Na β-hydroxybutyrate, such a dose disappearing at the end of an hr. With an av. glycogen content of 70–80 mg. % the disappearance of the β-hydroxybutyric acid proceeds without any effect on either glycogen or carbohydrate content, but the destruction of the β hydroxybutyric acid goes on even under a condition of extreme carbohydrate depletion of the organism. Large doses of the acid, far in excess of the acetone content of the comatous organism, cause a diminution of the glycogen. This is considered a toxic phenomenon. No evidence was obtained of a gluconeogenesis from the fatty acid. S. MORGULIS

Studies on vitamin A and D. VIII. The relation between the chromogens of fish-liver oils to cholesterol, ergosterol and to the A and D vitamins. WM. KERPPOLA. *Skand. Arch. Physiol.* **60**, 311–9(1930). —Cholesterol purified with charcoal gives at first a neg. reaction with $SbCl_3$ and concd H_2SO_4 followed later by a red coloration, the same results being obtained with the cholesterol-digitonin compd. Through preliminary radiation of the cholesterol with ultra-violet a rose color is produced, changing to violet and blue and finally disappearing. When the cholesterol crystals obtained by treating the ether ext. of the unsapond. residue from cod-liver oil with cold MeOH are filtered in CO_2 or N_2 with exclusion of light or in red light, they give entirely different color reactions, and with $SbCl_3$ a strong blue which quickly changes to violet and rose. But if the crystals from MeOH are exposed to air and light they give the cholesterol reaction with $SbCl_3$. A no. of other expts. are recorded, all of which tend to show that the cholesterol fraction of the unsapond. portion of the cod-liver oil, recrystd. from MeOH in the absence of light or air, yields color reactions entirely unlike those obtained with ordinary cholesterol. Preliminary oxidation or illumination changes the reaction to that of ordinary cholesterol. The chromogenic substance is adsorbed by animal charcoal from which it can be removed by boiling with AcH. The chromogen is not pptd. by digitonin and crystallizes only in combination with cholesterol. The crystals contg. the chromogen dissolved in neutral fat, soap or liquid petrolatum can be kept unchanged in a cool dark place. Fed in this condition to rats whose basic diet is free from vitamin A the wt. of the animals rapidly increases and xerophthalmia can be cured provided the condition is not too far advanced. Furthermore the tissues regain their typical blue reaction with $SbCl_3$ which in the vitamin-A-free rats has faded out or has been completely lost. The blue color with $SbCl_3$ produced by the crystals seems to be proportional to their vitamin A potency, and the vitamin activity is lost when, through heating to over 70° or exposure to air and light, the original color reaction has been altered. The vitamin A potency remains even after the pptn. of the cholesterol with digitonin, which leads to the conclusion of the identity of the chromogenic substance and vitamin A. The fact that this color reaction can be obtained with the liver of rats fed on vegetable matter which does not give this reaction indicates that the organism can synthesize vitamin A from some provitamin substances, of which carotene is a representative. Although the nature of the vitamin A cannot yet be definitely detd., its soly., crystn. with cholesterol and specific color reaction with $SbCl_3$ all indicate that it is an easily oxidizable sterol probably related to or easily convertible to ergosterol, so that both vitamin A and D may be different forms of the same original substance. Evidence is given to support the contention that the vitamin A is related to ergosterol. S. MORGULIS

Preliminary study of the antirachitic properties of shrimp oil. F. P. BROOKS, ROY F. ABERNETHY AND F. C. VILBRANDT. *J. Am. Chem. Soc.* **52**, 4940–3(1930).—From the analysis of the blood and the bones of rats, it is found that shrimp oil has properties akin to cod-liver oil in that it tended to cure rachitic rats. In the first series the oil was as potent as the cod-liver oil; in a second series there was some cure, the decreasing effect probably being due to the increasing rancidity of the oil. C. J. WEST

Antirachitic action of cod-liver oil and irradiated ergosterol in parathyroidectomized and thymectomized rats. ALWIN M. PAPPENHEIMER AND CHARLES L. BUXTON. *J. Exptl. Med.* **52**, 805–12(1930). - Cod-liver oil and viosterol in therapeutic doses are antirachitic in the absence of the parathyroid gland, or of the thymus, or of both. C. J. WEST

Vitamins and tumor growth. IV. The vitamin B consumption by growing rat tumor. WARO NAKAHARA AND EIICHI SOMEKAWA. *Proc. Imp. Acad.* (Japan) **6**, 345–7(1930); cf. *C. A.* **24**, 3815.—The rate of the depletion of the reserve vitamin B

in rats under vitamin B deficient feeding is not significantly influenced by the development in such rats of very rapidly growing tumors. If growing tumors actively consumed vitamin B in the body of the host, it seemed that tumor-bearing rats should have markedly less vitamin B reserve than non-tumor-bearing ones. That such is not the case leads to the conclusion that the vitamin B requirement of growing tumors must be so small as to be negligible. C. J. WEST

H. GIDEON WELLS

Further experience with a simple serum reaction for the diagnosis of pregnancy. E. MANOILOV. *Arch. Gynäkol.* **142**, 474-6(1930).—A method for the diagnosis of pregnancy by means of diuretin and Nile blue was described in *C. A* **24**, 4315. Up to date 2238 different sera have given pos. results of 94%. The reaction is a qual. one and can also be applied to the sera of animals (cows). HARRIET F. HOLMES

Studies on the carcinoma problem. VI. The behavior of the hydrogen-ion concentration. H. GUTHMANN AND P. WIRZ. *Arch. Gynakol.* **142**, 530-46(1930).—In cases of beginning carcinoma the p_H of the blood serum is shifted toward the acid side as compared with the p_H value of the blood serum of normal individuals. As the carcinoma progresses there is a shifting of the p_H toward the alk. side. It is probable that this shifting towards the alk. side is due to a compensated or over-compensated acidosis. In carcinoma cases therapeutic doses of x-rays after 6 hrs. cause a shifting of the p_H of the blood serum to the acid side and after 24 hrs. a shifting to the alk. side. Ultra-violet irradiation of women with mild chronic adnexitis caused an alkalosis without a preceding acidosis. It is probable that the shifting of the p_H to the acid side after x ray irradiation is due to a primary reaction of the x-rays on the deep-seated tissues and on the blood directly and that the alkalosis is secondary. After ultra-violet irradiation the alkalosis seems primary and arises in the skin. The alkalosis occurs at the same time with the onset of erythema and with changes in the K and Ca contents. HARRIET F. HOLMES

Mottled enamel in a segregated population. GROVER A. KEMPF AND FREDERICK S. MCKAY. *U. S. Pub. Health Rept.* **45**, 2923-40(1930).—No definite conclusions can be deduced at the present time other than that this enamel dystrophy occurs in certain areas in the U. S., and the etiological factors seem to be definitely assocd. with the *water supply* of these areas. Exposure of a child, during permanent enamel growth, to the environmental factors in an endemic area appears almost certain to result in the development of mottled enamel. There is included in this paper an extensive bibliography. J. A. KENNEDY

The mechanism of phlorhizin diabetes. II. The relationship between the nutritional state and the glucose tolerance. HARRY J. DEUEL, JR. *J. Biol. Chem.* **89**, 77-91(1930); cf. *C. A.* **21**, 3393.—"When a standard glucose meal was administered to fasting phlorhizinized dogs, the glucose tolerance curves obtained were distinctly of the diabetic type. When the same amt. of this sugar was given to the identical animals about 14 hrs. after the administration of a large dose of carbohydrate, the glucose tolerance was much increased as indicated by an early return of the blood sugar to the postprandial level and by the much smaller rise obtained above the initial level. The same qual. variations in response were noted in the same animals without phlorhizin when fasted as compared with that obtained 14 hrs after heavy carbohydrate feeding. These results are offered as addnl. proof that the action of phlorhizin is primarily renal in character and that no intrinsic impairment in the ability to oxidize carbohydrate exists under such conditions." A. P. LOTHROP

The nature of the sugar in four cases of pentosuria. A correction. ISIDOR GREENWALD. *J. Biol. Chem.* **89**, 501(1930); cf. *C. A.* **24**, 5857.—In designating the pentose G. did not observe the current practice. The xyloketose of the urine, as indicated by the rotation of its osazone, is derived from what is now known as *l*-xylose which has the configuration:

$$\begin{array}{l} CH_2OH \\ CO \\ HCOH \\ HOCH \\ CH_2OH \end{array}$$

A. P. LOTHROP

The resistance of red blood corpuscles to the hemolytic action of lysocithin in experimental scurvy. VIRGILIO GRONCHI. *Boll. soc. ital. biol. sper.* **5**, 637-8(1930).—During the early stages of the disease, the red blood corpuscles of the exptl. animals and of the normal controls showed no difference in their behavior toward hemolytic agents.

When the symptoms were most pronounced, the resistance of the red blood corpuscles was increased toward lysocithin but remained unaltered toward saponin. In the premortal stage there was a marked decrease in resistance to lysocithin. P. M.

The contents of certain mineral constituents in the blood during spinal shock. A. M. Di Giorgio. *Boll. soc. ital. biol. sper.* **5**, 798–800(1930).—In the period immediately following the transverse sectioning of the spinal medulla when the phenomena of shock are most pronounced, the Ca in the serum drops definitely below the normal; the inorg. P. does not vary appreciably, but the ratio Ca/P becomes markedly smaller. Peter Masucci

Serum lipase in the study of pancreatic lesions. Guido Melli and Angelo Lorenzi. *Minerva med.* **1930**, II, 361–70.—The detn. of pancreatic lipase in serum is useful in the diagnosis of pancreatic disturbances. The identification of the pancreatic lipase is based on its resistance to atoxyl and its lability toward quinine. Method: 1 cc. of serum is placed in each of 2 test tubes; to one is added $^1/_2$ cc. of 0.2% atoxyl soln.; to the other $^1/_2$ cc. of 0.2% quinine bisulfate soln. After $^1/_2$ hr. $^1/_2$ cc. distd. H_2O and 23.5 cc. tributyrin are added to the first tube. The soln. is placed in a stalagmometer and the no. of drops counted. Simultaneously, into the other tube is added $^1/_2$ cc. of 0.2% atoxyl and after $^1/_2$ hr. 23.5 cc. tributyrin and the no. of drops detd. as before. At the end of one hr. and $1^1/_2$ hrs. the no. of drops is detd. again. A pos. result is one in which the diminution of drops in the atoxyl tube is greater than that of the atoxyl + quinine tube.

Examples:

Material	Drops at first	Drops after 1 hr.	Difference	Diminution due to pancreatic lipase
(1)				
serum alone	136	88	48	
serum + atoxyl	136	128	8	
serum + atoxyl + quinine	136	128	8	0
(2)				
serum alone	140	93	47	
serum + atoxyl	140	135	5	
serum + atoxyl + quinine	140	140	0	5

In the above tests, no. 1 is neg. and no. 2 is positive. The test is specific and sensitive; a serum showing a diminution of 2–3 drops may be considered as pathological. Peter Masucci

Changes in azotemia and chloremia after surgical operations of the abdomen. M. Mairano. *Minerva med.* **1930**, II, 370–5.—The NaCl and non-protein N contents in the blood of 24 patients were detd. before and after abdominal operations. There was a diminution of the NaCl and an increase in non-protein N. These changes were slight in appendicitis and other simple operations but marked in the more serious ones (gastric ulcers, tumors, etc.). The resulting hypochloremia and hyperazotemia were not influenced by the anesthetic used. Peter Masucci

The serum proteins in dogs with experimental hyper- and hypo-thyroidism. Schmorl M. Ling and Hsi-Chun Chiang. *Chinese J. Physiol.* **4**, 375–9(1930).—The serum proteins of 3 dogs were studied during thyroid feeding and after thyroidectomy. No significant change in any protein fraction was observed. L. A. M.

Observations on human tetany. II. Postoperative tetany. Harold A. Salversen. *Acta Med. Scand.* **74**, 13–30(1930).—Five cases of tetany following thyroidectomy have been studied, of which 4 have been alive 3–4$^1/_2$ years after the operation. The symptoms of tetany were checked by means of oral administration of $CaCl_2$. In one type of case the serum Ca could be maintained at nearly the normal level by feeding $CaCl_2$ but tetany would occur at the usual crit. level of 7 mg. % as soon as the Ca medication was stopped. In an other type of case the organism adopts itself to a lower Ca level (even as low as 5 mg. %), so that no tetany occurs under ordinary circumstances but cataract may develop. The sugar tolerance, in one patient, was lower with a low Ca than with a high Ca level. Also, ultra-violet radiation caused a rise in serum Ca although the oral consumption was actually reduced. No difference was observed between the Ca of plasma or serum. S. Morgulis

Indicanemia and hyperindicanemia. S. Livierato and A. Simoneto. *Acta Med. Scand.* **74**, 59–84(1930).—The normal indican content of blood is 0.16 to 0.64 mg. % and this is unaffected by the use of narcotics or of purgatives. Increased indicanemia

was observed in cases of intestinal occlusion, in cases of liver insufficiency, in cases of extensive protein catabolism, and in kidney trouble, especially of the org. type.
S. MORGULIS

Tissue reaction and buffering in local anemias. N. OKUNEV. *Biochem. Z.* **227**, 319-25(1930).—Tying off of an artery produces not only local anemia but also marked acidosis of the affected region. This leads to the conclusion that the local acidosis due to skin implantation or adrenaline injection is likewise of a manifestation anemia. The local acidosis has been ascribed to the accumulation of CO_2 or to increased lactic acid production by anaerobic glucolysis due to lack of O_2. Possibly the latter fact explains the increased buffer value of the anemic tissue. Either restoration of the circulation or necrosis of the affected area is equally sufficient to correct the acidotic condition.
S. MORGULIS

Studies in cancer chemotherapy. VIII. The reaction of the fluid of rat sarcoma 10. L. C. MAXWELL AND FRITZ BISCHOFF. *J. Pharmacol.* **40**, 1-5(1930).—The acidity increases with the age of the tumor. Lactic acid content is high. The combined CO_2 is lower and the CO_2 tension higher than that of the blood.
C. RIEGEL

Potassium tellurite and its agglutination reactions. M. PERGOLA. *Boll. sez. ital. soc. int. michrob.* **1**, 177-93(1929); **2**, 35(1930).—Gosto has shown that K tellurite is reduced to metallic Te by microörganisms, on which the element is deposited, coloring them black and killing them. K tellurite can serve for agglutination reactions. The brown color of the agglomerated bacteria makes it easier to count them, and increases the sensitivity of the reaction. The method can be used for a diagnosis of typhoid in the first week. The agglutination is thus revealed from the first day of the illness.
R. SANSONE

Chemical and immunological properties of a species-specific carbohydrate of pneumococci. WM. S. TILLETT, WALTHER F. GOEBEL AND OSWALD T. AVERY. *J. Exptl. Med.* **52**, 895-900(1930).—Pneumococci contain a non-protein constituent which, on the basis of its chem. and immunological properties, appears to be a carbohydrate distinct from the type-sp-carbohydrate and common to the species. The product is amorphous, sol. in H_2O and insol. in org. solvents. Its immunological specificity was not impaired by the prolonged action of pepsin at p_H 2.0 nor by trypsin at p_H 8.1. A soln. (1:300) gave no Millon's test, no biuret test, no xanthoproteic reaction and no Hopkins Cole test; it gives no ppt. with Cl_3CCO_2H, tungstic acid, picric acid or sulfosalicylic acid. It is slowly hydrolyzed by HNO_2, with a corresponding loss in immunological activity and the appearance of reducing sugars.
C. J. WEST

Tuberculosis. I. Reaction of the connective tissues of the normal rabbit to lipoids from the tubercle bacillus, strain H-37. FLORENCE R. SABIN, CHARLES A. DOAN AND CLAUDE E. FORKNER. *J. Exptl. Med.* **52**, Suppl. 3, 3-72(1930).—The lipoid fractions from the tubercle bacillus contain maturation factors for monocytes, epithelioid cells and epithelioid giant cells. The most important component of the lipoids for biol. investigation is the phosphatide A-3, since this produces the most massive reaction toward epithelioid cells and epithelioid giant cells and also because it is the only partition of the lipoids which acts as an antigen. The stimulus to the formation of tubercles resides in certain fatty acids of high mol. wt. found in tubercle bacilli. These fatty acids are present in the 4 major partitions of the lipoids and this accounts in each instance for their sp. activity. The most potent fatty acid in the production of tubercles is that derived from the phosphatide. The purified, optically active phthioic acid obtained from the glyceride fraction, in small dosage, produces epithelioid cells but more non-sp. connective tissue; the optically inactive tuberculostearic acid is relatively inert. The sp. tuberculous tissues resulting from the intraperitoneal injection of the phosphatide from the tubercle bacillus undergo resorption. Beside the sp. reaction of the lipoids, these also produce a marked growth of non-sp. connective tissue cells, without, however, any reaction toward fibrous tissue in the acute stages. All the subfractions from the lipoids are irritating when injected into the peritoneal cavity, calling leucocytes into the tissues and stimulating clasmatocytic activity. The unsaponifiable substance from the purified wax is particularly active in producing an extreme general reaction of connective tissue cells. **II. Reaction of the connective tissues of the normal rabbit to a water-soluble protein and a polysaccharide from the tubercle bacillus, strain H-37; spontaneous pseudo-tuberculosis aspergillina as a complication in fraction testing.** C. A. DOAN, F. R. SABIN AND C. E. FORKNER. *Ibid* 73-87.—The water-sol. protein from the tubercle bacillus, when not denatured, is toxic to normal rabbits, inducing fever and hemorrhage when introduced intravenously but is not lethal except in massive doses. By the intraperitoneal route it is less toxic but calls forth a local response of leucocytes and phagocytes without any striking

proliferation of new connective tissue. A damage to endothelium is indicated by hemorrhage, chiefly in the bone marrow. Tuberculous guinea pigs succumb rapidly to protein 304 when given intraperitoneally. The polysaccharide is non-toxic when introduced intravenously in the normal animal; introduced intraperitoneally, on the other hand, it is irritative and each succeeding dose continues to elicit a fresh emigration of leucocytes from the vessels. Guinea pigs with extensive tuberculosis may die soon after subcutaneous or intraperitoneal injections of the polysaccharide. C. J. W.

I—ZOÖLOGY

R. A. GORTNER

Is the effect of thyroid and thyroxine upon the metabolic rate specific for vertebrates? WM. A. HIESTAND. *Proc. Soc. Exptl. Biol. Med.* **28**, 64–5(1930).—The CO_2 output of the wasp, *Polistes pallipes*, and of the roach, *Periplaneta australasiae*, was detd. before and after the feeding of Armour's desiccated thyroid and of Squibb's thyroxine crystals in a honey mixt. The results with desiccated thyroid in most cases were not significant. Thyroxine definitely increased the CO_2 output of the wasp, in 1 instance the rate was increased 650% for the 1st hr after feeding with a return to normal at the end of the 3rd hr. With roaches the results were less striking. Desiccated thyroid and thyroxine will increase the basal metabolism of organisms other than those having thyroid glands. The feeding of Lugol's soln. produced no marked change in the rate. C. V. BAILEY

Growth-promoting power for planarian worms of eosinophilic and basophilic cell groups in anterior pituitary. ROSALIND WULZEN AND ALICE M. BAHRS. *Proc. Soc. Exptl. Biol. Med.* **28**, 84–5(1930).—Newly regenerated planarian worms, *Planaria agilis*, were used. Diff. groups of 30 worms each were given 8 biweekly feedings of fresh rabbit liver, the outer light-colored portion of fresh beef anterior pituitary and the reddish inner core of the beef gland The liver-fed worms increased in length 83.5%; the 2nd group fed the outer acidophilic portion of anterior pituitary increased 55.5% and those fed the inner basophilic portion increased 10.6%. C. V BAILEY

The effect of temperature on the carbohydrate tolerance in Xenopus laevis (South African clawed toad). LOUIS P. BOSMAN AND HARRY SWARENSTEIN. *Quart. J. Exptl. Physiol.* **20**, 231–43(1930).—The normal blood sugar level in *Xenopus laevis* is about 44 mg. %. Injection of glucose causes a rise and return to normal in the blood sugar level, the rate depending directly on the temp. The extent of the increase at 20° is much greater than that at 10° which in turn is slightly less than that at 5°. The renal threshold of *Xenopus* approximates that of man. RACHEL BROWN

Cholesterol in earthworms. A DEWAELE. *Bull. sci. acad. roy. Belg.* [5], **16**, 592–7(1930).—In order to remove all org. material from the intestines of the earthworms, they were kept for 4 days in repeated changes of wet sand which had been heated previously to destroy org. matter The worms were then ground with sand and extd. with Et_2O. Cholesterol, m. 147.9°, Ac deriv. m. 114.3°, was isolated from the ext. The lower m. p. (142.3°) given for cholesterol by Dorée (*C. A.* **3**, 1187) was probably due to some phytosterol present in the intestinal contents of the animals used. Cholesterol is the only sterol in earthworms and is present in the fresh tissues to the extent of 0.0922%. LOUISE KELLEY

The limitations and significance of biological methylation processes. F. A. HOPPE-SEYLER. *Z. Biol.* **90**, 433–66(1930).—Trimethylamine oxide occurs regularly in the blood and urine of selachians. The concn. in the blood is considerable. Neither trimethylamine nor its oxide occurs in the muscle of fresh water teleosts, contrary to the findings in sea teleosts. The retention of metabolic products in these salt water forms is entirely impossible in fish of the same class living in fresh water. FRANCES KRASNOW

The absorption of fats and lipoids in the plaice. B. DAWES. *J. Marine Biol. Assoc. United Kingdom* **17**, 75–102(1930).—There is an increase in the fat content of the superficial epithelium of the fish stomach 30–50 hrs. after gastric digestion. There is a transference of the fat absorption from the stomach to the post-pyloric intestine when the frequency of feeding is increased C. M. McCAY

Growth and maintenance in the plaice. B. DAWES. *J. Marine Biol. Assoc. United Kingdom* **17**, 103–74(1930).—Two yr. old plaice were held in confinement and fed fresh mussels. The maintenance requirement of a 40 g. fish is about 2% of its body wt. of fresh *Mytilus edulis*. This maintenance requirement per unit of body wt. decreases as the fish grows. The efficiency of food conversion varies widely even in the same individual. C. M. McCAY

Spirographis hemin. OTTO WARBURG, ERWIN NEGELEIN AND ERWIN HAAS. *Biochem. Z.* **227**, 171–83(1930).—Blood was obtained from the worms *Spirographis*, each worm yielding about 0.1 cc. This was dild. 1:5 with H_2O and poured drop by drop with const. stirring into acidified Me_2CO (1 l. Me_2CO + 10 cc. *N* HCl), 100 cc. being used for each cc. of the blood soln. The globin-HCl seps. out as a white powder which is filtered off. The Me_2CO exts. contg. the hemin are evapd. under diminished pressure when the impure hemin crystalizes out, 6 cc. of the blood yielding 360 mg. globin-HCl and 12 mg. crude hemin. To purify this 60 mg. was shaken with acetone which removed 25% of the wt. The material was then mixed with 2 cc. pyridine, and after addn. of 5 cc. $CHCl_3$ heated on a water bath and filtered hot. The residue was washed with $CHCl_3$ + pyridine until the washings were no longer colored. These exts. were combined, condensed under diminished pressure and taken up with 20 cc. hot, NaCl-satd. AcH. The soln. was then filtered hot and left overnight in a cool place when the hemin crystals were formed; the total yield was 15 mg. The analyses correspond to the empirical formula $C_{32}H_{32}N_4O_3FeCl$. The *Spirographis* hemin contains 2 acid groups whose dissocn. const. is greater than 10^{-7} [mole/l.]; it conbines with only ½ as much H_2 as does ordinary hemin under the influence of Pd-H_2; a mole of it combines with 0.93 mole CO, and the CO combination has a max. light absorption at 410$\mu\mu$ unlike the CO-chlorocruorin which has a max. absorption at 440$\mu\mu$ The *Spirographis* hemin gives a similar hemochromogen reaction as does Fischer's phaeoporphyrin a_5 (575–590$\mu\mu$), and the hemochromogen is unstable. This may possibly necessitate a revision of the last point. S. MORGULIS

Oxygen consumption in the developmental stages of a cladoceran. VASIL OBRESHKOVE. *Physiol. Zoöl.* **3**, 271–82(1930).—Using the same technic as in an earlier study (*C. A.* **24**, 3059) O. detd. the rate of O_2 consumption of females of *Simocephalus exspinosus* at various stages in their development. The expts. were carried out at 25°. The rate of O_2 consumption in cc. × 10^{-7} per individual per min. was for the first instar young 5.6, third-instar young 34.7, first-brood mothers 121.6, third-brood mothers 166.2, fifth-brood mothers 202.8. O. then calcd. the size of the animals from their length, basing his calcns. on the assumption that the vols. of 2 similar but irregular bodies vary as the cube of their length. If the O_2 consumption of the first-instar young be represented by 100%, then the values calcd. for the other stages, size considered, are: third-instar young 96.4, first-brood mothers 52.1, third-brood mothers 50.8, and fifth-brood mothers 41.8%. Because of the parallelism between O_2 consumption and metabolic processes it is concluded from these results that senescence is progressive in the species examd. and that it is primarily a decrease in the rate of the dynamic processes of the individuals. G. SCHWOCH

The soluble proteins of the muscle tissue of the haddock. J. F. LOGAN. *Contributions Can. Biol. Fisheries* [N. S.], **6**, Nos. 1–6, 1–11(1930).—The sol. N extd. from haddock muscle by NaCl, neutral phosphate (KH_2PO_4:K_2HPO_4 = 1:2), and by water was detd. The results, after allowance was made for extractives, etc., appear to show the presence of both a water-sol. and a salt-sol. protein, which are pptd. slowly in the cold, and rapidly at 70°, at p_H 6 and 5, resp., and can be sepd. by this means. K. V. THIMANN

The role of chemical stimulation in the spawning reactions of Ostrea virginica and Ostrea gigas. PAUL S. GALTSOFF. *Proc. Natl. Acad. Sci.* **16**, 555–9(1930).—Rhythmic movement of the adductor muscle of the oyster, assocd. with spawning, can be induced by the addn. of a min. amt. of 0.01 mg. of male gonad tissue per l. water, and is independent of the concn. of added sperm above this amt. The latent period preceding the response is probably due to the necessity of ingesting the sperm. This is supported by the fact that the thermolabile substance in sperm, active in promoting spawning, does not pass into soln. The addn. of egg suspension induces sperm production by the male immediately, since the active (thermostable) substance in egg suspension is readily sol. in sea water. Males are also stimulated by the presence of sperm, and by rise in temp. to 27°. Spawning does not occur below 20° in *O. virginica* or 25° in *O. gigas*. K. V. THIMANN

12—FOODS

F. C. BLANCK AND H. A. LEPPER

The chemical composition of authentic samples of whole wheat flours and modified whole wheat flours. L. H. BAILEY AND S. C. ROWE. *J. Assoc. Official Agr. Chem.* **13**, 503–7(1930).—With a view to obtaining data which might be of value in differentiating

between the flour obtained by simply grinding the wheat berry, with nothing added and nothing taken away, and those flours in which the bran content is modified, 6 samples of hard red spring, durum, hard red winter, white and 2 soft winter wheats were carefully milled in the lab.; the following 3 divisions of each sample were then prepd. making a total of 18 samples for analysis: (*a*) the ground wheat berry, (*b*) the ground wheat berry sifted to effect a 10% by wt. bran removal, (*c*) the ground wheat berry plus bran to the extent of 10% of the wt. of the wheat. H_2O, protein, lipoids, sugars, starch, ash, CaO, MgO, crude fiber and pentosans were detd., and the following ratios were calcd.: CaO to MgO, starch to lipoids, starch to crude fiber, starch to ash, starch to pentosans and pentosans to ash. The data, which are tabulated, show that the crude fiber results indicate more definitely the removal or addn. of bran than do any of the other detns.; the pentosan detn. is next in this respect. The ratios of starch to crude fiber, starch to ash, and starch to pentosans are also valuable for distinguishing between the different classes of so-called whole wheat flours. The data given, while of value, should be extended by analyzing more samples, including a wider range of bran contents. A. PAPINEAU-COUTURE

The action of plant lecithin on the swelling and surface tension of glutin and the starches of flour. I. The investigation of agglutinants in cooking. W. ZIEGELMAYER. *Kolloid-Z.* **53,** 224–31(1930).—Swelling and viscosity measurements were made on noodles to which increasing amts of eggs were added. The agglutination effect of the eggs is due to their lecithin content. Lecithin prevents the syneresis of dough. In the absence of lecithin, swelling continues till sol formation occurs. The action of lecithin is due to its surface effect. ARTHUR FLEISCHER

The cause of beet odor and taste in milk and butter. P. POST. *Pharm. Weekblad* **67,** 1309–13(1930).—The offensive odor and taste of milk and butter, prevalent in the months of Oct. and Nov. in the best growing districts of Holland where the beet tops are used for cattle feed, are due to Me_3N derived obviously from the betaine present in the feed. It should be feasible to remove this Me_3N from the butter by washing with very dil. acid. A. W. DOX

The fat of ass milk. OTAKAR LAXA. *Ann. fals.* **23,** 474–5(1930).—The fat is a thick yellow liquid, solidifying at 2.5–3° and m. 12°, having sapon. no. 230.5, Reichert-Meissl no. 9.3, Wauters-Polenske no. 11.2, I no. 66.5, n_{40} 50 (presumably expressed in butyro-refractometer degrees). The compn. of the fat is: caprylic acid 2.57, caprinic acid 4.08, lauric acid 8.22, myristic acid 2.74, oleic acid 74.32, glycerol 8.07%. It is similar to mare milk, but contains less satd. acids and more caprinic and oleic acids; it contains neither butyric nor capronic acids, which are characteristic of the fats of ruminants. A. PAPINEAU-COUTURE

Report on (the analysis of) cacao products. J. O. CLARKE. *J. Assoc. Official Agr. Chem.* **13,** 481–2(1930).—The present tentative A. O. A. C. method for the *detn. of crude fiber* is satisfactory for material such as cocoa or bitter liquor where the factor for converting to the fat- and H_2O-free basis is comparatively small. With sweet chocolate and milk chocolate, the factor for calcg. the results to the H_2O-, sugar- and fat-free basis is about 10, and the factor is modified to a considerable extent by the errors in the detn. of fat and sucrose. The collaborative results reported in 1926 (Bailey, *C. A.* **21,** 285–6) were recalcd. to the fat-, H_2O- and sugar-free basis: the actual crude fiber detns. varied from 0.23 to 0.72%, and the recalcd. values from 5.11 to 15.82%; by use of the av. crude fiber actually detd. (0.49%) and the av. fat-free cacao mass (7.26%), an error of 1% either way in sucrose and in fat (H_2O, which in this case was unimportant being neglected,) might give 9.32 or 5.29% crude fiber on the H_2O-, fat- and sugar-free basis. This shows the extreme inaccuracy of the present tentative method with such materials. The method, consisting in detg. crude fiber on a weighed portion of the dried residue from extn. with H_2O, Et_2O and alc., gives much more concordant results. On the assumption that the H_2O-alc.-sol. matter of cacao is fairly const. (preliminary expts. indicate that it is in the neighborhood of 30%), the relatively arbitrary figures thus obtained can be converted to the usual basis; and even if the factor is somewhat variable, the method still yields more concordant results than the present tentative method. Cf. following abstr. A. PAPINEAU-COUTURE

Report on (the determination of) crude fiber in cacao products. MARIE L. OFFUTT. *J. Assoc. Official Agr. Chem.* **13,** 482–5(1930); cf. *C. A.* **24,** 440.—The H_2O-alc.-sol. material (*F*) of the dry Et_2O-extd. residue from 9 samples of cacao was 28.23–30.37%, av. 29.7%. Variation in the temp. of the H_2O used for extg. from 12° to 30° had no decided effect on the results, and room temp. can conveniently be used. The method for the detn. of crude fiber proposed in previous reports, is described in detail with certain modifications. The figures found for crude fiber (*D*) is converted to the for-

mal standard one (E) by the formula $E = D - (D \times F)$. Data are given showing the much closer agreement of results obtained by the proposed method than by the present tentative A. O. A. C. method. The value given above for F applies only to bitter and sweet chocolates, as a different method must be used for milk chocolates. The F for milk chocolate could be detd. in the same way as reported above for bitter and sweet chocolates; or the F already found might be used with some factor detd. for the amt. of milk not washed out in the prepn. of the residue. Work is being carried out along this line. A. PAPINEAU-COUTURE

"Tsing Mei," sirup-preserved plums, colored with basic copper acetate. JOHN E. S. HAN AND T. Y. CHAO. *Natl. Central Univ. Sci. Repts., Ser. A, Phys. Sci.* 1, 23–6 (1930).—Tsing Mei, a widely popular Chinese confectionery, contains an av. of 0.008% Cu. Whether this is harmful or dietetically beneficial is an open question. Calves' liver, in comparison, contains 0.0044% Cu. K. H. ENGEL

Preservation of raspberry juice with hydrofluoric acid. R. COHN. *Z. Untersuch. Lebensm.* 59, 422–8(1930); cf. *C. A.* 24, 4873.—The use of HF in the preservation of raspberry juice is defended. **Reply.** A. HANAK. *Ibid* 429–30. C. R. FELLERS

Toxicological aspect of the preservation of raspberry juice with hydrofluoric acid. P. DEUSSEN. *Z. Untersuch. Lebensm.* 59, 421–2(1930); cf. preceding abstr.—Hanak's statement (*C. A.* 24, 4873) that small quantities (0.006–0.009 g.) of HF are injurious to human health is questioned. The whole question is reviewed and the conclusion reached that addnl research is necessary definitely to settle the point. C. R. F.

Utilization of natural tomato pectin in catsup making. J. D. WILDMAN. *Canner* 72, 11–2(Dec. 20, 1930); cf. *C. A.* 24, 5890.—Tomato pulp made by the hot cook process, *i. e.*, cooked before cycloning, has a firmer consistency and gives a more satisfactory blotter test, than cold, crushed, cycloned tomatoes. By eliminating the skin and seeds, W. found a hot-process pulp was produced which had a desirable consistency and blotter test, indicating that the gummy substances and pectins in the seeds and skins are of little significance in catsup manuf. Pectic enzymes rapidly transform pectin into other substances when tomatoes are cold-crushed and pulped; this injurious effect does not occur when the hot-cycloning process is used. Six analyses show losses of 68–96% of the pectic acid content of tomatoes as a result of crushing in the cold as compared with pulping after a heat treatment. A full explanation of the behavior of tomato pectins must await further investigation. C. R. FELLERS

Report on spices and other condiments. (Methods for the analysis of salad dressings.) KENNETH C. BEESON. *J. Assoc. Official Agr. Chem.* 13, 480 (1930); cf. Andrew, *C. A.* 20, 78.—A comparative study of 3 different methods for the *detn. of lecithin* P_2O_5 in salad dressings showed that, regardless of what method of extn. is used, the detd. value for egg yolk and the calcd. value (obtained by detg. lecithin P_2O_5 in the eggs used) check very closely if the method of detg. the lecithin P_2O_5 in the salad dressing is the same as that used for the egg yolk. The tentative A. O. A. C. method for the *detn. of reducing sugars* is not entirely satisfactory because of the impossibility of breaking up the oil emulsion in some cases simply by extg. the sample with petr. ether, and the following method is proposed: to 20 g. of sample in a wide-mouth 4-oz. bottle add 10 cc. 95% alc. and 2 cc. concd. NH_4OH, heat to boiling on a steam bath, cool, ext. the oil with 80-cc. portions of petr. ether till the ext. is colorless (4 are usually sufficient), shaking, centrifuging and decanting each time, remove the petr. ether from the residue with a current of air, transfer the residue with H_2O to a 100-cc. volumetric flask, neutralize with HCl, add 5–10 cc. of a fresh soln. of metaphosphoric acid, and then proceed as in the present tentative A. O. A. C. method. The method will be studied collaboratively. A. PAPINEAU-COUTURE

The nutritive values of some typical Indian hays. F. J. WARTH. *Mem. Dept. Agr. India, Chem. Ser.* 11, 73–84(1930).—Data on the chem. compn. and digestibility of 30 typical Indian hays ranging in protein content between 1.96 and 18.16% are given. Graphic representation of the data showed that the digestibility of all the ingredients of a hay is related to its protein content, which fact can be utilized for estg. roughly the nutritive value of any hay of which the chem. compn. is known. It was found that the digestibility of the carbohydrates is at times seriously depressed through unknown causes. K. D. JACOB

The nutritive value of gram husk. F. J. WARTH AND LAL C. SIKKA. *Mem. Dept. Agr. India, Chem. Ser.* 11, 85–99(1930).—A comparative feeding expt. showed that, in the type of ration used, gram husk affects the ration much in the same way as wheat bran, both substances improving the consistency and palatability of the ration and both bringing about approx. parallel increases in food consumption and live wt. Di-

gestion expts. showed that gram husk possesses a distinctly lower starch equiv. than wheat bran and provides no digestible protein whatever. K. D. JACOB

Apples for livestock. W. J. SPAFFORD. *J. Dept. Agr. So. Australia* **34**, 122–3 (1930).—Chem. analyses of Australian apples are given together with their percentage digestibility. Feeding expts. show apples compare favorably with hay chaff and bran as feed for dairy cows. M. S. ANDERSON

The origin, composition and digestibility of bastard-saffron cakes and their food value for milk cattle. F. HONCAMP, C. EICHLER, W. HELMS AND E. REINMUTH. *Tierernähr.* **1**, No. 1, 3–29(1929).—Saffron cakes, frequently seen in commerce under the name of "Indian sunflower cakes," are the residue of the saffron fruit and are rich in the oils of the plant. Their compn. as obtained upon analysis of 3 samples of the dry substance is: protein 21.77–52.00, albumin 20.84–48.27, amides 0.93–3.73, non-N extractives 20.79–29.18, fat (ether extd.) 6.43–10.27, crude fiber 8.09–35.26, ash 7.36–8.78%. The compn. of the ash is: P_2O_5 0.96–2.43, CaO 0.64–0.87, MgO 0.03–0.05, K_2O 0.62–1.59, Na_2O 0.34–0.49, Cl 0.03–0.27, SO_3 0.18–0.26, insol. matter, 2.07–3.52%. The digestive coeff. for protein and fat of saffron cake is very high. With regard to its content of digestible albumin it is somewhat like the albumin-rich oil residue, though its starch content is less. Compared with peanut cakes, sunflower-seed cakes and soy bean meal, the use of saffron cakes is indicated for the production of milk in cattle. RUSSELL C. ERB

Transmission spectra of vanilla extracts (HARVEY) **17.** CO_2 storage of fruits, vegetables and flowers (THORNTON) **11D.** Apparatus for distillation of carbonaceous materials such as garbage (U. S. pat. 1,785,565) **21.**

Device for determining the water content of food, fuel, etc. JAKOB PRITZKER and ROBERT JUNGKUNZ. Ger. 504,940, Sept. 7, 1928.

Wheat-germ food. K. P. WANKLYN and F. STACEY. Brit. 332,847, Oct. 31, 1929. The wheat germ is maintained at a temp. of about 57° for 8 hrs. in a closed vessel under a vacuum of 20–27 in. Hg to remove moisture without damage to vitamins, etc., and may then be ground, granulated or flaked. An inert gas such as N or N peroxide may replace the air in the heating chamber.

Forming food products such as scrapple. CHARLES H. VOGT. U. S. 1,786,372, Dec. 23. Scrapple mixt. while hot is introduced into an imperforate molding receptacle, from which it is subsequently removed by a gaseous medium under pressure such as air applied between the molded scrapple and the wall of the receptacle.

Drying and damping device for grain, etc. EIJIRO SHIMIZU. Ger. 505,734, Aug. 14, 1929.

Bread. AUGMENTINE HOLDING S. A. Ger. 507,398, April 22, 1927. See U. S. 1,750,720 (*C. A.* **24**, 2512).

Cooling baked bread by latent heat of evaporation of atomized water. J. B. HILLARY, F. B. CORNWELL and BRAMIGK & CO., LTD. Brit. 333,572, May 8, 1929. App. and various details of procedure are described.

Baking powder. C. H. BOEHRINGER SOHN. Ger. 507,399, Dec. 2, 1926. The acid ingredient of baking powder consists of cryst. tartaric acid, of a granule size between 0.1 and 0.5 mm., which has been coated with paraffin or other protective substance, *e. g.*, by treatment in a rotary drum with the melted substance.

Granular calcium phosphate suitable for use in baking powder. HOWARD ADLER and GUY A. MCDONALD (to Victor Chemical Works). U. S. 1,785,473, Dec. 16. A mono-Ca phosphate contg. less than 0.5% Fe phosphate and 0.6–2.0% MgO may be prepd. by reacting on lime with H_3PO_4 in the presence of a small proportion of MgO.

Apparatus for sterilizing milk or similar liquids in bottles. A. GRAHAM-ENOCK and GRAHAM-ENOCK MFG. CO., LTD. Brit. 332,912, March 26, 1929. Structural features.

Apparatus for sterilizing milk or similar materials in bottles. A. GRAHAM-ENOCK and GRAHAM-ENOCK MFG. CO., LTD. Brit. 332,949–50, March 26, 1929. Structural features.

Butter. E. G. N. SALENIUS and E. S. SALENIUS. Brit. 333,233, May 7, 1929. Cream or whole milk is subjected to vacuum such that boiling takes place and the low-temp. ebullition works the cream into butter. App. is described.

Butter coloring. KARL J. MONRAD (to Chr. Hansen's Laboratory, Inc.). U. S. 1,786,256, Dec. 23. An oil-sol. green coloring substance is used to neutralize the red component of an orange coloring matter and thus lighten the color of an orange-colored butter.

Preserving eggs. DELASKA E. SEAWARD. U. S. 1,785,461, Dec. 16. Eggs are wrapped in a material such as paper which has been treated with an aq. $AgNO_3$ soln.

Sugar cane for blending with or coloring coffee. ALBERT E. KIENZLE. Ger. 504,913, Nov. 16, 1923. Addn. to 448,712.

Drying apparatus for coffee, etc. HENRI J. S. W. HOLMAN. Ger. 505,604, Aug. 22, 1928.

13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

Grasselli medal award to Per K. Frolich. *Ind. Eng. Chem.* **23,** 111(1931). **Pressure as a tool in the chemical industry of the future.** PER K. FROLICH. *Ibid* 111–15. E. C. K.

Model experiments in chemical engineering. R. EDGEWORTH-JOHNSTONE. *Ind. Chemist* **6,** 482-4(1930). E. H.

Ultra-violet radiation in industry. M. J. DORCAS. *Ind. Eng. Chem.* **22,** 1244–6 (1930).—C arc lamps have been developed to make the industrial use of ultra-violet rays possible. The cost of operating the industrial lamp is about 20 cents per hr. M. C. ROGERS

Industrial uses of ultra-violet. E. E. FREE AND C. C. CLARK. *Elec. World* **96,** 873-4(1930).—A review covering the degree of success attained with different applications and the problems that need solution before progress is resumed. C. G. F.

A new way of testing materials. FRIEDRICH SCHUBERT. *Kautschuk* **6,** 207–10 (1930).—The method was developed to meet the daily needs of a practical test which would not have the disadvantages of the usual breaking test, which is usually of significance only in conjunction with other tests and which requires test pieces that cannot be obtained from many products. The *app.* is illustrated and the *technic* described in detail. The test, which is purely phys., involves mech. penetration of the tightly drawn sheet to be tested. C. C. DAVIS

Large-scale experiments with a regenerative chamber built for studying purposes. II. Determination of heat transference numbers and pressure losses in double obstructed and unobstructed grate packing. HANS KISTNER. *Arch. Eisenhüttenw.* **3,** 751–68(1930).—The heat transfer and pressure losses in a regenerator, built similarly to a Siemens-Martin air chamber, with the grating (5 × 2 × 2 m.) made of fireclay bricks (300 × 150 × 80 mm.) arranged in double obstructed (I) and unobstructed (II) grate packing, are investigated. It is shown that for II with $d = 0.0945$ m., $\alpha_k = 16.4\,w_0^{0.5}$ kcal./m.²hr.°C. (where α_k = heat transfer due to convection, w_0 = normal velocity (m./sec.) in the heating period during operation). Good agreement with expt. is obtained by calcg. with Schack's formula the heat transfer due to radiation through CO_2 and the steam in the waste gases. An approximation method (graphical-math.) is developed which can be used for any gas, the formula being: $\alpha_{TR} = (\alpha_{(CO_2+H_2O)} + \alpha_{corr.})\cdot m\cdot n$ kcal./m.²hr.°C. (where α_{TR} = total heat transfer due to radiation). From $\alpha = \alpha_k + \alpha_{TR}$, α may be detd. for II for any temp., velocity and gas and for any channel cross section. For I with a channel breadth of $d = 0.0945$ the total heat transfer is about 16% greater than that of II. The pressure lost by friction is proportional to the sq. of the normal velocity and inversely proportional to $\sqrt[4]{d}$. J. BALOZIAN

Regulating organic reaction under high pressure. P. H. GROGGINS AND R. HELLBACH. *Chem. Met. Eng.* **37,** 693-4(1930).—An automatic, highly-heated oil bath, with immersed autoclaves, is described. E. M. SYMMES

Intensities of odors and irritating effects of warning agents for inflammable and poisonous gases. S. H. KATZ AND E. J. TALBERT. Bur. Mines, *Tech. Paper* **480,** 37 pp (1930).—An odorimeter is described with which concns. of 10% vapor down to 1 part in 10^{13} parts of air could be obtained. Intensities of odors, of nasal irritations and of eye irritations produced by 55 substances at various concns. in air are presented. Trinitro-*tert*-butylxylene was most powerful as an odor at the lowest concns., being observed at 0.000051 part per million. Chloroacetophenone was the most powerful nasal and eye irritant, 0.021 and 0.0083 parts per million, resp., being required. ALDEN H. EMERY

Reduces cable ionization by super-vacuum process. S. J. ROSCH AND H. G. BURD. *Power* **72,** 1132-6(1930).—Occluded gases and H_2O are removed from cable insulating materials at a pressure of 1 mm. D. B. DILL

Dichlorodifluoromethane overrated as a refrigerant. JOHN E. STARR. *Power* **72**, 972(1930).—This substance is non-toxic but is not superior to CO_2. D. B. DILL

Waterproof impregnated braiding of electric conductors. E. KINDSCHER. *Gummi-Ztg.* **45**, 333–6(1930).—A mixt. of linseed oil and minium is the most commonly used material for waterproofing the cotton braid of elec. conductors, but though it is known that it owes its virtue to the formation of an impermeable film, the nature of this formation is not well understood (cf. Laufenberg, *C. A.* **24**, 1231). Accordingly expts. were carried out to learn more about the reaction and the nature of the products. This was of special interest because in preliminary expts. it was found that the formation of org. Pb compds. varied in an obscure manner. In the beginning a mixt. of "non-thickening" minium and linseed oil was let stand (with daily agitation) for about 7 weeks at room temp., and the product was analyzed. This analysis was effected by decanting the product, filtering the decanted oil, combining the latter with the residue from the decantation (after this residue had been extd. with acetone) and chilling or dilg. the combined oily product, which pptd. a mixt. of Pb and fatty acids. The residue from the extn. of the original residue with acetone, extd. with a mixt. of C_6H_6 and EtOH and then extd. again with acetone, left a solid brown residue consisting of org. Pb compds. The latter contained 46.1% Pb and 53.5% fatty acids, and when hydrolyzed with HCl in Et_2O the fatty acids contained 5.1% oxy acids insol. in petr. ether and 90.3% unsatd. acids. The quant. data show that, with 2100 g. of minium and 1500 g. of linseed oil, 119 g. of Pb reacted to form org. Pb compds. This is far higher than could be accounted for by the free fatty acids originally present in the oil, and since the acids recovered from the Pb salts had a relatively low content of oxy acids, the minium reacted with the glycerides of fatty acids in the linseed oil. Similar expts. with other mixts. of minium and linseed oil, some of the type of mixts. used for protective coatings, and in which a highly dispersed minium was used, showed that instead of being more reactive, the highly dispersed minium was less reactive than the "non-thickening" minium. Further tests with different types of minium (including a non thickening type contg. 82.3% Pb_3O_4, a com. type contg. 90.5% Pb_3O_4 and a highly dispersed type contg. 99.7% Pb_3O_4) proved that the reactivity with linseed oil depended not upon the Pb_3O_4 content, but upon the PbO content of the minium, the higher this PbO content the more reactive the minium. Thus with the 3 types mentioned parenthetically above, and by starting with 500 g. of linseed oil and 700 g. of minium, 36.88, 20.54 and 1.99 g. of Pb had formed org. Pb compds. from the oil after several months. In similar tests with 3 types of minium, all of the same particle size but contg. 28.9, 31.7 and 33.1% Pb_3O_4, resp., 82.7, 27.5 and 18.5 g., resp., of Pb reacted with the linseed oil after 9 weeks (1000 g. of minium and 800 g. of oil) (cf. Laufenberg, *loc. cit.*). Tests with thin films of mixts. of minium and linseed oil, such as employed in practice, showed the same relation between PbO content and reactivity. C. C. DAVIS

Recovery of volatile material from gas or vapor mixtures. CHEMINOVA GES. ZUR VERWERTUNG CHEMISCHE VERFAHREN M. B. H. Ger. 498,731, Apr. 28, 1927. The materials are recovered by using absorptives in an oil layer, *e. g.*, crude cresol and alc. in transformer oil.

Heating liquids with hot gases. WILHELM SCHWARZENAUER. Ger. 507,066, June 30, 1922. Efficient exchange of heat is brought about by using the liquid and the gases to operate a hydraulic compressor or mammoth pump. App. is shown.

Evaporating liquids. METALLGES. A.-G. Ger. 507,065, Mar. 24, 1926. The evapn. of liquids in a plant comprises an evaporator and a separator for solids arranged in advance of the evaporator and heated to a higher temp. The improvement consists in passing only a part of the liquid back from the evaporator to the separator from time to time. A no. of evaporators may be connected to a common separator. The evapn. of salt solns. which deposit $CaSO_4$ is referred to.

Distilling liquids. I. G. FARBENIND. A.-G. Fr. 686,368, Dec. 10, 1929. Liquids are distd. in a continuous manner by causing them to flow over interiorly heated tubes to which directing surfaces are fixed so that a fractionation of the liquid takes place during distn.

Distillation of foam-forming liquids, especially tars. ADOLF SPILKER. Ger. 506,545, Feb. 27, 1925. The distn. is carried out in an app. in which the liquid is led over a vertical series of plates against a current of vapor.

Dehydrating vegetable matter. I. G. FARBENIND. A.-G. (Hans Enderlein and Otto Ambros, inventors). Ger. 504,891, Aug. 9, 1929. The vegetable material is mechanically reduced to fibers before drying.

Catalytic reactions. I. G. FARBENIND. A.-G. Fr. 686,280, Dec. 7, 1929. Endo-

thermic catalytic reactions are carried out by heating the reaction vessels exclusively or principally with radiant heat. The walls of the reaction chamber are made of materials having a high heat-emitting power.

Cleaning liquid mercury. BURT L. NEWKIRK (to General Elec. Co.). U. S. 1,786,312, Dec. 23. For sepg. minute particles such as metal and oxide from liquid Hg the liquid material is passed through a filter bed consisting of material such as steel balls, gravel or wire screen which is not wet by the liquid and serves to divide it and provide a large surface area of material. App. is described.

Apparatus for liquefying gases by the expansion method. AUTOGEN-GASACCUMULATOR KRÖKL & HANSMANN G. M. B. H. Ger. 505,900, Jan. 19, 1927.

Liquefaction and rectification system for separating gases. SOC. L'AIR LIQUIDE (Soc. anon. pour l'étude et l'exploitation des procédés G. Claude). Brit. 333,127, Dec. 18, 1928. Various details of app. and operation are described.

Rectification system for separating oxygen and nitrogen from liquid air. ADOLF MESSER. U. S. 1,785,491, Dec. 16. Various details of app. and procedure are described.

Double-column apparatus for separating atmospheric oxygen and nitrogen. MESSER & CO. G. M. B. H. Ger. 505,676, Feb. 19, 1926. Details of the apparatus.

System for delivering gas under desired pressure from a supply of liquid gas. CHRISTIAN W. P. HEYLANDT. U. S. 1,786,159, Dec. 23. Various details of app. and operation are described.

Removing dust, etc., from air and gases. PNEUMATIC CONVEYANCE & EXTRACTION (1929), LTD. Ger. 505,889, Aug. 19, 1926. Details of the app.

Emulsions. BERTHOLD REDLICH. Ger. 502,237, Jan. 5, 1927. Addn. to 495,934 (*C. A.* **24**, 3580). Aq. emulsions of high concn. are prepd. by intimately mixing a powd. inorg. gel. of high adsorptive capacity, (*e. g.*, Al_2O_3, Fe_2O_3) except SiO_2, with insufficient of the liquid or soln. to be emulsified to exhaust its capacity, and stirring into water. Examples are given.

Aqueous emulsions of cresols, hydrocarbons, dyes, oils, fats, resins, etc. I. G. FARBENIND. A.-G. Brit. 333,587, March 15, 1929. As an emulsifying agent there are used residues obtained by the distn. of MeOH synthesized by the catalytic hydrogenation of C oxides (such as so-called "isobutyl oil," b. 150–280°) together with an alkyl naphthalenesulfonic acid or a salt or the product of combined sulfonation of palm oil and PhOH. *Insecticides* and compns. for other purposes may be thus prepd.

Insulating and construction materials. ERNST RUDIN and HEINRICH KOLLBRUNNER Fr. 686,469, Dec. 12, 1929. Insulating and construction materials are made by completely filling the pores of fibrous materials with pitch of low m. p., heating in a current of gas or air for a long time at a temp. below 150° so that the pitch of low m. p. is converted into a pitch of high m. p.

Insulating material such as copper wire. HENRY A. GARDNER. U. S. 1,786,340, Dec. 23. A moisture-proof elec. resistive wrapping comprises a sheet of cellulosic material such as regenerated cellulose carrying on each side an adhering layer contg. a cellulose ester such as cellulose acetate and a plasticizing resin such as one of the toluenesulfonamide-aldehyde series.

Insulating electric cables. I. G. FARBENIND. A.-G. Brit. 332,891, Jan. 24, 1929. Cables are coated with the rubber-like polymerization products of butadiene and vulcanization is effected at 100–150°; other ingredients are used such as MgO or lampblack and S, and the material may be mixed with natural rubber, anti-agers, accelerators, artificial resins, etc.

Coating electric cables. FELTEN & GUILLEAUME CARLSWERK A.-G. Brit. 332,880, March 16, 1929. In a high-tension submarine cable insulated with oil-impregnated paper, the protecting sheathing is formed of rubber which has been rendered impermeable to water, and a layer of oil-impermeable material is applied over the paper insulation. Various details of manuf. are described.

Impregnating paper-cable insulation. G. F. KENNEDY (to Hercules Powder Co.). Brit. 333,196, March 5, 1929. Paper taping is impregnated with a compn. contg. substantially pure and substantially unoxidized abietic acid (in any of its stereoisomeric forms) which may be mixed with 5–50% of a hydrocarbon oil.

Electric insulation. W. S. SMITH, H. J. GARNETT and J. N. DEAN. Brit. 333,290, May 10, 1929. Materials such as rubber, gutta-percha or balata are treated with urea or thiourea or their derivs., with or without a proteolytic enzyme such as pepsin or trypsin to convert proteins into water-sol. compds. which are removed by washing to improve the elec. properties of the material. The treatment of latex and of solid rubber is described. Cf. *C. A.* **24**, 2816.

Heat insulators. S. A. I. G. (SOC. ANON. INVENZIONI GUADAGNIN). Fr. 686,226,

Dec. 6, 1929. A heat insulator is made by mixing Na_2SiO_3 or K_2SiO_3, asbestos, cork, $MgCO_3$, refractory earth and hemp with the necessary amt. of water to form a paste for molding.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Solubility of lead in the municipal water of Leipzig. STICH. *Pharm. Ztg.* **75**, 1262–3(1930).—The results are given which were obtained in a comparative series of expts. on the soly. of Pb shavings and pipe in various types of distd. water and that delivered in the mains of Leipzig. The results reported emphasize the necessity for const. control of municipal waters coming in contact with Pb conduits. W. O. E.

Titrimetric determination of calcium and magnesium in drinking water. M. E. STAS. *Pharm. Weekblad* **67**, 1245–59(1930).—The von Luck and Meyer method (*C. A.* **23**, 3037) for detg. the Ca and Mg content of river water, based on pptn. of Ca as oxalate and titration with $KMnO_4$ and pptn. of Mg as *o*-hydroxyquinoline salt and bromination thereof, is slightly modified for the detn. of Ca and Mg in drinking water where bicarbonate and Fe are frequently present. A. W. DOX

Rapid method of detecting and determining fluorine in mineral waters. J. CASARES AND R. CASARES. *Anales soc. españ. fis. quím.* **28**, 1159–62(1930).—Detection of F in mineral water rich in F is easy by evapn. of about 15 cc of the water in a porcelain dish on a water bath to dryness, and adding a little Ag_2SO_4 and glass powder, covering with a watch glass on which hangs a drop of 1% $Ba(OAc)_2$ soln. slightly acidified with AcOH, formation of Ba fluosilicate being observed by a microscope. The detn. of F is colorimetric. In a series of 120 cc. tubes, 100 cc of H_2O and increasing amts of NaF are placed. The samples are in another series To all is added 1 cc. concd. HCl, and after shaking, a few drops of a mixt. of equal parts of 0.17% Na alizarinsulfonate soln. and 0.87% $Zr(NO_3)_4$ soln. A comparison of colors shows the F content E. M. SYMMES

Methods for the determination of small quantities of active chlorine in purified waters. S. ANSELMI AND A. CALO. *Ann. chim. applicata* **20**, 410–24(1930).—A review of the colorimetric methods which have been used in detg. small quantities of Cl in waters. A. and C. prefer the *o*-tolidine method, which they find sensitive to 0.02 mg. Cl/l For concns. over 0.2 g. Cl/l., they recommend KI and starch and titrating with $Na_2S_2O_3$. A. W. CONTIERI

Experimental results in the purification of sewage waters with ozone. P. L. FIORANI. *Ann. igiene.* **40**, 593–600(1930).—A 2-l. sample of drainage water from a closet sink was treated with ozonized air for 5-min. periods four times a day for several days, with an interval of 1 hr. between treatments. The product was compared with an untreated sample kept during the same period. The ozonization removed the odor, brought about good sedimentation, lightened the color and killed all animal organisms. Bacteria were not greatly decreased. The liquid was sepd. from the sediment after treatment and was further ozonized. It became completely colorless, produced no more sediment, and was imputrescible. It contained slightly more dissolved organic matter than the control liquid. R. SANSONE

The extent of goiter in Hungary and its connection with the I content of the drinking water (STRAUB) 11A. Device for feeding solid reagents to a reaction vessel (Ger. pat. 507,041) 1.

Concentrating natural mineral waters. FRITZ MAYER. Ger. 504,807, July 18, 1928. The water is cooled to sep. ice till the required concn. is reached.

Cooling tower suitable for cooling water. REXFORD O. ANDERSON, ULYSSES S. RUDY and BENJAMIN M. GESSEL. U. S. 1,785,572, Dec. 16. Structural features.

Distilling water. G. E. HUGHES, A. H. WARING, J. E. BRAHAM and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 333,547, Feb. 24, 1929. In a multiple effect app. a plurality of falling films of impure water is subjected to indirect heating by steam, the condensed steam is passed to a flash boiler where its pressure is reduced, and steam thus produced is mixed with steam evolved from the falling films, and the mixt. is passed to the next effect. Various details of app. are described.

Apparatus for softening water by treatment with mineral reagents. EMIL G. DUDEN (to Wm. B. Scaife & Sons Co.). U. S. 1,784,893, Dec. 16. Structural features.

Base-exchanging material. S. A. KRÜGER. Brit. 333,844, Jan. 5, 1929. Clays of base-exchanging character are rendered more resistant to disintegration by the action of water, by calcination at 550–900° with exclusion of O or other oxidizing gases. A neutral or reducing flame may be used, or calcination effected in the presence of neutral or reducing gases.

Filter for water purification. JOSEF MUCHKA. Ger. 505,888, Sept. 23, 1928. Details of construction.

Purifying boiler-feed water. ROY O. HENSZEY. U. S. 1,786,113, Dec. 23. For maintaining boiler water at a low degree of concn., water is blown off from the boiler, make-up water is added to the boiler, and the amount of water blown off is regulated so that it is increased or decreased in proportion to the increase or decrease of the amount of make-up water added. App. is described.

Purifying waste water. FRIEDRICH SIERP and FERDINAND FRÄNSEMEIER. Ger. 504,993, Aug. 28, 1926. The water is purified by first treating with precipitants such as Fe or Al salts, and then by treating with biol. purifying agents which attack the coarser colloidal particles. Agents which attack the fine colloidal particles are added at a further stage, and the water is finally aerated.

Treating waste water. MAX KUSCH. Ger. 504,992, June 30, 1929. An app. is described for purifying waste water by biol. agents, comprising a series of overflow chambers and an aerating device.

Apparatus for treating waste water. C. OTTO & CO. G. M. B. H. Ger. 504,991, Dec 21, 1926. App. for washing PhOH out of phenolic waste water is described.

Oil trap for waste-water-purifying plants. KARL IMHOFF, FRIEDRICH SIERP and GEORG MAIER. Ger. 507,042, Dec. 3, 1926.

Pumping apparatus for sewage-disposal plants. THOMAS B. SIMS (to L. J. Wardlaw). U. S. 1,786,032, Dec. 23. Structural features.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER AND M. S. ANDERSON

Soils of Missouri. M. F. MILLER AND H. H. KRUSEKOPF. Univ. Mo., Agr. Expt. Sta., *Bull.* **264**, 120 pp.(1929).—Missouri soils vary in lime requirement per acre from 0 to 5 tons. An av. of 500 soils shows 2500 lb. N, 1250 lb. of P_2O_5 and 28,800 lb. of K_2O in 2,000,000 lb. of surface soil. The soils are of many types and vary widely in fertility. The phys. and chem. properties of the several soil types are discussed. A soil map accompanies the bulletin. C. R. FELLERS

Determination of the accuracy of the rapid colorimetric method of Dirks by comparison with the results obtained by the germination method of Neubauer. C. DREYSPRING AND W. HEINZ. *Superphosphate* **3**, 253-7(1930).—In comparative expts. on 770 samples of soil, results by the Dirks colorimetric method for detg. readily available P_2O_5 compared favorably with those obtained by the Neubauer germination method in 87.1% of the tests, when the following scale was used to indicate the relative fertility of the soil as detd. by the Dirks method: 0–6 mg. P_2O_5 per 100 g. of soil poor in P_2O_5, 6–10 mg. P_2O_5—medium P_2O_5 content, over 10 mg. P_2O_5—rich in P_2O_5. K. D. JACOB

The determination of the replaceable bases and the base-exchange capacity of soils. H. D. CHAPMAN AND W. P. KELLEY. *Soil Science* **30**, 391–406(1930).—Soly. and decompn. processes in soils render the detn. of exchangeable bases somewhat inexact. The NaCl method, and the alc. KCl, or alc. $BaCl_2$ methods all give reasonably accurate results for the detn. of replaceable Ca in calcareous soils, provided other sol. or decomposable Ca compns. are absent. The base-exchange capacity of the soil can be detd. by digesting and leaching the sample with *N* $AcONH_4$ soln. This soln. brings about approx. complete replacement of H ions without the necessity of treating the sample with an excess of alkali. Neutral MeOH is useful for the removal of the occluded electrolyte. The absorbed NH_4 can be accurately detd. by aeration in the presence of Na_2CO_3. M. S. ANDERSON

Investigation on antimony electrode for determination of hydrogen-ion concentration. II. Determination of the hydrogen-ion concentration of soils. ARAO ITANO AND SATIYO ARAKAWA. *Ber. Ohara Inst. landw. Forsch. Japan* **4**, No. 3, 383–94(1930).—An investigation is made of the applicability of the Sb electrode in the detn. of H-ion concn. of soil and of water contg. H_2S. In buffer solns. the H-ion concns. detd. with the Sb electrode agreed with those by the H electrode within 0.2 p_H units. Shaking with the Sb electrode hastened equil.; from 10 sec. to 2 min. was required. Soil in a pasty

prepd. with 0.1 *N* KCl the H-ion values obtained were quite ... acid than those shown by the Sb electrode. The Sb electrode contg. H_2S, where the use of quinhydrone is unsatisfactory.

The influence of artificial soil acidification on the soil and plant growth. FREIIN VON OLDERHAUSEN. *J. Landw.* **78**, 241–87(1930).—The addn. of lime ir the base exchange of the weathered complexes of the soil but it cannot replace the plant food. With a higher degree of base exchange normal plant growth is hindered because in such a soil the content of foodstuffs is too strongly reduced. J. R. H.

Presence of uronic acids in soils. E. C. SHOREY AND J. B. MARTIN. *J. Am Chem. Soc.* **52**, 4907–15(1930).—Results are presented of the examn. of 11 samples of soil for the presence of uronic acid (I), according to methods adopted and in use for the detn. of these acids in vegetable products. The soils are from 8 localities and represent types varying from sandy loams contg. 0.82, 0.88 and 0.96% of org. C, to loams contg. 3.00 and 4.90% of org. C, a muck contg. 30% and a peat contg. 53% org. C. These soils varied in reaction from p_H 4.7 to 8.3. The I CO_2 varied from 0.07 to 1.80% of the soil and this, when calcd. to the equiv. I, varied from 0.308 to 7.94% of the soil. The I C calcd from these figures varied from 0.113 to 2.80% of the soil and this I C varied from 5.15 to 28.4% of the total org. C. The presence of uronic acids or complex substances contg them (polyuronides) was confirmed by the sepn from 2 of the soils of colloidal material having all the properties of such complexes This sepn. was made both by hot H_2O extn. and by extn. with dil. NaOH. The bearing of the presence of uronic acids in soils on certain analytical operations is pointed out These are the detn. of carbonate in soils and methods proposed for the proximate analysis of the org. matter of soils. C. J. WEST

The state of unsaturation of the soil in relation to its field behavior and lime requirement. P. E. TURNER. *Soil Science* **30**, 349–81(1930).—There is considerable evidence that H and Ca together account for the great majority of the exchangeable ions present in the soils of humid climates. The properties of soils appear to depend largely upon the relative proportions of exchangeable H and Ca as well as upon the abs. amts. of these elements. The satn. capacity and satn. deficit vary significantly depending upon whether 2-liter or 5-liter extns. are made of the samples (*C. A.* **17**, 3221). The field behavior of a soil is intimately related to its degree of unsatn. Soils unsatd. to the extent of only 12 to 28% are in good condition; those which are 30 to 35% unsatd. lie in an intermediate group as regards tilth, and those more than 38% unsatd. are all in poor condition. These values appear to be independent of the nature of the colloidal material and the degree of colloidality. A general tendency exists for the p_H value of the soil to decrease with increasing unsatn., but striking irregularities frequently occur. A comparison is made of the values for unsatn. by the procedure of Page and Williams (*C. A.* **21**, 469) and that of Hissink (*C. A.* **19**, 2718). A comparison is also made of the lime requirements of a series of soils as detd. by the method of unsatn. and the p_H value method of Hardy and Lewis (*C. A.* **23**, 5263). M. S. A

Relation of nitrates in soils to the response of crops to potash fertilization. I. Factors contributing to the unproductiveness of "alkali" soils in Illinois. O. H. SEARS *Soil Science* **30**, 325–47(1930).—Lab., greenhouse and field results indicate that the unproductiveness of the alkali soils of Illinois is due chiefly to a lack of available K and a concn. of nitrate N which is harmful. The total K of 3 soils varies from 0.75 to 0.83%. Its low availability is thought to be due to the presence of an alk. reaction. The addn. of straw as a mulch is much more effective in increasing crop yields than is the addn. of K salts. The presence of straw lowers the concn. of nitrates. The addn of ashes from an equiv. quantity of burned straw is much less effective. Horse manure is more valuable than cow manure on these soils, whereas the opposite condition obtains on soils where there is a deficiency of available N. Analyses of displaced soil solns. show the presence of 430–1532 p. p. m. of nitrate in the solns. at moisture contents varying between 22 and 31.9%. Soils treated with KCl show that 50–70% of the K applied is used in releasing Ca ions. Large applications of KCl result in proportionately larger increases in the K content of the displaced soln. than do the smaller applications. M. S. ANDERSON

The action and efficiency of various water-insoluble forms of phosphoric acid on different soils with special reference to their influence on the phosphoric acid content of the plants. M. CLEMM. *J. Landw.* **78**, 289–308(1930).—Fertilizing with P_2O_5 causes an increase in the absorption of P_2O_5 by plants. This increase is shown clearly in the P_2O_5 content of the grains. With loam soils rich in alkali and P_2O_5 there is no

definite increase in the straw. But with the poorer soils there is always an increase in the content of P_2O_5 even in the straw. JOHN R. HILL

The decomposition of lignified materials by soil microörganisms. MAX PHILLIPS, HERMAN D. WEIHE AND N. R. SMITH. *Soil Science* **30**, 383–90(1930).—A study is made of the selective decompn. by soil microörganisms of various constituents of cornstalks, oat hulls, corncobs and wheat straw. The results indicate a rapid decompn. of the pentosans and cellulose. The abs. quantity of lignin as well as the percentage lignin shows a decided decrease in the expts. The greatest loss occurs where urea is used as a source of N. Methoxyl, known to be a characteristic group of lignin, also decreases with the decompn. of the mass. Under suitable conditions the rate of decompn. of lignin may be as rapid as that of cellulose or of pentosans. M. S. A.

Investigation on Winogradsky's Azotobacter test as to its applicability to some rice-field soils in Japan. ARAO ITANO AND SATIYO ARAKAWA. *Ber. Ohara Inst. landw. Forsch. Japan* **4**, No. 3, 365–9(1930).—Fixation of N by *Azotobacter* from different soils was tested in liquid culture medium, and in silica gel. The N fixed in liquid culture was much less than that in the silica gel plates. The results showed no agreement between productivity of the soils and the *Azotobacter* test. The p_H values of the soils and their P contents appeared to play an important part in N fixation. Optimum p_H for rice crops is about 4.0. Very small quantities of N were fixed in soils more acid than p_H 6.0. M. S. ANDERSON

Cross inoculation with Rhizobium radicicolum. VICTOR BURKE AND NELSON J. HOHL. *Soil Science* **30**, 407–11(1930).— Legume tissue and ext. do not have bactericidal action on heterologous strains of *Rhizobium radicicola*. The ext. alone does not have a bacteriostatic action and probably the same is true of the tissue. Different strains, and different cultures of the same strain, vary in their rate of growth in legume ext. The rates of growth in homologous and in heterologous legume exts. are the same. M. S. ANDERSON

The watering of pot cultures by means of a suitable device. C. DREYSPRING. *Superphosphate* **3**, 245–53(1930). - The importance of close regulation of the water supply in pot culture expts is emphasized. A special truck equipped with a balance and water tank for use in the greenhouse is described and illustrated. K. D. JACOB

Crushing and grinding machinery for the (fertilizer) trade. ALAN WHATHAM. *Fertilizer, Feeding Stuffs and Farm Supplies J.* **15**, 691–4(1930).—An illustrated discussion of various types of crushing and grinding equipment suitable for fertilizers and fertilizer materials K. D. JACOB

Economical fertilization. JAR. SOUČEK. *Listy Cukrovar* **49**, 137–9(1930).—Nutritional elements in soil up to a depth of 20 cm. are replenished by elements in deeper layers; in well-limed soils, the P_2O_5 in strata 20–40 cm. below the surface of the soil is 75% as effective as the same P_2O_5 concn. in the 0–20 cm. stratum. In poorly limed soils the P_2O_5 in the 20–40 cm. stratum is equally or perhaps more effective as the P_2O_5 in the 0–20 cm. stratum. However, this P_2O_5 may be flooded off by wash water and lost to the plant. With K, the same concns. in both strata showed the K to be 33% more effective in the 0–20 cm. layer; N in the 0–20 cm. layer is more effective than in the 20–40 cm. layer. Potatoes were able to absorb less P_2O_5 from the lower stratum than sugar beets. Barley and potatoes absorbed less K from the soil than oats, sugar beets absorbed less P_2O_5 than grain. FRANK MARESH

The effect of phosphoric acid on the development of roots. JOHANNES GÖRBING. *Superphosphate* **3**, 257–61(1930).— Fertilization of summer wheat with superphosphate had a marked effect in promoting root development, augmenting, in particular, the formation of fine fibrous roots. K. D. JACOB

Lignin as a possible factor in lodging of cereals. JEHIEL DAVIDSON AND MAX PHILLIPS. *Science* **72**, 401–2(1930).—An excess of $NaNO_3$ (600 lb. per acre) applied to a wheat plot caused lodging of the grain and depressed considerably the ash and silica contents of the straw. But, contrary to expectations, the lignin content of the straw from the lodged grain was distinctly higher in every case than that from the control plot JOHN R. HILL

Mercury salts as disinfectants for seeds. VITTORIO CASABURI. *Industria chimica* **5**, 1251–60(1930).—C. proposes the use of Hg salts as satisfactory disinfectants for seeds, notably the Hg salts of 3 tanning materials, *i. e.*, methylenedinaphtholsulfonic acid, lignomethylenedisulfonic acid, and the latter acid neutralized with $K_2Hg(CN)_4$. A. W. CONTIERI

Aqueous emulsions of cresols, hydrocarbons, dyes, oils, fats, resins, etc. [as insecticides] (Brit. pat. 333,587) **13.** Fungicidal and insecticidal composition (U. S. pat. 1,785,074) **20.** Superphosphate (Brit. pat. 333,518) **18.**

Fertilizer. HYDRO NITRO SOC. ANON. Brit. 333,477, Dec. 1, 1928. See Fr. 685,276 (*C. A.* **24**, 5927).

Fertilizers. BAYERISCHE STICKSTOFF-WERKE A.-G. (Carl Ehrenberg and Hugo Heimann, inventors). Ger. 507,320, Jan. 15, 1929. Fossilized plants and like vegetable materials, *e. g.*, coal or lignite, are heated under pressure in an autoclave with NH_3 and air or other gas contg. O. A temp. of 200–250° and a pressure of 50 atm. are suitable.

Fertilizers. KALI-CHEMIE A.-G. (Fritz Rothe and Hans Brenck, inventors) Ger. 507,925, June 29, 1926. Addn. to 492,310 (*C. A.* **24**, 2827). The method of Ger 492,310 is modified, when using Na_2SO_4 and (or) NaCl as reagents, by limiting the amt. of SiO_2 to about 0.5 mol for each mol of P_2O_5. If the crude phosphate contains Ca not combined as phosphate, a further amt. of SiO_2 sufficient to convert such Ca into orthosilicate should be included

Fertilizers. ERNST FRANK. Ger. 507,068, Aug. 24, 1924. Crude phosphate is treated with HCl, the acid is then driven off by heating to about 100°, and the residue is heated at 140° with the intermittent addn. of small quantities of water. The product is sol. in citric acid.

Fertilizers comprising urea-calcium nitrate double compounds. I. G. FARBENIND. A.-G. Brit. 332,945, April 29, 1929. Urea is added to a soln. of $Ca(NO_3)_2$, followed by evapn. until the water content of the material is 5% or less, and solidification by spraying. Urea 2 to 7 mol proportions may be used for each mol. proportion of Ca $(NO_3)_2$.

Urea and fertilizers containing urea. I. G. FARBENIND. A.-G. Brit. 332,948, April 29, 1929. Substantially anhyd products are obtained by adding to a pure soln. of urea not over 15% of substances adapted to lower the solidification point of the anhyd. melt, preferably to 120° or lower, (such as di NH_4 phosphate, urea phosphate, K phosphates, mono-Ca phosphate, H_3PO_4, nitrates of Na, K or NH_4, KCl, NH_4 sulfate, formamide or acetamide), evapg. to a water content below 10% and spraying the material or running it as a thin stream into a liquid such as an oil or CCl_4 kept in motion.

Ammonium phosphate fertilizer composition. GUY H. BUCHANAN (to American Cyanamid Co.). U. S. 1,785,375, Dec. 16. Mono-NH_4 phosphate in a substantially dry condition is treated with NH_3. App. is described.

Ammonium phosphate fertilizer and sodium bicarbonate. SOC. CHIMIQUE DE LA GRANDE PAROISSE (Azote et produits chimiques). Brit. 332,864, Nov. 23, 1928. Na phosphate is treated with NH_3 and CO_2 and water to produce NH_4 phosphate suitable for use as fertilizer, and $NaHCO_3$. Various details and modifications of procedure are described, and initial materials may be used which contain nitrates.

Seed fungicide and disinfectant. HOWARD ADLER and GUY A. MCDONALD (to Victor Chemical Works). U. S. 1,785,472, Dec. 16. Cu oxalate and $CaSO_4$ are formed together, as by reaction of $CuSO_4$ with Ca oxalate in water.

Fungicide and insecticide. WALTER C. O'KANE. U. S. 1,786,125, Dec. 23. A compn. suitable for use on plants, etc., comprises a pyrethrum-impregnated hydrocarbon white oil carrying a colloidal Cu material or other suitable colloidal metal compd.

Insecticides. J. GUILLISSEN and UNION CHIMIQUE BELGE, SOC. ANON. Brit. 333,743, Aug. 19, 1929. The insecticidal principle of pyrethrum is extd. (suitably with petroleum ether), the solvent is distd. off, and the ext. is dissolved in another solvent (suitably in pyridine for agricultural purposes, or in Et lactate for domestic use).

Insecticides. I. G. FARBENIND. A.-G. (Karl Dobmaier, inventor). Ger. 507,118, Feb. 25, 1927. The insecticidal action of furfural is enhanced, and the difficulty of dispersing it in water is avoided, by using it in the form of a mol. compd. with an org. base, particularly an aliphatic amine or amino alc. Crude initial materials may be used. Examples are given. Cf. *C. A.* **25**, 373.

Insecticide. I. G. FARBENIND. A.-G. (Carl Taube, Wilhelm Schepss and Hans Kükenthal, inventors). Ger. 507,215, Mar. 25, 1928. Ethylene oxide is used, alone or mixed with other insecticides, indifferent materials, inflammability-reducing substances, irritants, etc. Examples are given.

Insecticide for use on trees. JOSEPH H. LAMBERT (to Standard Oil Co. of Ind.) U. S. 1,785,451, Dec. 16. A concd. tree-spray compn. suitable for dilu. and emulsification with water in large quantity comprises straw oil mixed with a small quantity of an oil-sol. sulfonic compd. derived from the treatment of heavy hydrocarbons with concd. H_2SO_4, small quantities of a water-sol. emulsifying soap, and a small quantity of an alc. such as denatured EtOH.

Treating wounds of trees and plants. IRVING E. MELHUS. U. S. 1,785,641,

Dec. 16. **The wounds are covered with a compn. comprising a fungicide such as $Hg(CN)_2$ and a soln. of a condensation product of furfural, cresol and a condensing agent in an org. solvent contg. furfural.**

16—THE FERMENTATION INDUSTRIES

C. N. FREY

Bios. VI–VII. BUNSUKE SUZUKI, KENJI MATSUSITA AND KUNIO AOKI. *Proc. Imp Acad.* (Japan) **6**, 334–6(1930); cf. *C. A.* **22**, 2570.—The effects of bios (1/5000) on 18 species of yeasts show that there are 3 classes of yeasts, those indifferent to bios, those that need bios for fermentation and an intermediate class which are capable of fermenting to the full extent if sufficient time is allowed but which act in a normal time with the addn of bios. With *Schizosacch. pombe* the addn. of bios did not cause the yeast to ferment normally, although this was brought about by the addn. of oryzanin from rice bran. The bios or oryzanin had little or no favorable effect upon *Sacch. exiguus, Sacch. marxianus* and *Zygosacch. major* but the yeasts were capable of fermenting "Koji ext." normally. *Aspergillus oryzae* is capable of synthesizing bios. VIII. B. SUZUKI AND YASUJI HAMAMURA. *Ibid* 337–40.—The details of the sepn. of an active fraction of bios from rice bran by extg. with 2% NaOH, pptn. with basic Pb acetate and extn. of the residue from the filtrate with MeOH, EtOH, pyridine, AmOH and EtOH are given, the yield being 10% of a compd. which was 10 times as reactive as the crude biose. It is a very hygroscopic amorphous powder, insol. in Et_2O, $CHCl_3$ and C_6H_6 and giving a yellow color with $FeCl_3$. An Ac deriv. could not be prepd. but BzCl gives a benzoate which was inactive; purification by fractional pptn. from decalin gives fractions m. 116–8°, 105–7° and 99–100°, contg. 3 Bz groups. This indicates that the compd. does not contain N and that 1 or more of the HO groups are in a ring formation. C. J. WEST

The fermentation of loganberry must. W. NEWTON AND R. J. HASTINGS. *Can. Chem. Met* **14**, 348, 353(1930).—"Secondary fermentation" is a real problem in the manuf. of loganberry wine, that may be offset by the addn. of NH_4 phosphate (primary) in the proportion of 227 g. to 378.5 l. loganberry must. The addn. of this salt creates more favorable fermentation conditions. Two optima concns. of primary NH_4 phosphate were found. W. H. BOYNTON

Technology of malting. VII. The nitrogen balance during malting. E. JALOWITZ. *Brau- und Malzindustrie* **4**, 65–8(1930); cf. *C. A.* **25**, 167.—There is no loss of N during malting. The sum of albumin or N content of the malt, the germs and of the N which has been dissolved in the steep water equals the N content of the barley. These results are obtained for barleys of any compn. and for any malting operation. VIII. **The influence of the method of kilning on the malt character.** *Ibid* 81–4.—The same green malt was kiln-dried at 3 different temps., the final temps. being 56–7°, 61° and 63.5° R. The phys. and chem. analyses showed but little difference, except in color, between the three malts. The expts. proved that the malt type is produced chiefly by the germination process. The method of kilning must be adjusted to the given green malt type. S. LAUFER

The wines of Comtat-Venaissin. JEAN BORDAS AND GASTON MATHIEU. *Ann. falsif.* 23, 151–67(1930).—The geographical and geological situation of species of grapes grown in the Côtes-du-Rhône and Comtat-Venaissin vineyards are described. Analyses of 42 wines are tabulated and briefly commented upon. A. PAPINEAU-COUTURE

Wine distillates and wine brandies. H. ZELLNER. *Z. Untersuch. Lebensm.* **59**, 177–(1930). Mainly polemical against Büttner and Miermeister (*C. A.* **24**, 4892–3). Reply. G. BÜTTNER AND A. MIERMEISTER. *Ibid* 433–4. C. R. FELLERS

Production of fuel gas by anaerobic fermentations (BUSWELL) **21.** Quantitative application of the analytical quartz lamp, especially in wine analysis (HEIDUSCHKA, MOHLAU) **7.** Denicotinizing tobacco by fermentation (Ger. pat. 507,194) **17.**

Aldehyde-free alcoholic liquids. HERMAN HEUSER. U. S. 1,785,447, Dec. 16. **A portion of alc. liquid contg. fusel oil or aldehydes is charged into a closed chamber and heated to evap. and remove its entire aldehyde contents together with a portion of the alc. content; a second portion of the material is similarly treated in a second chamber, and the aldehyde-free residue from the second chamber, while boiling, is discharged into the first chamber completely to fill the latter, the first chamber is sealed**

while its contents are at a boiling temp., its contents are subsequently cooled, and an O free gas such as N or CO_2 is permitted to enter the space formed by extn. of the contents of the chamber. App. is described

Distillation apparatus for alcoholic beverages. WILHELM KREMER. Ger. 507,407, Aug. 15, 1928.

Cleaning malt. GOTTFRIED JAKOB. Ger. 507,403, July 29, 1927. The uncrushed malt is treated with hot water or steam and then washed. Alkalies, acids, or solvents may be added to the water in the first stage.

Coloring brandy, etc. WILLY DEHMEL. Ger. 507,404, June 19, 1927. A coloring material for brandy, etc., is prepd. by heating a mixt. of refined corn sugar with small quantities of AcONa and H_2O until the melt becomes dark brown.

Method and apparatus for sifting and sorting yeast. BRAUEREI STERNBURG G. M. B. H. Ger. 507,401, Feb. 22, 1929.

Yeast. OLGA K. SAUER NÉE BUCHHOLZ. Ger. 507,402, May 10, 1927. Dry yeast is prepd. by inoculating a sterile nutrient soln. in a vessel connected to an air pump, allowing the culture to stand at a suitable temp. while removing CO_2 and EtOH from time to time by operating the pump, and finally drying the culture in the same way.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

The preparation of loco-"calorose." J. C. DE JONG AND N. KEULEMANS. *Pharm. Weekblad* **67**, 1299–30(1930).—Loco calorose, an invert sugar prepn. used for hypodermic injection, may be prepd. as follows: Dissolve 750 g. of sucrose by boiling with 225 cc. of H_2O in a 1-l. flask. Add 15 cc. of 0.1 *N* HCl and heat 1 hr. in a boiling water bath. Neutralize by adding 215 mg. of $Na_2CO_3.10H_2O$ in 5 cc. H_2O, and dil. to 1 l. The prepn. contains 70% invert sugar. When dild. 1:10 and sterilized by heating 1 hr. in a boiling water bath the soln. is isotonic with blood. A. W. DOX

The preparation of concentrated phosphorus solution. M. H. P. SITSEN. *Pharm. Weekblad* **67**, 1313–6(1930).—Directions are given for prepg. a stable 0.5% soln. of P in paraffin oil; less than the customary amts. of Et_2O and lemon oil are used as preservatives. A. W. DOX

Detection of added dextrin in succus liquiritiae. C. GRIEBEL AND F. WEISS. *Apoth. Ztg.* **45**, 1566–9(1930).—Since dextrin is usually present as a normal constituent of the succus (because of degradation of starch) in amt. up to 10%, any higher % of dextrin found in certain com. samples of this commodity would almost certainly indicate added dextrin. W. O. E.

Essential oils of Zieria Smithii (Andrews) and its various forms. A. R. PENFOLD. *J. Proc. Roy. Soc. N. S. Wales* **64**, 83–8(1930).—The chem. compn. of the essential oils from Queensland material has shown the principal constituents to be phenol ethers (70–80%), mainly safrole and a little methyleugenol, while the minor constituents present are *d*-α-pinene, sesquiterpenes, eugenol, stearic acid, etc. Material collected near Sydney showed methyleugenol to be the principal substance present to the extent of 95%, while oils distd. from leaves collected in Terrigal, N. S. W., contained mainly safrole, and from Toronto, N. S. W., the phenol ethers present were found to be a mixt. of elemicin and safrole. These oils undoubtedly represent a very remarkable series. Some of the minor constituents of the N. S. W. oils are of special interest; such a ketone as nopinone was sepd. and identified. W. O. E.

Revision of the German Pharmacopeia. FRANZ VIEBÖCK AND CORNELIA BRECHER. *Pharm. Monatsh.* **11**, 203–6(1930).—It is shown among other things that the method for detg. mustard oil in its present form is open to serious criticism. The iodometric estn. after conversion of the oil into thiourea yields the "actual" mustard oil content, a value smaller for oils distd. at ordinary pressure than when distd. *in vacuo*, since at ordinary pressure some of the oil is converted into thiocyanates. A rapid and easily executed acidimetric method is suggested wherewith one may det. both thiocyanate and mustard oil content. An addnl. method is likewise cited for detg. allyloxythiourea in the presence of mustard oil, the former product resulting rather quickly in the present type of mustard oil spirit. W. O. E.

Examination of galenical preparations in filtered ultra-violet light. F. GIRSTNER AND L. ZECHNER. *Pharm. Monatsh.* **11**, 221–4(1930).—The results obtained in the examn. of tinctures official in the Ger. and Austrian Pharmacopeias are recorded in tabulated form. W. O. E.

Water-soluble oils. KORNEL GÖLLNER. *Pharm. Monatsh.* **11**, 248–9(1930).—An address. W. O. E.

Vegetable nostrums and their control. W. PEYER. *Pharm. Monatsh.* **11**, 249–50(1930); cf. *C. A.* **24**, 1466. W. O. E.

Bacteriophagic principle as the foundation of pharmacognostic evaluation. ERHARD GLASER. *Pharm. Monatsh.* **11**, 250–4(1930).—An address including an extensive bibliography. W. O. E.

Saponins and their importance in pharmacy. W. POETHKE. *Pharm. Zentralhalle* 71, 753–61(1930).—An address. W. O. E.

Quinoline as microchemical reagent for certain heavy metals. F. M. KORENMAN. *Pharm. Zentralhalle* **71**, 769–72(1930).—The cryst. ppts. produced by quinoline (or its HCl salt) and certain salts of Bi, Hg, Cd, Cu, Zn, Pb and Co in admixt. are described and illustrated. W. O. E.

Estimation of morphine in opium and its preparations. LAJOS DAVID AND ISTVAN NOVAK. *Pharm. Ztg.* **75**, 1419–20, 1433–5(1930).—An exptl. study of several methods, notably that of Dietrich (NH_3 method), and of Debourdeaux (lime method), for estg. the alkaloid, the results of the investigation are presented in tabulated form. W. O. E.

Economic drug testing. XI. L. ROSENTHALER. *Pharm. Ztg.* **75**, 1372–3(1930); cf. *C. A.* **24**, 686, **25**, 169, 170.—Extn. methods for the estn. of caffeine in guarana and cola, and of the alkaloids in nux vomica by the use of immiscible solvents (H_2O and $CHCl_3$) in separatory funnels are outlined. W. O. E.

Evaluation of surgical dressings. MAX KINSCHER. *Pharm. Ztg.* **75**, 1388(1930).—The tests described are essentially for the purpose of estg. the free acid, if any, in absorbent cotton, through detn. of the p_H value. W. O. E.

Antimony in drug synthesis. HANS SCHMIDT. *Z. angew. Chem.* **43**, 963–70 (1930).—An address portraying the historical development of drugs contg. Sb as an essential component. W. O. E.

Ether—the use of potassium hydroxide in testing for aldehydes. L. W. GREEN AND R. E. SCHOETZOW. *Am. J. Pharm.* **102**, 652(1930).—The use of solid KOH instead of the test soln. in the test for aldehyde in ether is recommended for the new revision of the U. S. P. Tests of ether for anesthetic use show that if a stronger soln. (50%) is used instead of the normal test soln., or if solid KOH is used, the sensitiveness of the test is increased. 100 parts of aldehyde per million of ether appears to be the extreme limit of sensitiveness of the U. S. P. test. At that concn. the faintest kind of yellow color or tint is just discernible at the completion of the test, while in a test using solid KOH, a distinct and pos. yellow color is obtained. W. G. GAESSLER

Transmission spectra of vanilla extracts. ELLERY H. HARVEY. *Am. J. Pharm.* 102, 659–61(1930).—Curves plotted from tabulated results obtained from the detn. of the transmission spectra in the visible of vanilla exts. made according to an identical and commercially used process indicate that none of the exts. shows characteristic absorption bands; they merely show general absorption in the violet to green region of the spectrum. Of the beans, Tahiti gave the darkest and Tonka the lightest ext. The slopes of the curves parallel each other sufficiently to make the transmission spectra of no value in the identification of the bean used in making the ext. W. G. G.

Preliminary chemical examination of Aegele Marmelos of the Indian Bel. B. B. L. DIKSHIT AND S. DUTT. *J. Indian Chem. Soc.* **7**, 759–64(1930).—The Bel tree, one of the most important medicinal plants of India, was examd. to det. the nature of the active principle. Roots, bark, leaves, fruit and seeds were extd. in 50-g. portions with EtOH, $CHCl_3$, Et_2O, C_6H_6, H_2O, EtOAc and ligroin, and the exts. were examd. without further purification. Needles, m. 103°, were obtained from the ligroin ext. of the fruit. The new substance is named *marmelosin*. W. D. LANGLEY

Simple and quick micro methods for the analysis of tobacco. III. Microtitrational determination of the ash components affecting the burning capacity of the tobacco. J. BODNÁR AND LADISLAUS BARTA. *Biochem. Z.* **227**, 429–51(1930); cf. *C. A.* **23**, 3057. Five-tenths g. of the finely powd dry tobacco is ashed in a Pt dish, which requires only about 10 min.; this yields about 0.1 g. of ash. The K_2O content is detd. in the ash from 0.1 g. tobacco powder incinerated at a low heat. The ash dissolved in dil. HCl is made up to 25 cc., of which 2.5 cc. (= 10 mg. tobacco) is analyzed. To this are added 0.5 cc. 50% $NaNO_2$ and 0.5 cc. Na cobaltinitrite reagent, the cryst. ppt. being centrifuged off after 15 min. and washed 3 times with water. The K_2O is then detd. by titration with 0.02 *N* $KMnO_4$. In 15 samples the K_2O content varied from 1.62 to 3.55%. The Ca is detd. in the HCl soln. of the ash from 0.25 g. tobacco powder; to the turbid soln. 1–2 cc. dil. AcH is added and the vol. made up to 25 cc. The pptd.

basic Fe and Al acetates are filtered off. The Ca is pptd. in 5 cc. aliquots in a hot water bath with 0.5–0.8 cc. 2.5% $(NH_4)_2C_2O_4$. The pptd. CaC_2O_4 is washed, dissolved in 3–4 cc 10% H_2SO_4 and titrated with 0.02 *N* $KMnO_4$. The CaO content ranged from 4.36 to 8.75%. For the Cl detn. 2 g. tobacco powder is mixed in a Pt dish with 1 g. MgO and about 10 cc. H_2O, and after evapn. this is heated over a small flame. The white ash is dissolved in 10 cc. dil. HNO_3, transferred to a 50 cc. flask, mixed with 25 cc. 0.02 *N* $AgNO_3$ and made up to the mark. To 25 cc. of the filtrate is added 1 cc. ferric NH_4 sulfate and titrated as usual with 0.02 *N* NH_4SCN. The Cl content of tobacco ranged from 0.13 to 1.19%. For the P detn. 0.25 g. tobacco powder is ashed with 0.2 g. MgO, and the ash dissolved in dil. HNO_3 is dild. to 25 cc. To 1.5 cc. of the soln. in a centrifuge tube are added 1.5 cc of a soln. contg 200 g. NH_4NO_3 and 130 cc 50% HNO_3 in a vol. of 600 cc., then 1 cc. 10% NH_4 molybdate. Upon the formation of the ppt. 1–2 cc. 1% KNO_3 is added, the ppt. is centrifuged off and washed several times with 1% KNO_3 soln. To the washed ppt. are added 4 cc. 0.02 *N* NaOH and 0.5 cc. formalin (20 cc. formalin + 50 cc. H_2O + 1 cc. 1% phenolphthalein and enough 0.02 *N* NaOH to make alk., the vol. being made up to 100 cc.). The excess NaOH is titrated back with 0.02 *N* HCl. The P content of the tobacco ranged from 0.42 to 0.70%. For the S detn. the ash from 1 g tobacco powder is taken up in 1 cc. 10% NH_4OH and 1 cc. 3% H_2O_2 and evapd. on the water bath. This is repeated several times. The ash is then dissolved in dil HCl and the vol made up to 25 cc. In 5 cc. aliquots measured into centrifuge tubes the acidity is neutralized to methyl orange with 0.1 *N* NaOH The sulfate is pptd with 5 cc benzidine-HCl soln. and the ppt. is washed 3 times with water satd. with benzidine-H_2SO_4. The ppt. is then transferred to a small Erlenmeyer flask, boiled and titrated hot with 0.01 *N* NaOH, phenolphthalein being used. The sulfate content of different tobacco samples ranged between 0.69 and 1.60%. **IV. Simplified micro method for the determination of nicotine.** J. Bodnár and Vitéz L. Nagy. *Ibid* 452–6.—The new method consists in treating 1 g. tobacco powder with 1 cc 20% NaOH and 20 cc. ether-petr. ether mixt (1:1) and shaking this frequently for 2 hrs. Ten cc. of the water-clear ether-petr. ether soln. is evapd. on the water bath until 1–1.5 cc. of a thick, greenish brown residue is left. To this is added 10 cc. water and the nicotine is titrated with 0.01 *N* HCl, methyl red being used.

S. Morgulis

Constitution of amino alcohols as local anesthetics. IV. S. Kanao. *J. Pharm Soc. Japan* **50**, 911-22(1930), German abstr. 115 8; cf. *C. A.* **24**, 3832.—The present paper deals primarily with the synthesis of ephedrine and its derivs. Cf. Hyde, Browning and Adams (*C. A.* **22**, 3154), Manske and Johnson (*C. A.* **23**, 1404), and K. K Chen (*C. A.* **23**, 4535).

F. I. Nakamura

Study of the possible utilization of the oil of a species of odoriferous Helichrysum from Madgascar. F. Heim de Balsac, H. Labbé and H. Heim de Balsac. *Bull. agence gén. colonies* **23**, 964-77(1930).—A very detailed description is given of the botanical and structural characteristics of *Helichrysum benthami*, Vig. et Humbert, from the Amboimahasoa region of Madagascar. Oil obtained locally from the twigs was a clear, amber colored liquid with an odor of everlastings, it had d_{15} 0.890, d_{20} 0.888, α^{10} 25°20′, acid no. 14, sapon. no. 16 0, ester no. (as linalyl acetate) 5.60%, incompletely sol. in 9 vol of 80% alc. About 75% b. 155–70°, this fraction consisting of hydrocarbons, probably chiefly pinene It is not considered likely that the oil could be utilized either for perfumery or in soap making; but a more detailed chem. study on a larger quantity of oil should be carried out before drawing definite conclusions

A Papineau-Couture

The identification of alkaloids by precipitation. I. A natural classification of the alkaloids based on precipitation. Charles C Fulton. *J. Assoc. Official Agr Chem.* **13**, 491-7(1930).- A natural classification of the alkaloids based solely on pptn. from dil. solns. is possible. Amines and similar basic substances pptd. by the same reagents are included in the scheme. The key to the classification is the relative sensitivity of the different reagents to each alkaloid. For convenience, all other reagents are compared with phosphomolybdic acid. The classification so obtained corresponds in certain ways to the data of pptn. from 2% solns. and to the soly. in H_2O and the basic strength of the free alkaloids. The alkaloidal solns. required are practically never more concd. than 1:1000; hence, a few mg. of an alkaloid suffices for its classification and even for the tentative identification of an unknown. Fully developed and combined with microscopic tests, the system will ensure the identification of any pure alkaloid that has been studied, and not more than 5 mg. will ever be required. For details of the classification, insofar as it has been worked out, the original article should be consulted.

A. Papineau-Couture

Standardization of ergot. Comparative study of the chemical and biological methods of ergot assay. MAURICE I. SMITH AND E. F. STOHLMAN. *J. Pharmacol.* **40**, 77–96(1930).—The Broom and Clark (*C. A.* **18**, 153) and USP (cock's comb) methods and a colorimetric method of assay were compared. In general, satisfactory agreement was obtained. C. RIEGEL

Two new series of local anesthetics derived from piperazine (FOURNEAU, SAMDAHL) 10. Treating fish oils to obtain vitamin A (U. S. pat. 1,786,095) 27.

Therapeutic phosphinate solutions. I. G. FARBENIND. A.-G. Brit. 332,926, April 30, 1929. Stable, clear, sterilized solns. of salts of *p*-dialkylaminoaryl phosphinous acids (such as salts prepd. as described in Brit. 214,836 (*C. A.* **18**, 2715)) are prepd. by adding an acid-binding agent (such as a caustic alkali, sol. alk. carbonate, phosphate or acetate) to a soln. of the salt, or dissolving a mixt. of the salt and acid-binding agent and sterilizing the soln. Examples are given of the prepn. of solns. from the Na salts of 1-dimethylamino- and diethylamino-3-methylbenzene-4-phosphinous acids with use of Na_2CO_3.

Medicinal preparations. SOC ANON. POUR L'IND. CHIM. À BÂLE, W. MERKI and P. SCHEIDEGGER. Brit. 333,159, April 2, 1929. The process described in Brit. 285,856 (*C. A.* **23**, 242) for treating internal secretory organs of females by cooling with an inert refrigerating agent such as solid CO_2, pulverizing them (suitably with addn. of an agent which combines with water) and extg. the powd. material with a suitable solvent, is applied to the treatment of various other animal and vegetable materials for the production of physiologically active exts. From yeast there is obtained a liquid fraction which deposits crystals of ergosterol, and a deliquescent water-sol. portion. Treatment of hearts of warm-blooded animals, bone marrow, ox spleen and fresh blood, and anterior lobes of the hypophysis glands is also described.

Medicinal solutions containing calcium gluconate and other therapeutic substances. CHEMISCHE FABRIK VORM. SANDOZ. Brit. 332,840, Oct. 29, 1928. Stable supersatd. solns contg. Ca gluconate together with other substances are prepd. in the same manner as described in Brit. 314,460 (*C. A.* **24**, 1468). The Ca gluconate may be used as a 10% soln and among the addnl. substances which may be used are: NaCl, Na salicylate, gluconates of Sr, Cd, Ni and Fe, tartar emetic, codeine-HCl, quinine-HCl, caffeine, cotarnine-HCl, caffeine-Na salicylate, methylene blue, Trypan blue, 2-ethoxy-6,9-diaminoacridinium lactate, the methyl sulfonic acid salt of *p*-aminobenzoic acid-diethylaminoleucinol ester, $(CH_2)_6N_4$, glycerol, gelatin and glucose (general mention also being made of various other substances).

Synthetic drug. I. G. FARBENIND. A.-G. (Karl Streitwolf, Alfred Fehrle and Walter Herrmann, inventors). Ger. 501,390, Oct. 26, 1928 Addn. to 481,997 (*C. A.* 23, 5196). The drug 3,3′-dichloro-4,4′-dihydroxy-5,5′-diacetylaminoarsenobenzene is prepd. by acetylating 3,3′-dichloro-4,4′-dihydroxy-5,5′-diaminoarsenobenzene. An example is given. Cf. *C. A.* **24**, 3861.

Synthetic drugs. I. G. FARBENIND. A.-G. (Gustav Reddelien and Werner Muller, inventors). Ger. 503,031, Feb. 3, 1929. Addn. to 484,996 (*C. A.* **24**, 1121). *N*-Hydroxyethyl derivs. of 2-amino-1-hydroxybenzene are prepd. by treating the nuclear substituted products of the latter with halohydrins of glycol or C_2H_4O at ordinary or raised temps. and pressure and with optional presence or absence of bases, diluents, solvents or catalyzers. Examples are given.

Synthetic drugs. I. G. FARBENIND. A.-G. (Gustav Reddelien, Werner Müller and Georg Matzdorf, inventors). Ger. 503,134, July 13, 1929. Addn. to 484,996 (*C. A.* **24**, 1121). *N*-Hydroxyalkyl derivs of 4-amino-1-hydroxybenzene are prepd. by treating 4 hydroxyalkylamino-1-alkoxybenzene with H_2SO_4. Examples are given.

Sulfur-containing guanidine derivatives (pharmaceutical preparations). HERBERT SCHOTTE (to Chemische Fabrik auf Actien, vorm. E. Schering). U. S. 1,785,916, Dec. 23. β,β′-Diguanidodiethyl sulfide hydrobromide, m. 162-3°, readily sol. in water and less readily sol. in alc., is made by a process comprising effecting reaction of *S*-ethylisothiocarbamide-HBr with β,β′-diaminodiethyl sulfide. Details are also given of similar reactions of *S*-ethylisothiocarbamide-hydrobromide (and hydroiodide) with β-aminoethyl mercaptan, and of *S*-methyl-*N*,*N*′-dibenzoylisothiocarbamide with β,β′-diaminodiethyl sulfide in alc. (forming β,β′-di(*N*,*N*′-dibenzoylguanido)diethyl sulfide, a difficultly sol. powder). The products may be readily oxidized and are not resistant to concd. alk. solns. Cf. *C. A.* **25**, 304.

Protein-halogen-sulfur compounds. A.-G. FÜR MEDIZINSCHE PRODUKTE. (Ernst

Flater and Siegmund Frommer, inventors). Ger. 505,893, Aug. 7, 1926. To obtain the above medicinal products, blood serum is acted upon by a soln. of halogen and S in CS_2. Examples are given.

Extracting alkaloids. Georg Knoth. Ger. 500,294, June 28, 1929. Addn. to 497,630. The method of extg. alkaloids by steam distn. of an aq. mash described in 497,630 (*C. A.* **24**, 4121) is modified by incompletely distg. the alkaloid in the distg. column and obtaining the alkaloid from the liquid residues.

Mercury derivative of tetraiodofluorescein. Louis M. Roeg (to Brewer & Co.). U. S. 1,786,172, Dec. 23. Germicidal therapeutic compns. suitable for use on cuts and local infections comprise a neutral, stable alkali-metal salt of the mono-Hg deriv. of tetraiodofluorescein without any excess of alkali.

Antiseptics. F. Hoffmann-La Roche & Co. A.-G. Ger. 507,418, May 18, 1929. Tasteless and odorless antiseptics are prepd. by converting phenoxyphenols or their alkali salts into their carbonates or carbamates in the customary manner. Thus, hydroquinone phenyl ether in NaOH soln. may be treated with $COCl_2$ in C_6H_6. Examples are given.

Vitamin-rich products from yeast. Diamalt A.-G. Ger. 504,816, June 27, 1922. Yeast liquified with sugar without addn. of water is heated to 40–60° for several hrs. after which the temp. is raised to 85–110° for at least 1 hr.

Purifying harmine. E. Merck, Chem. Fab. Ger. 507,420, June 1, 1928. The crude alkaloid is treated in acid soln. at about 0° with a small quantity of $KMnO_4$.

Hormones. I. G. Farbenind. A.-G. Brit. 333,155, Feb. 5, 1929. The process described in Brit. 305,475 (*C. A.* **23**, 4778) for obtaining active substances from the whole hypophysis is modified by substituting for the hydrolysis by means of acid or alkali, a treatment with an enzyme, either by effecting autolysis or by the action of an added enzyme such as a suspension of *succus caricae papyaae*. Various details of modified procedures are described. Cf. *C. A.* **24**, 1938.

Fumigants for inhalation. T. W. F. Clark. Brit. 333,520, May 11, 1929. Active drugs for producing gases or vapors for inhalation are treated with a soln. of a fireproofing substance such as NH_4 phosphate, Na tungstate or NH_4Cl before admixt. with auxiliary substances for making compns in the form of powders, tablets or rods. An example is given of the use together of stramonium, lobelia, powd. tea and KNO_3, half the stramonium being satd. with a soln. of NH_4 phosphate and NH_4Cl and dried before admixt. with the other ingredients.

Sterilizing catgut sutures. R. Graf & Co., A.-G. Brit. 333,847, Dec. 14, 1928. After chem. sterilization by I in the usual way, suturing material is treated with a soln. contg. albumin or other protein (such as a meat broth) and then with alc., so that free I is removed and the material is rendered non-irritant. Various details of the treatment are given.

Dry preparation of surgical material such as catgut, etc. J. Pfrimmer & Co. Ger. 505,560, June 4, 1927.

Denicotinizing tobacco by fermentation. Neuerburg'sche Verwaltungsges. m. b. H. Ger. 507,194, June 30, 1927. The process is accelerated by irradiating the tobacco with light of short wave length (400 to 100$\mu\mu$). Addnl. details and examples are given.

18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

Chrome iron indispensable in nitric acid plant. E. St. P. Bellinger. *Chem. Met. Eng.* **37**, 691–2(1930).—Cr-Fe has many uses in NH_3-oxidation plants making 55–60% HNO_3. Addn. of about 18% Cr to low-C steel raises the resistance to corrosion but addn. of 1–8% helps little. C above 0.12% reduces the resistance. Small quantities of Si are essential. Heat treatment is an important factor. Tables and curves of losses of various samples of Cr-Fe in boiling 65% HNO_3 and its vapor are given. E. M. S.

The chamber process. XXI. Electric conductance method. Mototarō Matsui, Tadao Okamoto and Tōkichi Noda. *J. Soc. Chem. Ind. Japan* **33**, Suppl. binding 446–50(1930); cf. *C. A.* **24**, 4902.—N_2O_4 lost from the Gay-Lussac tower is due to excessive feeding of HNO_3. Automatic feeding devices exist (Bruno Waeser, Handbuch der Schwefelsäurefabrikation, 1018, 1930; cf. *C. A.* **24**, 3864). An automatic feed is described which depends upon nitrosity of the nitrose from the Gay-Lussac tower. Elec. resistance is influenced much more by variation in H_2SO_4 concn. than by nitrosity, so that the reaction N_2O_3 (from nitrose) + O_2 + H_2O = $2HNO_3$ was used. E. M. S.

Ammonium sulfate from gypsum. B. WAESSER. *Brennstoff-Chem.* **11**, 396–8, 418–20(1930).—Cost and production data are given and the outlook for two processes is discussed. F. W. JUNG

Dissociation of sodium chloride by steam in the presence of silica. E. BERL AND H. STAUDINGER. *Z. angew. Chem.* **43**, 1006–9(1930).—$2\ NaCl + H_2O + SiO_2 = Na_2SiO_3 + 2\ HCl - 68{,}820$ cal. The min. temp. for satisfactory yield is above 1000°. For 1 kg. NaCl about 20 kg. of steam is required. The ratio $NaCl\ 2 : SiO_2\ 1$ was used, but this can vary. Addn. of charcoal to the smelt, and one-third air to the steam, raises NaCl decompn. from 5.65 to 22.6% under given conditions. After 11 hrs. the smelt was free from NaCl. Dissocn. is rapid up to 90%. The max. yield was 97%, because of the volatility of NaCl. The process may be carried out in producer-gas generators operated at 1000–1100°. Addn. of CaO gives a continuous production of bottle glass. E. M. SYMMES

Determination of boiling points and distillation curves of hydrochloric acid-water mixtures. E. BERL AND H. STAUDINGER. *Z. angew. Chem.* **43**, 1019–22(1930).—Concd. HCl is used in the modern Willstätter-Bergius wood treatment, and in glass production from NaCl dil. HCl is formed (cf. preceding abstract). Boiling point and distn. curves of all strengths of dil. HCl were redetd. with the Berl-Samtleben app. (*C. A.* **16**, 2388). Tables of results do not differ markedly from those of Oemann (*C. A.* **19**, 594, 1615) and Carrière and Arnand (*C. A.* **19**, 1217). E. M. SYMMES

Properties and uses of helium. W. E. SNYDER AND R. R. BOTTOMS. *Ind. Eng. Chem* **22**, 1189–91(1930).—Helium is now available in com. quantities. Besides use in airships, He has possible uses in treatment of certain diseases when mixed with O_2, in metallurgy, because of high heat cond. as a heating or refrigerating medium, in easy septn. of solids formed by grinding, in drying, and in food preservation. The portable plant of the Helium Company is described. M. C. ROGERS

Physical characteristics and commercial possibilities of chlorinated biphenyl. CHESTER H. PENNING. *Ind. Eng. Chem.* **22**, 1180–2(1930).—Phys. properties of 2- and 4-chlorobiphenyl are given. Properties of the more highly chlorinated Ph_2 compds. (Aroclors) are also given. Increasing Cl content gives increase in viscosity, change in color from water-white to amber, and rise in m. p., b. p. and sp. gr. The heavier Aroclors will not ignite below their b. ps. Aroclor oils are non-drying and do not oxidize appreciably in air. Continued heating and cooling apparently do not change their properties. Com possibilities are in protective coatings, flame-proofing, molding compds., elec. insulation, adhesives, printing inks and artificial leather. M. C. ROGERS

Mining amosite asbestos in the Pietersburg District, South Africa. W. KUPFERBURGER. *Eng. Mining J.* **130**, 571–4(1930).—Amosite is an amphibole asbestos contg. principally Fe^{++} and SiO_2, with variable amts. of Al, CaO and MgO. In character of fibers, amosite closely resembles chrysotile. It is used extensively in 85% magnesia insulation products, in laggings and packings, in felted insulation products, in the manuf. of roofing shingles, and for asbestos cement board. W. H. BOYNTON

Feldspar in 1929. OLIVER BOWLES AND JEFFERSON MIDDLETON. Bur. Mines, *Mineral Resources of the U. S. 1929*, Pt. II, 83–93(preprint No. 8, published October 21, 1930). E. H.

Gypsum in 1929. R. M. SANTMYERS AND JEFFERSON MIDDLETON. Bur. Mines, *Mineral Resources of the U. S. 1929*, Pt. II, 105–18(preprint No. 10, published October 29, 1930). E. H.

Magnesium and its compounds in 1929. PAUL M. TYLER. Bur. Mines, *Mineral Resources of the U.S. 1929*, Pt. II, 119–39(preprint No. 11, published November 20, 1930). E. H.

Plastic cements, especially dental cements. OTTO RUFF, CURT FRIEDERICH AND WOLF ASCHER. *Z. angew. Chem.* **43**, 1081–7(1930).—To learn about the requirements the com. dental cements were tested. In both so-called phosphate and silicate cements, formation of phosphate is essential to hardening. The degree of plasticity depends mainly upon the relation of viscosity of the fluid and particle size of the powder. Improved cements comprised $ZnSiF_6$ or $MgSiF_6$ in place of phosphoric acid, and as powders BeO, ZnO and in part Al_2O_3. Others comprised oxides or silicates of rare earths, *e. g.*, a powder made by calcining at 1400° mol. proportions of La_2O_3 and SiO_2, chilling, and mixing the fine powder with Zn phosphate, with or without phosphoric acid. Hardening is accompanied by SiO_2 gel formation. E. M. SYMMES

Ornamental grasses and leaves. FRED. GROVE-PALMER. *Textile Colorist* **52**, 526–8, 559(1930).—Various treatments are described for preserving and ornamenting natural grasses, flowers and leaves. Directions are given for removing the natural

color by org. solvents, or bleaching with the usual reagents. Basic, acid and substantive dyes may be used; a few specific ones are suggested. The application of cellulose lacquers and electroplating are described. R. K. WORNER

Evaporating bore-hole water (KONSTANTINOV, *et al.*) **22.** NH_4 phosphate fertilizer and Na bicarbonate (Brit. pat. 332,864) **15.** The state of water and the active surface of Japanese acid clay (TANAKA, NAKAMURA) **2.**

Boric acid. CHEMISCHE FABRIK GRÜNAU LANDSHOFF & MEYER A.-G. Ger. 504,825, Oct. 23, 1929. B minerals contg. Mg are treated with H_2SO_4 and the H_3BO_3 is partly sepd. by cooling the soln. The $MgSO_4$ in the mother liquor is sepd. by evapn. and super satn. of the liquor with Na_2SO_4, the $MgSO_4$ being sepd. as a double Mg-Na sulfate. Na_3BO_3 or a B mineral such as kernite or rasorite, together with H_2SO_4, may be used instead of Na_2SO_4. The liquor so purified is rich in H_3BO_3.

Chromic acid. MARVIN J. UDY (to Electro Metallurgical Co.). U. S. 1,784,950, Dec. 16. An impure Na_2CrO_4 soln. or other solns. contg. sol. salts of chromic acid are treated with Pb sulfate to form Pb chromate, the latter is sepd. and is decompd. with H_2SO_4 of such a concn. (suitably about 50° Bé.) as to directly ppt Pb sulfate and simultaneously form a soln. of chromic acid substantially free from dissolved salts; the Pb sulfate is sepd. and the chromic acid recovered from the soln. Cf. *C. A.* **24,** 793.

Hydrocyanic acid. I. G. FARBENIND. A.-G. (Reinhold Fick, inventor). Ger. 476,662, Dec. 20, 1924. HCN is prepd by heating CH_2O to above 400° for less than 1 sec. ($^1/_{10}$ sec. is mentioned). Water-sepg., non-metallic catalyzers such as $AlPO_4$ may be present and the pressure reduced. Examples are given.

Hydrocyanic acid. I. G. FARBENIND. A.-G. (Eduard Münch and Fritz Nicolai, inventors). Ger. 477,437, Apr. 11, 1926. Addn. to 476,662 (preceding abstr.). The method of 476,662 for forming HCN from CH_2O or $HCOONH_4$ is modified by leading the vapor of the CH_2O or $HCOONH_4$ through metal tubes over metal catalyzers at temps. above 300°. Examples are given. Cf. *C. A.* **24,** 1185.

Phosphoric acids. SOC. D'ÉTUDES SCIENTIFIQUES ET D'ENTREPRISES INDUSTRIELLES. Fr. 686,402, Dec. 10, 1929. P in gases contg. CO, particularly in the vapors coming from the reduction of natural phosphates with C in the presence of SiO_2 or Al_2O_3, is oxidized by means of HNO_3 or nitrous vapors at 60–70° so as to oxidize the P practically completely without altering the CO. Substances such as phosphoric acid capable of favoring absorption of the P_2O_5 produced by the oxidation may be mixed with the HNO_3.

Nitric acid concentration. J. L. BENNETT (to Hercules Powder Co.). Brit. 333,264, Oct. 26, 1928. A mixt. of aq. HNO_3 and a dehydrating material such as H_2SO_4, H_3PO_4 or anhyd. Na_2SO_4 is passed in counterflow with a mixt. of steam and HNO_3 vapor to effect partial denitration of the former mixt.; the partially denitrated mixt. is heated to generate steam and HNO_3 vapor and a portion of the generated steam is used to denitrate further quantities of the acid mixt.; HNO_3 is sepd. from the balance of the steam generated, and the quantity of steam passing into the tower in which counterflow takes place is sufficiently limited to avoid unnecessary diln. of the concd. HNO_3. Various details of app. and its operation are described.

Concentrating nitric acid. HENRI A. M. G. MORIN. Fr. 686,543, Dec. 11, 1929. An app. either for concg. HNO_3 and simultaneously reconcg. the H_2SO_4 used, or for sepg. a sulfonitric mixt. into its elements, HNO_3, H_2SO_4, and water, has one column for the distn. of the HNO_3 and a second for the elimination of steam. It is heated over a furnace with injection of steam.

Separating sulfuric and nitric acids. I. G. FARBENIND. A.-G. (Christoph Beck and Helmut Weissbach, inventors). Ger. 507,317, Nov. 29, 1928. See Fr. 684,430 (*C. A.* **24,** 5440).

Sulfuric acid. METALLBANK AND METALLURGISCHE GES. A.-G. (Hans Woisin, inventor). Ger. 469,011, Oct. 21, 1927. Addn. to 370,369. Details are given of the contact and mixing chambers in the prepn. of H_2SO_4 from SO_2-contg. gases and O. Cf. *C. A.* **24,** 2248.

Acid- and alkali-proof containers. FRITZ AHRENS and HARZER ACHSENWERKE G. M. B. H. BORNUM AM HARZ. Ger. 484,894, May 19, 1925. Metal containers are rendered acid- and alkali-proof by coating with two layers of rubber, the under layer contg. a colloidal soln. of acid or acid-yielding material, *e. g.*, acid cellulose. The substance rubber surrogate (contg. oils sulfurized by S_2Cl_2) may also be used.

Gas-treating apparatus suitable for ammonia absorption, etc. WM. L. SPALDING (to National Aniline & Chemical Co.). U. S. 1,785,792, Dec. 23. A system is arranged

for circulating liquid in a cyclic path and for admitting hot gases into an upwardly circulating portion of liquid in the system to promote circulation and means is provided for cooling the upper part of this portion of liquid. Various details of app. arrangement are described.

Alkali metal carbonate and barium sulfate, etc. INTERNATIONAL INDUSTRIAL & CHEMICAL CO., LTD. Brit. 333,834, Nov. 21, 1928. See Fr. 678,977 (*C. A.* **24**, 3612).

Alkali orthophosphates. I. G. FARBENIND. A.-G. (Robert Griessbach and Adolf Rossler, inventors). Ger. 504,812, Mar. 10, 1926. In producing mono alkali orthophosphates by heating alkali chlorides with H_3PO_4, the reaction takes place between temps. of 120° and 250° and in a current of steam. Alkali sulfates or bisulfates or H_2SO_4 may be added. In an example, a mixt. of KCl and H_3PO_4 in mol. proportions 1:2 is heated to 180–185° in a current of steam for 1 hr. A 98.7% yield of HCl can be condensed and a product $KH_2PO_4.H_3PO_4$ seps. out. Other examples are given. Cf. *C. A.* 24, 4125.

Treating crude phosphate. CHEMIEVERFAHREN-GES. Brit. 333,797, May 28, 1928. See Fr. 682,028 (*C. A.* **24**, 4361).

Soluble phosphates. COMPAGNIE GÉNÉRALE DES SUPERPHOSPHATES PYRÉNÉES (Soc anon.). Fr. 686,502, Dec. 12, 1929. Sol. phosphates are made by subliming the P_2O_5 obtained by heating natural phosphates with SiO_2 at a high temp. in rotating furnaces, condensing and dissolving the P_2O_5 in known absorption app. and converting the phosphoric acid obtained to the mono- and di-Ca phosphates. The slag from the furnace is ground and added to the phosphates.

Superphosphate. L. ADELANTADO. Brit. 333,518, May 9, 1929. Superphosphate is rendered neutral to methyl orange by treatment with aq. or gaseous NH_3, lixiviated with water (which may be slightly acidified with H_2SO_4) and from the resulting liquor there may be crystd. mono-Ca phosphate admixed with some di-Ca phosphate, NH_4 phosphate and $(NH_4)_2SO_4$, and the crystals can be freed from NH_4 salts by washing. In a modified process, the Ca of the leach liquor may be pptd. while hot with H_2SO_4, the soln. of H_3PO_4 obtained purified with alc., filtration and distn. of the alc. or alk. sulfates may be added for production of alkali phosphates. Cf. *C. A.* **24**, 2230.

Cupricyanide compound. I. G. FARBENIND. A.-G. (Hermann Hagenest and Friedrich W. Stauf, inventors). Ger. 505,631, Sept. 4, 1928. See Fr. 680,690 (*C. A.* 24, 4127).

Alumina. TSUNEO SUZUKI, HIROSHI TANAKA and TORAO KURITA (to Zaidan Hojin Rikagaku Kenkyujo). U. S. 1,785,464, Dec. 16. Impure alumina contg. Si, Fe, ferro Si and Fe oxides as impurities is heated with a carbonaceous reducing agent such as charcoal to reduce the major portion of any Fe oxide present and the alumina is then treated with Cl and CO at an elevated temp. to remove volatile chlorides of Fe and Si.

Alumina. URBAIN B. VOISIN. Ger. 505,517, Dec. 23, 1928. Aluminiferous material such as bauxite is treated with H_2SO_4 and fluorides to produce crude $Al_2(SO_4)_3$ free from SiO_2. The crude $Al_2(SO_4)_3$ is treated with lime water and the pptd. $Al(OH)_3$ taken up with NaOH and worked up to Al_2O_3 in the usual way. Cf. *C. A.* **24**, 473.

Aluminum oxide. NORTON CO. Brit. 332,902, April 27, 1929. Al oxide substantially free from impurities such as Fe, SiO_2 and Ti is obtained by fusing aluminous materials such as calcined bauxite with C, Fe and Al sulfide (the latter not exceeding 3% the quantity of the aluminous material), the Al sulfide being preferably produced in the furnace by adding an Fe sulfide such as Fe pyrites. Some Al carbide, Al suboxide, metallic Al and ferro-Al are also produced, and the non-metallic part of the product is disintegrated (preferably by satd. steam), the fine material is dried, screened and subjected to magnetic sepn. and may then be treated with dry Cl at 500° to remove non-aluminous metals and $AlCl_3$. Any Ca remaining is removed by use of dil. acids.

Aluminum sulfate and nitrate. M. BUCHNER. Brit. 333,835, Nov. 24, 1928. For producing $Al_2(SO_4)_3$, $Al(NO_3)_3$ (which may be in the solid state) is treated with H_2SO_4 (preferably concd.) at temps. up to 300° (suitably either under reduced pressure or with introduction of air or steam). Various details are given for prepg. the $Al(NO_3)_3$. *App* may be used made of an alloy of Fe and Cr or Fe, Cr and Ni alloys such as "V2A."

Ammonium chloride. J. I. BRONN and CONCORDIA-BERGBAU A.-G. Brit. 333,098, Oct. 4, 1929. See Fr. 682,572 (*C. A.* **24**, 4594).

Ammonium sulfate and alkali sulfate. FERDINAND STEIN. Ger. 497,611, Nov. 12, 1924. Solns. to be used for the prepn. of $(NH_4)_2SO_4$ and alkali sulfate or their double salts are obtained by treating mineral salts contg. Na salts with excess of NH_3 and CO_2. The resulting liquid contains $(NH_4)_2CO_3$ and carbonates or bicarbonates of Na, Ca,

Mg, etc., which are worked up to sulfates. In the example, glauberite is treated with NH_3 and CO_2, giving a ppt. of $CaCO_3$ and Na_2CO_3 and a mother liquor contg. 26.5% $(NH_4)_2SO_4$, 5.1% $NaHCO_3$, 2.4% Na_2SO_4 and 66% water.

Calcium-alkali phosphates. A. MESSERSCHMITT. Brit. 333,805, Oct. 23, 1928. In production of Ca-alkali phosphates from raw phosphate mixts. as described in Brit 300,961 (*C. A.* **23**, 4027), with use of alkali sulfate and C, sufficient C is used completely to reduce the alkali sulfate and the mixt. of raw materials is so proportioned as to contain sufficient acidic compds. such as silica to bind any free alkali or alk. earth bases, so that the S is recovered in elemental form and a product is obtained which is free from sulfides.

Calcium cyanamide. I. G. FARBENIND. A.-G. Brit. 333,353, July 1, 1929. Ca cyanamide is rendered free from dust and non-caustic by mixing it with a solid NH_4 salt such as NH_4NO_3 or with solid phosphoric acid. Liberated NH_3 may be removed by heating to not above 150°. Various modifications of procedure are described. Cf. *C. A.* **24**, 5442.

Dicalcium phosphate. ERICH THILO (to Adolf Heicke). U. S. 1,786,097, Dec. 23. See Fr. 677,191 (*C. A.* **24**, 3091).

Solid carbon dioxide. K. C. PEGGS. Brit. 333,212, May 6, 1929. Liquid CO_2 is admitted through a valve into one end of a chamber closed at its other end by a block of solid CO_2 formed by the reduction of pressure on gas previously admitted and the block of solid CO_2 is progressively moved forward under the pressure behind it in a regulated manner. Various details of app. and operation are described.

Storage and transportation of solid carbon dioxide. CHARLES L. JONES and JOHN D. SMALL (to Dryice Equipment Corp.). U. S. 1,786,161, Dec. 23. Blocks of solid CO_2 are placed in a container such as a balsa-wood box together with addnl. solid CO_2 in such state of subdivision and so located in the container that most of it will evaporate before the shapes of the blocks are seriously impaired

Carbon disulfide. I. G. FARBENIND. A.-G. Brit. 333,090, Nov. 17, 1928. Retorts used for CS_2 manuf. are maintained free from slag-like residues, left after consumption of charcoal, by adding inert infusible substances (such as bauxite, pyrites, pumice, fire brick, clinkers, sand or coke) which mix with the charcoal slag to form a hard, easily removable mass. Cf. *C. A.* **24**, 4594.

Apparatus for chemical reactions such as carbon disulfide production. THOMAS GRISWOLD, JR. (to Dow Chemical Co.). U. S. 1,785,080, Dec. 16. An app. is described comprising an externally heated vertically disposed tubular reaction chamber, an externally heated vertically disposed tubular vaporizing vessel, and an externally heated horizontally disposed clean-out chamber below the reaction chamber and vaporizing vessel, sep. therefrom but in communication.

Magnesium chloride. I. G. FARBENIND. A.-G. Brit. 333,741, Oct. 4, 1928. Anhyd. $MgCl_2$ is obtained by the reaction of substances such as $MgCO_3$, MgO or $Mg(OH)_2$ with C and Cl by passing the Cl in uniform distribution through a loose mixt such as pieces of magnesite and pieces of wood or peat charcoal, at a temp. above the m. p. of $MgCl_2$, and immediately removing the molten $MgCl_2$ formed in a direction opposite to the flow of the Cl. App and various details of procedure are described Cf. following abstr.

Magnesium chloride. I. G. FARBENIND. A.-G. Ger. 502,646, Jan. 16, 1926. Anhyd. $MgCl_2$, alone or mixed with other salts, is prepd. by treating a fused mass contg. MgO or $MgCO_3$ and $MgCl_2$ and optionally other salts with gaseous HCl, $COCl_2$ or Cl and CO. The fused mass is allowed to flow freely over the filling bodies of a heated irrigating tower against a countercurrent of gas. Examples are given.

Chlorides. I. G. FARBENIND. A.-G. (Robert Suchy, Karl Staib and Wilhelm Moschel, inventors.) Ger. 509,601, Apr. 25, 1928. Addn. to 502,646. The method of 502,646 (preceding abstr.) is applied to the production of anhyd. oxide-free chlorides, especially $MgCl_2$, by fusing the oxide (*e. g.*, MgO) by elec. heating in an irrigating tower up which Cl is passed.

Nitrous oxide from ammonia. I. G. FARBENIND. A.-G. (Leo Schlecht and Alfred von Nagel, inventors). Ger. 503,200, Apr. 26, 1929. Addn. to 498,808. In the prepn. of N_2O by the oxidation of NH_3 at 200–500° as described in 498,808 (*C. A.* **24**, 4595), the current velocity of the gases is regulated so that the formation of NO and higher oxides of N is hindered. Catalyzers contg. Fe_2O_3, Bi_2O_3 and MnO_2 are used. Cf. *C. A.* **24**, 4362.

Phosphorus pentoxide. BAYERISCHE STICKSTOFF-WERKE A.-G. Ger. 506,543, May 29, 1929. P_2O_5 or H_3PO_4 and H are produced from P, PH_3 or lower oxidation products of P and H or P and H_2O by heating to high temps., *e. g.*, 450°, at ordinary

pressures over contact agents and in the presence of added H. In the examples, PH_3 and H_3PO_2 are used as the starting materials, and H is added at the rate of 10 l./hr.

Apparatus for crystallizing sodium carbonate or other substances. IMPERIAL CHEMICAL INDUSTRIES, LTD., and H. E. COCKSEDGE. Brit. 333,598, April 18, 1929. A soln. of the material to be crystd. is circulated down the center of a vessel provided with an annular partition and up through the annular space by a propeller, and crystals which have attained the desired size are removed through an elutriating tube attached to the bottom of the vessel. Various details of the app. and its operation are described.

Sodium sulfate. KALI-FORSCHUNGS-ANSTALT G. M. B. H. Ger. 505,891, and 505,892, May 18, 1923. A strakanite pptd. as in 445,608 or double salts pptd. in a similar way are stirred with rock salt at low temps., Na_2SO_4 and the resulting lye are used for the pptn. of further double salts with Na_2SO_4 (505,891). Thus, crude astrakanite is stirred with NaCl in water at 0° to give Na_2SO_4 and a lye contg. NaCl, $MgCl_2$ and $MgSO_4$. The double salt may be dissolved in hot water and the Na_2SO_4 obtained by crystn. (505,892).

Stannic hydroxide gel, etc. J. J. ETRIDGE and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 333,670, June 5, 1929. Stannic hydroxide gel is made by delayed pptn. of a soln. contg. a stannic salt by gradual addn. of NH_3 with const. stirring. Substances such as NH_4 vanadate may be added for the production of a mixed product contg. catalytic oxides such as those of V, and a product may be obtained suitable, after activation at 600°, for use as a catalyst in oxidizing SO_2.

Sulfur dioxide. AKTIESELSKAPET MALMINDUSTRI. Ger. 469,781, Nov. 1, 1927. Solns. of SO_2 are prepd. by absorption of SO_2 or roast-gases in liquids, under pressure. If roast gases are used, the air is admitted into the roasting furnace under pressure.

Furnaces for the production of sulfates and hydrochloric acid. HERMANN FRISCHER. Fr. 686,419, Dec. 11, 1929. Carbides, particularly SiC, corundum or substances having a basis of SiC, are used for the construction of muffles and elements such as pipes and agitators for furnaces used for the production of acids or acid substances or sulfates.

Rotary drum furnace for roasting sulfurous ores, etc. METALLGESELLSCHAFT A.-G. (Hans Klencke and Wilhelm Sonnemann, inventors). Ger. 505,863, Feb. 5, 1927. Details of construction.

Active carbon. METALLGESELLSCHAFT A.-G. Ger. 499,791, Dec. 14, 1924. C soaked with water is heated to glowing in a limited supply of air. Cf. *C. A.* **24**, 2558.

Active carbon. OSKAR SCHOBER. Ger. 506,424, Jan. 28, 1928. Addn. to 488,944 (*C. A.* **24**, 2255). The method of producing active C by heating carboniferous material to 500–800° in oxidizing gas (488,944) is modified by using a gas mixt. in which the partial pressure of the O is 38–115 mm. of Hg, and of the steam 76–380 mm., *i. e.*, a mixt. contg. at atm. pressure, 5–15% O and 10–15% steam, by vol. Cf. *C. A.* **24**, 3614.

Active carbon. CHEMISCHE WERKE CARBON G. M. B. H. Ger. 506,522, June 11, 1927. Carboniferous material is mixed with powd. sulfides and wood tar, molded, dried and heated to glowing. The wood tar may be mixed with sulfide solns. The molded product may be subjected to the action of activating gases during heating.

Active carbon. I. G. FARBENIND. A.-G. Fr. 686,322, Dec. 9, 1929. Active C is prepd. in grains by mixing a carbonaceous material with an org. binder such as gas tar and 2 inorg. substances, one of which is a non-hydraulic binder such as clay or kaolin while the other is chosen to lower the fritting temp. of the inorg. binder below 1000°, as is the case with NaOH or KOH. The mixt. is molded under pressure and heated and activated by gas or steam.

Cadmium. METALLGESELLSCHAFT A.-G. Ger. 505,582, June 19, 1929. Pure Cd is prepd. by heating anhyd. $CdCl_2$ with metallic Zn or Zn-Cd. The Zn may be stirred into fused $CdCl_2$ and the temp. so arranged that the $ZnCl_2$ formed distils off. In the case the temp. is kept at 400° for 1½ hrs. for Cd contg. 0.07% Zn is obtained.

Froth flotation concentration of feldspar. JOHN C. WILLIAMS and OMER W. GREEMAN (to Aluminum Co. of America). U. S. 1,785,992, Dec. 23. In concg. fluorspar values in fluorspar ore contg. substantial amounts of calcite, most of the slimes are removed, and a pulp is formed of the deslimed ore with oleic acid and a modifying agent such as cresylic acid to decrease the calcite-lifting properties of the froth.

Purifying materials such as quartz or feldspar, etc. CECIL R. B. YOUNG. U. S. 1,786,284, Dec. 23. The disintegrated material is treated with a liquid contg. H_2SO_4, HCl and oxalic acid to dissolve Fe, Mn, etc.

Decomposing siliceous minerals such as spodumene and feldspar. P. E. BILLINGHURST. Brit. 333,076, Sept. 9, 1929. The powd. material is forced by an air blast or current of steam along a feed tube and through a tube which may be of inverted U shape heated by a bath of molten metal to a temp. of 1500–1800° to volatilize alkalies,

An elec. induction furnace may be used and the material may be preheated to about 450° by an auxiliary heater. Infusible silicates are collected by settling in a tower and alkali is absorbed by water flowing over baffles. App. is described.

Fused silica articles. QUARTZ & SILICE SOC. ANON. Ger. 507,079, Feb. 16, 1927. See Brit. 266,711 (*C. A.* **22**, 849).

Treating limestone, etc. BAMAG-MEGUIN A.-G. Ger. 497,806, July 11, 1928. Limestone, carbonates and similar foaming acid-sol. substances are treated with solvent, *e. g.*, HNO_3, and the gases evolved are sucked into a container of liquid which can be used afterward as the solvent for further limestone, etc.

Condensation product from *m*-cresol and acetone. SCHERING-KAHLBAUM A.-G. (Walter Schoeller, Hans Jordan and Reinhard Clerc, inventors). Ger. 499,436, Oct 11, 1927. Addn. to 494,508 (*C. A.* **24**, 3517). The condensation is carried out in the cold.

Urea-furfurol condensation products. HANS KAPPELER. Ger. 507,419, July 12, 1928. See Brit. 293,872 (*C. A.* **23**, 1729).

Vegetable adhesive. IRVING F LAUCKS and GLENN DAVIDSON (to I. F. LAUCKS, Inc.). U. S. 1,786,209, Dec. 23. An adhesive which is suitable for use with veneers comprises the reaction products of a vegetable protein-contg. meal such as soy-bean meal, an alk. medium such as NaOH and a small proportion of a Zn compd. such as $ZnSO_4$.

Adhesive films and sheets. R. ARNOT. Brit. 333,194, Feb 27, 1929. Synthetic resins in the reactive state are used with carriers which may be initially solid or initially liquid and subsequently become solid, without addn. of solvents other than those present in, or resulting from, the manuf. of the components. The hydrophile resins made as described in Brit. 290,327 (*C. A.* **23**, 1002) are especially suitable for this use, and the solid carrier used may be paper, sheets of woven paper strands, cloth, asbestos paper or sheets, wood-pulp sheets, "cellulose," glass wool or fine wire netting. In drying the sheets the temp. must not exceed the setting point of the resin (a temp. of 60° usually being sufficient). Softeners, plasticizers, metal powders, etc., may also be added. The synthetic resins also may be mixed with materials such as viscose, cellulose acetate or nitrocellulose which in their initial state contain substances serving as solvents for the resin such as excess alkali in the viscose or HOAc in the cellulose acetate, and the mixts. formed into films. The films may be used as adhesives for uniting articles under the action of heat and pressure to convert the synthetic resin into insol. and infusible form. Numerous details, examples and modifications are described. Cf. *C. A.* **24**, 4597.

Plastic compositions such as putties and priming compositions. I. G. FARBENIND. A.-G. Brit. 333,304, May 14, 1929. A cellulose deriv. such as nitrocellulose or the like is kneaded with 3–10 times its wt of fillers such as slate meal and lithopone in the presence of softening agents and resins (such as dibutyl phthalate and gum mastic) and either without solvents or with easily volatile solvents, such as benzene and acetone, in quantity not exceeding 10% of the solids which disappear during the mixing, so as to produce a relatively dry mass, and the latter is prepd. for use by mixing with an org solvent such as BuOAc or glycol ethers, etc.

Paste for use on windows to prevent dimming by moisture. H. E. GRIFFITHS Brit. 332,966, Oct. 10, 1929. Soap (preferably carbolic soap) 1.25 lb. is mixed with glycerol 2 teaspoonfuls, water 1 pint and with spirit varnish or acetone to serve as a drying agent.

Waterproof cement. S. A. I. G. (Soc. ANON. INVENZIONI GUADAGNIN). Fr 686,193. A waterproof insulating cement is made from washed sand, plaster, resin, Al_2O_3, linseed oil and water.

Friction surface material of compressed cork. HERMAN F. BUSCH (to Armstrong Cork Co.). U. S. 1,786,190, Dec. 23. A material suitable for covering loom take-up rolls is formed with integral projections forming an irregular frictional surface, the planes of compression of the cork granules being at an angle to the working surface at the top of the projections.

Friction material for automobile brakes, clutches, etc. IZADOR J. NOVAK (to Raybestos-Manhattan, Inc.). U. S. 1,785,701, Dec. 16. Fibrous asbestos and a hardenable binder such as a rubber compn. are mixed to form a readily malleable mass through which the fibers are distributed and the mass is extruded through a die to form a non-laminated strip of the desired cross-section in which the fibers run in all directions; the product is dried to produce a flexible porous mass of somewhat greater thickness than that desired in the completed article, and the material is compressed and hardened. Cf. *C. A.* **24**, 4365.

Forming and curing brake bands, etc., comprising indurating material such as synthetic resin. THOMAS M. RUSSELL (to Russell Mfg. Co.). U. S. 1,785,391, Dec. 16. Various details of mech. and heat treatment are described.

Liquids for use in hydraulic brake systems, presses, lifting devices or other hydraulic apparatus. I. G. FARBENIND. A.-G. Brit. 333,200, April 26, 1929. Various glycols are mixed with sulfonation products of org. compds. contg. at least 6 C atoms in the mol. such as Turkey-red oils, sulfonic acids of castor oil, of oleic acid or propylated or butylated naphthalene, or of mineral or tar oils or their distn. residues; and there also may be added other substances such as alcs., water, ethers of glycols, etc. The mixts. are suitable for use at low temps.

Mixing fiber and fillers with bituminous material. CARL P. NELLIS and ARTHUR H. FLOWER (to Inland Mfg. Co.). U. S. 1,785,910, Dec. 23. Bituminous materials of different m. ps. are separately melted; the material of lower m. p. is passed as a relatively flat stream into a container while fibrous material such as cotton fiber is distributed on it; the bituminous material of higher m. p. is passed into the container as a similar stream to which finely divided filler such as diatomaceous earth is added, and the combined materials are kneaded to form a homogeneous mixt. suitable for making *molded battery boxes*, etc.

Porous fibrous products such as flower pots. DANIEL M. SUTHERLAND, JR. (to Better Packages, Inc.). U. S. 1,785,101, Dec. 16. Products such as flower pots or filters are formed of fibrous material such as paper fibers with interstices between the fibers and with a deposit of red gum serving as a binder for the fibers.

Light filter. CLARENCE E. GREIDER (to National Carbon Co.). U. S. 1,786,205, Dec. 23. A light filter which is transparent to ultra-violet rays to about 2900 A. U. comprises a film of a polymerized vinyl compd. such as polymerized vinyl acetate reënforced with a reticulated material such as wire mesh or woven fabric. The material is suitable for glazing windows.

Sound records. R. H. CHESTER. Brit. 333,175, May 3, 1929. Records are formed with 2 outer transparent plies such as transparent celluloid and a plurality of inner plies, 2 of which are formed of paper, carrying printed matter, sepd. by one or more opaque plies such as a core of opaque celluloid.

Sound records formed with magnetic powder. F. PFEUMER. Brit. 333,154, Feb. 5, 1929. Powd. magnetic material (such as may be prepd. by mixing an org. binder like molasses or sugar with soft iron powder and heating to effect caramelization, carbonization and conversion of the metal to steel, followed by quenching to effect hardening, drying and regrinding) is applied to a backing strip such as a cinematograph film. Iron contg. H prepd. electrolytically or ferro-Si or other suitable alloy of Fe or Ni also may be used.

Magnetic cores of loading coils, etc. GUSTAF W. ELMEN (to Bell Telephone Laboratories, Inc.). U. S. 1,784,827, Dec. 16. Cores of high initial permeability, high constancy of permeability and low hysteresis loss are formed of sep. portions of hard steel and an alloy of Fe and Ni such as "permalloy." Cf. *C. A.* **24**, 3209.

Magnetic material for transformer cores. WIEBOLD F. BRANDSMA, POPKO R. DIJKSTERHUIS, GERARDUS J. SIZOO and GOTTFRIED B. JONAS (to Radio Corp of America). U. S. 1,785,246, Dec. 16. Magnetic material such as plates contg. 50% Ni is partially decarbonized and partially oxidized to such an extent that the hysteresis curve is substantially straight.

Extrusion mold for bituminous materials such as that for conduits, expansion joints, etc. ANTHONY J. PFOHL. U. S. 1,785,457, Dec. 16. Structural features of a mold formed in part of Babbitt metal and which may be heated.

Stencil sheet. SHINJIRO HORII. U. S. 1,785,260, Dec. 16. A base of fibrous material such as Yoshino paper is coated with a compn. comprising a soln. of esters of polysaccharides, tempering agents and stabilizing coloring substances such as chrome yellow, toluidine red or Bismarck brown lakes which absorb the ultra-violet rays of the sunlight. Cf. *C. A.* **25**, 178.

Cleaning composition. WILHELM J. A. HUYZER. Fr. 686,170, Dec. 5, 1929. A cleaning compn. particularly for metals contains, *e. g.*, finely powd. magnesite 700, mineral oil 150, olein 30, denatured alc. 60, ammoniac 60 g. and thymol 1 drop.

Detergent composition containing volatile hydrocarbon material. LESTER KIRSCHBRAUN (to Frank L. Belknap). U. S. 1,786,249, Dec. 23. A volatile hydrocarbon material such as gasoline is dispersed in an aq. medium with a water-sol. saponaceous emulsifying agent to form a substantially permanent emulsion with the hydrocarbon as dispersed phase; the product is homogenized and has a viscosity suitable for extrusion from a tube.

Paint- and varnish-remover. JOSEPH J. MCEVOY and CHARLES H. UPSON. U. S. 1,785,417, Dec. 16. A mixt. is formed from ingredients such as NaOH 10.45, 40–42° Bé. water glass 9.14, water 69.55, copperas 0.71 and flour 10.15 parts.

Zinc-block treatment for preparing printing plates. FRIEDRICH ULLMANN. U. S. 1,785,606, Dec. 16. Zn blocks for carrying light-sensitive layers contg. Cr are preliminarily treated with an $AlCl_3$ soln., in order to prevent undesirable action of the plate on prepns. applied to it.

Dental cement. O. SIMON. Brit. 333,325, May 27, 1929. Water-repelling substances such as paraffin oil, wax, bitumen or castor oil are used as ingredients in making dental cements of the silicate or Zn phosphate types, and are incorporated with the acid used or with salts of Al, Ca, Mg, etc. Examples are given.

Plates for dental and medical uses. WALTER HENGSTMANN. Ger. 499,676, Aug. 18, 1929. The plates are made of a mixt. of cellulose ether, resin, synthetic resin and aliphatic dicarboxylic acids.

Chewing gum. CANADIAN ELECTRO PRODUCTS CO., LTD. Ger. 506,381, Oct. 30, 1927. See Brit. 280,247 (*C. A.* **22**, 3026).

Rat poisons. C. BALL. Brit. 333,216, May 6, 1929. A paste is formed contg. finely divided Zn phosphide dispersed in an oily or fatty vehicle such as benzoated lard or tallow, cottonseed oil, olive oil or mineral oil, and various other substances may be added such as baked maize meal, dried fish, fish meal, middlings, or crushed maize. Brit. 333,218 relates to poisons of similar compn. in the manuf. of which the poison ingredient is caused to adhere to the surface of cereal particles used with a minor proportion of an oily or fatty substance, so that the product is in the form of sep. non-coherent particles.

Fireproofing. I. G. FARBENIND. A.-G. (Rudolf Engelhardt, inventor). Ger. 507,104, May 3, 1927. Addn to 503,673. The material (*e. g.*, fabric) is treated with halogenated aromatic esters of H_3PO_3 and H_3PO_4, instead of the anilides of these acids, as mentioned in 503,673 (*C. A.* **24**, 6035). Trichlorophenyl phosphite is mentioned.

Fire extinguisher. ERWIN MÜLLER and NEUFELDT & KUHNKE G. M. B. H. Ger. 506,530, Oct. 31, 1926. The quenching fluid is a non-conductor of electricity, *e. g.*, CCl_4 or other hydrocarbon-halogen compd. driven out by compressed gas. The gas and fluid are sepd. by a liquid such as glycerol.

Apparatus for producing fire-extinguishing foam. FISHER L. BOYD (to National Foam System, Inc.). U. S. 1,785,723, Dec. 16. Structural features.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON AND C. H. KERR

Reactions in the melting of glass batches. G. TAMMANN AND W. OELSEN. *Z. anorg. allgem. Chem.* **193**, 245-69(1930).—The reactions for typical soda, lead and sulfate glass batches were detd. by means of heating curves combined with analytical data. For the soda glass 1000 parts of SiO_2, 400 parts of $CaCO_3$ and 300 parts of Na_2CO_3 were used. In the reaction the double carbonate $CaNa_2(CO_3)_2$ is first formed, beginning at about 600°. This is accompanied by evolution of CO_2. The eutectic of Na_2CO_3 and $CaNa_2(CO_3)_2$ then commences to melt and SiO_2 begins to react with this, more CO_2 being liberated with the formation of CaO and Na_2O. For the Pb glass Pb_3O_4, SiO_2 and K_2CO_3 are used. O_2 is first evolved (590°), after which PbO and SiO_2 form $PbSiO_3$ (580°). At 700°, any SiO_2 still present combines with K_2CO_3, liberating CO_2. K_2CO_3 dissolves in the Pb silicate eutectic at between 580° and 750° without decompn., CO_2 being evolved. The batch for the sulfate glass was comprised of 1000 parts of SiO_2, 400 parts $CaCO_3$, 400 parts Na_2SO_4 and 25 parts of sugar charcoal. The reactions are complex and are discussed very completely. Na_2SO_4 is reduced to Na_2S by C (740°), and this forms Na_2CO_3 and CaS by interaction with $CaCO_3$. The double carbonate, $CaNa_2(CO_3)_2$, is formed and this reacts with SiO_2 at 600° to give off CO_2. Na_2SO_4 and Na_2S react to form Na_2O and SO_2 which is evolved, and $CaSO_4$ and CaS in a similar manner form CaO and SO_2 (850°). This type of glass should become a clear melt at 1240°, but if insufficient reduction of Na_2SO_4 has occurred, galls are formed. This sepn. is caused by the presence of SiO_2. They can be removed mechanically or can be reduced by addn. of finely divided C. H. STOERTZ.

Changes in length of glass threads at elevated temperatures. IKUTARO SAWAI AND MORIO NISHIDA. *Z. anorg. allgem. Chem.* **193**, 133-43(1930).—Measurements were

made on a soda lime glass contg. 74.04% SiO_2, 9.48% CaO, 14.86% Na_2O, 2.44% (Al_2O_3 + Fe_2O_3), threads of 0.07, 0.17 and 0.27 mm. diam. being used. Variation in length was measured over a range of $\lambda = 10^8$ to $\lambda = 10^5$, in which λ is the coeff. of viscous traction. At 500° and lower, no shrinkage was observed even if no load was applied. Two bends are obtained in the curve of shrinkage velocity. A discussion of theory is included. H. STOERTZ

Clay in 1929. JEFFERSON MIDDLETON. Bur. Mines, *Mineral Resources of the U. S. 1929*, Pt. II, 95–104 (preprint No. 9, published November 1, 1930). E. H.

Ground clay as a plasticizing agent. A new use for clay. M. G. SPANGLER. *J. Am. Ceram. Soc.* **13**, 927–8(1930).—Tests of relative tensile strengths of mortars contg. $Ca(OH)_2$ or finely ground, raw clay showed no distinct difference between the two. C. H. KERR

Observation on the effect of silicon in clay bodies. S. F. WALTON AND E. L. HAUMAN. *J. Am. Ceram. Soc.* **13**, 935–40(1930).—Replacing grog by SiC increases transverse strength and thermal cond. Data on slag resistance are also given. C. H. KERR

Carbon and sulfur contents of certain Ohio common clays used in heavyware industries. GEORGE M. MACHWART AND JAMES R. WITHROW. *Ind. Eng. Chem.* **22**, 1224–5(1930).—Analysis of 28 Ohio clays successfully used in heavyware manuf. showed S varying from 0.01 to 0.84% and C from 0.28 to 3.01%. The av. was 0.12 S and 0.91% C. M. A. EDDY

China clay. FRANK R. VAN HORN. *Eng. Mining J.* **130**, 525–6(1930).—The geology, mining and dressing practice in the St. Austell district of Cornwall are briefly outlined. W. H. BOYNTON

Quantity of lime in a raw mixture for silicate bricks. A. TAL. *Stroitelnuie Materialui* (*Building Materials*) No. **2**, 63–6(1930).—The quantity of lime depends upon: (1) the porosity of the lime, its temp. of firing and its fineness; (2) the mech. and chem. compn. of the sand and the shape of grains, and the state of their surface; (3) homogeneity of the raw mixt.; (4) method of slaking the lime. Uncombined lime in a brick increases its solidity which increases in proportion to its uniform distribution in the brick, especially in the spaces between the grains. M. V. KONDOIDY

Slag bricks. B. EVALD AND N. VAGANOV. *Stroitelnuie Materialui* (*Building Materials*) No. **2**, 60–3(1930).—The authors describe different German and Russian methods for prepg. slag bricks. Data on their compn. and properties are given. M. V. KONDOIDY

Production of Dinas blocks in U. S. S. R. P. P. BUDNIKOV. *Stroitelnuie Materialui* (*Building Materials*) No. **1**, 27–36(1930).—Results of tests given in curves and tables show that the properties of Russian Dinas blocks are equal to those prepd. abroad. M. V. KONDOIDY

Tests on Dinas and grog blocks. OSKAR LEKHER. *Stroitelnuie Materialui* (*Building Materials*) No. **4**, 41–6(1930).—L. describes his investigations on the stability of refractory blocks to the action of slag and fused glass. A series of grog blocks, the chem. compn. of which is given, was tested in a gas kiln in which a grog crucible with holes at the bottom was put. The samples for testing were put into the crucible. The crucible was filled with a batch and the required temp. maintained. The fused glass dropped slowly from the bottom into water. Every 15 min. the crucible was filled with batch to keep the samples covered by the fused glass. For 3 hrs. the samples were subjected to the action of fused glass; then they were slowly cooled. The samples were broken into 2 parts and were investigated. This method is very simple; the test blocks can be heated to the different temps. required. The glass paste flowing from the crucible can also be investigated to ascertain the action of the Dinas or grog blocks on the glass batch. M. K. KONDOIDY

Slag corrosion of grog blocks by the action of fused peat ashes. D. S. BELYANKIN AND V. V. KLYITCHAREV. *Keram i Steklo* **6**, 383–7(1930).—The authors discuss several cases where grog blocks were greatly affected and, in some cases, entirely melted, by the slagging action of fused peat ashes. The compn. and properties of the grog blocks and peat used are given. Ashes produced by the burning of peat melt and flow down on the walls of the shaft and enter into the joints of the blocks. The melted ash forms glassy stalactites of dark green almost black color, or dark brown with a cryst structure. These glassy and cryst. stalactites are of a different chem. compn. The latter have not over 28% SiO_2, as high as 38% CaO, and up to 6.24% MgO. The glassy stalactites have up to 50% SiO_2, up to 19.2% CaO, and are almost free from P_2O_5. Conclusions: (1) The reciprocal action of grog and peat ashes in the gas-generating shaft begins to be noticeable between 1100° and 1200° and is especially sharp at 1300°

and higher. (2) Peat ashes present in the firing zone melt and, depending on the acidity of their melting compds., crystallize and form plagioclase, ghelenite, augite and calcareous orthosilicate, hypothetically. (3) The reciprocal action of grog and peat ashes begins with the penetration of the melted glassy ashes, and of the oxidized iron, lime and alkalies, into the joints of the grog. (4) The grog blocks change their chem. compn. near their surface and are characterized by a very high content in alkalies. The fusing temp. of such blocks is greatly lowered, to about 1150°. M. V. K.

Cost of feldspar. C. R. AMBERG. *J. Am. Ceram. Soc.* **13**, 923–6(1930).—The classification proposed is based on lb. of fluxing oxides per ton. C. H. KERR

Influence of iron borate on the rate of inversion of quartz in silica bricks. W HUGILL AND H. J. REES. *Trans. Ceram. Soc.* (England) **29**, 299–303(1930).—In silica brick fired to cone 17 it was found that Fe_2O_3 accelerated the rate of tridymite formation, while the presence of B_2O_3 at the same time had little or no addnl. effect on the rate of quartz inversion or tridymite formation. H. F. K.

The kiln of Grum-Grzhuimailo. G. SHTUIKGOLTZ. *Stroitelnuie Materialui* (*Building Materials*) No. 1, 58–62(1930).—A new kiln for firing bricks is described and compared with the Hofmann kiln. It is a rational annular kiln constructed on the hydraulic theory of the movement of gases. A system of intersecting pipes gives a correct motion to the gases and guarantees uniform heating and cooling of fired bricks, thus avoiding the chief defect of the Hofmann kiln. M. V. KONDOIDY

Advantages and use of a carbon dioxide meter on a forced down-draft periodic kiln as to temperature distribution. D. M. MCCANN. *J. Am. Ceram. Soc.* **13**, 944–6 (1930).—The CO_2 meter is used to (1) regulate forced draft, (2) maintain uniform pressure, (3) save fuel and (4) regulate time of firing. C. H. KERR

Servicing of kiln cars. H. SPURRIER. *J. Am. Ceram. Soc.* **13**, 929–30(1930). C. H. KERR

The ceramic engineer in Canadian industry. ROBERT J. MONTGOMERY. *Can. Mining J.* **51**, 1166(1930) W. H. BOYNTON

The use of the autoclave in testing ceramic products for resistance to crazing. R. G. MILLS. *J. Am. Ceram. Soc.* **13**, 903–14(1930).—Results indicate that the autoclave is of value in testing work. C. H. KERR

Improvements in the burning of ceramic ware. A. BIGOT. *Corriere ceram.* 11, 231–7(1930); cf. *C. A.* **24**, 5449.—Temp. distribution and measurement, structural features and heat balance are given. R. D. BUMBACHER

Acidproof ceramic products. P. P. BUDNIKOV. *Stroitelnuie Materialui* (*Building Materials*) No. 4, 46–52(1930).—B. describes the prepn., properties and qualities of acidproof ceramic products made from Russian clays. M. V. KONDOIDY

Systematic research to prevent soluble salts in the firing of ware. 1. A. SIMON AND W. VETTER. *Ber. deut. keram. Ges.* **11**, 12 25(1930).—The temps. at which different sol. salts cease to be sol. were detd. for certain clays. With one clay NaCl ceased to be sol. at 750°; $MgCl_2$ at 720°, $CaCl_2$ at 700°; Na_2SO_4 at 1000+°; K_2SO_4 at 1000+°, and $CaSO_4$ at 1000+°. These temps were somewhat higher for Zettlitzer kaolin and lower for a more vitreous clay. H. G. SCHURECHT

Information on white ware sagger bodies. JOHANNES MECKWITZ. *Sprechsaal* 63, 789–91, 809–12, 829–32, 849–51(1930).—Vagueness over the most suitable compn., prepn and method of manuf. of a sagger body still prevails. A systematic investigation was made to establish certain claims and properties of sagger bodies. Properties required are resistant against sudden temp. changes, mech. strength and stability. Stability against sudden temp changes is dependent upon the d. of the burnt clay mixt. For circular-oven operation the body should have a mech. strength of at least 250 kg. sq cm., and for tunnel-oven operation about 200 kg. sq. cm. The mech. strength is dependent on the d. of the body and the fineness of the fireclay. Softening should not be noticeable at 1200° to 1300°. Stability is increased by increasing the fineness and amt. of fireclay. C. H. LORIG

The control tests for sagger bodies. E. KIEFFER. *Ber. deut. keram. Ges.* **11**, 152–6 (1930). H. G. SCHURECHT

Advances in chemical stoneware construction. F. MÜLLER. *Ber. deut. keram. Ges.* **11**, 30–42(1930). H. G. SCHURECHT

Impact properties of china. EDWARD SCHRAMM AND F. P. HALL. *J. Am. Ceram. Soc.* **13**, 915–22(1930).—Diagrams and tables show results of impact tests on various china bodies. C. H. KERR

Influence of oxidizing and reducing atmospheres on refractory materials. III. Experiment with a refractory mixture containing added amounts of colloidal ferric hydroxide. A. E. J. VICKERS. *Trans. Ceram. Soc.* (England) **29**, 290–8(1930); cf. *C. A.*

22, 852.—Cones were made of refractory materials plus 0.29–3.67% colloidal $Fe(OH)_3$ and some C and H_2O. When these were fired so that the C and H_2O were expelled, no reduction in softening point was found in air or in N_2. If these are not expelled, the Fe acts independently of the atm. and lowers the refractoriness of the specimen. Water vapor produced the greatest lowering of the softening point, H_2, CO, SO_2 and CO_2 following in order of decreasing effect. The temp. of softening-point lowering is approx. proportional to the amt. of Fe_2O_3 present in the materials. H. F. K.

Practical testing of refractory products. E. STEINHOFF. *Ber. deut. keram. Ges.* 11, 1–11(1930).—The refractories carry a vertical load of 390 kg and the lateral pressure necessary to move the brick at high temps. indicates the quality of the mortar joint. H. G. SCHURECHT

Relation between the strength and temperature of some refractories. H. HIRSCH. *Ber deut. keram. Ges.* 11, 156–7(1930).—The strengths of 2 fireclay bricks were found to be 150–152 kg./sq. cm. at room temps., 117–231 kg./sq. cm at 800°, 345–354 kg./sq cm. at 1000°, 162–223 kg./sq. cm. at 1200° and 86–92 kg./sq. cm. at 1300°. H. G. SCHURECHT

The manufacture and use of dolomite refractories. F. HARTMANN. *Ber. deut. keram. Ges.* 11, 47–62(1930). —The use of dolomite in place of magnesite in some cases reduces costs Methods of dead-burning dolomite and making dolomite brick, also some properties, are given. H. G. SCHURECHT

Flux for chemical analysis of fused alumina refractories. EDGAR B. READ. *J. Am Ceram. Soc.* 13, 941–3(1930).—With 1 g. borax and 5 g Na_2CO_3 for a flux, only 1 fusion is needed. It is not necessary to eliminate the B by evapn with MeOH. Results are satisfactory for com. work. C. H. KERR

Abrasive materials in 1929. OLIVER BOWLES. *Bur. Mines, Mineral Resources of the U. S. 1929*, Pt. II, 65–81 (preprint No. 7, published October 25, 1930). E. H.

A laboratory method for grading abrasives. JOHN W. VANDERWILT. *Econ. Geol.* 24, 853–9(1929).—A series of connected siphons is used to grade abrasives as fine as 0.001 mm Convection currents are avoided by keeping the classifier at const. temp. ALICE W. EPPERSON

Refractory-maintenance cements in the non-ferrous foundry (WHITE) **9.** Care and maintenance of fuel-fired furnace linings in the non-ferrous foundry (WHITE) **9.** Purifying materials such as quartz or feldspar, etc. (U. S. pat. 1,786,383) **18.** Froth flotation concentration of feldspar (U. S. pat. 1,785,992) **18.**

Glass. SOCIÉTÉ LA RADIOTECHNIQUE. Ger. 505,782, Sept. 22, 1926. A readily fusible glass with a small coeff. of heat expansion, particularly suitable for elec purposes, is made from 75% silica and the rest H_3BO_3 and Na in the proportions 85:15.

Glass for reflectors. GLASHÜTTENWERKE VORM. J. SCHREIBER & NEFFEN. Ger. 505,947, Sept. 24, 1929. The glass is composed of layers of opal and crystal glass. The opal glass layers are formed by coloring transparent glass by S, Na_2SeO_4, CoO or MnO_2.

Glass purification. GEORGE C. COX and HENRY K. MCINTYRE. U. S. 1,785,888, Dec 23. A glass stock electrolyte is maintained at an optimum temp. by generation of heat within the electrolyte (suitably by electric a. c.) and an elec d. c. is passed through the electrolyte, effecting deposition of reduced metal at the cathode.

Suction gathering apparatus for glass working. KARL E. PEILER (to Hartford-Empire Co.). U. S. 1,785,209, Dec. 16. Structural features.

Method of making constricted glass tubes. FELIX MEYER. Ger. 507,213, June 18, 1926. Manipulative details are described. This forms part of Brit. 274,765.

Forming thin-walled glass articles such as bulbs, lamp chimneys and tumblers. THEODORE H. SLOAN (to Macbeth-Evans Glass Co.). U. S. 1,785,535, Dec. 16. Mech. features.

Sheet glass manufacture by use of stationary rollers. Y. BRANCART. Brit. 333-140, Feb. 4, 1929. Sheet-forming and stretching rolls, as well as their driving and cooling devices, are mounted on a frame which can be rocked about a horizontal axis in order to vary the slope of the path followed by the sheet between the upper and lower rolls. Various details of construction are described.

Apparatus for continuous downward drawing of sheet glass. CLIFFORD A. ROWLEY and JOSEPH A. REECE (to Libbey-Owens-Ford Glass Co.). U. S. 1,785,497, Dec. 16. Structural features.

Tempering glass sheets by air blasts or by use of adjacent cooling panels. SOC. ANON. DES MANUFACTURES DES GLACES ET PRODUITS CHIMIQUES DE ST. GOBAIN, CHAUNY

ET CIREY. Brit. 333,839-40, Aug. 7 and Aug. 8, 1929. Various details of app. and operation are described. Brit. 333,843 also relates to app. for tempering glass, as by sudden cooling after reheating.

Cooling glass sheets or plates after formation. A. BRANCART. Brit. 333,500, Feb. 23, 1929. A device such as a metal rod is used to loosen a glass plate or sheet from a support so that air is permitted to come between the support and sheet and prevent too rapid cooling on the side next the support. Various details of app. and operation are described.

Annealing glass sheets. CHARLES B. KINGSLEY (to Mississippi Glass Co.). U. S. 1,785,264, Dec. 16. App. and various details of procedure are described.

Tunnel furnace for annealing glass, etc. W. A. MORTON. Brit. 333,596, April 17, 1929. Structural features.

Apparatus for feeding glassware through annealing leers. IRVING SIMONIS (to Owens-Illinois Glass Co.). U. S. 1,785,534, Dec. 16. Structural features.

Non-splintering glass. JOHN NEWTON. Ger. 505,862, Feb. 1, 1928. See Fr. 648,085 (*C. A.* 23, 2797).

Reënforced glass. MARIA SCHMIDT. Fr. 686,271, Dec. 7, 1929. The celluloid and the contacting faces of the sheets of glass are coated with a vegetable or chem. resin and the whole is plunged into a bath composed of C_6H_6, xylene, $CHCl_3$, turpentine, cedar oil and other oils.

Sealing the edges of laminated reënforced glass sheets. JAMES H. SHERTS (to Duplate Corp.). U. S. 1,785,099, Dec. 16. The edges of a laminated product formed of 2 glass sheets with an intervening sheet of material such as pyroxylin compn. are submerged in a corrosive liquid such as concd. H_2SO_4 which will react with the material of the reënforcing sheet but not with the glass, to remove the edge portions of the reënforcing sheet and prepare the product for sealing the edges.

Laminated product of glass and celluloid. ROBERT W. HACKETT and ARTHUR G. WORRALL (to Louis J. Kolb, trading as Safetee Glass Co.). U. S. 1,785,696, Dec. 16. The border edges of the glass sheets extend beyond those of the celluloid and the groove thus formed is filled with a sealing compn.

Laminated sheets of glass and celluloid or like material. J. NEWTON. Brit. 333,242, Feb. 8, 1929. Sheets of glass of larger size than available sheets of celluloid or the like for intervening material are used with a plurality of sheets of the latter joined at their edges (suitably after chamfering and heating for 5–10 min. with a plasticizer or solvent such as a mixt. of alc 80 and AmOAc 20%). Various details of procedure are described for uniting the sheets of different materials by hot pressing.

Sand, clay, etc., used for glassmaking. CHANCE BROS. & CO., LTD. Fr. 686,426, Dec. 11, 1929. Fe is eliminated from sand or other material used for glassmaking by heating the sand and treating it with a reducing gas such as H, CO or SO_2, and simultaneously or subsequently with Cl.

Apparatus for testing the bonding strength of clays or other plastic materials. JOSEPH F. MACKIN. U. S. 1,785,521, Dec. 16. Material under test is compressed in a thin layer between 2 smooth metal surfaces and an adjustable weight serves to indicate the force required to sep. the 2 surfaces and intervening material under test. Various structural details are described.

Bricks. ANDRÉ GERSON. Fr. 686,248, Dec. 7, 1929. Hollow bricks are made from cinders, sand, cement and ochers, the sand and ochers being optional.

Brick, tile, etc., manufacture by extrusion, cutting and sanding. C. S. JILLINGS. Brit. 333,346, June 25, 1929. App. and various details of operation are described.

Ceramic products. MARSHALL LASLEY. Fr. 686,207, Dec. 6, 1929. In the prepn. of ceramic products, the org. substances are eliminated from the materials before the articles are formed by grinding the materials and heating in the presence of O. The heat is less than the heat used in the manuf. of the article.

Preventing efflorescence or scumming of ceramics. ARTHUR HOUGH and JOHN G. HARRISON (Hough to Harrison). U. S. 1,785,309, Dec. 16. Ba silicate is added to the material.

Supports for ceramic ware during firing. P. D'H. DRESSLER and GIBBONS BROS., LTD. Brit. 333,402, Aug. 20, 1929. Structural features.

Drying chamber for ceramic objects. MASCHINENFABRIK VORM. GEORG DORST A.-G. Ger. 505,605, Feb. 5, 1929.

Ceramic kilns. C. H. WECK, KOMM.-GES. Ger. 505,503, Jan. 13, 1929. Details of charging.

Tunnel kiln for ceramic objects. RENÉ M. D'ARLEUX and EMILE VIOLETTE.

Ger. 505,603, April 21, 1929. Addn. to 439,935. The kiln is heated by a compressed mixt. of air and generator gas.

Furnace for ceramic products. WILHELM ECKARDT & ERNST HOTOP G. M. B. H. Fr. 686,488, Dec. 12, 1929.

Tunnel kiln suitable for drying and burning molded ware. JOHN M. PILLATZKE. U. S. 1,786,364, Dec. 23.

Apparatus for molding quartz objects. DEUTSCH-ENGLISCHE QUARZSCHMELZE G. M. B. H. Fr. 686,342, Dec. 9, 1929.

Ceramic insulators. JOSEPH L. A. HILBRENNER. Ger. 504,869, Oct. 13, 1926. In the manuf. of these, clay, kaolin, alumina, ZnO and ZrO_2 are used with a flux or binding material formed by sintering together, MgO, ZnO and Al_2O_3.

Vitreous material suitable for making spark plugs or other electric insulating parts, etc. P. B. CROSSLEY. Brit. 333,240, Feb. 8, 1929. Finely ground mica and asbestos are used with relatively infusible materials such as porcelain, soda lime and lead glass and relatively fusible materials such as Pb salts (suitably the borate or borosilicate) and compound borates in which Pb oxide has been partially replaced by oxides such as those of Bi or of Zn, and at least part of the ingredients are used in a colloidal state of subdivision. When the mass contains over 30% of colloidal material it may be slip cast (preferably in porous molds). Zr oxide may be incorporated in the mixt. or applied to the surface of the product; colored metal oxides or opalizing agents such as Sn oxide or fluorides also may be added; and the finished articles may be glazed. Alloy steel molds with a Cr inner surface may be used for hot pressing the material.

Linings for electric induction furnaces. N. R. DAVIS, G. A. WOOD and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Brit. 333,582, May 15, 1929. The lining is graded axially so that material of least refractory character is arranged at the rim and the most refractory material is placed where the most rapid erosion tends to occur. The normal lining material comprises magnesite 65 and lime 35% and for the bottom of the furnace 6–7% borax is added. Erosion is likely to be most rapid about 6 in. from the bottom and at this location only 4% borax is used. The amount of borax may then increase up to 15% at the wash line, and at the rim 25% or more borax and 5% of dextrin may be added.

Abrasive and refractory products. PRESCOTT H. WALKER and SHERMAN S. KENYON (to Carborundum Co.). U. S. 1,785,102, Dec. 16. See Brit. 310,841 (*C. A.* **24**, 705).

Abrasive material from bauxite. JACOB S. MASIN and HAROLD E. WHITE (to Swann Research, Inc.). U. S. 1,786,016, Dec. 23. A charge of bauxite is furnaced with an excess of C to reduce substantially all the oxides of Si, Fe and Ti and a small percentage of the alumina present in the bauxite; the fused material is then cooled and there is formed a high-purity cryst. alumina embedded in a matrix of acid-decomposable character which after crushing may be removed by the action of H_2SO_4 and HF. Cf. *C. A.* **24**, 5959.

Abrasive disks. ALBERT J. DOERMANN. U. S. 1,785,437, Dec. 16. A mixt. comprising powd. abrasive and bakelite cement is placed in a mold with a layer of finely powd. abrasive on the bottom, and the material is baked.

Abrasive articles such as wheels. N. P. ROBIE and CARBORUNDUM CO., LTD. Brit. 333,409, Oct. 27, 1928. Products comprising abrasive grains bonded with artificial resin are made by mixing the grains with a liquid reactive resin contg. no volatile solvent, adding dry powd. reactive resin or other dry powd. material, molding under pressure and hardening by heating. Various compns. are described.

Vitreous enamels. CHARLES J. KINZIE (to Titanium Alloy Mfg. Co.). U. S. 1,785,777, Dec. 23. In the prepn. of a slip for vitreous enamels and glazes from mill liquor contg. alk. substances, the liquor is treated with a salt, such as Ti sulfate, of one of the metallic elements in Group 4, sub-group A, of the periodic classification having a mol. wt. below 100 to neutralize the alk. substances present and produce a hydrate ppt. of the element introduced as the added salt. This serves to give proper consistency to the slip.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

The cause of poor agreement between pure cement strength and sand mortar strength. K. KOYANAGI. *J. Soc. Chem. Ind. Japan* **33**, Suppl. binding 425–7(1930)(in German).—**Strength of pure cement is affected just as much by the quantity of water**

added as is sand mortar cement. There is an optimum water addn. for each. Pure cement strength is usually extraordinarily high with cements which withstand the water test but not the boiling test. The sand mortar strength of such cements is always low. Pure cement strength is affected somewhat by fineness; it is sometimes greater with coarse than with fine cements. Sand mortar strength is increased by fine grinding. Factors which raise the strength of pure cement are adverse to sand mortar cement strength; hence there is poor agreement. E. M. SYMMES

Injury to plaster due to osmosis. F. L. BRADY. *Nature* **126**, 684(1930).—If lime plaster is applied to bricks contg. $MgSO_4$, a semi-permeable membrane forms at the interface and $MgSO_4$ concentrates behind the membrane and crystallizes, eventually causing the plaster to bulge. ARTHUR FLEISCHER

A note on exploded wood for insulating and structural material. ROBERT M. BOEHM. *Trans. Am. Inst. Chem. Eng.*, New Orleans Meeting **1930**, 8 pp.(Adv. copy).—A discussion of the masonite process originally developed in connection with extn of naval stores from southern-pine lumber but now devoted to the manuf. of synthetic wood products. The various qualities and grades of masonite are described. At the present time the process is limited to long-leaf pine and southern gum, but almost any type of wood can be successfully used. The mfg. process is described. Essentially a gun is loaded with wood chips and high-pressure steam is introduced to soften the wood. The pressure is then increased to 1000 lb./sq. in., after which the wood is discharged from the gun and allowed to explode. The fibers are refined and made into boards. Modifications of the process in pressing, drying and surfacing give materials of different qualities. In connection with the manuf of Presdwood, it was found necessary to obtain smooth polished plates coated with Cr to impart the necessary finish and luster to the board The company had to install its own plant to plate with Cr and polish the 4.5 × 12.5-ft. plates needed for their work. Work is continuing in an effort to improve the product and cheapen the process. C. L. MANTELL

Wood preservation with zinc chloride finds place in textile industry. HARRY E TUFFT. *Textile World* **78**, 2125-7(1930).—The use of treated lumber wherever rot is likely to attack the untreated is advocated The fire hazard and the cost of maintenance are thus decreased. R. K. WORNER

Paving blocks with rubber tread portion (Brit. pat. 333,047) **30.** Extrusion mold for bituminous materials such as that for conduits, expansion joints, etc. (U. S. pat 1,785,457) **18.**

Cement. ELIAS R. WILNER (to Eddystone Cement Corp.). U. S. 1,785,508, Dec. 16. Lime and clay, shale or other suitable siliceous earths are separately heated to a relatively low temp. (suitably about 800°), mixed and ground together, and a jet of water or steam is introduced into the mixt under agitation.

Cement. H. BERRY. Brit. 332,925, April 30, 1929. Oxide or hydroxide of Ca or Mg is heated in an atm. contg. H_2SO_4 or H_2SO_3 and the resulting product is ground with a material such as waste slate, china clay, coal shale, sand, flint or other mixts of silica and alumina. The heating in the acid atm. may be combined with the step of calcining $CaCO_3$ or $MgCO_3$, or may be a secondary heating, and is preferably at a temp. of 700–900° and in the presence of steam. Preliminarily calcined material may be treated with an acid soln. such as one contg. H_2SO_4 and Al sulfate, and blast furnace slag may be used as an initial material.

Cement. JOACHIM HEMPEL. Fr. 686,455, Dec. 12, 1929. A cement having a high content of SiO_2 which is calcined below the temp. of agglutination and is composed of SiO_2 60–70, CaO 25–30 and $Al_2O_3.Fe_2O_3$ 4–5% is mixed in the proportion of 20–30% with ordinary portland cement for use where high resistance to the action of sea water or acids is necessary.

Cement. INTERNATIONAL CEMENT CORPORATION. Ger. 506,615, Sept. 29, 1927. Fr. 642,168 (*C. A.* **23**, 1239).

Cement. ANTONI EIGER. Ger. 504,965, Jun. 3, 1927. The hot water vapor waste from the wet manuf. of cement is used to preheat further raw materials.

Portland cement. GUY S. LAFORGE. U. S. 1,784,840, Dec. 16. A mixt. formed of raw calcareous material and raw argillaceous material with 10–50% of unground portland cement clinker is subjected to pulverization and is then calcined.

Discharge device for rotary furnaces for burning cement, etc., or smelting ores. FRIED. KRUPP GRUSONWERK. A.-G. Ger. 504,966, Nov. 12, 1927.

Apparatus for cement manufacture. RAY C. NEWHOUSE. U. S. 1,786,080, Dec. 23. A vertical stack is arranged for receiving hot gases from a rotary cement kiln, the open end of which extends into the stack, and a feeding device is provided for introducing a slurry of cementitious material in finely divided form into the upper portion of the stack so that it is collected in dried form in the lower part of the stack and introduced into the open end of the rotary kiln. Various details of app. are described.

Porous compounds. RHEINHOLD & Co. Fr. 686,345, Dec. 9, 1929. In the manuf. of materials of high porosity with the aid of gypsum, cement or lime or other substances solidifying with water or hardening in air, the use of hardening agents which also retard the solidifying phenomenon or even prevent it (such as sugar, glue, gelatin, soaps, gels, oils, grasses, bitumen or colloidal earths) is made possible to a far greater extent than up to the present by the addn. of products which accelerate the solidifying phenomenon such as sulfates, nitrates, chlorides, alums or org. acids or salts.

Road surfacing. MARCEL LEVY (one-half to Prodorite S. A.). U. S. 1,785,130, Dec. 16. A freshly tarred road surface is improved by scattering over it a dry bituminous stone powder obtained by impregnating powd. limestone 100 with bitumen 10–15 parts.

Bituminous emulsions for roads. C. G. FOX. Brit. 332,897, March 20, 1929. Spreading of bituminous emulsions on aggregate or on road surfaces is facilitated by treating the aggregate or road surface with solns. of pyridine or pyridine bases or by adding such solns. to the emulsions. A small proportion of a 0.5–2% soln. may be used, as may also industrial waste liquors contg. pyridine or pyridine bases. Cf. *C. A.* 24, 5457.

Bituminous compositions. N.-V. KONINKLIJKE STEARINE KAARSENFABRIEK GOUDA. Brit. 333,433, Feb. 4, 1929. Aggregate to be coated with bituminous emulsion is first coated with melted bitumen which may be thinned with petroleum. The emulsion used may contain stabilizers and a finely divided material such as cement.

Preserving natural or artificial stone, brick, etc. D. DEROS. Brit. 333,535, May 13, 1929. The material is treated with an aq. liquid in which is dispersed a protective colloid such as gum arabic, preferably while the liquid is hot, to saturate the capillary ducts of the material. It is stated that the colloid retains the deleterious salts present and draws them to the surface of the material, whence, after they dry, they may be removed by washing or brushing.

Composition suitable for use as a patching plaster, etc. CLEMENT K. STODDER. U. S. 1,785,053, Dec. 16. Plaster of Paris 32, dextrin 4 and volcanic ash 4 parts.

Water-resistant fiber product suitable for wall board, etc. WM. H. MASON (to Masonite Corp.). U. S. 1,784,993, Dec. 16. Unsized vegetable-fiber pulp such as that from wood waste is agitated with an excess of water and paraffin or the like m. about 50° and in the proportion of 0.5–10% the wt. of the dry fiber, and the water bath is maintained at a temp. sufficient to prevent congealing of the paraffin or like material during the agitation. Free water is then sepd. from the pulp.

Fire- and water-resistant fibrous product. HUGH M. SPENCER (to Upson Co.). U. S. 1,786,270, Dec. 23. Fibrous material such as wood pulp in fluid suspension is mixed with a fire-proofing salt such as NH_4 phosphate and paraffin-coated comminuted material such as clay or $CaSO_4$ to prepare a product which is suitable for *wall board* manuf.

Waterproofed felted fibrous sheet material. HAROLD L. LEVIN (to Flintkote Co.). U. S. 1,785,357, Dec. 16. Sheet material suitable for floor covering, etc., is formed of fibers, a filler such as sawdust, asbestine, clay and bone black and thermoplastic material such as asphalt fused on to the fibers; the fiber content of the sheet is so low as to be incapable, in the absence of the thermoplastic material, of fabrication into a felted form-sustaining sheet. Various modifications of compns. are described. Cf. *C. A.* 25, 422.

Kiln and air-circulating system for drying lumber, etc. C. GOODALL. Brit. 333, 403, Aug. 20, 1929.

Treating wood for preserving it, etc. ARTHUR P. ALLEN. U. S. 1,785,571, Dec. 16. Wood is impregnated with a saccharide soln. to which a mineral or vegetable oil is added to form an emulsion. NaF, fireproofing salts, latex, etc., also may be added.

Fungicidal and insecticidal composition. LEO P. CURTIN (to Curtin-Howe Corp.). U. S. 1,785,074, Dec. 16. Fibrous org. material such as wood to be preserved is impregnated with a soln. of As_2O_3 and with an aq. soln. of a base such as $Ba(OH)_2$ not in excess of one-third the molar equiv. of the oxide. The same substances are suitable for other fungicidal and insecticidal uses also when used in the specified proportions.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

Motor fuel survey of Alberta for 1930. P. V. ROSEWARNE AND H. McD. CHANTLER. Can. Dept. Mines, Mines Branch, *Memorandum Series* **42**, 13 pp.(1930).—Analyses are given of 122 samples. ALDEN H. EMERY

Alcohol automobile fuels. K. R. DIETRICH. *Automobiltech. Z.* **33**, 792–3(1930).—A discussion in connection with the addn. of a high percentage of a 99.6% alc. to gasoline and gasoline-benzene mixts. Precautions in handling and using it are also given. A. A. BOEHTLINGK

The use of sugar as a motor fuel. K. SÁNDERA AND J. ZFMAN. *Listy Cukrovar.* **49**, 147–9(1930).—Sugar (30 parts) was dissolved in a mixt. of EtOH (57 parts) and MeOH (13 parts) under pressure at 110–125° for several hrs. The sucrose dissolved and the soln. was filtered with activated charcoal. To increase the calorific value, NH_4NO_3, C_6H_6 0.2%, and eventually 3–5% C_6H_5OH were added. The mixt. burned (when volatilized) without leaving a coke. The sp. gr. is slightly over 1.0 and showed an insignificant acidity which was suppressed by NH_4NO_3. Prepns have kept for 3 years. The calorific value is 5940 cal. per g. Changes in motor design are necessary to adapt it to an internal combustion engine. FRANK MARESH

Heat of evaporation of fuels and a method for its determination. WAWRZINIOK *Automobiltech. Z.* **33**, 618–20, 644–6, 694–6, 764–6(1930).—The heat of evapn. of automobile fuels is detd. in an app. constructed by W. and described in detail. Fuels with high heat of evapn. and especially heavy fuels, such as gas oil, which tend to form droplets require a preheating of the fuel-air mixt. to assume a homogeneous mixt. A. A. BOEHTLINGK

Catalysis and its application to fuel chemical processes. HORST BRÜCKNER *Brennstoff Chem.* **11**, 358–9, 420(1930).—Present development is discussed. F.W. JUNG

The coal industry of South Africa. T. COULTER. *J. Chem. Met. Mining Soc. S. Africa* **31**, 75–6(1930); cf. *C. A.* **24**, 4374, 5133.—Discussion. ALDEN H. EMERY

Accelerated laboratory test for determination of slacking characteristics of coal. A. C. FIELDNER, W. A. SELVIG AND W. H. FREDERIC. Bur. Mines, *Rept. of Investigations* **3055**, 24 pp.(1930).—Lumps between 1.05 and 1.75 in. in size are air-dried at 30–35° for 24 hrs., cooled, immersed in H_2O at room temp. for 1 hr., drained, air-dried for 24 hrs., cooled and sieved on an 8-in. screen with 0.263-in. openings. The % of undersize is calcd. as the first cycle slacking index. The whole process is repeated and the cumulative % undersize calcd. as the second cycle slacking index. This can be repeated as many times as necessary. Results are given on the following coals: 11 Colorado bituminous, 5 Illinois bituminous, 2 Illinois subbituminous, 2 Kentucky bituminous, 2 Montana subbituminous, 1 New Mexico bituminous, 6 Pennsylvania bituminous, 1 Texas lignite, 17 Washington semibituminous, 123 Washington bituminous, 135 Washington subbituminous, 15 Wyoming bituminous, and 7 Wyoming subbituminous. ALDEN H. EMERY

The slacking of coal and its proper interpretation. S. W. PARR AND D. R. MITCHELL. *Ind. Eng. Chem.* **22**, 1211–2(1930).—The eight-cycle slacking test for coals is outlined and its application to lignite and bituminous coals is discussed. Two tables giving data from slacking tests applied to some Illinois and Iowa coals show wide divergences in percentages of fines through a 1/4-in. sieve when screened after each cycle and only at the end of the cycles, and on duplicate samples of the same coals. These coals charged with slacking propensities produced high grade cokes; hence such coals could not be lignitic in character. Apparently slacking as related to bituminous coals is directly dependent upon the thickness, distribution and porosity of the fusain bands, rather than, as with lignites, upon the absorptive property of the coal proper. Clay bands when they occur behave about the same as fusain when subjected to the slacking test. The slacking tests are inapplicable to bituminous coals as an indication of rank, but may serve as a measure of the fusain layers or the behavior of the coal under open storage conditions. One or 2 cycles would be sufficient to det. these characteristics and the 8 cycles of drying and wetting might give an index representative of the ultimate degradation of a particular coal when stocked for a long period of storage. W. W. HODGE

A study of the production of activated carbon from various coals and other raw materials. A. C. FIELDNER, R. E. HALL AND A. E. GALLOWAY. Bur. Mines, *Tech. Paper* **479**, 30 pp.(1930).—To obtain dependable activated C, coals must be ground,

mixed and briquetted. High-volatile coals must be given a preliminary carbonization at 650–750° as a max. before briquetting when a binder is to be used. The briquetted material is carbonized up to a max. temp. of 900°. Straight-run, high-temp., coal-tar pitch of low m. p. is a satisfactory binder. Blends of caking coal with non-caking material may be briquetted without a binder. The proper proportions have been detd. for such blends as will give hard and dense products with no swelling or some shrinkage during carbonization. In some cases a binder of petroleum oil may be used to advantage. A small quantity of carbohydrate gives a briquet of sufficient strength and adds to the general activity and particularly retentivity. High pressure in briquetting adds strength but not density to the carbonized product. The temp. during activation should usually be 925°. The lignites, the subbituminous coals of Wyoming and Colorado, the natural cokes, some bituminous coal from Illinois, Pocahontas coal, pitch coke and petroleum coke did not yield satisfactory absorbent C by the methods tried. Bituminous coal from Pennsylvania and W. Virginia and certain Utah coals gave a fairly satisfactory product. The best and most active C was obtained from anthracite coal with the highest C content and lowest ash, volatile matter and S. Although the rate of activation and ease of control of the process with coconut-shell C are advantageous, the C is not necessarily better and the activation is no more certain than with suitable coals. A bibliography of 50 references is given. A. H. E.

Occurrence of resin in Ruhr coal. E. Hoffmann and H. Kirchberg. *Brennstoff-Chem.* **11**, 389–94(1930).—Appearance and condition of the resin of Brassert coal do not indicate that it has been subjected to extremes of temp. or pressure in formation. The resin is sol. in C_6H_6 on warming, to 15–20% in acetone, and only slightly in alc. The acid no. is 8.5 and sapon. no. 84.66; they are very similar to those of amber. It does not sublime on heating; the content of volatile matter is 86%, with ash 0.1%. Petrographic examn. shows non-homogeneity characterized by streaks, inlays and net-like structure of fibrous coal and fusain. Plates, sections and reliefs are shown.

F. W. Jung

Control of coal for carbonizing plants. Hermann Koelsch. *Gas u. Wasserfach* **73**, 1047–50(1930).—Control methods for coal used by the municipal gas works at Munich are reviewed with respect to (1) sampling, (2) detn. of moisture and (3) methods of ash detn. Moisture is detd. by drying 2 kg. coal for 2 hrs. at approx. 100° in a vacuum oven. Tests indicated that no appreciable loss occurred in that time The increase in weight of dry coal samples during prolonged standing on an analytical balance was detd. as approx. 0.3% after 12 min., the rate of moisture absorption appearing to decrease after that time. Total moisture absorption in 24–48 hrs. reached 0.2 to 1.3% (the latter unusually high). R. W. Ryan

The combustibility of powdered coal as fuel of the coal-dust engine. Tetsuro Suwa. *J. Fuel Soc. Japan* **9**, 1199–1204(1930); Sect. 2, 100–2 (in English).—A lecture.

F. I. Nakamura

Coal-dust firing for small boiler plants. P. Rosin and R. Fehling. *Braunkohle* **29**, 817–27(1930).—Principles of burner construction, the development of marine and stationary dust burners (illustrations) and economics of dust firing are discussed.

K. H. Engel

Effect of excess air on chain-grate stoker operation. E. C. Cawrse. *Power* **72**, 1042–4(1930).—Under some conditions it is advisable to increase excess air above the min. consistent with good combustion of gaseous products. Charts give details of test runs. D. B. Dill

The significance of spores in the correlation of coal seams. I. The Parkgate seam, South Yorkshire Area. L. Slater, Marjorie M. Evans and Gladys E. Eddy. *Dept. Sci. Ind. Research, Fuel Research, Phys. and Chem. Survey of the Natl. Coal Resources* No. 17, 28 pp.(1930).—Microscopical examn. was made of a complete series of thin sections representing the coal seam from floor to roof. The spores encountered were classified according to size, shape and ornamentation and their frequency of occurrence was noted. The aim of the investigation was to det. whether a single spore type by its presence in any part of the seam or by its concn. in certain parts, or the distribution of the spores as a whole, is characteristic and would therefore serve as a basis of correlation. H. F. Johnstone

The cause of gas outbreaks in coal mines. Otto Ruff. *Z. angew. Chem.* **43**, 1038–40(1930).—CO_2 pressures up to 3 atm. may exist in coal seams. The soly. of CH_4 in coal is lower than that of CO_2. E. M. Symmes

From coal to gas. II. Fritz Schuster. *Gas u. Wasserfach* **73**, 1033–8(1930); cf. *C. A.* **23**, 5301.—A further study is made of the various combinations of coal-gas plants with water gas, complete gasification gas, etc. R. W. Ryan

Coal evaluation for gas works. W. SCHWEDER. *Gas u. Wasserfach* **73,** 1074 (1930).—A discussion of the factors involved in the evaluation of coal for gas works. Polemical with Mezger (*C. A.* **24,** 485, 709). **Reply.** R. MEZGER. *Ibid* 1075.
R. W. RYAN

The specific gravity and proximate composition of some Indian durains. L. LEIGH FERMOR. *Records Geol. Survey India* **63,** pt. 3, 358–77(1930); cf. *C. A.* **24,** 1488.—In a comparison of durain from 10 coal fields of the Gondwana age the following averages were obtained for caking and non-caking durain, resp.: moisture, 0.67, 3.76; volatile matter, 20.18, 23.45; fixed C, 44.63, 38.00; ash, 34.52, 34.79%; sp. gr., 1.628, 1.656; fuel ratio, 2.21, 1.62. A comparison of ash-free durain with its corresponding vitrain supports the theory that the vitrain acts as a dispersion medium with ash as the disperse phase. The av. ash-free caking durain and vitrain are, resp.: moisture, 1.03, 1.50; volatile matter, 31.05, 32.64; fixed C, 67.92, 65.86%; fuel ratio, 2.19, 2.01; sp. gr., 1.286, 1.267. The av. ash-free non-caking durain and vitrain are, resp.: moisture 5.68, 9.46; volatile matter, 36.55, 34.07; fixed C, 57.77, 56.47%; fuel ratio, 1.58, 1.68; sp. gr., 1.309, 1.298. Differences are probably due to the second disperse phase of vegetable detritus.
ALDEN H. EMERY

Hygrometric and psychrometric investigations and their application to brown coal drying. RUDOLF DÖRING. *Braunkohle* **29,** 760–8, 781–4(1930).—The hygrometer and psychrometer of the meteorologist have been adapted to the control of the drying process. They are suitable, in skilled hands, for lower temps. and with dust-free air. Relations between moisture content of air and coal are not simple. Hysteresis in the drying process proves that lignite coal is an inelastic gel.
K. H. ENGEL

Studies in the development of Dakota lignite. III. Drying of lignite without disintegration. IRWIN LAVINE, A. W. GAUGER AND C. A. MANN. *Ind. Eng. Chem.* 22, 1347–60(1930); cf. *C. A.* **25,** 397.—N. D lignite can be processed successfully by the Fleissner method (*C. A.* **23,** 958, 4553) under the following conditions: (1) satd. steam pressures not < 13 atm.; (2) a preheating period of approx. 40 min. in which the pressure is gradually increased to a max.; (3) a heating period of approx. 90 min.; (4) a release period of approx. 30 min.; (5) an aeration period of 1.5 hrs. with 312 l. of air per min. (preheated to 80°). Moisture can be reduced from 36 to approx. 16%. Phys tests indicate that the processed material will withstand handling without excessive breakage and has good weathering properties.
ALDEN H. EMERY

A new procedure for the determination of total acids in peat. E. SAUER AND H. J STEINMETZ. *Kolloid-Z.* **53,** 218–24(1930).- Tacke and Süchting's (*C. A.* **2,** 1587) $CaCO_3$ method is modified by the use of a $Ca(HCO_3)_2$ soln. The bicarbonate soln is prepd by passing CO_2 into a $CaCO_3$ suspension until satn. One g. of finely divided peat is weighed into a 400 cc. Erlenmeyer flask, 200 cc. of $Ca(HCO_3)_2$ soln. contg. 0.4 g. CaO per l. is added, the flask is stoppered and either shaken in a thermostat or allowed to stand with occasional stirring for 24 hrs. It is filtered rapidly and the filtrate titrated with 0.02 *N* HCl. The results are expressed in mg. of CaO per g. of air-dry peat When shaken, the final value is reached in 8 hrs. Neutral salts such as KCl have no effect on the results. Increased fineness of grinding increases the reaction velocity and slightly increases the final value. Increase in temp. is unfavorable because of the decompn. of the bicarbonate soln. The method is suitable for fibrous peats. The values found fluctuated from 20 to 30 mg. of CaO, with most of the values about 28
ARTHUR FLEISCHER

Evaluation of African torbanite. P. NIEMANN. *Brennstoff-Chem.* **11,** 469–71 (1930).—Analytical data, low-temp. carbonization yields and by-product analyses are given for bog-head coal from the Transvaal and Angola.
F. W. JUNG

Burning gas at Memphis Power and Light Plant. R. BRUCE. *Power* **72,** 1034–6 (1930).—Change from soft coal to natural gas resulted in 10% increase in continuous steaming rates besides savings in labor and a reduction of $^4/_5$ in furnace repairs.
D. B. DILL

British experience with low-grade city gas. NORMAN SWINDIN. *Chem. Met. Eng.* **37,** 680(1930).—Gas of not more than 400 B. t u gross heating value, when burned properly, may give better results than 500–600 B. t. u. gas under ordinary conditions. Low-grade gas can be made in a simple producer, with complete gasification of coal, or with low temp. a smokeless fuel can be made. A special gas burner is used.
E. M. SYMMES

Natural gas in 1929. R. B. HARKNESS. *Ann. Rept. Ont. Dept. Mines* **39,** pt. 5, 1–36(1930).—Detailed figures of gas production, consumption, leakage, etc., in Ontario for 1929 are given.
ALDEN H. EMERY

Summary report of analyses of natural gas from Turner Valley field in Alberta.

P. V. ROSEWARNE. Can. Dept. Mines, Mines Branch, *Memorandum Series* **43**, 5 pp. (1930).—Analyses of 26 well samples shows He trace–0.014, CH_4 85.0–89.8, C_2H_6 4.7–7.4, C_3H_8 3.2–4.0, C_4H_{10} 1.2–2.1, and C_5H_{12} + 0.5–1.7%. ALDEN H. EMERY

Long-distance transportation of natural gas. EDGARD G. HILL AND GEO. I. RHODES. *Trans. Am. Inst. Chem. Eng.*, New Orleans Meeting, **1930**, 26 pp. (Adv. copy.) C. L. MANTELL

Nomographs for gas calculations. ARRIGO BOEHM. *Gas u. Wasserfach* **73**, 1045–7 (1930).—Methods of prepg. nomographs for various equations are given, as well as examples of such nomographs. R. W. RYAN

Use of steam accumulators in gas works. E. PRAETORIUS. *Gas u. Wasserfach* **73**, 1118–20(1930).—Economies are described which are the result of the use of a Ruth steam accumulator in gas-works practice to equalize steam requirements. R. W. R.

Gas purification by cooling. STOLL. *Gas u. Wasserfach* **73**, 1102–4(1930).—Naphthalene, ammonia and water are removed from the gas by cooling it as close as possible to 0°. Plants have been installed at Hamborn and Linz, the first using absorption and the second compression cooling. At Linz cold, tar-free ammonia liquor is contacted directly with the gas. Temps. and ammonia concns. are given at several points in the system, before and after use of refrigeration. Costs are given. R. W. RYAN

Production of fuel gas by anaerobic fermentations. A. M. BUSWELL. *Ind. Eng. Chem.* **22**, 1168–72(1930).—B. describes expts. made to det. yields of fuel gas from fermentation of waste. Municipal waste contains nitrogenous material 25, fat 25, carbohydrates 25 and ash 25%, and is decompd. about 65% at 25° by bacteria. Exptl work on waste yielded 12.3 cu. ft. gas per lb. of solid digested in 7 to 8 days equiv. to 0.34 cu. ft. per capita. Gas produced analyzed CH_4 64, CO_2 28, H_2 3.4 and N_2 4.3%. Expts. with pure substances, fatty acids, proteins and carbohydrates give quant. yields of gas and a general formula is given for the reaction on acids of the aliphatic series. Results from a pilot plant operating on pith from corn stalks indicates that 5–10 cu. ft. of gas can be produced from 1 lb. of corn stalks. This corresponds to a yield of 1 year's supply of gas for 1 person from 1 acre of stalks. M. C. ROGERS

Humidity effects in the iron oxide process for the removal of hydrogen sulfide from gas. C. GORDON MILBOURNE AND WILBERT J. HUFF. *Ind. Eng. Chem.* **22**, 1213–24 (1930). The sulfiding and revivification of Fe oxide in gas works practice have been studied. Results from exptl. work show that a relative humidity of 65% at 38° is most favorable for sulfiding. Revivification is slower and higher humidities approach 100% but not high enough to cause deposition of water on the mass. Water hinders revivification. M. C. ROGERS

High-pressure hydrogenation of neutral and phenolic oil in low-temperature tar. SABURO TASHIRO AND S. ANDO. *J. Fuel Soc. Japan* **9**, 1206–14(1930); Sect. 2, 102–4 (in English).—An attempt was made to improve the properties of low-temp. tar by hydrogenation under high pressure. The hydrogenation of neutral oil of low-temp. tar is affected by pressure, temp. and time and each oil shows a definite temp. at which a vigorous reaction occurs. A similar reaction takes place during the hydrogenation of the phenolic part of low-temp. oil. Catalysts accelerate the reaction, Ni is most effective, followed by Fe and the activity of the catalyst is reduced by a poison such as S. The theory of the reaction was also proposed. F. I. N.

Tar emulsions and "cold tars." W. KÄRSTEN. *Teer & Bitumen* **28**, 437–40(1930).—Differences in sp. gr. must be overcome to make stable tar emulsions. "Dr. Raschigs Kiton," the first successful emulsion, contains 50% road tar, 10% petroleum asphalt, 10% clay and 30% water. The application of cold tars, which owe their fluidity to the addn. of solvent, requires a much smaller outlay in app. and labor than ordinary road tar. K. H. ENGEL

Tar separation and tar recovery from coke-oven gases. OTTO KREBS. *Teer & Bitumen* **28**, 517–22(1930). K. H. ENGEL

The effect of the rate of heating upon the properties of coke. T. SHIMMURA *J. Fuel Soc. Japan* **9**, 1183–98(1930); Sect. 2, 97–100(In English).—The quicker the heating the greater are the swelling and caking of coal while the slower the heating the more uniform is the cell structure of coke. The properties of coke depend upon the rate of heating. F. I. NAKAMURA

Determination of the reactivity of a coke to steam and carbon dioxide. ARTHUR KEY AND JOHN WM. COBB. *J. Soc. Chem. Ind.* **49**, 439–44T, 454T(1930).—An attempt is made to devise a method for finding reactivities from the data supplied by percent decompn which are obtainable experimentally and are already available in considerable numbers. The method of expressing reactivities depends on the following principle:

If two columns of a coke (*A*) are taken, identical in all respects except that one is of unit length and the other of length *n*, the second column will present *n* times the amount of the same kind of surface to the reacting gas, and its total reactivity will be *n* times that of the first column. If a column of unit length of another coke (*B*) decomposes as much gas as the column of length *n* of coke *A* under the same conditions, the total reactivities of the two columns will be equal, and since the percent decomposed by coke *B* of unit length is its specific reactivity, this must be equal to *n* times that of coke *A*. If the specific reactivity of coke *B* is unity, that of *A* is $1/n$, and this gives a definition of reactivity, as the reciprocal of the length of a standard coke under the same conditions. This argument is equally valid whether wt. or length of column is used as the basis of measurement. Standard wts. are used in this paper. Curves show the construction of the reactivity curves for the steam-carbon reaction at 900° F. (482°) and at 1000° F. (538°). The order of the CO_2-carbon reaction and that of the steam-carbon reaction are derived. The water-gas reaction and the retarding effect of H both have the effect of increasing the apparent order of the whole reaction and it seems probable that the primary reaction is of the first order. Curves have been constructed by the use of several cokes varying in reactivity; from these curves, the reactivity of any coke can be read off, when the % decompn. of gas effected by that coke has been measured. A brief discussion is included. W. H. BOYNTON

Relation between oven width, coking time and capacity. T. KURODA. *J. Soc. Chem. Ind. Japan* **33**, Suppl. binding 485-6(1930).—Solvay coke ovens 470 mm. wide were tested against some 370, 400 and 420 mm. wide. The net coking time was reduced proportionally to width, $t = T + K$, where t = coking time, T = time of carbonization only and K = time of loading and unloading. For large output, a width of 400 mm. is best. E. M. SYMMES

Gas mixtures for multi-fuel-fired furnaces (SHADGEN) **9**. Blast-furnace gas as a metallurgical fuel (SHADGEN) **9**. Chemical examination of lignite (FUCHS) **8**. Presidential address [rationalization in the Fe, steel and coal industries of S. Africa] (HENDERSON) **9**. Distillation of foam-forming liquids, especially tars (Ger. pat. 506,545) **13**. Device for determining the water content of fuel, etc. (Ger. pat. 504,940) **12**. Plate drier for lignite, chemicals, etc. (Ger. pat. 505,606) **1**.

Liquid fuels. I. G. FARBENIND. A.-G. Brit. 333,550, March 11, 1929. High b. p. constituents of distillable liquid carbonaceous materials such as tars or mineral oils or products derived from distn., destructive hydrogenation or cracking of coal, tars or mineral oils are treated with solvents (such as liquid SO_2, liquid NH_3 or a mixt. of cyclohexane and MeOH, or mixts. of all these) to sep. the materials into 2 portions, one richer and the other poorer in H, and the second portion is then treated with H under pressure (preferably with a catalyst immune to S poisoning) either alone or with carbonaceous substances such as part of the first portion sepd., to produce a "*non knocking*" *motor fuel*. Various details and examples of procedure are given. Cf. *C. A.* **24**, 2580.

Motor fuel. WALTER STEIGER. Ger. 505,929, April 8, 1928. An alc. fuel is carbureted with C_2H_2 by satg. a vegetable oil, *e. g.*, olive or castor oil, etc., with the C_2H_2 and spraying it into the alc. Crude petroleum may also be mixed with the vegetable oil. Cf. *C. A.* **24**, 2580.

Igniting fuel below the surfaces of liquids. WILHELM SCHWARZENAUER. Ger. 486,877, Feb. 24, 1927. Jets of finely divided solid fuel are ignited below the surface of liquids, for heating, decomposing, distg. or gasifying them, by one or more elec. arcs.

Fire-lighting fuel. A. E. DREW and A. WILKINSON, Brit. 333,398, Aug. 14, 1929. Shaped products from wood-pulp sheets are impregnated with waxes, oils, resins, paraffin, etc.

Destructive hydrogenation of carbonaceous materials. STANDARD OIL DEVELOPMENT CO. Fr. 686,220, Dec. 6, 1929. In the destructive hydrogenation of heavy materials having a basis of asphalt, a mass of this kind is kept at the decompn. temp. in the presence of H under a high pressure and in the presence of a solid catalyst. The ratio between asphalt and catalyst is kept below 1. The temp. is preferably 426-521° and the pressure above 25 atm. Details of the process are given.

Apparatus for distillation of carbonaceous materials such as coal, oil shale, peat, garbage or wood waste. FREDERICK T. SNYDER. U. S. 1,785,565, Dec. 16. A vertical distn. chamber comprises an upper evapg. section, an intermediate carbonizing section and a bottom cooling section. A conduit leads to the bottom of the cooling section to supply cooling gas; a second conduit leads to the bottom of the carbonizing

section to supply hotter gas; and a third conduit leads to the bottom of the evapg section to supply coal gas. A fourth conduit leads from the top of the distn. chamber for withdrawing all the gas supplied by the other conduits and the fourth conduit discharges into a heat exchanger connected with a condenser and a reflux connection is provided between the condenser and heat exchanger to deliver cooled gas from the condenser to the exchanger for reheating, and connections are provided between the heat exchanger and the first, second and third conduits for supplying them with reheated gas. Various details of the app. are described. Cf. *C. A.* **25**, 399.

Horizontal chamber retort for distilling solid fuel. Firma Carl Still. Ger. 505,775, Nov. 27, 1925. Details of construction.

Retort for low-temperature carbonization. W. A. Collis. Brit. 333,020, July 4, 1929. A retort is described which has a vertical and tapering lower part and an upper part which is inclined and provided with steps or terraces.

An improved occlusion device for preventing explosions in fuel-treating apparatus. Maschinenfabrik Buckau R. Wolf A.-G. Ger. 504,770, Mar. 28, 1929. Addn. to 496,644 (*C. A.* **24**, 3632). A description is given of an improved occlusion device placed between the drying chamber and conveying spiral of a lignite- or peat-treating app. to prevent explosions.

Briquetting. Emil Kleinschmidt. Ger. 467,321, Aug. 10, 1926. An app. is described for mixing fuel with a liquid binding material, such as fluid pitch for briqueting.

Apparatus for forming and baking fuel briquets. Wm. C. Carpenter. U. S. 1,785,827, Dec. 23. Structural features.

Fuel briquets. Metallges. A.-G. and O. Hubmann. Brit. 333,811, Oct. 29, 1929. Coarse and fine material such as coal or lignite is used together in making briquets, and the coarse portion of the material only is subjected to low-temp. carbonization. Various details of operation are described.

Briquets of inferior fuel with organic and inorganic binding material. Kommanditgesellschaft Emanuel Friedlaender & Co. Ger. 505,672, Nov. 28, 1926. The fuel is mixed with such substances as cement, $MgSO_4$, CaO, pitch, naphthalene, tar oil, etc., and pressed into molds.

Smokeless briquets. Trent Process Corp. Ger. 505,791, Jan. 6, 1929. The briquets are made from a mixt. of finely divided C and oil and are subjected to a two-stage heating process in absence of O before being burned.

Coal briquets. H. Alexander. Brit. 333,713, July 19, 1929. Coal (preferably a mixt. of small anthracite and bituminous coal) is heated in containers which are carried through a furnace (details of the app. being described) to produce gaseous distillates and tarry material which serves as a binder in making briquets. Cf. *C. A.* **24**, 5982.

Furnace for drying and distilling coal. Kohlenveredlung A.-G. Ger. 505,561, May 21, 1922. Details of construction.

Rotary plate retort for drying and distilling coal. Kohlenscheidungs-G. m. b. H. Ger. 506,541, Jan. 11, 1929.

Annular kiln for distilling coal in containers or for other chemical operations. Woodall-Duckham (1920), Ltd., and A. M. Duckham. Brit. 333,227, May 4, 1929.

Apparatus for charging coal or other granular material into containers or retorts. S. R. Illingworth and Illingworth Carbonization Co., Ltd. Brit. 333,597, April 18, 1929

Vertical apparatus for distilling and carbonizing solid carbonaceous materials such as lignite. Wm. W. Odell (to Northern Lignite Coal Co.). U. S. 1,785,645, Dec. 16. Structural features.

Montan wax. A. Riebeck'sche Montanwerke A.-G. (Theodor Hellthaler and Erich Peter, inventors). Ger. 505,815, July 16, 1927. Hot solns. of crude montan wax are cooled rapidly so that the pure wax esters and non-resinous parts are pptd. and sepd. from the resinous parts by filtration or decantation.

Distilling crude montan wax. I. G. Farbenind. A.-G. Ger. 505,927, May 12, 1929. The distn. takes place in the presence of absorbing agents such as active C, fuller's earth, unglazed earthenware, pumice stone, H_2SiO_3 gel, etc., the wax vapor being passed over or through these agents.

Waste water from bitumen manufacture. Curt Bunge and Heinrich Macura. Ger. 505,570, Dec. 1, 1927. Waste or distn. water from the working up of bituminous materials is purified with simultaneous production of *artificial resin*. The water is heated with aldehyde to attack such impurities as phenols, the resinous product being removed by flotation. Clarifying agents such as $Al_2(SO_4)_3$, $(AcO)_2Pb$, etc., may also be added.

Apparatus for separating light ash from flue gases. ALWIN BARTL. Ger. 505,932, Sept. 21, 1927. Details of construction and arrangement.

Gasification of solid fuel. CALEB DAVIES, JR. U. S. 1,784,985, Dec. 16. An app. is described comprising a rotary water-gas generator, a carbonizer above the generator connected to receive hot water-gas from the generator and to supply carbonized residue to it; the carbonizer is inclined and has a rotary mounting to effect continuous lifting and dropping of the fuel through the hot gases. A fuel preheater is also provided connected with the carbonizer.

Domestic gas-generating apparatus for producing gas from ignited carbonaceous fuel, air and moisture. HARRY F. SMITH (to Gas Research Co.). U. S. 1,785,820, Dec. 23.

Gas-producer operation. SOUTH METROPOLITAN GAS CO. and C. C. CARPENTER Brit. 332,921, April 30, 1929. To diminish loss of fuel during the clinkering period, the natural draft is replaced by a suction so controlled that the draft is kept above the minimum requisite for avoiding dangerous escape of hot gas through the clinkering doors. Good-quality gas is made during the clinkering period. Various details of producer construction and operation are described.

Gas producer. C. S. CHRISMAN (to Humphreys & Glasgow, Ltd.). Brit. 333,072, Oct. 18, 1928. Various details of construction are described of a producer in which the fuel bed is supported on an inverted conical rotary bosh provided with ribs to force fuel or ash downward.

Gas producer for use with bituminous fuel. H. HIDAKA. Brit. 333,021, July 4, 1929. A revolving coke-extn tube projects up into the producer and removes part of the coke, the remainder being gasified to produce an amount of water gas for production of a gas of the desired calorific value when mixed with the distn gas from the upper zone of the producer. Various details of the app and its operation are described

Gas producer with a rotatable body. JOHN F ROGERS (to Wellman Engineering Co.). U. S. 1,784,882, Dec. 16. Structural features.

Gas-producing furnace. C. OTTO & COMP G M. B. H. Ger. 503,814, Jan. 20, 1928. Details of the method of heating by means of upright heating canals.

Feed mechanism for gas producers. JOHN F. ROGERS (to Wellman Engineering Co.). U. S. 1,785,789, Dec. 23.

Fuel loaders for gas producers. CARL PFEIFFER. Ger 504,927, Mar. 24, 1929.

Steam-generating and heat-conserving system suitable for utilizing waste heat from water-gas plants. F. W. STEERE (to Semet-Solvay Engineering Corp.). Brit 333,472, Nov. 17, 1928. Gases are passed into a flash boiler, the steam from which is delivered to a heat-conserving body of water. Various details of app. and operation are described.

Water gas. A. BREISIG. Brit. 333,842, Dec 3, 1928. Part of the waste blast gases from a water-gas generator pass to a steam superheating regenerator above which a vaporizer is mounted and the remainder pass to a regenerator connected with a waste heat boiler. During the run the last-mentioned regenerator is swept over by a carrying gas (which may be part of the water gas produced) to supply the stored heat to the boiler so that the latter is heated both during blasting and steaming. Various details of app. are described.

Water gas. HENRY O. LOEBELL (to Henry L. Doherty). U. S. 1,785,519, Dec 16. In a process involving alternate blasting of a fuel bed with air and with steam water is introduced into a vaporizing zone during the steam blast period where it is substantially instantaneously converted to steam, the resulting steam is used for blasting the fuel and the supply of water thus used is automatically decreased at a predetd. time-controlled rate during the blasting period to maintain a substantially const. excess of steam in the water gas passing from the gas-making zone. App. is described.

Water gas. THEODOR LICHTENBERGER and LUDWIG KAISER. Ger. 493,675, Feb. 15, 1927. C and superheated steam are led into a bath of fused salt at about 800° to produce water gas.

Purifying gases. I. G. FARBENIND. A.-G. (Christian J. Hansen, inventor) Ger. 507,396, July 22, 1926. Addn. to 504,640. In the absorption of NH_3 and H_2S from gases, the greater amount of the NH_3 and H_2S is removed by washing with $(NH_4)_2S_2O_3$ soln. contg. NH_4 polythionate and H_2SO_3 soln. The remainder is removed by the method of 504,640 (*C. A.* **25**, 400).

Purification of distillation gas. CHEMINOVA GES. ZUR VERWERTUNG CHEMISCHE VERFAHREN M. B. H. Ger. 500,896, May 12, 1928. The gas is treated with such amount of naphthalene solvents at ordinary pressure, that the gas is satd. therewith. The solvent is liquefied by compression when the dissolved substances separate out and the purified gas escapes. Cf. *C. A.* **24**, 949.

Purifying coal gas. Soc. anon. ammonia. Ger. 507,301, Jan. 24, 1926. In removing H_2S, CO_2, etc., from coal gas by washing with water under pressure, the water contg. gas under pressure is used to drive a turbine or the like, which assists in supplying the water under pressure. App. is shown.

Coal-gas purification. Gewerkschaft M. Stinnes. Brit. 333,297, Feb. 6, 1928. In removing naphthalene from coal gas, the gas is compressed and bubbled through a naphthalene solvent such as naphthalene oil, benzene washing oil, steam-volatile portions of washing oil, tar oil or anthracene oil (suitably at 30° and 1.5 atm. pressure) and then cooled to ppt. solvent vapor and naphthalene. Cf. *C. A.* **24,** 2277.

Removing ammonia and hydrogen sulfide from coal gas. Heinrich Koppers A.-G. and Christian J. Hansen. Ger. 504,777, Apr. 6, 1928. For simultaneously washing out both NH_3 and H_2S, the gas is passed through a single liquid contg. FeS_2O_6 for absorbing NH_3 and H_2S in the stoichiometric proportion of 2:1, and $Fe(OH)_3$ for absorbing the excess of H_2S. To ensure the maintenance of the FeS_2O_6 and $Fe(OH)_3$ in the wash liquid, this is treated with H_2SO_3 and O (air).

Removing benzene from gases. Ges. für Linde's Eismaschinen A.-G. Ger. 478,927, May 21, 1925. Gases, especially coke-oven gases, are freed from C_6H_6 by submitting them to low temps., to condense the C_6H_6. The app. is described.

Removing naphthalene and carbon disulfide from gases. Gilbert E. Seil (to Koppers Co.). U. S. 1,785,365, Dec. 16. There is recirculated in the path of the flowing gas a solvent such as kerosene which will absorb both naphthalene and CS_2, portions of the solvent are withdrawn to reduce the amount of naphthalene contained in the recirculated body of solvent, and fresh solvent is added to maintain the solvent at a suitable state of purity, and the recirculated solvent is treated (suitably by an alc. or alkali soln.) to remove CS_2 from it and thus maintain its capacity for further absorption of CS_2. App. is described.

Removing carbon disulfide from gas. Walter J. Klaiber (to Koppers Co.) U. S. 1,785,415, Dec. 16. In a process of the general type described in U. S. 1,785,365 (preceding abstr.), an oil such as gas oil is used as the recirculated solvent, and an aq. alk. sulfide soln. is used for removal of CS_2 from the recirculated oil.

Gas holder. Bamagmeguin A.-G. Brit. 333,142, March 1, 1929. The roof of a gas holder of the floating disk type is covered with a material resistant to weather and normal stresses but easily collapsible without splintering in the event of an explosion, such as balloon fabric, celluloid or cellophane.

Combustible compositions. Asociacion de productores de Yodo de Chile. Brit. 333,364, July 11, 1929. See Fr. 680,116 (*C. A.* **24,** 3888).

Device for intensively mixing combustible gas with air. C. Otto & Co. G. m. b. H. Ger. 507,414, July 21, 1929. The device is intended particularly for the heating flues of *coke ovens*, etc.

Coking. Heinrich Koppers. Ger. 504,810, May 30, 1926. The method is described of charging the coal into the retort to avoid uneven distn.

Coke-quenching device. Woodall-Duckham (1920), Ltd., and James Wilson Rieber. Ger. 504,907, May 20, 1926. Details of arrangement.

Coking oven. Arthur Killing and Wilhelm Elbert. Ger. 505,630, May 31, 1928. Details of the door.

Coke-oven-heating wall. C. Otto & Co. G. m. b. H. Ger. 501,464, Aug. 4, 1927. Addn. to 498,730 (see following abstr.) Further details.

Coke oven. C. Otto & Co. G. m. b. H. Ger. 498,730, Nov. 29, 1925. Addn. to 480,740 (*C. A.* **23,** 5034). Details of an upright burner arrangement and heating walls for a gas-producing furnace.

Gas producers. C. Otto & Co. G. m. b. H. Ger. 505,458, July 29, 1927. Addn. to 498,730 (see preceding abstr.) Details of the burner arrangements for heating the walls.

Rotary plate coking oven. Trocknungs-, Verschwelungs- und Vergasungs-G. m. b. H. Ger. 504,824, Jan. 16, 1927. Details are given.

Rotary annular plate oven for carbonizing fuel. Trocknungs-, Verschwelungs- und Vergasungs- G. m. b. H. Ger. 505,886, May 6, 1927. Addn. to 504, 824 (preceding abstr.) Details of construction.

Method and apparatus for heating coking ovens having vertical heating flues. Carl Wessel. Ger. 507,295, Feb. 1, 1927.

Coke oven (especially relating to means for smoke removal). Joseph van Ackeren (to Koppers Co.). U. S. 1,785,748, Dec. 23.

Apparatus for charging coke ovens or similar retorts. Joseph van Ackeren (to Koppers Co.). U. S. 1,785,749-50-1, Dec. 23. Structural features.

Coke oven (especially relating to discharging and quenching apparatus). JOSEPH BECKER (to Koppers Co.). U. S. 1,785,760, Dec. 23. Structural features.

Coke-oven-discharging apparatus. WELLMAN SMITH OWEN ENGINEERING CORP., LTD., and S. STOCKDALE. Brit. 333,294, May 11, 1929. Structural features.

Apparatus for discharging vertical coking retorts, etc. F. J. WEST, E. WEST and WEST'S GAS IMPROVEMENT CO., LTD. Brit. 333,381, Aug. 1, 1929. Structural features.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

Phenols of petroleum. E. HOLZMANN AND S. VON PILAT. *Brennstoff-Chem.* **11**, 409–13(1930).—Crude naphthenic acids from Boryslaw light-oil distillate contained 30% while the acids from Bitkòv distillate contained only 3.1% of phenols. The absence of PhOH in the extd. phenolic fraction of Boryslaw distillate was proved, but all 3 cresols, the 1,3,5- and 1,3,4-xylenols and β-naphthol were isolated, identified and detd. The 1,2,4-xylenol and a mesitol were tentatively identified. Phenolic compds. with long side-chains, as well as methoxy groups, were not found. In contrast to the naphthenic acids, the phenols could be detected in the alk. ext. of the original petroleum.

F. W. JUNG

Cracking of hydrocarbons. E. BERL AND RUDOLF LIND. *Petroleum Z.* **26**, 1027–42, 1057–70(1930).—Messel shale oil, paraffin m. 54–6°, $C_{10}H_{12}$, and $C_{10}H_8$ were subjected to a heat treatment in contact with catalysts, at atm. pressure. The charge was distd. and the vapors were conducted up through the catalyst contained in an electrically heated tube 30 mm. × 480 mm., thence through a fractionating column and condenser. Any condensate in the column was returned to the still for retreatment. The uncondensed vapors were led through a U-tube contg. activated charcoal. The oil recovered at this point was added to the distillate. (*A* will designate the distillate boiling below 200°; *B*, the distillate boiling above 200°; and *G*, the gas and loss.) In an empty iron tube the yields of *A* and *B* were better than those obtained in a Monel-metal tube. Of the catalysts used pumice had no effect. Activated charcoal gave the best results, by virtue, perhaps, of its adsorption of heavy, easily condensable hydrocarbons, retarding their progress through the cracking zone until they were cracked. The cracked products were then replaced by heavier hydrocarbons. At a given temp. both the yield and the quality varied with the rate of distn. With 50 g. of catalyst, 400 g. of paraffin yielded at 383–420°, 34.8% *A*, 5.7% *B*, and 57% *G* in a 6-hr. run, and 53.3% *A*, 9.5% *B*, and 30.7% *G* in an 8.5-hr. run. When the catalyst was reused for a second batch distd. in 8.5 hrs., the yields were 44.5% *A*, 19.3% *B* and 26% *G*. The content of olefins (*U*) and aromatic hydrocarbons (*Ar*) was higher in the faster run and in the expt. where the catalyst was reused. In general, the *U* and *Ar* increased as the distn. progressed while the H content of the gas dropped and *U* rose. The total distillate obtained from paraffin with the used catalyst was about equal to that obtained when the catalyst was fresh. This is not true in the cracking of the shale oil; in this case the activity of the charcoal dropped very rapidly and could not be restored by treatment with Me_2CO. Presumably the pores were filled with carbon or carboids of high mol. wt., insol. in Me_2CO. $C_{10}H_8$ was practically unchanged at 550° while $C_{10}H_{12}$ was converted to $C_{10}H_8$. The gases consisted of 75.5% of H_2 and 22.1% of paraffins + N_2. No olefins were present. Porcelain in the form of beads 3 mm. in diam. was not as active as charcoal, yielding 64 cc. of distillate at 492–518° in 10 hrs. as compared with 346 cc. at 468–506° in 8½ hrs. for the charcoal. The gasoline was much less paraffinic while the gases contained 50% of olefins and 2.1% of H_2 as compared with 2.3% of olefins and 39.4% of H_2 with the charcoal. In the presence of molybdic acid, the shale oil yielded 22% of *A*, 2.6% of *B* and 15.2% of *G*. When the catalyst was reused, the yield of *A* dropped to 14.4% but rose to 21.7% when the catalyst was reactivated by heating in a stream of air for 1.5 hrs. at 520–600°. The catalyst was prepd. by adsorbing, on pumice, a soln. of $(NH_4)_2MoO_4$ in a min. of hot H_2O, drying at 110° and heating to 500–50° in the presence of air. The MeOH catalyst (D. R. P. 441,433) showed little activity. For its prepn., 2 mols. of ZnO, 1 mol. of CrO_3 and 2 mols. of $MnCO_3$ were ground together with a little H_2O, dried, ignited, compressed with a hydraulic press and broken up in pieces. Expts. were conducted to det. the efficiency in the recovery of hydrocarbons adsorbed by activated charcoal. About 10 cc. of the hydrocarbon was adsorbed by the charcoal and driven off by steam at 130–135°. The losses were 0.43 cc., 0.32 cc., 0.45 cc. and 1.3 cc. for PhMe, $C_6H_4Me_2$, benzine boiling

at 100–110°, and that boiling at 60–70°, resp. These figures compare with an av loss of 0.45 cc. for C_6H_6. A review of cracking is also given, covering the theory of cracking in the liquid and the vapor phases and in the presence of catalysts, together with a short description of the app. and operation of the Burton, Dubbs, Cross, Holmes-Manley, Tube-and-Tank, and Carburol processes. I. M. LEVINE

Advance in the rational processing of crude oils (Seelig process). A. SALMONY-KARSTEN. *Petroleum Z.* **26,** 1015–21(1930).—In 1929, about ⅔ of the world's requirements of motor fuel was provided by cracking. The adoption of metal baths for heat transfer, as in the Blümner and Seelig processes, is an aid in avoiding coke formation. The Seelig process is based upon the belief that the best yields of gasoline are obtained when the oil is brought almost to the cracking temp. and then very rapidly heated to the temp. at which max. cracking takes place. A pressure of 35–40 atm. is used. Little coke has been found in practice. The process operates on various charging stocks and produces 68.5–70% of antiknock gasoline contg. 25% of aromatic hydrocarbons, 21–23% of residue from which 62% of oil of high viscosity could be made and 8–9% of gas, the heating value of which was 15,000 and 8,000 kg. cal. per cu. m. before and after stripping, resp. The operating loss is 2%. The process is economical of heat and can be operated economically in small units processing 50–100 tons daily. I. M. LEVINE

Hydrogenation of residues from Boryslaw crude oil. J. EHRLICH AND A. SZAYNA. *Petroleum Z.* **26,** 1043–6(1930).—A Boryslaw crude oil, from which the fraction b. to 220° was removed, was subjected to destructive hydrogenation without a catalyst for 220–320 min. at 435–52° with an initial H_2 pressure of 89–98 atm. The product was fractionated and the residue again hydrogenated. After fractionating and hydrogenating 3 times, the total yield of oil b. to 180°, based each time on the residue processed, was 23.32%, 16.4% and 16.1%. The benzine was heavier and contained less of paraffins and olefins but nearly 3 times as much of aromatic hydrocarbons and possibly more naphthenes. The d. of the residue rose from 0.907 to 0.929 while the cold test dropped from +26° to lower than −18°. This signified that paraffin had been decomposed. The residue from the last hydrogenation was subjected to a steam distn. Paraffin was still present. A residue of 10.3% of asphalt remained. PhOH was detected in the aq. distillate. The oil distillate was hydrogenated. A yield of 17.62% (temp. 430–50°) and 8.48% (temp. 435–40°) of benzine was obtained. From the 4 hydrogenations, averaging the yields at each step, 47.4% of benzine and 26.2% of residue and asphalt were obtained, based on the original topped crude oil. The gas and loss amounted to 26.4%. The gas was practically free from benzine. I. M. LEVINE

A new type of Surakhanui crude oil. L. GUKHMAN AND A. PLOTKO. *Azerbaidzhanskoe Neftyanoe Khozyaĭstvo* **1930,** No. 9, 102–3.—A nonparaffinic crude oil (unusual for Surakhanui) of the following compn. was obtained from the first well drilled into the sixth layer: sp. gr., 0.8812–0.8839; excise resins, 11.2–12%; fraction boiling below 150°, 0.44–1.62% of 0.7564–0.7665 sp. gr.; 150–300°, 39.7–40.6%, of 0.8368–0.8437 sp. gr., and 31–37° Abel-Pensky flash; fuel oil, 57.1–59.4% of 0.9071–0.9144 sp. gr., 5.08–5.97 E_{50} viscosity, 158–174° Brenken flash, 15.6–19% excise resins; cold test below, −20°. The crude oil contained gas oil 8.9, spindle oil 5.9, machine oil 10.0, cylinder oil 5.9 and residues 18.7%. It is very low in asphalt and requires only small quantities of reagents to produce high-grade com. products. About 30% of oils suitable for automobiles was obtained. A. A. BOEHTLINGK

Experiments with a refinery distillation of the new Surakhanui crude oil. R. PROZUMENTIK. *Azerbaidzhanskoe Neftyanoe Khozyaĭstvo* **1930,** No. 9, 122–3.—The results are similar to those obtained by Gukhman and Plotko (preceding abstr.). A. A. BOEHTLINGK

Preheating crude oil. P. VARDIKYAN. *Azerbaidzhanskoe Neftyanoe Khozyaĭstvo* 1929, No. 12, 73–6.—Crude oil preheated to 90° is passed through a heat exchanger constructed of a pipe into which a smaller pipe is inserted concentrically. The crude oil is heated to 116° by residues having a temp. of 245°, discharged from the last of a series of shell stills. The crude oil then enters the settling vessel where water and mud are sepd. The oil is then passed into the first still. A higher yield of distn. products and a smoother operation are claimed. Full calcns. are given. A. A. B.

Air investigation in refineries. I. LAPKIN AND G. EGOROVA. *Azerbaidshanskoe Neftyanoe Khozyaĭstvo* **1929,** No. 12, 76–8.—The content of hydrocarbon vapors in the air in various locations in refineries was detd. by adsorption in silica gel. In a still house was found a max. of 16.7 mg. of gasoline vapors in one l. of air. A. A. B.

Cracking value of straight-run and cycle gas oil. H. SYDNOR AND A. C. PATTERSON. *Ind. Eng. Chem.* **22,** 1237–40(1930).—Upon successive passes through the equip-

ment under the same operating conditions (1) the yield of gasoline, based on the feed stock for each pass, decreases; (2) the ratio of fuel-oil yield to gasoline yield increases; (3) the boiling range of the cycle gas oil produced is lowered; (4) the A. P. I. gravity corresponding to a given boiling range is lowered; and (5) a decided change in the chem. compn. of the cycle gas oils occurs, as indicated by the decrease in the aniline point. Conclusion: The cracking value of cycle gas oils, in terms of the products derived, decreases with successive passes through the equipment. A. H. E.

Evaporating oil-well water. S. KONSTANTINOV, V. MALUISHEK AND B. TUMILLO-DENISOVICH. *Azerbaidzhanskoe Neftyanoe Khozyaĭstvo* **1929**, No. 11, 82–91 and No. 12, 78–86.—It is claimed that I, Br, NaCl and $MgCl_2$ solns. obtained from oil-well waters can be concd. by passing them through brush-wood evaporators. The brine so obtained can be worked up by the usual methods. The sepn. of constituents can be effected at a cost far below their actual market value. A. A. BOEHTLINGK

Table for calculating the dynamic viscosity in centipoises from Engler degrees. M. FREUND. *Petroleum Z.* **26**; *Motorenbetrieb und Maschinen-Schmierung* **10**, 3–4 (1930).—Viscosity should be expressed in the c. g. s. system, since this would standardize the results obtained all over the world and thus aid in international commerce. Relative viscosity expressed in the arbitrary units adopted does not run parallel with the abs. viscosity and for two oils having the same viscosity in terms of any of the arbitrary units but a different d , the abs. viscosities are different. A table is given by which the abs. viscosity in centipoises can be calcd. from the viscosity in degrees Engler. For oils having a higher viscosity than 8° E., the formula $\eta = 7.6\ Ed$ is used, where η is the abs. viscosity in centipoises, E is degrees Engler and d is the density I. M. LEVINE

Distilling naphthenic acids. I. GUTT, L. IOANESYAN AND G. NOVRUSKHANOV *Azerbaidzhanskoe Neftyanoe Khozyaĭstvo* **1930**, No. 9, 138–9.—Crude oils when distd carry over naphthenic acids boiling up to 50° above the boiling range of the resp. petroleum cuts. Steam or vacuum distn. produces the same results. A. A. B.

Sources of error in the determination of boiling point and boiling range of commercial benzines by the method of Krämer and Spilker. W. MELZER. *Brennstoff-Chem.* **11**, 371–2(1930).—For 3 different grades of motor fuel, the effects upon boiling range caused by variations in flask-diam., wall-thickness and resultant distn. rates are shown in tabular form. F. W. JUNG

Progress toward a uniform method of measuring detonation. T. A. BOYD. *Ind. Eng. Chem.* **22**, 1301–2(1930).—Antiknock value is affected by carburetor setting, spark advance and temp. Standard variable compression and fixed compression engines are adopted. Standard fuels are *n*-heptane and isooctane, antiknock values being expressed in octane no. Speed, temp., compression, spark timing, atm. conditions, mixt. ratio, etc., will be standardized. E. M. SYMMES

Technical and economic significance of the Edeleanu refining process for the supplying of transformer, switch and turbine oils. FRITZ FRANK. *Petroleum Z.* **26**, 1046–7(1930).—See *C. A.* **24**, 5991. I. M. LEVINE

Sludge determination. L. GUKHMAN. *Azerbaidzhanskoe Neftyanoe Khozyaĭstvo* **1930**, No. 5, 97–100.—Errors in the Russian method of detg. excise resins are due to the high soly. of H_2SO_4 in the gasoline that is used for diluting heavy oil fractions The use of gas oil as a diluent is recommended. A. A. BOEHTLINGK

Lubricating oils. YU. E. EMMUIL. *Neftyanoe Khozyaĭstvo* **18**, 413–19(1930).—A heavy Binagadui asphalt-base crude oil contained 3% of second-grade gasoline, 10–12% of kerosene, 16–18% of gas oil and 58–60% of fuel oil (composed of machine oil 25–27%, cylinder oil No. 2 1–2%, gas oil grade 1 4–5%, black solar oil 26–28%) and bottom oils which yielded 92–95% of tar. The fuel oil used in the prepn. of lubricating oils had a sp. gr. of 0.9480, E_{50} viscosity 24.0, open-cup flash 150°, excise resins 58%, cold test below −18°, C 4.24%, S (by bomb) 0.349%, acidity (% SO_3) 0.157%, ash 0.024% and paraffin 0.420%. The distillates were treated with 92% H_2SO_4 and 1.5–2.0° Bé. soln. of water glass. Spindle oil, machine oil and cylinder oil obtained by vacuum-steam distn. consumed 6–7% H_2SO_4, 0.05% water glass, 0.4–0.5% NaOH, [illegible] treating operation. [illegible] 0.0000–0.0027, color scale 4.0–32.5, cold test below −14° to below −20°, acidity [illegible]% 0.0027–0.0105%, ash 0.00–0.003%, S (bomb) 0.217–0.262% and paraffin 0.014–0.280%. The oils were stable and transparent and met the resp. standards. The treating process with water glass is characterized by its cheapness, absence of emulsions and an easily pptg. acid sludge which is explained by the coagulating action of the water glass.

A. A. BOEHTLINGK

Origin of petroleum (FISHER) 8. Liquid fuels (Brit. pat. 333,550) 21. Apparatus for gravity separation of liquids such as oil and water (U. S. pat. 1,784,943) 1. Apparatus for combined ore-reduction and hydrocarbon refining (U. S. pat. 1,785,427) 9. Apparatus for distillation of carbonaceous materials such as coal, oil shale, peat, etc. (U. S. pat. 1,785,565) 21.

Petroleum oil conversion. WALTER M. CROSS (to Gasoline Products Co.). U. S. 1,785,073, Dec. 16. Oil is heated in a coil and passed to an enlarged chamber (both the coil and chamber being maintained under sufficient pressure to keep the oil in liquid condition), and an O-contg. gas such as air or O is added to the oil in the chamber to maintain the thermal conditions of conversion and to supply O to increase the "anti-detonating properties" of the product; heated oil from the conversion chamber is passed to a subsequent stage where the pressure is suitably reduced to distil off lighter fractions. App. is described.

Treating residues from distillation of petroleum oils with caustic soda. ARMAN E. BECKER and REGINALD G. SLOANE (to Standard Oil Development Co.). U. S. 1,785,242, Dec. 16. The residue is thinned with naphtha, washed with water and naphthenates are recovered from the wash water, and while in the presence of the naphtha the residue is treated with 66° Bé. H_2SO_4 at the rate of about 50 lb. per bbl. and sludge is removed after settling, followed by treatment with NaOH soln., washing and distg. off naphtha.

Distilling and cracking oils such as crude petroleum. EDWARD O. BENJAMIN. U. S. 1,784,956, Dec. 16. The oil is passed successively through a series of retorts, in each of which it is maintained at higher temps. and lower pressures than in the preceding retort; vapors are led off from each retort and their constituents are separately condensed; lighter condensate is segregated and heavier condensate is fed into a retort of higher temp. and lower pressure than that of the retort from which it was derived by injector action of higher-pressure gases. Various details of app. and operation are described.

Cracking hydrocarbon oils. N.-V. DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Brit. 333,335, June 7, 1929. See Fr. 677,640 (*C. A.* **24**, 3353).

Cracking hydrocarbon oils. C. P. DUBBS. Brit. 332,913, March 27, 1929. In a cracking process of the general character described in Brit. 249,604 (*C. A.* **21**, 1006), polymerization of the residue is checked by controlling the reduction of pressure in the scpg. or reaction chamber by controlling the liquid level in this zone by regulating the speed of withdrawal of the residue, and by dissipating the heat from the residue immediately after its withdrawal, as by passing it through a cooling coil. App. and various details of operation are described. Cf. *C. A.* **25**, 199.

Continuously skimming and cracking hydrocarbon oils. JOHN W. COAST, JR., and GORDON T. GRANGER. U. S. 1,786,053, Dec. 23. A stream of charging stock is preheated in a reflux condenser by which the lightest fraction is vaporized from the stream, and the skimming operation is continued by forcing the unvaporized oil through a skimming still without substantial cracking of the oil; the resulting vapors are subjected to reflux condensation in the reflux condenser mentioned and the reflux condensate is forced through a cracking still to effect cracking of the condensate, the cracked condensate is vaporized and the cracked vapors are subjected to reflux condensation and the cracked reflux condensate thus formed is added to the reflux condensate produced in the skimming operation. App. is described.

Apparatus for cracking hydrocarbons. WALTER MILLER (to Continental Oil Co.) U. S. 1,785,042, Dec. 16. Various details are described of a dephlegmating and refluxing column from which mixed charging stock and reflux condensate is supplied to a cracking app.

Apparatus for cracking oils, evaporating various solutions, etc. I. G. FARBENIND. A.-G. Brit. 333,241, Feb. 8, 1929. Various details of app. are described provided with heated immersed stirrers which are made of such shape as to offer relatively small resistance to the liquid under heat treatment such as oil to be cracked or solns. or dispersions such as those of gelatin to be concd.

Pressure-control apparatus suitable for use with oil-cracking apparatus. THEODORE H. CARPENTER (to Gulf Refining Co.). U. S. 1,785,807, Dec. 23. Structural features.

Converting heavy into lighter hydrocarbon oils. N.-V. MIJNBOUW- EN CULTUURMAATSCHAPPIJ "BOETON." Brit. 333,553, Jan. 16, 1929. A soln. of $FeCl_3$ of 1.6 sp. gr. or other soln. of chlorides such as those of Zn, Cu, Al or Ni contg. at least 58% of the chloride is used for decolorizing and converting high b. p. hydrocarbon materials contg.

unsatd. compds. into lower b. p. products at temps. above 60° (preferably 70–100°), followed by distn. of the oil after removal of the salt soln. Examples are given of the treatment of crude petroleum.

Pyrolytic conversion of hydrocarbon oils. NATHANIEL E. LOOMIS, ALBERT H TOMLINSON and FRANK A. HOWARD (to Standard Oil Development Co.). U. S. 1,785,274, Dec. 16. A stream of oil is passed through a heating zone such as a pipe coil with temp., pressure and time conditions to effect substantial cracking and vaporization, then through a zone such as an insulated drum where the oil is held for a longer time and where relatively cool oil is introduced while still maintaining a cracking temp and fluid products are withdrawn together from the last-mentioned zone. App. is described.

Flash drum apparatus for distilling hydrocarbon oils. CLARKE C. MILLER (to Standard Oil Co. of Ind.). U. S. 1,786,357, Dec. 23. Structural features.

Purifying light hydrocarbon oil distillates. EDWARD B. HUNN (to Standard Oil Development Co.). U. S. 1,786,246, Dec. 23. A distillate such as sour cracked naphtha is treated with "doctor soln.," a low b. p alkyl disulfide such as Pr or Me disulfide is added, and the ppt. formed is sepd.

Cracking mineral oils. ARTHUR E. PEW, JR., and HENRY THOMAS (to Sun Oil Co.). U. S. 1,786,315, Dec. 23. Oil is passed to a cracking zone and thence is continuously circulated through a second cracking zone and back to the first cracking zone; a body of Hg is vaporized and the Hg vapor used to heat the second cracking zone, and vapors are continuously removed from the first cracking zone and treated in a fractionating device. App. and various details of operation are described Cf. *C. A.* **24**, 1498

Refining mineral oils, etc., containing sulfur. N.-V DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Brit. 332,944, April 27, 1929. Gas oil or the like contg. S is refined by heating with H in the presence of a colloidal Mo compd. absorbed in or distributed on a finely divided material such as absorption C, under substantially non-cracking conditions (suitably at a temp. of 380° under pressure with a catalyst prepd. from an NH_4 molybdate soln. acidified with H_2SO_4, heated and reduced with H_2S, mixed with "Carboraffin," and dried) Cf. *C. A.* **24**, 1212.

Apparatus for purifying heavy mineral oils by treatment with liquid sulfur dioxide. ALLGEMEINE GES FÜR CHEMISCHE INDUSTRIE. Brit. 333,687, June 21, 1929. Structural features.

Device for bailing and taking samples from oil wells, etc. JOSEPH F. DORNACHER U. S. 1,786,152, Dec. 23. Structural features

Locating water strata in wells such as oil wells. GEORGE H. ENNIS (one-half to Robert V. Funk). U. S. 1,786,196, Dec. 23. An ionizable chemical such as NH_4Cl is dissolved in the water of the well, plates such as Cu and Zn are lowered into the soln. to form a voltaic cell and are moved through the soln while held in spaced relation, and the potential difference between the plates during the movement is recorded.

"Non-knocking" fuels for internal-combustion engines. I G. FARBENIND. A.-G Brit. 333,224, April 24, 1929. Motor fuels having a tendency to "knock" (other than fuels obtained by destructive hydrogenation of carbonaceous materials), such as "straight run gasoline," are blended with liquid products of the destructive hydrogenation of coal or of coal distillates in sufficient proportion (usually about 10–20%) to suppress "knocking" and other "anti-knock" agents may be conjointly used. Various examples are given.

Petrolatum. FRANCOIS LAVIROTTE (to Standard Oil Development Co.). U. S. 1,785,270, Dec. 16. Petrolatum of substantial purity is obtained by the reaction at an elevated temp. (suitably about 120–160°) of fuming sulfuric acid upon a petrolatum-contg. material assocd. with carbonizable substances to convert the latter into non-liquid carbonaceous products, and then effecting sepn.

Removing oils from paraffin masses by exudation. RICHARD NEUMANN. Ger. 505,926, Dec. 9, 1928. An app. for sweating and cooling the paraffin is described.

Lubricant for internal-combustion engines, etc. NELS C. BEIM. U. S. 1,784,899, Dec. 16. Substantially equal quantities of 2 grades of com. lubricating oil, such as "viscous stripped neutral" and bright stock, paraffin base, are injected under heavy pressure into a closed chamber so that thorough intermixture takes place; the mixt is subjected to a partial vacuum of approx. 10 lb., heated to about 220° to drive off a portion of the lighter fraction, followed by addn. to the residue of about 0.3% Mg stearate, and filtering. App. is described.

Still suitable for distilling volatile materials from used lubricating oils from internal-combustion engines in garages, etc. F. O. KRIEGER. Brit. 333,271, April 10, 1929.

Emulsions. DEUTSCHE ERDÖL-A.-G. (Friedrich Schick, inventor). Ger. 490,-

883, May 27, 1923. Mineral-oil emulsions for lubricating and drilling are prepd. by heating the oil with unsapond. montan wax, without addn. of soap soln. or salt soln.

Bituminous emulsions. JOHN A. MONTGOMERIE. Ger. 506,135, Dec. 31, 1927. See Brit. 300,414 (*C. A.* **23**, 4061).

Bituminous emulsions. C. G. FOX. Brit. 333,152, Feb. 4, 1929. Emulsification of materials such as tar or liquefied asphalt is effected by use of soaps assocd. with higher monohydric aliphatic alcs. The soaps and alcs. may be mixed together as such or may be derived by reaction of caustic alkali with a liquid animal wax such as sperm oil. Protective colloids or stabilizers may be added to the emulsions. Brit. 333,153 describes emulsification of similar bituminous materials by use of the products obtained by treating liquid marine animal waxes or fats contg. esters of monohydric aliphatic alcs. (such as sperm oil) with H_2SO_4 or H_3PO_4.

Bituminous emulsions. J. PARKER. Brit. 333,303, May 14, 1929. Aq. emulsions of coal tar oils, creosote, tar, petroleum oils, pitch bitumen, asphalt, etc., are prepd. by agitating a mixt. of casein, rosin, NaOH or KOH and water at 98–100° until complete saponification is effected, cooling to 95°, adding crude coal-tar naphtha at the same temp. under a reflux condenser and then adding the main ingredient heated to about the same temp.

Asphalt emulsions. P. LECHLER. Brit. 333,496, Feb. 2, 1929. A soln. of an alkali such as carbonate or hydroxide of Na or K is added to a molten mixt. of asphalt and a saponifiable substance such as a fatty acid, in successive quantities, of different concns., most of the alkali being added at an early stage of the process, preferably the first treatment. Various details of procedure are given.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Determination of cellulose in straws. SAMUEL H. JENKINS. *Biochem. J.* **24**, 1428–32(1930). The cellulose is detd. by treating the straw with hot dil. alkali and acid and then with cold hypochlorite soln. BENJAMIN HARROW

A modification of the method for the differentiation of bleached and unbleached fibers. FRANK R. FILZ. *Paper Trade J.* **91**, No. 16, 49(1930).—The technic of the Bright staining method has been modified by staining at room temp., and by using the following stable soln. as soln. *C*: shake 0.5 g. of benzopurpurin 4B crude with 100 cc. EtOH, let the insol. matter settle, and decant. Two yrs.' experience with the method showed it to be sufficiently accurate for all ordinary purposes, while the time required for a detn. is only about 10 min. With this technic, unbleached fibers are stained the usual blue color, and bleached fibers are stained a delicate pink instead of a bright red. A. PAPINEAU-COUTURE

Pulping eastern hemlock by the sulfite process. II. The effect of different types of temperature curves. W. H. MONSSON AND G. H. CHIDESTER. *Paper Trade J.* **91**, No. 16, 50–2(1930); cf. *C. A.* **23**, 973.—Under the same conditions of pulping, the yield and strength of pulp obtained from eastern hemlock are lower than those obtained from white spruce, and the bleach requirement is higher. The yield per cord is consistently lower with hemlock than with spruce, which is partly accounted for by the lower solid wood content per cord. In order to obtain a high folding strength combined with a low bleach requirement, temps. much higher than 140° are undesirable. Results are given and discussed of comparative cooks of eastern hemlock with the so-called "straight-line," "concave" and "convex" types of temp. curves. For strong unbleached pulp either the "concave" or the "straight-line" type of temp. curve is satisfactory, and a 9½-hr. digestion with a final temp. of 148° gave good results. The max. temp. should be increased where a shorter cooking time is used and decreased when a longer time is allowed. For easy-bleaching pulp, either the "straight-line" type of curve, with the pulp held for some time at the max. temp., or a modification in which the temp. is increased more rapidly to 130° and then more slowly to a lower max. temp., should give the best results. For a 10½-hr. digestion, the "straight-line" curve should start from 115° in 2½ hrs., increasing at a uniform rate to 148° at the end of 9½ hrs., and then this temp. should be held for 1 hr. A satisfactory modification of this curve might be a uniform increase in temp. to 130° at the end of 4½ hrs., followed by a slower uniform increase to 143° at the end of 9½ hrs., with the temp. held at 145° for 1 hr. In applying these results commercially, the cooking time should be detd. by balancing the requirements of the mill for production, yield, strength and bleach requirement. For a high yield of strong easy-bleaching pulp, it seems

necessary to cook at least 12 hrs. For a shorter cooking time a low bleach requirement is obtained at the expense of yield, and very likely also at the expense of the strength of the pulp. A. PAPINEAU-COUTURE

United States patents on paper making: third quarter, 1930. C. J. WEST. *Paper Trade J.* **91**, No. 17, 41-2(1930).—A list by serial no. of patents relating to pulp and paper issued during July, Aug. and Sept 1930. Cf. *C. A.* **24**, 5483. A. P.-C.

The microscope in the paper mill. A LAMBRETTE. *Industrie papetière* **9**, 283–7, 351–5(1930).—A discussion of the errors which are liable to be made in the use of microscopes, especially with high magnifications, either through inexperience or through defective construction of the instrument, and of the precautions which should be observed in the selection and use of a microscope. A. PAPINEAU-COUTURE

Modern digester practice. GUS. ENDERLEIN. *Paper Mill* **53**, No. 43, 14–7 (1930).—A brief review of the evolution of digesters used for sulfite, soda and sulfate cooking. A. PAPINEAU-COUTURE

Investigation of a digester explosion at Berlin, N. H. W. B. VAN ARSDEL AND P. L. IRWIN. *Pulp Paper Mag. Can.* **30**, 471–3(1930); *Paper Trade J.* **91**, No. 18, 169–71(1930).—Although the results obtained so far in the investigation of the causes of the explosion of digester No. 16 at the Burgess mill of the Brown Co., at Berlin, N. H., on Aug. 12, 1930, do not permit of detg. the immediate cause until further information is available, sufficient evidence has already been collected to prove that some of the steel used in building this type of digester was faulty, probably embrittled in service. The single butt-strap construction used is now recognized to be of poor design. A. PAPINEAU-COUTURE

Williams' sizing process. F. M. WILLIAMS. *Paper Mill* **53**, No. 44, 16–7(1930).—The Williams' process of making rosin size consists essentially in crushing the rosin, grinding it to a soft paste with water in a pebble mill, and then adding the other constituents (alkali and protective colloids if desired), continuing the grinding process until the reactions or mixing is complete. The size is then dild. and filtered, and is ready for use or storing. A. PAPINEAU-COUTURE

The determination of p_H values and total acidity of paper. B. L. WEMHOFF. *Paper Trade J.* **91**, No. 14, 59–60(1920) — A progress report on the coöperative research on methods of detn. of p_H values and total acidity being conducted by the Bur. of Standards, Bur. of Chemistry and Soils and the Govt. Printing Office, Washington, D. C Preliminary data had indicated that no appreciable variation in results would be found by extg. the sample at 98° on a water bath and by boiling at 100° on an elec hot plate, but subsequent results gave varying results in different labs under slightly varying extn conditions. The data indicate that it is not feasible for different labs to obtain check results on the same ext. unless the detns. can be made within a few hrs. after the extn. is made; the variation in p_H values due to the lapse of time between extn. and detn. of the p_H value is particularly noticeable in glue-sized paper, indicating some colloidal effect. Results obtained with the H electrode, quinhydrone electrode and the Fawcett-Acree isohydric indicator method showed that the 3 methods check very well when the extns are made in the same manner. Colorimetric indicators adjusted to the mid-point of their ranges are probably sufficiently accurate for mill control work; but where accurate results are desired and colorimetric methods are preferred, isohydric indicators adjusted to 0.2 p_H intervals should be used. Extns. of samples of 2.5 and 3.75 g. of paper with 125 cc of water gave p_H values which agreed within rather close limits; detns. made on exts. of 1.25 g of paper showed a tendency toward slightly higher results. Detns. made on samples cut in 0.25-in. squares had a tendency to give slightly lower results than those on samples ground in the Swedish disintegrating mill. A. PAPINEAU-COUTURE

The development of paper manufacture from southern pines. R. H. STEVENS. *Trans. Am. Inst. Chem. Eng.*, New Orleans Meeting 1930, 5 pp.(Adv. copy).—The conditions for paper making in the South are reviewed and the development by large companies in southern states is pointed out. In the South today there are 12 large mills with a capacity of 540,000 tons a year, or approx. 52% of the entire national consumption of kraft papers. These mills employ the sulfate process, cooking with a soln. contg. NaOH and NaSH as active reagent. Several by-products are obtainable from the cooking process, *viz.*, turpentine, methanol and $(NH_4)_2SO_4$. Though all are reclaimed in some of the Swedish mills, only the turpentine is recovered in American plants. The mfg. operations and factors involved in their applications, as well as special adaptability of the paper products manufd. from southern pines, are briefly described. Also in *Chem. Met. Eng.* **37**, 734–5 (1930). C. L. MANTELL

Precision color-measuring apparatus. MONROE BARNARD AND PAUL MCMICHAEL.

Paper Trade J. **91**, No. 14, 55–8(1930).—A discussion of the merits of the A. P. C. (American Photoelectric Corp.) opacimeter and of the A. P. C. photoelectric spectrophotometer. The 1st enables one to measure the translucency of paper with a degree of accuracy within 0.5%. In the latter the various sources of error in the measurement of the spectral transmission or reflection characteristics of a substance have been eliminated or compensated for, and moreover the instrument is simple of operation and maintenance. With the 2 instruments one can secure the accurate data necessary to evaluate the several attributes of pulp and paper that influence ones concepts of their colors. A. PAPINEAU-COUTURE

Apparatus for distillation of carbonaceous materials such as wood waste (U. S. pat. 1,785,565) **21**. Tanning extracts (Brit. pat. 332,935) **29**.

Cellulose. FIRMA OTTO C. STRECKER. Ger. 505,401, Dec. 4, 1927. Addn. to 486,533 (*C. A.* **24**, 1511). Cellulose is obtained from disintegrated vegetable fiber by treatment with sulfo- or carboxylic acids or their metal salts, which yield sulfites or carbonates on heating with boiling lye. Examples are hydroxybenzene-sulfonic or -carboxylic acids.

Digestion of cellulosic materials. J. HOLMES and H. A KINGCOME. Brit. 333,426, Sept 20, 1929. In a continuous process for cellulose extn. from vegetable materials, the material is subjected to a graduated treatment by which the more easily hydrolyzable constituents are eliminated first and the more highly resistant lignone is treated with clean cooking liquor at the maximum digestion temp. for a final digestion, with a final counter-current washing. App. is described.

Treating cellulose before acetylating. SOCIÉTÉ DES USINES CHIMIQUES RHÔNE-POULENC. Ger. 505,610, Nov. 11, 1924. Air-dried cellulose, especially cellulose previously treated with alkali, is moistened with a small quantity of glacial AcOH so that it contains AcOH of strength 60–80%. The mass is then acetylated in the usual way.

Treating cellulose before acetylating. SOCIÉTÉ LYONNAISE DE SOIE ARTIFICIELLE AND PIERRE A. A. CHEVALET. Ger. 505,674, Dec. 23, 1926. The cellulose is treated with a mixt. of aq. HCOOH and H_2SO_4 or $ZnCl_2$ at reduced temps., *e. g.*, 15°.

Cellulose derivatives. SOC. ANON. POUR L'IND. CHIM. À BÂLE. Fr. 686,575, Dec. 13, 1929. New derivs. of cellulose which preserve the original structure of the fiber are prepd. by treating alkali cellulose with a mixt. of CS_2 and alkylating or aralkylating agents, then treating the products thus obtained with org. amines contg. at least one NH group. Thus, alkali cellulose is treated with a mixt. of $ClCH_2COOEt$ and CS_2, rinsed and then treated with an aq. soln. of piperazine. Other examples are given. Cf. *C. A.* **24**, 4156.

Nitrating cellulose. LOUIS A. PINCK. U. S. 1,784,945, Dec. 16. N oxides are passed into H_2SO_4 and the cellulosic material, such as filter paper or cotton, is then added and the reaction is carried to completion.

Nitrocellulose. ARTHUR HOUGH, JOHN R. DUFFORD and WM. C. LEONHARD. U. S. 1,785,030, Dec. 16. Nitrated paper parchment in substantially stable condition is obtained by nitrating the parchmentized paper and boiling with dil. NH_3 soln. It is suitable for use in *lacquers*, *celluloids* or *explosive manuf.*, etc.

Nitrocellulose. V. PLANCHON. Brit. 333,817, Jan. 18, 1929. Materials such as wood pulp sheets or compressed cotton, alfa, flax or straw are immersed, with the sheets a small distance apart from each other, in a nitrating bath which is kept cool during the first part of the treatment and then heated after the sheets are partially nitrated. Various details of app., temps. used, etc., are given.

Cellulose esters. CAMILLE DREYFUS. Fr. 686,332, Dec. 9, 1929. Cellulosic materials are made reactive in view of esterification, by first treating the materials with HNO_3 and a diluent and afterwards with an aliphatic anhydride. The diluent may be HCOOH or AcOH and the amt. of HNO_3 is preferably 1–2% of the wt. of the cellulose. The HNO_3 used in the first stage acts as catalyst for the esterification in the second stage.

Cellulose esters. U. S. INDUSTRIAL ALCOHOL CO. Fr. 686,491, Dec. 12, 1929. Org. esters of cellulose such as the acetate are prepd. in a phys. state favorable for their further treatment by the reaction of cellulose with an esterifying agent such as Ac_2O in the presence of liquid SO_2 as the reaction medium, in a closed vessel under pressure, and discharging the ester in soln. in the SO_2 into another vessel where the SO_2 is gasified suddenly, thus causing a disruptive action on the ester. A catalyst such as H_2SO_4 may be used in the esterification, and the cellulose acetate may be hy-

drated in the reaction medium under pressure before the pptn. An app. is described. Cf. *C. A.* **24**, 1508. Fr. 686,492 describes an app. for pptg. cellulose esters from solns or like mixts. capable of flowing, in which one or more currents of such a soln. are mixed with one or more currents of pptg. liquid (with or without one or more currents of steam) under such conditions that a constituent of the soln. is liberated or vaporized with disruptive effect on the ester. The soln. of ester may have incorporated with it a coagulant almost sufficient to bring the soln. to the point of pptn.

Mixed esters of cellulose. CHARLES S. WEBBER AND CYRIL J. STAUD (to Eastman Kodak Co.). U. S. 1,785,466, Dec. 16. Mixed esters are produced by treating an acyl cellulose such as hydrolyzed cellulose acetate in a soln. contg. an aromatic org. acid such as toluic acid having an ionization const. greater than 1.82×10^{-5}. Sp. examples also are given of the production of cellulose acetate mandelate and of cellulose acetate salicylate and general mention or particular disclosure is made of the production of mixed esters derived in part from tartaric, racemic, malic, glycolic, glyceric, pyruvic, α-keto-butyric, α-keto-valeric, α-keto-caproic, levulinic, the *o*-, *m*- and *p*-toluic acids, benzoic, mandelic and cinnamic acids. The cellulose aceto-toluate is sol. in cold 1,4-dioxan, and other mixed esters have varying solubilities.

Hydrolysis of cellulose acetate. KODAK PATHÉ (SOC. ANON. FRANÇAISE). Fr. 686,401, Dec. 10, 1929. Cellulose acetate is hydrolyzed or deacetylated by treatment with a soln. contg. phosphoric acid and H_2SO_4, the amt of phosphoric acid being greater than the amt. of H_2SO_4, and the sum of the 2 being less than 1% of the total soln. The temp. of the reacting mixt. is not above 40°.

Cellulose ethers. I. G. FARBENIND. A.-G. (Otto Leuchs and Eduard Dörr, inventors). Ger. 505,797, Nov. 9, 1926. In forming cellulose ethers, alkali hydroxide is present in the reaction vessel but sepd. from the reaction mass. The hydroxide extracts water from the mass to become liquid and flow into the reaction mass

Cellulose ethers. I. G. FARBENIND. A G Fr 686,598, Dec. 13, 1929. Mixed cellulose ethers are made by the reaction of a mixt. of a simple or substituted alkyl halide, satd. or not, and ethylene oxide or one of its homologs with alkali cellulose in the presence of a diluent and a catalyst Examples are given of the prepn. of benzyl oxyethylcellulose from $C_6H_5CH_2Cl$, ethylene oxide and alkali cellulose, and of propyloxyethylcellulose, PrCl being used

Plastic substances. I. G. FARBENIND A G Fr. 686,470, Dec. 12, 1929. Plastic substances are made from cellulose acetates by using as solvent a liquid alkylene oxide such as ethylene oxide, with or without a swelling agent for the cellulose ester

Apparatus for making seamless tubes of cellulose. KALLE & Co. A.-G. (Julius Voss, inventor). Ger. 507,357, Oct. 14, 1928.

Machine for the preparation of thin endless bands of cellulose derivatives. CELLON-WERKE ARTHUR EICHENGRÜN Ger. 505,861, Oct 21, 1924.

Viscose. I. G. FARBENIND. A.-G. (Harry Meyer and Wilhelm Eller, inventors) Ger. 504,732, Apr. 6, 1928 Addn. to 486,769 (*C. A.* **24**, 1980). In treating viscose to prevent the formation of heavy metal salts during its manuf. processes, the $(COOH)_2$ of 486,769 is replaced by org. hydroxy acids such as citric, tartaric or lactic acids, or their salts.

Artificial silk. HENRY DREYFUS Fr. 686,331, Dec. 9, 1929. In the manuf of artificial silk, particularly by the dry method, that part of the spinning nozzle which is exposed to the evapg. agent has an unpolished surface around the spinning opening or openings.

Artificial silk. MEINRAD F. THOMA. U. S. 1,785,823, Dec. 23. By subjecting artificial silk such as that made from viscose, cellulose acetate or cuprammonium cellulose to a treatment such as with warm softening and crinkling and hygroscopic substances fiber is obtained which produces yarns of silky soft feel and a strength about 25–40% higher than that of yarns made of untreated fibers. App. is described.

Artificial silk and similar products. BRITISH CELANESE, LTD., and W. I TAYLOR Brit. 333,504, Feb. 5, 1929. Filaments, ribbons, tapes or straws which are capable of being at least partially delustered as by treatment with moist steam, water or aq alc. are formed by extruding solns. in org. solvents of cellulose acetate contg. wetting agents (of which various types are listed as suitable) comprising org. carboxylic acids or org. sulfonic acids or sulfuric esters or their salts. Numerous details and modifications of procedure are described.

Artificial filaments. I. G. FARBENIND. A.-G. (Hans C. Stuhlmann and Fritz Mehns, inventors). Ger. 507,351, Nov. 17, 1928. Endless bundles of artificial filaments from viscose are subjected to strong tension, while still moist with acid, before washing and after-treating in a slack state in known manner.

Dry-spinning apparatus for artificial silk. SYNTHETA A.-G. Ger. 507,212, Feb. 9, 1928. Means for cooling the spinning nozzles and adjacent parts is described.

Driving means for artificial silk spinning pot. Soc. ANON. DES CONSTRUCTIONS ELECTRIQUES PATAY. Ger. 507,303, June 12, 1926.

Electrically driven spinning pot for artificial silk. ADOLPH H. RAILING and HARRY J. FLEY. Ger. 507,302, Mar. 20, 1927. See Brit. 286,927 (*C. A.* **23**, 514).

Disintegrating wood chips. GEORGE H. ELLIS (to Insulite Co.). U. S. 1,785,544, Dec. 16. The chips are passed between a pair of rollers submerged in liquid to force air out of the wood, the squeezed chips are then allowed to expand and absorb the liquid, and the liquid-soaked chips are immediately subjected to a second pressing operation quickly to force the liquid out of the chips to sep. the fibers. App. is described.

Pulping raw cellulosic material such as wood chips. GEORGE A. RICHTER (to Brown Co.). U. S. 1,784,849, Dec. 16. A confined pool of cooking liquor such as used in kraft pulp production is subjected to high temp. and pressure conditions and the liquor is added to the raw cellulosic material while displacing the air in the latter and causing it to escape into and displace liquor in the pool, and the confined charge is cooked with the liquor until pulped. App. is described. Cf. *C. A.* **24**, 2884.

Wood-pulp grinder (electric driving system). WILBUR L. MERRILL (to General Elec. Co.). U. S. 1,785,490, Dec. 16. Structural and elec. features.

Separator for wood pulp, etc. RUDOLF ERNST WAGNER. Ger. 507,586, Aug. 4, 1927. A centrifugal separator for wood pulp, cellulose and similar materials made into a pulp with water is described.

Digester for sulfite wood pulp. EINAR MORTERUD. U. S. 1,785,591, Dec. 16. Structural features.

Preparing fibers for wall-board pulp. TREADWAY B. MUNROE (to Celotex Co.). U. S. 1,785,840, Dec. 23. Raw fibrous material such as bagasse is cooked in the presence of chemical substances resulting from previous cooks and at a temp. and for a time sufficient to loosen fiber-encrusting material but insufficient to produce fibers suitable for paper making, the fibers are freed from their cementing tissues by forcible hydraulic action, and are recovered. App. is described.

Bleaching (raw materials for paper manufacture). I. G. FARBENIND. A.-G. (Hermann Wenzl, inventor). Ger. 500,201, May 18, 1926. Addn. to 498,856. The method of 498,856 (*C. A.* **24**, 4635) for HClO bleaching is modified by using Co, Cu and other metals for the catalyzer instead of Ni or Ni compds.

Paper. ERNST FUES. Ger. 504,953, Sept. 16, 1926. A method is described of coloring pergamin and similar highly glazed paper prior to the hot glazing.

Paper. OTTO H. SIDO and HERMANN WIEDERHOLD. Ger. 505,589, Aug. 18, 1929. Cellulose is prepd. by digesting wood, etc., with cyanides or cyanates, which, on sapon. with water, form NH_3. The NH_3 is recovered as a by-product.

Paper. AKTIESELSKAPET RAOUL PICTET OG F. THARALDSEN. Ger. 504,667, April 7, 1926. Cellulose is prepd. for paper manuf. by treating wood with an aq. soln. of SO_2 under a pressure of at least 8 atm. at about 120°.

Paper. I. G. FARBENIND. A.-G. (Kuno Franz and Carl Dankert, inventors). Ger. 505,994, Feb. 6, 1925. Paper is colored and embossed by moistening the glazed paper, pressing and producing the desired depth of color by the immersion method. Cf. *C. A.* **24**, 4635.

Paper making. R. MARX. Brit. 333,167, May 1, 1929. The felts or the felts and web at the wet end of a paper-making app. are passed through one or more heated zones to accelerate removal of moisture and to prolong the life of the wet felts. Various details of app. and operation are described.

Sizing paper. RAFFOLD INTERNATIONAL CORP. Brit. 333,620, May 17, 1929. Pulp stock is used having a carbonate filler and a paraffin emulsion mixed with the fibrous material. Alum may be added and rosin size may be used for emulsifying the paraffin. The emulsion and filler produce a stable flocculent ppt. which is non-sticky, non-agglomerant and ink-resistant. Numerous details and modifications of procedure are described. Cf. *C. A.* **24**, 2884-5.

Coating paper. CHAMPION COATED PAPER CO. Brit. 333,226, May 3, 1929. Paper is treated on either one or both sides with uncooked starch made into a slurry with water, with or without a pigment, and the adhesive properties of the starch are developed on the paper by heating. Various other auxiliary substances also may be used such as gum arabic, waxes, dyes and other coloring substances, and softening agents such as glycerol or castor oil. Cf. *C. A.* **24**, 501.

Coating and coloring paper webs. MEAD PUMP & PAPER CO. Brit. 333,034, July 15, 1929. A color layer is applied to a traveling sheet and then subjected to the ac-

tion of a smoothing and spreading roll rotating with such high peripheral speed (suitably about 650 ft. per min.) that a force resistant to adhesion of the color to the roll is developed and prevents irregular adhesion of the color.

Calender rolls for finishing paper. ARCHIBALD LADE (to B. F. Perkins & Son, Inc.). U. S. 1,785,265, Dec. 16. One of a pair of rolls is formed with a yielding surface comprising paper and asbestos laminations pressed together.

Sulfurized paper. ÉTABLISSEMENTS DALLE FRÈRES ET LECOMTE. Fr. 686,276, Dec. 7, 1929. Paper pulp which does not stand the action of H_2SO_4 at ordinary concn. is sulfurized superficially with acid of 45–55° Bé. The paper thus obtained may be impregnated with fatty substances and lends itself to suppling with glycerol, glucose, chlorides, gums, etc.

Removing water from piled sheets of wet pasteboard or the like. RICHARD KASTNER and HERBERT SCHMOLKA. U. S. 1,785,484, Dec. 16. A pile of sheets is pressed at ordinary temp., to remove a portion of the water, and an elec. a c. is passed through the sheets while the pile is subjected to pressure to supply heat, a further quantity of water is allowed to flow from the pile without increasing the pressure, the heat is then increased to raise the temp. and the pressure is reduced. App. is described.

Dyeing paper, cellulose, leather, wood, etc. I. G. FARBENIND. A.-G. (Hermann Köcher, inventor) Ger. 505,859, June 19, 1925. Addn. to 427,009. The process of 427,009 for producing water-fast colors on metals is extended to other materials such as paper, cellulose, leather and wood. The color is obtained by treating the material with tannin, or other water-sol. compds. with free phenolic OH groups with no dye character, mixed with a suspension of basic dye in acetone or other solvent which dissolves fat and mixes with water. The mixt. mentioned in the example consists of Rhodamine B, tannin, water, alc. acetone and shellac.

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

Production of explosives in the United States during the calendar year 1929. W. W. ADAMS AND L. S. GERRY. Bur. Mines, *Tech. Paper* **478**, 51 pp.(1930); cf. *C. A.* **24**, 3114.—Total sales of industrial explosives in 1929 were 509,708,300 lb., 7% more than 1928. These were divided into 120,045,650 lb. of black blasting powder, 326,993,276 lb. of high explosives other than permissibles, and 62,669,434 lb. of permissibles.

ALDEN H. EMERY

Smokeless powder grains: Causes and characteristics of structural variations. A. J. PHILLIPS. *Army Ordnance* **11**, 195–8(1930).—Photomicrographs are given of over 50 powder grains made with different components, in varied stages of decompn., some viewed by polarized and some by normal light and a brief discussion of each is given.

CHARLES E. MUNROE

Permissible methane detectors. A. B. HOOKER, W. J. FENE AND R. D. CURRIE. Bur. Mines, *Bull.* **331**, 30 pp.(1930); cf. *C. A.* **24**, 5978.—Comparative tests of the following CH_4 detectors are reported: Burrell, U. C. C., Martienssen and Wolf. The U. C. C. was the most accurate, although all were fairly so.

ALDEN H. EMERY

Toxic gases from 60 per cent gelatin explosives. G. ST. J. PERROTT, L. W. BABCOCK, C. D. BITTING AND G. W. JONES. Bur. Mines, *Tech. Paper* **482**, 30 pp.(1930).—Field tests showed that low percentages of toxic gases are produced by 60% gelatins when the explosives have O balances, including the wrapper, that vary within the limits of −2.5 to +2.5 g. per 100 g. of explosive. Further increase of the + O balance decreases only slightly the CO produced, but increases the oxides of N. CO production was not affected appreciably by the wetness of the bore hole or by the method of loading, O balance being the sole detg. factor. Storage over 8 months had no appreciable effect as compared with 1 month. The oxides of N were affected by the wetness of the bore hole, a wet hole giving 5 times as great an amt. of N oxides as a dry one. Oxides of N decreased rapidly with time after firing. The paper wrapper takes part in the reaction to the extent of 70–100%, depending on the O balance of the explosive. Comparison of field with lab. tests in (1) Bichel gage, (2) Crawshaw-Jones app. and (3) Hercules tank showed major agreement of all 3 with field results for CO, but wide divergence for N oxides, (3) being the best. Curves were prepd. from which the CO produced by 60% gelatins can be detd. direct from the CO/CO_2 ratio.

A. H. E.

Nitration of *sym*-diphenylethane (RINKENBACH, AARONSON) **10.** Nitrocellulose (U. S. pat. 1,785,030) **23.** The motion of flames in closed vessels (STEPHENSON) **2.**

Explosive. CHARLES H. WATERS (to Dumor National Chemical Co.). U. S. 1,786,046, Dec. 23. A chlorate such as $NaClO_3$ is used with liquid mononitrotoluol about 3 and liquid dinitrotoluene about 11 parts, to form an explosive which is suitable for stump or rock blasting. $NaNO_3$, $CaCO_3$ and sawdust also may be added.

Explosive detonator charges. K. F. PAUL (to Hercules Powder Co.). Brit. 333,539, Oct. 13, 1928. Diazonitrophenol is used in blasting detonators over a base charge which may contain the same substance, and an oxidizing salt such as $KClO_4$, $KClO_3$ or NH_4ClO_4 may be used in either the top or base charge. Other substances such as tetryl, TNT or picric acid may be used for the base charge.

Explosive detonator charges. E. M. SYMMES (to Hercules Powder Co.). Brit. 333,534, Oct. 13, 1928. Diazodinitrophenol is mixed with Pb azide, especially as a top charge over a base charge of tetryl, TNT or picric acid.

Blasting-explosive assembly. CARL D. PRATT (to Atlas Powder Co.). U. S. 1,785,529, Dec. 16. A main charge of a deflagrating but non-high explosive compn. such as granular blasting powder is provided with a longitudinal core with a minimum diam. of 0.75 in. consisting of a high explosive compn. such as dynamite comprising not less than 2% and not more than 50% of the total wt. of the assembly (the core extending entirely through the main charge).

Safety matches. I. G. FARBENIND. A.-G. (Theodor Spängler, inventor). Ger. 505,667, Aug. 26, 1927. The match heads contain binding material, $KClO_3$, S and cement, and the rubbing surface contains binding material, amorphous P and cement.

Waterproof matches. I. G. FARBENIND. A.-G. (Theodor Spängler, inventor). Ger. 505,668, July 4, 1928. The binding material consists of egg albumin dried and heated to render it insol. The match heads contain albumin, $KClO_3$, ZnO, glass powder, kieselguhr and $KHCO_3$. The rubbing surface contains albumin, amorphous P and Sb_2S_3.

Waste acid-separating apparatus for nitroglycerin plant. DYNAMIT A.-G. VORM. ALFRED NOBEL & Co. (Arnold Schmid, inventor). Ger. 502,150, Oct. 26, 1927. Addn. to 488,922 (*C. A.* **24**, 2297). Structural details.

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Interesting sources of natural dyestuffs. C. D. MELL. *Textile Colorist* **52**, 682-4, 752-5, 777, 842-4(1930); cf. *C. A.* **25**, 208.—The following sources are briefly discussed: the pokeweed of Jamaica for a red dye; the bark of the common hornbeam tree, *Carpinus betulus*, for a yellow dye; the randia species for a blue dye; the bark of the tanekaha tree, *Phyllocladus trichomanoides*, of New Zealand, for tannin and a red dye; Guinea corn or great millet, *Andropogon sorghum*, for a red dye, the color principle of which is known as durasantalin; narra wood, *Pterocarpus indicus*, for a red dye, the color principle of which is known as narrin; the bark of the nance or malpighia of Mexico and Central America for tannin and a dyestuff which dyes silk and wool a coffee color; the cojoba of Venezuela, *Piptadenia peregrina*, for tannin and dyes for leather; goldenrods for a yellow dye; the barbados-flower, *Caesalpinia pulcherrima*, for tannin and yellow and red dyes; dandelions, *Taraxacum densleonis*, for a yellow dye; red cabbage, *Brassica oleracea capitata nigra*, for cauline, a purplish red coloring matter. The economic importance of the barks of the bibnoniaceae or trumpet-creeper family is also considered. R. K. WORNER

New processes in dyeing with Naphthol AS. W. CHRIST. *Bol. assoc. ital. chim. tes. col.* **6**, 184-8(1930).—On wetting cotton with Naphthol AS solns. there is reached a state of equil. between the amount of naphthol dissolved in the bath and the quantity taken up by the material that is independent of the relation between the wt. of the goods and vol. of bath. An important factor in dyeing

ıe Naphthol AS series is the product used for fixing the alkali. The goods trans- ... bath to the developing bath a certain quantity of NaOH ... itself to the coupling energy of the ... energy compds. with a more marked acid ... smaller coupling energy need a more nearly neutral medium. The products resulting must be indifferent. With Fast Violet Base B, Variamine Blue B and the Base of Fast Blues BR and BB, which have little coupling power, $ZnSO_4$ and $MgSO_4$ can be used The Zn salts react with slight acidity, having no retarding action with NaOH. The Zn hydroxide formed is neutral and leaves unaffected the stability of the diazo compds Mg is a stronger base, and its mineral salts have a neutral reaction, pptg. with NaOH as hydroxide, very little sol. and alk. Mg is, therefore, to be used where the Zn compds. stop complete coupling and a union with NaOH does not take place in the dye bath The neutral point is reached with AcOH after addn. of the theoretical quantity of NaOH with Al sulfate after 71% of the theoretical, with $ZnSO_4$ after 63%, with $MgSO_4$ after 7%. The neutrality continues with Al sulfate and $ZnSO_4$ until all the NaOH necessary for the double decompn. has been added The $MgSO_4$ solns. become alk. as soon as the neutral point has been passed. Zn and Al hydroxides do not act unfavorably on the dye bath, as does the Na acetate formed by AcOH. The alk. reaction of $Mg(OH)_2$ renders unstable the diazo solns. Zn and Al compds. reduce the absorption of cloth, causing uneven and lighter dyeings. The defect is more marked with diazo compds with high mol. wt. A little AcOH is advantageous. $Mg(OH)_2$ does not have the same objectional effect The difficulties with the alkali fixer can be avoided with Jellinek's process, based on passing the dry naphtholated cloth into a diazo soln. with much AcOH. This eliminates the NaOH, stopping the formation of the colors; the colors are then produced by passing into a Na_2CO_3 bath. The combination with the naphthol is complete also with bases of slight coupling power. The diazo soln. with excess of AcOH is stable, and the temp. of the developing bath can be brought with many bases to 35 40°, permitting a strong penetration. The coupling in the alk bath is nearly instantaneous. R. SANSONE

Something on the dyeing and charging of lined or ribbed silk fabrics, with possible future innovations. RAFFAELE SANSONE *Textile Colorist* **52**, 309-10, 342, 523-5, 559, 668-71, 710(1930).—A description is given of different types of machines for dyeing this type of material together with a discussion of the advantages of each machine R. K. WORNER

Selecting dyes for glove-silk dyeing. T. P SHERIDAN. *Textile Colorist* **52**, 814, 849(1930).—General and practical R. K. WORNER

Application of the azo dyes to viscose. MORRIS A. BARSKY. *Textile Colorist* **52**, 519–22, 557, 596–600(1930).—The purpose of this study was to investigate the various factors that enter into the production of the insol azo colors on viscose yarn, and the effect of these factors on the shade of the dyeings thus produced, in relation to their fastness to light and Cl_2. It was concluded that the time of coupling affects neither the shade nor the fastness, whereas the temp. affects both The higher the temp. of coupling the bluer and duller the resultant dyeing, and the more resistant to light and Cl_2. A more concd. padd liquor gives a heavier dyeing with an increased resistance to light and Cl_2. Increase of NaOH content of padd liquor has no practical effect on the shade, but increases the fastness slightly. Increase of Naphthol AS content changes the shade slightly and increases the fastness to Cl_2 appreciably. Light exposures of 10 hrs. or less affected yarns padded with β-naphthol, Naphthol AS, Naphthol AS-RL, Naphthol AW-SW, Naphthol AS-OL, and Naphthol AS-G, but on coupling with Fast Red B, the yarns padded with Naphthol AS or its immediate derivs. showed no difference between the exposed and unexposed parts. Padded yarns coupled in the presence of the most common metals showed no effect of the metal on the shade or fastness of the dyeing. A padding temp. of 55° and the following padd soln. for viscose yarns are suggested: 18 g. Naphthol AS, 6 g. NaOH, 24 g. Turkey red oil, 6 g. formaldehyde, per l. R. K. WORNER

Dyeing and finishing rayon. NOEL D. WHITE. *Cotton* **94**, 575–7, 581(1930); cf. *C. A.* **24**, 1743.—This article is based on practical experience. The first part deals with nitrocellulose rayon, the second with cuprammonium, viscose and cellulose acetate. R. K. WORNER

Dyeing canvas stock for "art moderne" store and house awnings. GEO. RICE. *Textile Colorist* **52**, 621–2(1930).—General discussion of the problems involved. Colored awnings are being produced both by dyeing the yarns or fabrics and by painting. R. K. WORNER

Fur dyeing. W. F. A. ERMEN. *Textile Colorist* **52**, 744–5, 825–6(1930).—Some of the more important fur dyes, their manuf. and method of application are briefly described. R. K. WORNER

Dyeing paper textiles. FRED. GROVE-PALMER. *Textile Recorder* **48**, No. 569, 61 3, 59(1930).—A general discussion of paper textiles, their use, manuf., dyeing and cleansing. R. K. WORNER

Colloid mills in the color shop. ALAN A. CLAFLIN. *Textile Colorist* **52**, 623–5 (1930).— An illustrated description of a com. paste type colloid mill and its applications in the textile industry. R. K. WORNER

The carbanthrene printing colors. GEO. M. BISHOP. *Textile Colorist* **52**, 680–1, 710(1930).—The advantages of these colors over the aq. pastes hitherto available are enumerated as follows: non-freezing, non-drying, homogeneous, non-settling, grit-free, more sol. leucos, superior penetration and superior leveling. Some formulas are given indicating the procedure followed in preg. stock and reducing pastes. R. K. WORNER

Color constants. F. P. GROAT. *Textile Colorist* **52**, 601–2, 629(1930).—A method of classifying color, using the 3 constants, hue, value and intensity, is described and proposed. R. K. WORNER

Mixing and matching of colors. GEO. WALLACE. *Textile Colorist* **52**, 672–4, 676–7(1930).—The application of the Colorscope is discussed. R. K. WORNER

Producing cheap bright colors on cotton. RAFFAELE SANSONE. *Dyer, Calico Printer* **63**, 85(1930).—The material is first dyed with a direct color and then with the basic dyestuff. A simple plant for this method is sketched and described. R. K. W.

How much should a dyer know about flax, hemp and China grass? GEO. RICE. *Textile Colorist* **52**, 550–1(1930).—Some of the properties of these fibers are briefly described R. K. WORNER

How much should a dyer know about bacteria in wool? GEORGE RICE. *Textile Colorist* **52**, 748–9(1930).—Practical. Various types of bacteria attack wool at different stages of its processing and also when the sheep is on the range. Some of the effects of bacterial attack are cited. R. K. WORNER

The treatment of water for bleaching and dyeing. C. D. BLACKWELDER. *Textile Colorist* **52**, 769–70(1930).—The type of troubles which an unsatisfactory water treatment can cause are briefly indicated. The importance of proper study of the particular supply to be treated and of the processes and chem. reactions taking place in the plant, prior to designing the plant and deciding on the chem. treatment to be applied, is stressed. R. K. WORNER

The kinetics of the chlorine bleaching process. HUGO KAUFFMANN. *Papier Fabr.* **28**, Tech. Wiss. Teil 557–9(1930).—In order to obtain improved understanding of technical bleaching operations, studies were made on (1) the rate of bleaching a dyestuff (phenolphthalein), (2) on the rate of autodecompn., and (3) on the rate of attack on cellulose (purified cotton) with hypochlorite solns. of various p_H values and neutral salt content. It was found that (1) decreased with increase in p_H, but was increased by certain neutral salt concns. Effect (2) followed the 2nd order reaction law exactly, and also showed important neutral salt influences. Effect (3) followed an entirely different law, however, being greater in alk. than in acid solns. The explanation is advanced that (1) and (2) depend on the HClO concn., while (3) is due to the complex ion $(ClOH{\cdot}ClO)'$. From known hydrolysis and dissocn. consts. it can be calcd. that effect (3) will reach a sharp max. in the range between Cl_2:NaOH mol. ratios of 1 1 and 1 2. This agrees strikingly with exptl. facts. On this basis a new *bleaching process* was evolved in which the fibers were first treated with acidified hypochlorite contg. 5–10 g./l. HCl in excess of that required to liberate all the HClO, and then with hot alk. peroxide. Cotton cloth was bleached by this process with no loss in strength. R. H. DOUGHTY

The great advantages of bleached fabrics. H. D. MARTIN. *Textile Colorist* **52**, 694–5(1930).—Chem., mech., sanitary and comfortable advantages are listed. R. K. WORNER

The bleaching of feathers and hair. FRED. GROVE-PALMER. *Textile Colorist* **52**, 606–7(1930). Practical directions are given for bleaching feathers and hair with $KMnO_4$ and with the vapors from H_2O_2. R. K. WORNER

Spectroscopic investigation of the mineral constituents of textiles. SAMUEL J. LEWIS. *Textile Colorist* **52**, 552–3(1930); see *C. A.* **25**, 211. R. K. WORNER

X-ray histological studies. I. Determination of the texture of individual ramie fibers by aid of the x-ray micro method. K. ECKLING AND O. KRATKY. *Z. physik. Chem.*, Abt. B, **10**, 368–70(1930).—The type of x-ray analysis formerly used requires

macroscopic objects and the diffraction picture so produced represents a summation effect arising from the entire object. In contradistinction with this method, biol. structure elements of microscopic proportions can also be photographed by aid of the x-ray micro method. The first histological investigation of this kind was undertaken for the purpose of detg. the texture of individual cells of ramie fiber. Narrow zones of the cross-section were illuminated and the usual diagram showing a fiber structure was always obtained It is concluded that any higher order structure showing radial or concentric symmetry is not present or at least is not clearly developed. C. J. H.

Textile fibers. AMBALAL J. PATEL. *Indian Textile J.* **40**, 507–10, 556–59(1930).—A compendium is made of the phys. and chem. properties of various textile fibers. H. H. MOSHER

Mineral oils on textile yarns. A. A. COOK. *Am. Silk J.* **49**, No. 12, 53–4, 72 (1930).—Petroleum oils possess better lubricating and penetrating powers for textile products than vegetable oils. When properly purified, mineral oils can be removed from rayon without difficulty, from silk by exercising certain precautions, and from wool only with considerable trouble. A blend of mineral and sulfonated oil (1–2) was found most satisfactory for textile purposes. H. H. MOSHER

Fundamentals of cotton piece goods finishing. THOMAS F. HUGHES. *Textile World* **78**, 2132–3, 2173(1930).—General. R. K. WORNER

Improved methods of processing enhance appearance of cotton-rayon fabrics. RAY COTTRELL. *Textile World* **78**, 2247–9, 2351–3(1930).—A review of modern trends in scouring, bleaching, dyeing, delustering, weighting, iron-proofing acetate yarns, wrinkel-proofing, etc. No marked discoveries have taken place, but rather a refinement of methods has resulted in improved appearance and handle of the finished fabric. R. K. WORNER

Sizing rayon yarns. R. H. SMITH. *Am. Silk J* **49**, No. 12, 76(1930).—A general article in which the phys. requirements for rayon size are listed. H. H. MOSHER

Sizing woolen warps. RINOLDI. *Wool Record and Textile World* **38**, 669–71 (1913).—General. H. H. M

The nature and condition of the sulfur in wool. G. SALOMONE. *Bol. Laniera* **43**, 992–5(1929).—S is a constituent of wool, and when eliminated the structure and tenacity of the fiber are changed. If the wool is treated with dil. alkalies to eliminate a small part of the S there is a change indicated by Becks $SnCl_2$ reagent or Pauly's diazobenzenesulfonic acid soln. Acids and alkalies produce cystine, cysteine, thiolactic acid, thioglycol, ethyl sulfide, Me and Et mercaptans and H_2S with wool. Cystine predominates. Some of the other compds. come from the decompn. of cystine. A part of the S in wool is present as bisulfide or org. sulfide, and a part in different combinations. The presence of S compds. in wool is proved by the easy oxidation of a portion of these. When wool is exposed for a long time to ultra-violet rays it becomes slightly acid, forming H_2SO_4. The S atoms in wool are therefore not all equally combined; there are 2 different sulfurized protein complexes, one with S easily decompd. by weak alkalies and oxidizing agents, and the other with S of strong stability, only detached when the total decompn. of wool is brought about with warm concd HNO_3, saltpeter or Na_2O_2 in a melted condition. R. SANSONE

The use of antiseptic agents for the prevention of mildew. L. L. LLOYD. *Dyer, Calico Printer* **63**, 689–90(1930).—A general discussion of the conditions favoring mildew growth. The anilide or naphthalide of salicylic acid is considered the most efficient reagent for its control. Shipment of textiles in a dry condition is advocated. R. K. WORNER

Wood preservation with Zn chloride finds place in textile industry (TUFFT) 20. Ornamental grasses and leaves (GROVE-PALMER) 18. Orthanilic acid (SHARVIN, *et al.*) 10. A microbalance of new design (STANBURY, TUNSTALL) 1. Some new monosubstitution derivatives of retene (KOMPPA, WAHLFORSS) 10.

Dyes. I. G. FARBENIND. A.-G. Brit. 333,573, May 10, 1929. Substantive *o*-carboxyazo dyes contg. Cu are made (1) by causing an agent yielding Cu to act on azo dyes obtainable from tetrazotized benzidine-3,3'-dicarboxylic acid and 2 mol. proportions of aryl- or aroyl-aminonaphtholsulfonic acids substituted by solubilizing groups in the aryl or aroyl groups, (2) by effecting the dye coupling in the presence of suitable agents yielding Cu, or (3) by adding a coppering agent when prepg. the dye bath. Numerous examples are given of the production of dyes giving reddish violet to blue shades.

Dyes. I. G. FARBENIND. A.-G. Brit. 333,762, Sept. 4, 1929. Chlorodimethoxydibenzanthrones are made by treating pure dimethoxydibenzanthrone (which may be formed as described in Brit. 181,304 (*C. A.* **16**, 3762)) in an org. solvent such as $PhNO_2$ with a chlorinating agent (such as sulfuryl chloride in the presence of Fe chloride to produce a green dye or in the addnl. presence of MgO or CaO to produce a yellower dye). Fe fluoride, $Fe_2(SO_4)_3$, Ni chloride, $CoCl_2$ and $SbCl_5$ also may be used as halogenating catalysts.

Dyes. I. G. FARBENIND. A.-G. (Georg Kränzlein and Paul Ochwat, inventors). Ger. 507,340, Sept. 8, 1927. The dyes obtainable from trianthrimides as described in Ger. 230,407 (*C. A.* **5**, 2733), 240,080 (*C. A.* **6**, 2177), 249,000 (*C. A.* **6**, 2851), and 251,350 (*C. A.* **7**, 267), are treated with H_2SO_4 at a low temp., and the products are oxidized, *e. g.*, with Cl water at 70–80°. New dyes giving brighter shades than the initial materials are so obtained. An example is given.

Dyes. I. G. FARBENIND. A.-G. (Paul Nawiasky, inventor). Ger. 507,345, Feb. 7, 1929. Addn. to 498,292 and 500,178. The *N*-dihydro-1,2,2′,1′-anthraquinoneazinesulfonic acid, described in Ger. 216,891 (*C. A.* **4**, 965), is rendered fast to Cl by treatment as described in Ger. 498,292 (*C. A.* **24**, 3907) and 500,178 (*C. A.* **24**, 4400). An example is given.

Dyes. I. G. FARBENIND. A.-G. Fr 686,165, Dec 5, 1929. Dyes of the 4,5,8,9-dibenzopyrene-3,10-quinone series contg. different atoms of halogen are prepd. by introducing into 4,5,8,9-dibenzopyrene-3,10-quinones contg. in the mol. one or more halogen atoms, one or more other atoms of halogen different from those already present. Examples are given.

Dyes. SOC. ANON. POUR L'IND. CHIM À BÂLE. Fr. 686,194, Dec. 6, 1929. Metallized dyes capable of dyeing vegetable, artificial and animal fibers are made by treating azo dyes answering to the general formula $(R^1—N=N—R^2—N=N—)_xR^3$, in which R^1 signifies an aromatic group not contg. OH, R^2 an aromatic group contg. in the *o*-position with respect to the second azo group, OR (in which R is an atom of H or a group capable of forming salts such as CH_2COOH and which besides is capable with the aid of the azo group and the R group of forming complexes with substances liberating metals), R^3 the group of a coupling component capable of coupling one or more times with diazo compds. and x is a whole no. Examples and a list of components with the colors obtained are given.

Azo dyes. I. G. FARBENIND. A.-G. Brit. 332,932, March 21, 1929. Azo dyes are formed in substance, on a substratum or on the fiber by combining any diazo, tetrazo or diazoazo compd. free from sulfonic and carboxylic groups with a 2-(2′-hydroxy-3′-naphthoylamino)-5-halo-1,4-diethoxybenzene. Examples are given of prepg. the dyes and intermediates

Azo dyes. I. G. FARBENIND A.-G. (Erwin Hoffa, Erwin Thoma and Hans Heyna, inventors) Ger. 501,106, Dec. 3, 1926. Addn. to 499,535. 2,5-Dimethyl-3,4-dihalo-1-diazobenzene is coupled with arylamides of 2-hydroxynaphthalene-3-carboxylic acid or β ketocarboxylic acid, instead of the 4,6-dihalo-1-diazobenzene of 499,535 (*C. A.* **24**, 4640).

Azo dyes. I. G. FARBENIND. A.-G. (Leopold Laska, Arthur Zitscher, Wilhelm Christ and Adolf Petzold, inventors). Ger. 508,585, Dec. 14, 1927. Azo dyes are produced by coupling 4-diazodiphenylnitrosamine (contg. no HSO_3 or COOH groups) with arylides of 2,3-hydroxynaphthoic acid, and then splitting off the nitroso group. Thus, cotton fabric is boiled with a soln. of 2-3-hydroxynaphthoyl-4-chloroaniline, Turkey red oil and KOH, after which 4-amino-4′-ethoxydiphenylamine, HCl and $NaNO_2$ are added. Finally Na_2CO_3 is added. This gives a garnet color to the cotton. A dye bath composed of the above liquor, soda, soap and Na_2S gives fast greenish blue tints to cotton. Many examples together with a long table showing diazo compds., coupling 2,3-hydroxynaphthoyl compds., and the colors the dyes produce before and after the separation of the nitroso group, are given.

Azo dyes. IMPERIAL CHEMICAL INDUSTRIES, LTD., and R. BRIGHTMAN. Brit. 332,954, April 29, 1929 Azo dyes giving even shades on regenerated cellulose materials are made by tetrazotizing a diamine such as α,β-4,4′-diaminodiphenylethylenediamine or other diamine of like type and coupling with salicylic acid or other suitable coupling component, or by diazotizing a deriv. of a similar diamine in which one of the amino groups is replaced by a nitro or acylamino group, coupling with any component not contg. a free amino group, reducing the nitro group or hydrolyzing the acylamino group, again diazotizing and coupling with another component. Various details are given of the production of the dyes and intermediates employed. Cf. *C. A.* **24**, 2891.

Azo dyes. IMPERIAL CHEMICAL INDUSTRIES, LTD., and R. BRIGHTMAN. Brit.

333,513, April 11, 1929. Trisazo dyes contg. at least 2 carboxylic groups or 2 sulfonic groups and suitable for dyeing regenerated cellulose materials in level shades are obtained by coupling tetrazotized 3-aminobenzene-1'-azo-4'-aminonaphthalene or a nuclear substitution product with 1 mol. proportion of a phenol, a naphthol or a carboxylic or sulfonic acid deriv. of these, and with 1 mol. proportion of the same or another component (other than a naphthol aryl ketone or an arylide of 2,3-hydroxynaphthoic acid), or by a described alternative process for producing the same dyes. Various examples are given. Cf. *C. A.* **24**, 6029.

Azo dyes. KARL THIESS (to General Aniline Works). U. S. 1,785,846, Dec. 23. Dyes of good fastness to light are produced either in substances or on the fiber by coupling the diazo compd of a 5-halo-2-amino-1-benzoic acid alkyl ester with a naphthylamide of 2,3-hydroxynaphthoic acid. Several examples of dyes producing various red tints are given, with details of manuf. Cf. *C. A.* **24**, 419.

Azo dyes of the benzidine series. BYRON L WEST (to National Aniline & Chemical Co.). U. S 1,785,799, Dec. 23. A dye producing bluish green shades from a neutral bath on cotton, wool, and silk may be produced by coupling one mol. proportion of tetrazotized benzidine with one mol. proportion of H-acid in an acid medium to form a diazoazo compd., then treating the diazoazo compd. thus obtained with an excess of diazobenzene in an alk. medium whereby a diazodisazo compd. is produced, filtering off the diazodisazo compd. suspending it in an alk. soln., heating said suspension to effect hydrolytic decompn. of said diazodisazo compd. and salting out the resulting coloring matter from said suspension Some closely similar starting materials yield similar dyes.

Azo dyes containing metals. FRITZ STRAUB and WALTER ANDERAU (to Soc anon pour l'ind. chim. à Bâle). U S 1,786,272, Dec. 23. 5,5'-Dihydroxy-7,7'-disulfo 1,2',1',2-dinaphthazine is combined with aromatic diazo compds. such as those of 4-chloro-2-aminophenol-6 sulfonic acid, 4-nitro-2-aminophenol-6-sulfonic acid, aniline-4-sulfonic acid, 4-chloro-2-aminodiphenyl ether or the like, and if sulfonated or unsulfonated diazo components are used which contain lake-forming groups, the dyes may be treated with a metal-yielding reagent such as a compd. of Cr, Cu, Fe, Mn, Sn, Al, Ni, Co, Ti, Ce or U. Numerous examples are given for producing dyes and metal compds. and derivs. dyeing various colors.

Forming azo dyes on the material to be dyed. I. G. FARBENIND. A.-G Brit 332,940, March 28, 1929. The fiber is impregnated with a dihydroxyquinoline contg. a naphthalene residue, a diphenyl radical or a residue of the benzene series which carries a substituent (such as an azo or a pseudoazimino group) increasing generally the affinity of aromatic compds. for vegetable fiber, and free from sulfonic, hydroxy and carboxylic groups, and development is effected with a diazo, tetrazo or diazoazo compd. free from sulfonic, carboxylic and hydroxy groups Various examples are given of the production of the dyes and intermediates and dyeings in yellow to red shades may be obtained.

Vat dyes. FELICE BENSA. Ger 505,521, Jan 13, 1929. New vat dyes are formed by treating chlorinated β-dinaphthol with concd. or fuming H_2SO_4. The dyes color cotton brown in an alk. vat, the shade turning to heliotrope on hanging. An example is given.

Vat dyes. FELICE BENSA Ger. 505,522, April 23, 1929; Fr. 686,344, Dec. 9, 1929. New vat dyes of the perylene series are formed by heating perylene-3,9-dicarboxylic acid chloride with aminoperylenequinone or aminoperyleneanthraquinone or derivs. Examples are given. In one, the use of β-aminoanthraquinone yields a yellow-orange dye for cotton and in another, 1-chloro-4-aminoanthraquinone a brown dye

Vat dyes. AZIENDE CHIMICHE NAZIONALI ASSOCIATE AND BELLONI & COLLI. Fr. 686,415, Dec. 10, 1929. Vat dyes are prepd by the reaction of SCl_2 on dibenzanthrone or isodibenzanthrone dissolved or suspended in a dehydrating solvent such as oleum, $ClHSO_3$ or SO_2Cl_2. Brighter colors are obtained by the addn. of small quantities of H_3BO_3 during the reaction. The dibenzanthrone may also be dissolved in indifferent solvents such as $PhNO_2$, $C_6H_3Cl_3$ in the presence of chlorides of Al, Fe, Cu, As or P

Vat dyes. W. G. WOODCOCK, E. G. BECKETT, J. THOMAS and SCOTTISH DYES, LTD. Brit. 333,191, Jan. 31, 1929. Vat dyes such as those of the anthraquinone class are purified by treating them with a hypochlorite (such as NaOCl) and H_3BO_3 or an acid or acid salt of substantially the same ionization value in dil. aq. soln. such as $NaHCO_3$. Examples are given of the treatment of Caledon brown R and 2,7-diphenyl-(1,2,5,6-dithiazoleanthraquinone).

Vat dyes. I. G. FARBENIND. A.-G. Brit. 333,165, April 22, 1929. Halo-4,5,8,9-dibenzopyrene-3,10 quinones, differing from the dyes described in Brit. 287,050 and

Brit. 287,845 (*C. A.* **23**, 525) and dyeing cotton more reddish brilliant shades than the unhalogenated initial materials, are obtained by allowing halogens or other suitable halogenating agents to act on 4,5,8,9-dibenzopyrene-3,10-quinone or its derivs. other than iodo derivs., in the presence of org. solvents or diluents, or in aq. suspensions, or in the absence of solvents, and preferably in the presence of halogenating catalysts. Numerous examples with details of procedure are given.

Vat dyes. I. G. FARBENIND. A.-G. Fr. 686,188, Dec. 6, 1929. Vat dyes are prepd. by treating with reducing agents the 2,2′-dimethyl-1,1′-dianthraquinonyls, or the 2,2′-dimethyl-*meso*-benzo(or naphtho)-dianthrones in which the H atoms of the CH_3 groups are replaced wholly or in part by substituents of the most diverse nature. If the compds. formed contain OH groups these are etherified. Several examples and formulas of the reactions are given, in which *meso*-anthraquinones and hydroxypyranthrones are formed as end products.

Vat dyes. I. G. FARBENIND. A.-G. Fr. 686,480, Dec. 12, 1929. Vat dyes are prepd. by introducing a halogen in known manner into the "*Bz*" ring of 4-amino-3-haloanthraquinone-1,2 acridones. The process may be carried out by decomposing in a convenient solvent the 1-amino-2,4-dihaloanthraquinones with haloanthranilic acids or their salts in the presence of an acid-binding agent and a catalyst such as $CuCl_2$, and treating the intermediate product with acid condensing agents such as H_2SO_4 or $ClHSO_3$. In an example, 1-amino-2,4-dibromoanthraquinone is heated with K 2-amino-3,5-dichlorobenzoate in cyclohexanol in the presence of $CuCl_2$. The free acid is obtained by boiling the product with HCl and is then condensed with H_2SO_4.

Vat dyes. I. G FARBENIND A.-G. (Max A. Kunz and Karl Köberle, inventors). Ger. 493,896, June 10, 1927 Nitrogenous dyes are prepd. by treating halodi- or haloisodi-benzanthrone or their derivs with polynuclear aromatic N-contg. compds. which have at least one replaceable H atom linked to the N, in the presence or absence of solvents, suspension agents, catalyzers or bases. Thus, tetrabromodibenzanthrone is treated with 1-aminoanthroquinone in the presence of $CuCO_3$, $PhNO_2$ and AcONa to give a grey-blue dye for cotton, from a blue vat. Several other examples are given.

Vat dyes. I. G. FARBENIND. A.-G. (Hugo Wolff, Max A. Kunz and Karl Köberle, inventors). Ger. 498,064 and 498,065, July 23, 1927 and 498,066, Aug. 19, 1927. Addns. to 489,957 (*C. A.* **24**, 2305). New vat dyes are produced by treating ethers of anthraquinonylamino-*Bz*-1-hydroxybenzanthrone with alkali (498,064), by treating the condensation products of halo-*Bz*-1,*Bz*-1′-dibenzanthronyl and 1-aminoanthraquinone or derivs, with alkali (498,065), or by heating tetrahalo-2,2′-dibenzanthronyl with aminoanthraquinone or derivs., in presence of bases and Cu or other metal compds. (498,066). Each patent gives examples and a table of starting materials and dyes produced. Cf. *C. A.* **24**, 4940, 4941.

Vat dyes. I. G. FARBENIND. A.-G (Paul Nawiasky and Emil Krauch, inventors). Ger. 498,067, Jan. 11, 1929. Addn. to 493,813 (*C. A.* **24**, 2893). 2-Halopyrazolanthrone is heated with 1 aminoanthraquinone or its substitution products in the presence of alk. condensing agents. Examples are given. Cf. *C. A.* **24**, 4168.

Vat dyes. I. G. FARBENIND. A.-G. (Hugo Wolf, Max A. Kunz and Karl Köberle, inventors) Ger. 500,324, Oct. 6, 1927. Addn. to 489,957 (*C. A.* **24**, 2305). 1′-Anthraquinonyl-2-aminobenzanthrone is treated with alk. agents, to produce a vat dye Several examples are given.

Vat dyes. I. G. FARBENIND. A. G. (Werner Zerweck, inventor). Ger. 507,343, May 10, 1928. Addn. to 485,961 The condensation product from haloanthanthrone and aminoanthraquinone, which contains a free amino group in the mol., is acylated, giving a vat dye. Examples are given.

Vat dyes. I. G. FARBENIND. A.-G. (Heinrich Neresheimer, inventor). Ger. 504,544, Oct. 27, 1928. Addn. to 504,016 (*C. A.* **24**, 5507). Green or olive vat dyes are prepd. by the action of acid condensing agents on derivs. of 2-benzanthronyl-1-aminoanthraquinone contg at least one aliphatic acylamino group, *e. g.*, 2-benzanthronyl-1-amino-4-acetamidoanthraquinone. Other new dyes may be obtained by splitting off the acyl group from the products, or from the products of Ger. 504,016, or by replacing the acylamino group with H or another substituent. Examples are given

Dispersing ester derivatives of vat dyes. L. J. HOOLEY, J. THOMAS and SCOTTISH DYES, LTD. Brit. 333,147, Jan. 30, 1929. Various compns. suitable for coloring wool or "acetyl silk" are prepd. by mixing ester derivs. of vat dyes with dispersing agents (various kinds of which are enumerated as suitable) and drying the mixt. Several examples are given.

Vat dyes and intermediates. I. G. FARBENIND. A.-G. (Robert E. Schmidt,

Berthold Stein and Kurt Bamberger, inventors). Ger. 507,342, Apr. 11, 1928. Addn. to 499,350. The products described in Ger. 499,350 (*C. A.* **24**, 4168) are obtained in simpler fashion by heating 2-amino-3-haloanthraquinone or its derivs. or substitution products with CuCN in an indifferent solvent until the nitrile intermediately formed is no longer detectable. Examples are given.

Vat dyes; intermediates. I. G. FARBENIND. A.-G. Fr. 686,341, Dec. 9, 1929. Condensation products which are vat dyes or intermediates for dyes are prepd. by treating with alk. condensing agents the products obtained by the action of aromatic *o* haloaldehydes with pyrazoleanthrone, 1,5-dipyrazoleanthrone and their ring-substituted products. Thus, the condensation product obtained from pyrazoleanthrone and *o*-chlorobenzaldehyde is heated with KOH in alc. A ring closure probably takes place with the formation of acridone compds. The sepd. product dyes cotton from the vat in orange-yellow shades. Other examples are given.

Anthraquinone dyes. CHEMISCHE FABRIK VORM. SANDOZ. Brit. 333,188, Nov. 21, 1928. Water-sol. anthraquinone ... amino-2-bromo-4-*p*-aminoacetanilidoanthraquinone or 1-amino-2-bromo-4-*p*-aminomethylacetanilidoanthraquinone with a sulfite, phenol and water under pressure at 130-140°. Complete substitution of Br is effected without splitting off the acyl group.

Acridone derivatives; dyes. I. G. FARBENIND. A.-G. Fr. 686,187, Dec. 6, 1929. New derivs. which are dyes are made by introducing halogen into acridones capable of forming vats, which contain besides one acridone ring at least 4 other rings. Thus, 1,2,5,6-diphthaloylacridone is chlorinated and brominated using I and Fe as a catalyst, giving a product which dyes cotton an orange-red from the vat. Similarly, the dye obtained from 2 mols. of 1-chloroanthraquinone-2-carboxylic acid and 1 mol. of benzidine is brominated to give a product which dyes cotton brown-red from the vat. Several other examples are given.

Anthanthrone derivatives. I. G. FARBENIND. A.-G. (Richard Herz and Werner Zerweck, inventors). Ger. 507,338, Oct. 14, 1926. *Hydroxyanthanthrones* are prepd. by the action of acid condensing agents, *e. g.*, H_2SO_4 or $ZnCl_2$, on hydroxy-1,1',8,8'-dinaphthyldicarboxylic acids, which may be obtained from hydroxynaphthostyrils (cf. Ger. 504,342, *C. A.* **24**, 5307). *Alkoxyanthanthrones* may be prepd. similarly from alkoxy-1,1',8,8'-dinaphthyldicarboxylic acids, or by alkylating the hydroxyanthanthrones. The products are *vat dyes* or *intermediates*. Examples are given. Cf. *C. A.* **24**, 3248.

Benzanthrone dyes. I. G. FARBENIND. A.-G. (Arthur Lüttringhaus, Heinrich Neresheimer, and Willy Eichholz, inventors). Ger. 507,339, Mar. 13, 1928. The condensation products prepd. by the method of Ger. 502,042 (*C. A.* **24**, 4942) are hydrolyzed with acid or alk. reagents, and the products so obtained are simultaneously or subsequently oxidized. Examples are given.

Phthalein dyes. IMPERIAL CHEMICAL INDUSTRIES, LTD., and M. WYLER. Brit. 333,016, June 27, 1929. 1-Hydroxy-3-amino-2,4-dimethylbenzene is condensed in the presence of H_2SO_4 with a 4-mono- or di-alkylamino-2-hydroxybenzophenone-2'-carboxylic acid followed by esterification of the free carboxyl group, or the acetylaminoxylenol may be used and the acetyl group removed during the process. Dyes are obtained which are suitable for application to tannin-mordanted cotton, wool and cellulose esters and ethers, and which give bright pigments with complex inorg. acids such as phosphotungstic acid. A bright bluish red dye is obtained in a specific example given.

Rhodamine dyes. IMPERIAL CHEMICAL INDUSTRIES, LTD. Ger. 507,236, Oct. 25, 1928. See Brit. 303,243 (*C. A.* **23**, 4577).

Sulfureted dyes. I. G. FARBENIND. A.-G. (Georg Kalischer and Werner Zerweck, inventors). Ger. 507,346, Feb. 23, 1929. Thiazole derivs. of the anthraquinone series, *e. g.*, the dyes obtained by the method of Brit. 189,367 (*C. A.* **17**, 2509), are purified by dissolving them in concd. H_2SO_4 and pptg. with water, or by dissolving out the impurities by grinding with 85% H_2SO_4. Examples are given.

Wool dyes. I. G. FARBENIND. A.-G. (Georg Kalischer and Ernst Honold, inventors). Ger. 507,341, Feb. 2, 1928. Red to violet wool dyes are prepd. by treating 1-amino-4-haloanthraquinone-2-sulfonic acids with mercaptans in the presence of an acid-binding substance. Some of the products dye acetate silk. Examples are given.

Dye compositions. J. S. WILSON, E. G. BECKETT, J. THOMAS and SCOTTISH DYES, LTD. Brit. 333,236, Feb. 2, 1929. Dry powders of anthraquinone "acetyl silk" dyes such as "Duranol Blue CB," "Duranol Orange G" or "Duranol Red 2B" are prepd. by mixing aq. pastes of the dyes with alkali soaps of higher fatty acids and subsequently drying at a temp. not above 50°. Other dispersing or solubilizing agents may be conjointly used, such as saponin sulfite cellulose waste liquor, formaldehyde-naphthalene-

sulfonic acid condensation products or naphthalenesulfonic acids. The drying may be effected *in vacuo* or in a stream of air.

Binding agent for dyes. OTTO BRATKE. Ger. 510,735, May 10, 1928. A binding agent for dyes consisting of sapond. linseed oil, chrome size, varnish and water, contains twice as much of the first-mentioned materials as water.

Pyranthrone derivatives (dyes and intermediates). ARNOLD SHEPHERDSON and SIDNEY THORNLEY (to British Dyestuffs Corp., Ltd.). U. S. 1,785,600, Dec. 16. Pyranthrone or a halogenated pyranthrone is condensed with hydroxylamine (in the presence of H_2SO_4 and $FeSO_4$) and amino compds. are thus obtained which dye cotton from an alk. hyposulfite vat deep brown and which also may serve as intermediates for the production of other dyes, as by acylation with reagents such as AcCl or benzoyl chloride which produce dyes giving different brown shades on cotton. Examples with details of procedure are given. U. S. 1,785,601 relates particularly to the acylated vat dyes as just mentioned.

Dyes and intermediates. D. A. W. FAIRWEATHER, J. THOMAS and SCOTTISH DYES, LTD. Brit. 333,146, Jan. 25, 1929. Ester derivs. are produced by treating the disulfuric ester of 2-aminoanthrahydroquinone or its derivs. having the 1-position free (*e. g.*, chloro derivs. or their sol. salts such as the Na salt) with an oxidizing agent such as $K_3FeC_6N_6$ in an acid medium not acid to Congo Red such as HOAc. From the products, compds. which are probably esters of hydroindanthrones may be sepd. in solid form by filtration, and sol. compds. giving green fluorescent solns. are isolated; the latter may be diazotized and coupled with β-naphthol, and the esters may be employed in dyeing and coloring. Several examples are given. Cf. *C. A.* **24**, 967.

Dyes and intermediates of the anthraquinone series. HEINRICH VON DIESBACH. Ger. 507,049, Sept. 22, 1927. New condensation products are prepd. by treating hydroxyanthraquinones with methylol or dimethylol compds. The condensation products may be sapond. in the presence or absence of oxidizing agents, the nature of the products then obtained depending on the conditions. In one example, 2-hydroxyanthraquinone, treated in H_2SO_4 soln. with methyloltrichloroacetamide while cooling, yields *1-trichloroacetylaminomethyl-2-hydroxyanthraquinone*, m. 215°. In another example, alizarin is treated with dimethylolurea to yield *α-(dihydroxyanthraquinonyl)-methyl-β-hydroxymethylurea*, decompg. 204°, which is converted, by heating with H_2SO_4 for a short time, into a dihydroxyaminomethylanthraquinone from which *lakes* dyeing wool in brown shades can be prepd. Numerous other examples are given also.

Dye intermediates. I. G. FARBENIND. A.-G. Brit. 333,173, May 2, 1929. Phenanthridone and its derivs. are prepd. by treatment of fluorenone or a deriv. with hydrazoic acid, suitably in the presence of an inorg. acid such as H_2SO_4 and an inert solvent such as benzene. N is evolved and the product is sepd. by pouring into water. The fluorenone oxime probably is first formed followed by the Beckmann change to give the corresponding phenanthridone. Several examples are given

Dye intermediates. I. G. FARBENIND. A.-G. Brit. 333,568, Feb. 15, 1929. Halogen, nitro and hydroxy substituents are introduced into benzanthrone-*Bz*-1-alkyl ethers having the *Bz*-2-position free so that the substituents enter this position. Several examples are given.

Dye intermediates. I. G. FARBENIND. A.-G. Brit. 333,666, June 4, 1929. 4-Aralkyl-1 naphthyl ketones are obtained by the action of carboxylic acid chlorides by the Friedel Crafts method on 1-aralkylnaphthalene or its substitution products which are unsubstituted in the 4-position, and by oxidation there may be obtained the corresponding naphthalene 1,4-di-ketones or 4-aroylnaphthoic acids. Several examples are given.

Dye intermediates. I. G. FARBENIND. A.-G. Brit. 333,667, June 4, 1929. 4-Benzoyl-1-naphthoic acid is made by oxidizing 4-methyl-1-naphthyl phenyl ketone with HNO_3. 4-Methyl-1-naphthyl methyl ketone when oxidized with NaOCl yields the 4-methyl-1-naphthoic acid and by oxidation with HNO_3 yields the 1,4-dicarboxylic acid. The 4-alkyl-1-naphthyl ketones are made from 1-alkylnaphthalenes and carboxylic acid chlorides by the Friedel-Crafts reaction.

Dye intermediates. I. G. FARBENIND. A.-G. Brit. 333,783, Sept. 28, 1929. *m*-Arylaminophenolcarboxylic acids are made by treating a dry alkali salt of a *m*-arylaminophenol with CO_2 with heating and use of pressure. The *m*-arylaminophenols in which the aryl group may contain substituents such as halogens, methyl or methoxy groups are prepd. by condensing resorcinol with arylamines. Various examples are given

Dye intermediates. I. G. FARBENIND. A.-G. (Georg Kränzlein, Heinrich Greune

and Willy Laßmann, inventors). Ger. 507,417, Oct. 20, 1928. **Trinitro-*p*-halobenzoyl-*o*-benzoic acids** are prepd. by treating *p*-halobenzoyl-*o*-benzoic acids with strong nitrating agents at a raised temp. Examples are given describing the prepn. of *trinitro-p-chlorobenzoyl-o-benzoic acid*, m. 238°, and *trinitro-p-bromobenzoyl-o-benzoic acid*, m. 256°.

Dye intermediates (monosulfuric esters of anthrahydroquinones). D. A. W. Fairweather, J. Thomas and Scottish Dyes, Ltd. Brit. 332,907, Jan. 23, 1929 Monosulfuric esters of anthrahydroquinones are prepd. by way of mixed 9,10-diesters in which one ester group is a sulfuric ester and the other an acetyl, benzoyl or other acyl group, by first reducing the corresponding anthraquinone in the presence of a metal or a tertiary org. base, treating the product with pyridine-SO_3 and an acylating agent for the formation of the sulfuric and acyl esters, and partially hydrolyzing the resulting mixed 9,10-diester to split off the acyl group. Several examples are given and the products may be used in dyeing "acetyl silk," wool and other materials and developed with an acid oxidizing agent.

Dyeing fabrics. I. G. Farbenind. A.-G. Brit. 332,986, May 22, 1929. White and colored discharges on ice colors are produced, *e. g.*, by a process in which goods impregnated with an arylide of 2,3 hydroxynaphthoic acid are dried, printed with a non-volatile acid agent, dried and developed with a diazo soln. of a base which does not combine in acid soln. with the arylide, such as 4-aminodiphenylamine (for white effects at the imprinted places) or (for colored effects) adding to the acid agent the diazo compd. of a base which combines in acid soln. Various examples and details are described, as is also a modified process in which an ester-salt of a leuco-vat dye is printed on the impregnated fabric with addn. of a salt such as NH_4 oxalate, $NaClO_3$, NH_4 vanadate and a thickener, followed by drying, steaming and development with a diazo compd.

Dyeing materials. D. A. W. Fairweather, J. Thomas and Scottish Dyes, Ltd. Brit. 333,506, Feb. 8, 1929 Various materials such as cotton, wool, silk and artificial silk, such as that made from viscose and cellulose esters, are dyed or printed by use of esters of reduced quinones or of reduced vat dyes, including indigoid dyes, contg. azo linkages, and the dyeings may be developed by hydrolysis and oxidation on the fiber or the dyes may be employed as azo dyes without development Cr compds may be used as mordants before or after development or chroming may be combined with developing by use of a chrome oxidizing agent. Numerous details and examples are given. Brit. 333,507 relates to the production of azo dyes (which may be thus employed) by diazotizing esters of reduced quinones, such as anthraquinones, and reduced vat dyes, including indigoid dyes, and coupling with usual components. Numerous examples are given.

Dyeing mixed materials. I. G. Farbenind. A.-G. Brit. 333,554, May 6, 1929. In dyeing mixed materials with substantive dyes, a reserve effect is produced on wool or silk by adding to the dye bath a water-sol. sulfonic or carboxylic acid amide or a deriv. or substitution product in which the H atoms of the amino groups are replaced wholly or in part by alkyl, aryl or aralkyl groups; *e. g.*, half-wool or half-silk is first dyed with Orange II and then in a bath contg Brilliant Benzo Blue 6B and the Na salt of bis-1,2-dichlorobenzene-4-sulfonylbenzidine-*m,m'*-disulfonic acid (the orange shade of the wool being unaffected by the blue cotton dye). Numerous other examples are also given. Brit. 333,559 describes the production of sulfonic acid amides and carboxylic acid amides suitable for such use, by condensing an aromatic sulfonic or carboxylic acid halide 2 mols. with an aromatic diamine 1 mol. (at least one of the reacting components being substituted in the *m*-position to the sulfonic or carboxylic acid halide or to the amino group) and gives several examples.

Dyeing regenerated cellulose materials. Imperial Chemical Industries, Ltd., and R. Brightman. Brit. 333,239, Feb. 7, 1929 Level blue dyeings are obtained by applying disazo dyes produced by coupling with a 1,8- or 2,8-aminonaphthol mono- or di-sulfonic acid a diazo compd of an aminoazo product obtained either by coupling a diazotized *p*-nitramine of the benzene series contg. at least one alkoxy group with a naphthol, a naphtholsulfonic acid or a *N*-substituted 2,8-aminonaphtholsulfonic acid and reducing the nitro group, or by coupling a diazotized *p*-aminoacetanilide contg. at least one alkoxy group with one of the same coupling components and hydrolyzing the acetylamino group. Numerous examples are given.

Dyeing regenerated cellulose materials. Imperial Chemical Industries, Ltd., and R. Brightman. Brit. 333,243, Feb. 8, 1929. Dyeing in level violet to blue to bluish green shades is effected by application of secondary disazo dyes of the type having as first component a naphthylaminesulfonic acid or an aminonaphtholsulfonic acid (other than 2,5,7-acid), as middle component a monoamine of the benzene series coup-

ling in *p*-position to the amino group, and as end component a 1,8-aminonaphthol-, mono- or di-sulfonic acid. Numerous examples are given. Cf. *C. A.* **25**, 421.

Dyeing regenerated cellulose materials. IMPERIAL CHEMICAL INDUSTRIES, LTD., R. BRIGHTMAN and W. L. B. WELLACOTT. Brit. 333,260, March 5, 1929. Dyeing in even shades is effected with dyes obtained by tetrazotizing 3,3′-diaminodiphenylurea or a deriv. (other than a carboxylic or sulfonic acid) and coupling with a phenol- or naphthol-sulfonic or -carboxylic acid and a naphthylamine-, naphthol-, dihydroxynaphthalene- or aminonaphthol-sulfonic acid or a *N*-substituted deriv. in equimol. proportions. Numerous examples are given.

Dyeing skins, etc. I. G. FARBENIND. A.-G. (Heinrich Wagner, inventor). Ger. 474,934, Mar. 18, 1926. A polychromatic effect is produced on skins, furs, etc., by vat dyes. The skin, etc., is moistened in places by alk. soln., dried, the adhering alkali removed, and the skin, etc., immersed in a neutral or weakly alk. vat dye.

Dying furs, hairs, feathers, etc. I. G. FARBENIND. A.-G. (Paul Virck, inventor). Ger. 503,989, Sept. 15, 1926. The goods are treated with an aq. soln. of salts of naphthalene derivs. which contain at least one 4-aminoarylamino group of the benzene series. The goods may be previously mordanted. An example mentions 2-(4′-aminophenylamino)-7-(4′-aminophenylamino)naphthalene for a violet-grey tint. Cf. *C. A.* **25**, 217.

Printing textiles. IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 686,428, Dec. 11, 1929. Textiles contg. cellulose esters or ethers are printed with insol. dyes of the anthraquinone series by adding to the dyeing material hydroxyethylamines, particularly com. triethanolamine.

Yarn-dyeing machine. ADOLF THEWALT. Ger. 505,788, May 22, 1927.

Apparatus for dyeing piece goods. A. A. HUDSON. Brit. 332,979, May 14, 1929. Structural features.

Jigger-dyeing apparatus. J. MACE. Brit. 333,366, July 13, 1929. Various structural features are described.

Dye-jigger apparatus. ASSOCIATED DYERS & CLEANERS, LTD., and H. J. CRICK. Brit. 333,447, Oct. 9, 1929. A float in the dye liquor counteracts or takes up the tensional stress imposed on the material at each change in the direction of travel. Structural details are described.

Tenter frame, etc., for dyeing apparatus. LESTER C. SCOTT (to Two-Tone Corp.). U. S. 1,786,031, Dec 23.

Dyeing vat. W. SPINDLER A.-G. (Arpad Barényi, inventor). Ger. 505,789, Aug. 3, 1928. Details of construction.

Drying apparatus for dyes, iron and copper sulfate and other substances difficult to dry. ERNST DANNDBERG. Ger. 505,607, Mar. 5, 1929. The material is dried in a series of superposed shallow pans.

Transfers with a paper base. KAUMAGRAPH CO. Brit. 333,768, May 3, 1929. A design on a base such as paper is printed in a slowly-fusible compn. such as a compn. comprising a mixt. of ethyl or benzyl cellulose with a resin and a plastifier such as tritolyl phosphate, and is overprinted with a more readily fusible compn. such as rosin, beeswax and ultramarine, so that in transferring to a fabric (especially one with a complicated weave) by use of a hot iron the overprinting is transferred first and penetrates the fabric so that the slowly melting compn. cannot penetrate but lies on top of the fabric. Various examples of compns. are given.

Treating textiles. HENRY DREYFUS. Fr. 686,644, Dec. 14, 1929. Textiles of or contg. cellulose acetate having a high resistance to the action of warm delustering agents are made by submitting the textiles to a steaming operation.

Apparatus for singeing textiles. J. CHADWICK & CO., LTD., and F. SHARPLES. Brit. 333,084, Sept. 18, 1929. The singeing tube or plate of a singeing app. is made of SiO_2 and may be vitrified or its surface may be glazed, and it may be heated by gas, oil, hot air or an elec. heater.

Moistening and cooling hygroscopic materials, such as textiles. HEINRICH BRÜGGEMANN Ger. 504,822, May 28, 1927. The materials are cooled in a chamber filled with moisture-laden air.

Dressing and stage-dying machine for textiles. GEBRÜDER SUCKER MASCHINENFABRIK. Ger. 505,790, Aug. 7, 1926.

Drying device for loose textile fibers. HERMANN HAAS. Ger. 505,771, Nov. 26, 1927.

Bleaching textile fibers. FIRMA FR. KÜTTNER. Ger. 507,413, Oct. 14, 1926. Textile fibers are simultaneously bleached and brightened by treatment at 65–85° with aq. hypochlorite solns. contg. org. compds., such as soap, which impart a soft feel to the fibers.

Waterproofing textile materials. WALTER A. BRIDGEMAN (to Wilbur White Chemical Co.). U. S. 1,785,434, Dec. 16. A compn. for use in conjunction with Al sulfate in waterproofing textile fabrics comprises an emulsion of a fat solid at ordinary temps. such as oleostearin or tallow in an aq. soap soln. contg. a phenol.

Mercerizing fabrics. ZITTAUER MASCHINENFABRIK A.-G. Ger. 504,809, Dec. 1, 1925. The arrangement is described for passing the fabric through the mercerizing lye, and for removing the excess of lye.

Pile fabrics. COLLINS & AIKMAN CORP. Brit. 333,268, April 9, 1929. The free ends of pile threads projecting from a woven backing of a pile fabric are embedded in an adherent material (such as a rubber dispersion contg. a vulcanizer, an oxide and an accelerator, or a suitable viscose or pyroxylin soln. or rubber and glue or casein compns.) and the pile threads are cut from the original backing to form a new pile fabric with the new backing which may be subjected to coagulation, vulcanization or other suitable treatments.

Dressing artificial silk. I. G. FARBENIND. A.-G. (Alfred Thauss and Carl Posth, inventors). Ger. 505,629, May 30, 1926 Cellulose di- and poly-fatty acids and their salts are used as the dressing agents. Cellulosediacetic acid and its Na salt are mentioned in examples. Cf. *C. A.* **24,** 1992.

Weighting artificial silk yarn or fabrics. R. CLAVEL. Brit. 333,724, March 16, 1929. The weighting process described in Brit 277,602 (*C. A* **22,** 2663), modified as described in Brit. 280,094 (*C. A.* **22,** 3052), is further modified by treating the material with a metal salt soln., removing excess soln by centrifuging, squeezing or other suitable treatment, and then transferring to an acid-fixing bath which may contain a protective colloid without intermediate washing, deacidification or neutralization. Successive use of $SnCl_4$ and NaH_2PO_4 is described

Yarns and threads. H. DREYFUS. Brit. 332,903, April 29, 1929. Crepe or like effects are produced by use of a composite thread consisting of 2 threads, both of which are highly twisted but in opposite directions. Artificial silk, natural silk, cotton and wool may be used, and various details of manuf. are given

Artificial threads. HENRY DREYFUS. Fr 686,330, Dec. 9, 1929. The luster of artificial threads or filaments is reduced by submitting the threads, etc., to a rubbing action while they are in movement. The rubbing surfaces may be cloth contg. an abrasive.

Bobbins or similar yarn holders. EINSTEIN'S ELECTRO CHEMICAL PROCESS, LTD., and W. EINSTEIN. Brit. 333,309, May 14, 1929. Cores of bobbins or the like may be formed of compressed fibrous material, electroplated with Cu or Ni after coating with graphite and burnished, or may be rendered impermeable with waterglass followed by spray-coating with Pb, or may be sprayed with a suspension of graphite in Na silicate soln.

Washing yarns and fabrics. A RAYNER. Brit. 333,177, May 3, 1929. A soap-forming acid (such as com. olein emulsified with Turkey-red oil, gelatin and water) is first applied to the material, followed by treatment with dil. alkali to form soap *in situ*.

Washing and fulling yarn in skeins. EMIL MUNDORF. Ger. 495,710, Nov. 27, 1927. The yarn is fed between washing and fulling drums.

Apparatus for washing fabrics. JAKOB MAURER. Ger. 504,625, Feb. 26, 1929.

Washing fabrics. JAKOB MAURER. Ger. 506,538, Mar. 22, 1929. Addn. to 504,625 (preceding abstr.). Details of the apparatus

Apparatus for washing fabrics. JAKOB MAURER. Ger. 508,384 and 508,385, May 24, 1929. Addns. to 506,538 (preceding abstr.).

Cleansing solvents such as those used for "dry-cleaning." R. R. STOLLEY CORP. Brit. 333,217, May 6, 1929. The liquid to be cleansed is passed through a caustic soln., then through water or an aq. washing soln. to remove caustic, and finally over $CaCl_2$ or other suitable solid dehydrating agent Activated charcoal, potash or other cleansing agent may be placed on or over the caustic soln Cf. *C. A.* **24,** 2900.

Softening hard artificial fiber bands. I. G. FARBENIND. A.-G. (Adolf Kämpf, inventor). Ger. 505,818, July 27, 1928. Addn. to 491,619 (*C. A.* **24,** 2617). The bands are passed between alternating teeth on endless bands. Cf. *C. A.* **24,** 3658.

Apparatus for treating animal hair, feathers, etc., with ozone. AMERICAN HAIR & FELT CO. Brit. 333,197, April 4, 1929. The loose material is fed from a pneumatic conveyer into a treating chamber through which it passes downwardly in contact with an upward current of ozonized air. Various details of construction are described.

Anti-moth preparations. I. G. FARBENIND. A.-G. (Ernst Tietze, Wilhelm

Schepss and Winfrid Hentrich, inventors). Ger. 504,886, Sept. 14, 1927. Wool, fur, etc., are protected against moth and other pests by a prepn. contg. F compds. in which at least one F atom is coupled to a C atom. Examples mention 3-nitro-4-fluorobenzoic acid, CH_2FCOOH, 1-fluoronaphthalene-5-sulfonic acid and $C_6H_4F_2$.

Anti-moth preparations. I. G. FARBENIND. A.-G. (Johann Huismann and Hugo Schweitzer, inventors). Ger. 506,988, June 23, 1928. Wool, hides, pelts, furs, etc., are treated with amides of arylsulfonic acids or their derivs., in which a H atom of the NH_2 group is replaced by an alkyl, aryl or aralkyl group, for protection against moths. Many examples are given.

Halogenated hydroxyarylmethanes. I. G. FARBENIND. A.-G. Brit. 333,561, May 11, 1929. Hydroxyaralkyl alcs. or hydrols or their anhydrides, prepd. by condensing aldehydes (except aromatic hydroxyaldehydes and their sulfonic, carboxylic or sulfo-carboxylic acids) with *p*-halophenols or naphthols contg. a free *o*-position to the OH group and contg. no salt-forming group, are condensed with a further mol. proportion of the same or different *p*-halogenated phenol or naphthol. Products are obtained similar to those produced as described in Brit. 316,900 (*C. A.* **24**, 1993) which may be used for *protecting wool, fur or the like from moths*, etc. Several examples are given.

Mothproofing wool, etc. I. G. FARBENIND. A.-G. (Hermann Stötter, inventor). Ger. 507,097, Feb. 22, 1927. The goods are treated with a mixt. of a known mothproofing agent and a wetting agent of the sulfonic acid type.

Mothproofing wool, fur, etc. I. G. FARBENIND. A.-G. Brit. 333,583, May 15, 1929. The material is treated with an org. F compd. contg. at least one F atom attached to a C atom such as 1-fluoronaphthalene-5-sulfonic acid, 4,4'-difluorobiphenyl or fluoropseudocumene or the Na salt of 3-nitro-4-fluorobenzoic acid. Wetting agents and other auxiliary agents also may be used. Brit. 333,584 relates to the use as mothproofing agents of a hydroxybiphenyl or a deriv. contg. in the nucleus halo or alkyl groups, *e. g.*, *o,o'*-dihydroxybiphenyl dissolved in cyclohexanone and benzine or solns. such as those contg. 3,5,3',5'-tetrabromo(or tetrachloro)-2,2'-dihydroxybiphenyl, which may be used with wetting agents and other substances. Cf. *C. A.* **25**, 422.

Water-soluble product from fatty acids of wool fat. GUSTAV MAUTHE and ALFRED THAUSS (to General Aniline Works). U. S. 1,784,941, Dec. 16. Fatty acids of wool fat are treated with air at a temp. of 100–300° and the products are sulfonated in the presence of a phenol such as PhOH to form a product which may be used as an auxiliary substance in the prepn. of stable solns. of 2,3-hydroxynaphthoic acid arylides. Cf. *C. A.* **25**, 219.

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

New studies of the dispersion of paint materials (lakes). HANS HEBBERLING. *Farbe u. Lack* **1930**, 219–20, 537–8.—Iso-dispersed pigments are superior to hetero-dispersed but the advantage is lost as most pigments belong to the latter class. H. suggests that before pptg. lakes on a barytes base, the latter should be coated with a pigment such as lithopone. The softness and hiding power of lithopone would then be added to the properties of barytes. In the dispersion of lakes on barytes by grinding, better results are obtained by the wet process. H. cannot confirm an increase of fugitiveness with an increase in fineness of lakes. G. G. SWARD

Chalking of paints. HANS WOLFF. *Farben-Ztg.* **36**, 221–3(1930).—The progress of chalking of paint films was followed by the colorimetric detn. of molybdic acid, 1% of which had been incorporated with the pigment portion of the paint. Tinted paints chalk less than white ones, although not in proportion to the amt. of tinting material, *e. g.*, 0.1% lamp black was as efficient in reducing chalking as 0.5%. Chalking does not proceed uniformly throughout the life of the film, but is directly proportional to the distribution of the pigment in the film (cf. *C. A.* **23**, 1291). White lead paints chalk less than ZnO paints because, with the former, the layer next to the air is rich in pigment, but poor with the latter. Standoil paints chalk uniformly because distribution of pigment is uniform. G. G. SWARD

Selective adsorption by pigments. A study to explain chalking. C. P. VAN HOEK *Farben-Ztg.* **36**, 267–9(1930).—The weathering properties of the various metallic soaps do not account for the excellent weathering properties of paints contg. them. Expts. tend to show that some pigments are able selectively to adsorb fatty acids and their oxidation products. In such cases, the pigment particle becomes the center of a soft easily oxidized mass which chalks easily. On the other hand, basic

pigments react with the acidic products to form stable metallic soaps. Pigments which neither absorb ultra-violet light nor adsorb the decompn. products of the oils should prove to be the most weather resistant. ZnO fulfills these 2 requirements, but to be of practical use, brittleness and cracking must be avoided. Neither flocculation nor lack of wetting can explain chalking as both chalking and non-chalking pigments possess these properties. G. G. SWARD

Determination of tung oil in varnish-like products. JOHANNES SCHEIBER. *Farbe u. Lack* **1930,** 513–4, 524–5.—When linseed oil is heat treated, the double bonds of the linolic and linolenic acid constituents rearrange to form conjugated systems similar to those in tung oil. This fact increases the difficulty of detg. tung oil by methods involving the formation of insol. gels. To det. tung oil in the presence of such products, S. proceeds as follows: A 5 g sample is mixed with 10 g. sand. To this mix there is added, with const. stirring, 10 cc of a 5% soln. of $SnCl_4$ in $CHCl_3$, which converts the tung oil to a gel. The gel is stored in a desiccator for 24 hrs. and then extd. with ether. The wt. of the residue represents tung oil. In the presence of highly thickened linseed oil or of rosin, the above method is modified by the addn. of EtOAc before the $SnCl_4$ soln. and also by the use of EtOAc as the extn. liquid. In case of small quantities of tung oil or of non-gelling products, tung oil of known gelling properties is added and the proper correction made. EtOAc may be added in amts. sufficient to produce reasonably rapid gelling. Wolff's refractive index method (*C. A.* **24,** 1752) is not suitable because duration and temp. of heating oils have a varying effect on the refractive index, that for tung oil sometimes passing through a min. G. G. SWARD

Some notes on exposure tests. H. A. GARDNER, G. G. SWARD AND STANLEY LEVY *Am. Paint & Varnish Mfrs.' Assoc. Circ.* No. **372,** 21–7(1931).—The importance of multiple exposures on coatings is emphasized. G. G. SWARD

Permeability of surfacer films to air and water. W. TOELDTE. *Farben-Ztg.* **36,** 318–21, 364–6, 409–10(1930); cf. *C. A.* **24,** 2900.—The permeabilities of 24 lab. and com. surfacer films were measured with an app. similar to that described in *C. A.* **24,** 2900. In order to save time, measurements in some cases were made at pressures as high as 12 atm. Special equations were developed for reducing results at higher pressures to values at 1 atm. The linear speed of air through the films ranged from 1.2×10^{-2} to 6.8×10^{-7} cm./sec. Pb soaps and copal varnishes imparted less permeability than boiled linseed oil, slowly vaporizing benzines less than rapidly vaporizing ones, turpentine oil less than benzine. Pigments imparted decreasing permeability in the following order: chalk or slate flour, Fe oxides, white lead, red lead (ordinary), ZnO, lithopone and ZnS. Permeability to water was roughly detd. by placing powd. methylene blue between a glass plate and a film prepd. on sized paper, and a cc. of H_2O on the film, subsequently noting the interval of time for the blue to dissolve. In general, permeabilities of the films to air and to water were parallel, with the exception of films contg. red lead. In those cases the permeability to air varied greatly while that to water remained const. and relatively low. G. G. SWARD

Miscellaneous research on lacquers. A. W. VAN HEUCKEROTH AND J. R. STEWART, JR. *Am. Paint & Varnish Mfrs.' Assoc. Circ.* No. **371,** 1–20(1931).—Some phys. properties of nitrocellulose lacquers using diphenyl phthalate, dibenzyl phthalate, cresol carbonate and 12 vegetable oils as plasticizers are given. Of the first 3, lacquers using diphenyl phthalate possessed durability equal to that of lacquers using dibutyl phthalate. Exposures of the lacquers using vegetable oils had not progressed to the stage where their durabilities could be rated. The results of exposures on lacquers prepd. with various resins (*C. A.* **24,** 5515) are tabulated. An app. for drying nitrocellulose by passing air heated to 65–70° through it is described. It is shown how arithmetic-logarithmic graph paper may be used to predetermine the viscosities of binary mixts. of nitrocellulose of known viscosities. Accelerated and outdoor exposure tests were made on films of uniform thickness of lacquers prepd. with nitrocelluloses ranging in viscosity from 1/4 to 600 sec. Nitrocellulose of medium viscosity (4–15 sec.) imparted the max. durability. As a result of consistency detns. of widely varying materials with the Gardner mobilometer, and the du Pont-Parlin, the Pratt & Lambert and the General Electric viscosity cups, the authors prefer the mobilometer for lab. control work and the *P* & *L* cup for plant control work. G. G. SWARD

Oil (varnishes) or cellulose lacquers. H. KÖLLN. *Farben-Ztg.* **36,** 223–4(1930).—The advantages of oil varnishes, nitrocellulose lacquers, combinations of both and of processes using both are briefly reviewed. G. G. SWARD

Accelerated weathering of cellulose lacquers. OTTO MERZ. *Farben-Ztg.* **36,** 316–8, 362–4(1930).—Expts. were conducted with red, white and black lacquers before and after addn. of 33.3, 66.7 and 100% of ester gum based on the non-volatile binder.

Films on coarse black iron panels which had been primed and surfaced were exposed out of doors to 3 accelerated weathering devices differing only in the source of light. The 3 light sources were a Hg-in-quartz arc, a group of 3 "Vitalux" lamps and a 10 amp. C arc. In addn. the lacquers were subjected to a bending test which consisted in baking films on black iron panels (0.3 mm. × 5 cm. × 15 cm.) for 0, 0.25 and 0.5 hrs. and then bending over rods 1.5, 3 and 7.5 mm. in diam. The results were reported as no cracks, hair line cracks or cracks. As a criterion of weathering the panels were bent over the 7.5 mm. rod and the results reported as in the baking test. Weathering under the C arc and the baking-bending test over the 7.5 mm. rod gave the best correlation with outside weathering. G. G. SWARD

Report on naval stores. (Determination of toluene-insoluble matter in rosin.) F. P. VEITCH. *J. Assoc. Official Agr. Chem.* **13**, 488–90(1930).—The following method was studied collaboratively and gave results sufficiently satisfactory to warrant recommendation of its adoption as a tentative A. O. A. C. method: dissolve 50 g. of freshly powd. (10-mesh) sample in a 300-cc. beaker in 150 cc. C_7H_8 (free from H_2O and nonvolatile residue) with the aid of heat and occasional shaking, filter at once through a 25 cc Gooch crucible, if necessary repass the filtrate through the Gooch crucible till clear, wash the residue and outside of the crucible free from rosin with hot C_7H_8, dry to const. wt. at 105–10° (1 hr. usually suffices). A. PAPINEAU-COUTURE

Para-rubber-seed oil (JAMIESON, BAUGHMAN) **27.** Waterproof impregnated braiding of electric conductors (KINDSCHER) **13.** Nitrocellulose [in lacquers] (U. S. pat. 1,785,030) **23.** Finishing leather, rubber, etc. (Fr. 686,381) **29.** Lamelliform metal powder such as that for bronze paints (U. S. pat. 1,785,283) **9.** Forming and curing brake bands, etc, comprising indurating material such as synthetic resin (U. S. pat. 1,785,391) **18.** Waste water from bitumen manufacture (Ger. pat. 505,570) **21.**

Pigments. TITAN CO. A/S. Fr. 686,553, Dec. 11, 1929. Pigments of Ti compds. of high covering power are made by pptn. of insol. Ti compds. with $BaSO_4$, washing and calcining. The process is regulated to give a ppt. contg. 40–60% TiO_2. A P compd. may also be added.

Iron oxide pigments. GEBRÜDER GUTBROD G. M. B. H. CHEM. FAB. Ger. 507,348, June 28, 1927. Dried crude materials contg. FeS are treated with warm concd. H_2SO_4 and the sulfate so obtained is calcined

White pigments. SOC. MINIÈRE "LA BARYTINE." Fr. 686,440, Dec. 11, 1929. White pigments having a basis of TiO_2 are made by treating freshly prepd. TiO_2, or the soln. in the presence of which this oxide is pptd., with substances which transform part of the product into the colloidal state with very finely divided grains, and which disappear on calcination. Such substances include gelatin, starch and dextrin. Cf. C. A. **24**, 2903.

Naphthazarine derivatives. I. G. FARBENIND. A.-G. (Georg Kränzlein and Robert Welde, inventors). Ger. 507,347, Aug. 5, 1928. The naphthazarine intermediates obtainable by reduction of 1,8- or 1,5-dinitronaphthalene are treated with an aliphatic aldehyde, *e. g.*, CH_2O, AcH or aldol. Products useful as *pigment colors for varnishes*, etc., are obtained. An example is given.

Converting turpentine and pine-tar oils into heavier oils. EUGENE B. SMITH (to Edward W. Colledge, trustee for National Turpentine Products Co., *et al.*). U. S. 1,784,949, Dec. 16. For converting turpentine and pine-tar oils into heavier products adapted to serve as paint vehicles, their vapors are passed in contact with fuller's earth as a catalyst, the vapors are condensed, and the condensate is passed into contact with the fuller's earth catalyst to dissolve and remove the polymerized oil from it, and this procedure is repeated until the polymerized processed product attains a suitable viscosity and sp. gr. for use as a *paint vehicle*.

Emulsions of drying oils, varnishes, lacquers, etc. P. C. VAN DER WILLIGEN. Brit. 333,690, Nov. 6, 1928. Stable products suitable for use as paints, waterproofing agents or adhesives or in the manuf. of linoleum are prepd. by oxidizing emulsions of drying oils such as tung oil or lacquers or the like contg. them, in the presence of caustic alkali or NH_3 to keep the emulsion alk., or in the presence of buffer substances such as alkali phosphates or alk. metal or NH_4 carbonates, as by a current of O or air. Various details and examples are given.

Emulsified aqueous lacquer mixtures. I. G. FARBENIND. A.-G. Brit. 333,570, March 13, 1929. Water is emulsified with at least twice its volume of a cellulose deriv. lacquer which contains only constituents which are practically insol. in water and in

which most of the solvents b. below 150°; emulsification is effected so that the water is stated to be in the disperse phase. Several examples are given of compns. contg. nitrocellulose and solvents, modifying ingredients, synthetic resins such as urea and formaldehyde reaction products and the like, and ethyl cellulose.

β-Acetoxyethyl butyl phthalate, etc. HOYLANDE D. YOUNG. U. S. 1,786,404, Dec. 23. Various details and modifications of procedure are given for the prepn. of this compd. which may be used as a solvent in producing pyroxylin lacquers, as may also the corresponding butyryl compd. and various esters of similar type contg. alkyl or aryl groups such as Me, Et, Pr, Bu, Am, benzyl or tolyl and derived from either phthalic acid or other dibasic acids such as citric, succinic, tartaric, phenylmalonic, trimesic or succinylsuccinic acids. Formulas are given for pyroxylin lacquers contg. these esters.

Shellac-like mass. WALTER DUX. Ger. 504,828, Nov. 22, 1927. Higher aliphatic hydroxy fatty acids are combined with halogen addn. products of resinolic acids by heating. Alternatively, the reaction products of Cl on unsatd. higher fatty acids may be combined with hydroaromatic hydroxycarboxylic acids. The combination may be effected in the presence of catalyzers.

Apparatus for coating wire with enamel and for baking and hardening the coating. FRANK MARTINDELL (to Western Elec. Co.). U. S. 1,786,416, Dec. 23. Structural features.

Coating compositions containing nitrocellulose and an artificial rubber isomer, etc. CARL H. SIEVER. U. S. 1,785,367, Dec. 16. Compns. adapted for coating by dipping, brushing or spraying, producing coatings of good dielectric properties and which have the waterproof, tough qualities of nitrocellulose and the elasticity, flexibility and strength of rubber, are formed of a cellulose deriv. preferably nitrocellulose, and an artificial isomer of rubber obtained by heating rubber with H_2SO_4 or a suitable compd. such as a sulfonic acid or org. sulfonyl chloride, with addn. of solvents, plasticizing and other modifying agents, such as natural or synthetic resins, etc., if desired, or of stabilizing agents such as a condensation product of acetaldol with α-naphthylamine.

Coumarone and indene resins. I. G. FARBENIND. A.-G. Brit. 332,963, April 30, 1929. In the production of synthetic resins by treating crude solvent naphtha with borofluoro-fatty acids as described in Brit. 310,816 (*C. A.* **24**, 740), analogous compds. of B fluoride with hydroxy acids such as lactic acid or with unsatd. acids such as oleic acid are employed. These complex acids may be prepd. as described in Brit. 316,987 (*C. A.* **24**, 1927) and various details of procedure are given.

Molded articles of synthetic resins. A. V. KELLER. Brit. 333,763, Sept. 4, 1929. For decorating molded articles of synthetic resinous condensation products, a decorative sheet of paper or fabric impregnated with a viscous soln. of the intermediate condensation product contg. also an agent such as $(CH_2)_6N_4$ or an NH_4 salt for accelerating the preliminary drying is molded in or upon the article. Various details of procedure are described including the use of a resin formed from urea and CH_2O. A retarding agent may be added if desired, such as weak acid salts of alkali or alk. earth metals, to retain the impregnating soln. in viscous condition, prior to the addn. of the accelerating agent.

Synthetic resins. BAKELITE G. M B. H. (Fritz Seebach, inventor). Ger. 506,129, Feb. 18, 1925. See Brit. 247,957 (*C. A.* **21**, 660).

Synthetic resins. I. G. FARBENIND. A.-G. Brit. 333,166, April 25, 1929. Vinyl esters such as vinyl acetate are condensed in the presence of at least 5% by wt. of acid condensing agents (such as HCl, H_3PO_4, $FeCl_3$, $AlCl_3$, $ZnCl_2$, aniline-HCl or S chloride) with mono- or poly-hydric phenols or their mixts., and various other materials such as mineral, animal or vegetable oils, long-chain fatty acids or their esters, factis, cellulose esters, fillers and coloring substances may be added before or during the condensation. Condensation may be effected at temps. of 40-100° and the primary condensation products may be distd. *in vacuo* and subsequently hardened by heating with or without pressure.

Synthetic resin composition. THEODORE F. BRADLEY (to Ellis-Foster Co.). U. S. 1,785,930, Dec. 23. By heating a mixt. of glycerol, phthalic anhydride and castor oil to 200–300°, a product is obtained which is suitable for use with nitrocellulose in the manuf. of lacquers, etc.

Synthetic resins from aldehyde and urea or thiourea. BAKELITE GES. Brit. 332,964, Feb. 3, 1928. Molded articles are formed by mixing urea or thiourea, solid polymerized formaldehyde, and various fillers, coloring agents, water-binding substances and auxiliary materials while heated, and subjecting to pressing and further heating. Cf. *C. A.* **24**, 2624.

Urea-formaldehyde resins, etc. BAKELITE GES. Brit. 333,296, Sept. 13, 1928. In the production of shaped articles from urea or its derivs. and solid polymerized formaldehyde in fused org. compds. as described in Brit. 318,959 (*C. A.* **24**, 2624) and in Brit. 333,298 (following abstr.), any of the known catalysts for the condensation are added to effect acceleration or retardation of the reaction. For retardation, to maintain fluidity of the material for a longer time, basic catalysts are added such as NH_3, $Ca(OH)_2$, $(CH_2)_6N_4$ or Na_2CO_3, and for accelerators there are used acid catalysts such as citric acid, HOAc or HCl or urea nitrate; neutral catalysts usually also accelerate the reaction. Various details of procedure are given.

Urea-formaldehyde resins, etc. BAKELITE GES. Brit. 333,298, Sept. 11, 1928. Reaction between urea or its derivs. and solid polymerized formaldehyde is effected in a melt of a solid hydrocarbon or solid nitrated, chlorinated or hydrogenated product such as naphthalene, anthracene or chlorinated, nitrated or hydrogenated naphthalene. Various addns. may be made and shaped articles formed as described in Brit. 318,883 (*C. A.* **24**, 2624).

Artificial resins. THE BRITISH CYANIDES CO., LTD. Fr. 686,261, Dec. 7, 1929. Artificial resins are made by condensing phenols with aldehydes in the presence of a small proportion, *e. g.*, less than 10% of dicyanodiamide. Cf. *C. A.* **24**, 982.

Floor covering. ROBERT D. BONNEY and WM. Y. IRWIN, JR. (to Congoleum-Nairn, Inc.). U. S. 1,784,810, Dec. 16. A body of felt is satd. with waterproofing material such as asphalt. A facing coat of paint is applied to one side, forming a wearing surface and to the opposite side there is applied a backing coat comprising a thin coat of discrete particles of a metallic powder such as bronze powder, a flaky mineral substance such as mica and a pigmented bonding medium such as paint or varnish adhesively securing the film to the body and partially visible through the film.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Cacao butter. VI. Extracted or pressed butter? H. P. KAUFMANN. *Chem. Umschau Fette, Oele, Wachse Harze* **37**, 305–11(1930); cf. *C. A.* **24**, 3663.—The highest grade of cacao butter is obtained by pressing the roasted and hulled kernels, while lower grades result from extg. the hulls, broken kernels, siftings and "germs," etc., with various solvents. Decided differences are observed between the pressed and extd. fats, but no definite analytical procedure has been developed to detect mixts. of them quantitatively; 5 samples of extd. butter which had been mixed with pressed butter showed the following analytical data:

	M.P.	n_D^{40}	I no.	Thiocyanate no.	Partial I no.
(1)	34.2	1.4573	36.53	33.86	31.42
(2)	34.0	1.4572	36.94	33.75	31 79
(3)	32.4	1.4585	39.80	35 34	32.08
(4)	33.46	1.4585	39.75	35.66	32.21
(5)	33.0	1.4580	40.63	36.06	33.61

Samples 3, 4 and 5 have a high n_D^{40}, and since the remaining consts. are also high, they might be condemned, but samples 1 and 2 fall within the usual limits of purity, although they are not pure pressed butter. P. ESCHER

Report on [the detection of coconut and palm kernel oils in] cacao butter. MARION M. JACKSON. *J. Assoc. Official Agr. Chem.* **13**, 486–8(1930); cf. Baughman, *C. A.* **23**, 217.—The previously described method (Baughman, *C. A.* **20**, 118) was studied collaboratively and found satisfactory. As it requires about 15% milk in cacao butter to produce a very faint opalescence, and as the cacao butter of milk chocolate usually runs 15% or less, a blank of 85% cacao butter and 15% butter fat ought to fulfill all the requirements for the test for cacao butter contg. 15% or less of milk fat, which would shorten and simplify the method as compared with the prepn. of a blank of cacao butter contg. the same amt. of butter fat as the sample to be analyzed. The latter procedure should be followed when there is more than 15% butter fat. A. P.-C.

Fatty acid distillation. Comparison of intermittent and continuous operation. OTTO KREBS. *Teer & Bitumen* **28**, 421–4, 440–3(1930). K. H. ENGEL

Solidifying points of binary mixtures of fatty acids and esters. L. A. BHATT, H. E. WATSON AND Z. H. PATEL. *J. Indian Inst. Sci.* **13A**, Pt. 11, 141–6(1930).—A knowledge of the solidifying points of binary mixts. of fatty acids or of their esters is

of value for detg. the proportion of the constituents in mixts. For the higher acids and esters the depression produced by adding a substance of higher m. p. than the solvent is very much greater than when the added substance has a lower m. p. The values of K (cryoscopic const.) for the same acid are not const. but seem to rise with rise in the mol. wt of the added acid. The depression produced by 100 g. of acid dissolved in 100 g. of solvent acid is not far from 23 when the added acid has the lower m. p. and is in the neighborhood of 40 when the converse is the case. This fact may be used as a rough method of estg. the amt. of impurity in an acid undergoing purification but is of no value for quant. work unless the impurity is a known acid. A table is given showing the solidifying points of binary mixts of acids and esters, also one giving depressions of solidifying points. E. SCHERUBEL

The Mackey test. STIEPEL. *Chem Umschau Fette, Oele, Wachse Harze* 37, 326-7(1930); cf. *C. A.* **24,** 5503.—Referring to Wolf and Heilingötter's article (*C. A.* **25,** 429) the removal of metallic soaps from the sample before testing is not necessary unless the actual cause of the temp. increase is desired; the proposed duration of 1½ hr. cannot be applied in all cases, the use of brass gauze should be rejected, employment of paper thimbles of fixed dimensions obviates the difficulties arising from metal and indefinite vol., the placing of the sample into the bath denotes the beginning of the test. P. FISCHER

Twitchell reagent. V. Change of the colloidal properties of a new reagent on the market. Divulsion D, by the addition of various substances. KYOSUKE NISHIZAWA AND BUNTYU SAKUMA. *J. Soc. Chem. Ind Japan* **33,** Suppl binding 412-4(1930); cf. *C. A.* **25,** 427. The influence of the addn of electrolytes on the reagent with respect to emulsifying power, viscosity and surface tension at 95 ± 0.2° was studied. The results show that it has properties similar to the 3 reagents previously studied. Divulsion D resembles Idrapid especially, but it is more easily salted out with strong electrolytes. **VI. Fat-splitting power of Divulsion D and the darkening of fatty acid.** KYOSUKE NISHIZAWA AND KIYOTA FUZIMOTO. *Ibid* 414-7. The addn of weak acids has a bad effect on the fat-splitting power of this reagent, but this power increases with the strength of the acids. The more easily the reagent is salted out the less effective is the fat-splitting. The addn. of salts of strong acids increases the emulsifying power, but reduces the fat-splitting power. The addn of glycerol or free fatty acid is also harmful to fat-splitting power of this reagent. The effect of agitation at 100 r. p. m. decreases its power to that of 45% at 500 r. p. m. The theory previously proposed that the harmful effect of the addn of salts was due to the salt formation of the reagent in soln. is applicable to this reagent as is also the theory that the addn of strong acids increases emulsifying power by hindering the salt formation of the reagent in soln. The color of the fatty acids increases with progressive fat-splitting, but in the presence of salts the decrease in the color intensity with progressive fat splitting is more remarkable. The color intensity of the fatty acids is almost equal with either H_2SO_4 or HCl. Divulsion D gives better colored fatty acids than Pfeilring or Kontakt but is inferior to Idrapid in this respect. The fat-splitting power is superior to Pfeilring or Kontakt and also to Idrapid in the presence of a small quantity of strong acids. E. SCHERUBEL

Investigations of olive oil. II. The acidity of olive oils. F. TRAVITA-MOSCA AND M. VENEZIA. *Ann. chim. applicata* **20,** 452-6(1930); cf. *C. A.* **20,** 3091.—Olives, when held at higher temps. for prolonged periods before extg. the oil, develop a higher degree of acidity. The highest acid contents result when the olives are held at 29-30° before extg. the oil. A. W. CONTIERI

Studies in Indian oil seeds. The types of Sesamum indicum. KASHI RAM. *Mem. Dept. Agr. India, Botanical Ser.* **18,** 127-47(1930).—Rough-surfaced seed of *Sesamum indicum* yields a lower percentage of oil than the smooth-surfaced seed, probably because of the greater percentage of husk in the rough-seeded varieties. The smooth-surfaced seed contains 47 to 51% of oil and the rough-surfaced seed 38 to 41%. The oil varies in color from pale yellow to dark amber, is odorless and does not become rancid. The oil is used for culinary and medicinal purposes and in the manuf. of soap and perfume. K. D. JACOB

New compounds produced during the hydrogenation of fish oils. II. Hydrocarbons 2. SEI-ICHI UENO AND RIICHIRO YAMASAKI. *J. Soc. Chem. Ind Japan* 33 Suppl. binding 451-2(1930); cf. *C. A.* **24,** 4947.—A further investigation was made of the fraction contg. the higher mol. wt. compds. from the mixed hydrocarbons obtained during the hydrogenation of fish oils. The results show that a considerable amt. of the satd. isohydrocarbon, $C_{19}H_{40}$, is present. E. SCHERUBEL

Koryo oil from Andropogon sorghum var. vulgaris, Hack. (Manchu). SEI-IC

[illegible] AND NOBUO KUZEI. *J. Soc. Chem. Ind. Japan* **33**, Suppl. binding 452–6(1930).— [illegible] oil as found were: d_{20} 0.9206, n_{40} 1.4659, sapon. no. 183, I no. 114, unsapon. 4.0%. The oil belongs to the semi-drying oils. The unsatd. acids consist of oleic and linolic acids in the proportion of 2 to 1. The satd. acids consist mainly of palmitic acid with a small quantity of myristic and stearic acids. The unsaponifiable contains hydrocarbons, higher alcs. and sterols. E. SCHERUBEL

Para-rubber-seed oil. G. S. JAMIESON AND W. F. BAUGHMAN. *Oil and Fat Ind.* **7**, 39–42(1930).— The % compn. found for this oil was: linolenin 20.5, linolin 32.9, [illegible] 5.5 palmitin, 7.3, stearin 9.1, arachidin, 0.3, unsapon. 0.8. The oil should be [illegible] to soy-bean oil for use in the *paint industry*. Com. samples of the oil have been found to have poor drying properties. The high free fatty acid content is thought to be responsible for this. If the oil is filtered soon after manuf. its acidity upon standing increases very slowly; but the seeds are so sensitive that they die shortly after maturity and a considerable portion of the fatty acids is liberated by the hydrolytic enzymes in the seeds. E. SCHERUBEL

Investigation of Japanese beeswax. I. General properties. HARUICHI IKUTA. *Chem. Ind Japan* **33**, Suppl. binding 467–71(1930).— The honey plants seem to have no connection with the consts. of beeswax. The differentiation of the general properties of European and Japanese beeswax depends on the species of bees. The ripened comb has a close connection with the chem. consts. of the beeswax. E. S.

Emulsifying agents for technical use. H. A. NEVILLE. *Am. Silk J.* **49**, No. 10, 4–6(1930).— A general article in which soaps and sulfonated oil are compared as emulsifying agents. The latter has been found to possess practical advantages over soap because of the greater stability and uniformity of its emulsions, its greater stability in acids, alkalies and hard water and its greater powers of dispersion and penetration. H. H. MOSHER

Reciprocal influence of soap and perfume. E. I. LEDERER. *Seifensieder-Ztg.* **57**, 631–4(1930). cf. *C. A.* **25**, 429. Electrolytes, NaCl, Na_2SO_4 and weak org. acids, are without action upon perfumes while benzoic acid is said to prevent rancidity. NaOH and to a lesser extent Na_2CO_3 are dangerous, especially toward eugenol, vanillin, heliotropin, coumarin, etc., both in regard to color and perfume. Nonelectrolytes are mostly neutral in their action except albuminoid and gelatinous substances which are deleterious. Glycerol is said to be beneficial, but the reason for this is not clear. Catalysts, Cu, Mn and Fe, are detrimental, especially in ultra-violet light. This latter action may be used as an accelerated test for the permanency of soap perfumes by exposing samples of perfumed and unperfumed soap to the action of ultra-violet light and noting any change in color or odor. Summary: The essential factors for permanency of odor and color are a neutral soap body, purity of the odoriferous agents, proper fixing agents and lab. tests for keeping quality. Appended are 9 perfume formulas for various types of toilet soaps. P. ESCHER

Solubility of metallic soaps of naphthenic, oleic and stearic acids. TEIKICHI YAMADA. *J. Soc. Chem. Ind. Japan* **33**, Suppl. binding 412(1930).— The soaps of 22 metals were tested for soly. in the common solvents. The oleates and naphthenates were similar in soly. except that Hg and Pb naphthenates are sol. in alc. while the oleates are [illegible]

	Solvent	Soly. at 5°.
Hg naphthenate	Alc.	Above 33%
Hg oleate	Alc.	Less than 0.1%
Pb naphthenate	Alc.	Above 29%
Pb oleate	Alc.	Less than 0.2%
Zn naphthenate	Acetone	Above 22%
Zn oleate	Acetone	Less than 0.4%

E. SCHERUBEL

Preparation and physical properties of α-monoglycerides. R. S. REWADIKAR AND H. E. WATSON. *J. Indian Inst. Sci.* **13A**, Pt. 11, 128–40(1930).— The α-monoglycerides of fatty acids with an even no. of C atoms from caprylic to stearic were made in a state of high purity and their densities, refractive indices, viscosities and surface tensions measured. The glycerides of the 4 higher acids exhibit 2 definite m. ps. corresponding with those of the 2 forms α and β. The rate of the change β ⟶ α increases with decrease in mol. wt. and is almost instantaneous with α-monolaurin. The solidifying point of the fused glyceride always lies below the m. p. of the α-form, indicating that the transformation β ⟶ α is not complete. E. SCHERUBEL

The problem of rancidity in soaps. F. WITTKA. *Seifensieder-Ztg.* **57**, 773–4 (1930).— A general review in which 2 types of rancidity are discussed, (1) by oxidation

of the unsatd. acids, and (2) the rancidity from after-sapon. of the coconut oil group in which free acids of low mol. wt. are said to be liberated, thereby causing a rancid odor. P. ESCHER

Spotted soaps: cause and prevention. E. U. BROEMME AND S. WARSCHAUER. *Seifensieder-Ztg.* **57**, 821–3(1930).—Rust spots are prevented by settling the NaOH lye before use and by chrome plating the steel dies or by using Nirosta steel dies. Rancidity spots are prevented by the use of sprays for introducing NaOH into the kettle to prevent lump formation; by the use of 15–18° Bé. NaOH in place of stronger lye, the use of boiling water in place of cold water, also introduced through the spray systems and only together with some caustic; by the use of labels free from bronze or other metallic colors; by preventing lubricating oil from dropping into the kettle and by cleaning the kettle before each charge. P. ESCHER

Apparatus for gravity separation of liquids such as oil and water (U. S. pat. 1,784,943) I. Water-soluble product from fatty acids of wool fat (U. S. pat. 1,784,941) 25.

Apparatus for obtaining fats from animal carcasses, etc. H. KRÜGER. Brit. 333,059, Jan. 2, 1929. An app. suitable for use with steam under pressure or with fat solvent vapors comprises a vapor-tight casing within which is mounted a rotary screening drum. Various structural details are described.

Apparatus for "dry-rendering" of fat-containing materials. WM. T. POWLING (to John W. Pittock). U. S. 1,785,361, Dec. 16. Various structural features are described.

Neutral fats and oils. OTTO JORDAN and GEORG KRAEMER (to I. G. Farbenind. A.-G.). U. S. 1,786,248, Dec. 23. Linseed, soy-bean, peanut or castor oil or other fats or oils contg. free acids are treated with an alkylene oxide such as ethylene oxide at 100–200° which serves to react with the free acids Catalysts are used such as acetates, phosphates or chlorides of alkali or alk. earth metals, Al_2O_3 or TiO_2. Cf. *C. A.* **24**, 983, 5522.

Removing oil and fat deposits from steam-heated drying chambers. LOTHAR WOLF and KARL KUNZE. Ger. 505,426, Oct. 19, 1929. Addn. to 478,637 (*C. A.* **23**, 4803).

Treating fish oils to obtain vitamin A. KATSUMI TAKAHASHI (to Zaidan Hojin Rikagaku Kenkyujo). U. S. 1,786,095, Dec. 23. A fish oil such as cod-liver oil is treated with an alk. soln. of alkali metal hydroxide to saponify the oil and convert the fatty acid constituents of the oil into alkali metal soaps; the alc. vitamin and soap mixt. thus obtained is treated with an alk. earth metal chloride to ppt. alk. earth metal soaps and the insol. soaps are sepd. from the alc. soln. of vitamin A by filtration.

Apparatus for decolorizing oils. CO-OPERATIVE WHOLESALE SOC., LTD., and ARTHUR GLOVER and CHARLES W. COUCHE. Fr. 686,442, Dec. 11, 1929. An app. is described for decolorizing palm oils, in which the oils are heated to a relatively high temp., *e. g.*, 250°, with exclusion of air. The oil is then passed to a heat exchanger. The addn. of $Pb(AcO)_2$ made the process more rapid. Cf. *C. A.* **24**, 5175.

Hardening paraffin, waxes, etc. WILHELM PUNGS and MICHAEL JAHRSTORFER (to I. G. Farbenind. A.-G.). U. S. 1,786,263, Dec. 23. Up to 10% of oxidation-bleached montan wax is added to substances such as paraffin, beeswax, tallow or spermaceti in order to produce products of higher m. p.

Soap. NEW PROCESS SOAP, LTD. Ger. 505,931, April 12, 1928. Details of a pivoted soap boiler.

Apparatus for producing shredded soap from semi-liquid soap. JULIUS A. SCHWANTES (to Colgate-Palmolive-Peet Co.). U. S. 1,785,532-3, Dec. 16. Various details of app. and operation are described relative to producing an air-current drying of soap shreds. Cf. *C. A.* **24**, 1535.

Soap powder. CLEMENT K. STODDER. U. S. 1,785,054, Dec. 16. A semi-plastic moisture-contg. soap stock is divided into pieces of large surface areas relative to their mass (as by extrusion to form strips) and these pieces are embedded in a dehydrated powd. alkali such as Na_2CO_3 having an affinity for the moisture in the soap stock and the mixt. is aged to permit the alkali to absorb a substantial proportion of the moisture and render the soap stock brittle, and it is then reduced to the desired degree of fineness. App. is described.

Soap press. RUEL A. JONES (to R. A. Jones & Co.). U. S. 1,785,312, Dec. 16.

29—LEATHER AND GLUE

ALLEN ROGERS

Report on [the determination of copper and zinc in] gelatin. R. M. MEHURIN. *J. Assoc. Official Agr. Chem.* **13**, 479(1930); cf. Berry, *C. A.* **21**, 286.—A simplified method, involving ashing of the sample and colorimetric estn. of the Cu, was devised and compared collaboratively with the alternative A. O. A. C. method which involves hydrolysis of the sample. The results were not considered sufficiently satisfactory to warrant a detailed report of the expts. and of the technic of the new method, but the latter gave more uniform results than the alternative A. O. A. C. method. From past experience with a similar method for the detn. of Cu and Zn in gelatin, M. believes that preliminary ashing of the sample and colorimetric estn. of Cu will result in considerable saving of time and, in the hands of the av. chemist, give greater accuracy in results than is obtained by hydrolysis of the sample and gravimetric or volumetric estn. of Cu. A. PAPINEAU-COUTURE

A note on the testing of gelatin for jelly strength. E. J. GUILD. *J. Soc. Chem. Ind.* **49**, 453–4T(1930).—For the test described below, it is necessary to have the gelatin broken into small pieces and well mixed. A moisture test is carried out with it. For the strength test, 15 g. of gelatin is soaked overnight in 250 cc. distd. water. The next morning it is drained off as far as possible, fresh distd. water is added and the whole melted at 50° and made to a vol. of 300 cc. After thorough soln. and mixing, the soln. is poured into a cylindrical flat-bottom glass vessel 2.5 in. in diam. and 4.5 in. deep. After another stirring with a glass rod, any froth is removed, the contents are allowed to set at a temp. of 18–20°, and the vessels are placed in an incubator or const.-temp. room at 15° and left overnight. The app. (similar to that described by Lawrie) consists of a hollow bulb of 1.8 cm. outside diam. forming one end of a tube 20 cm. in length and of 0.45 cm. internal diam., which is opened out at the other end to an inside diam. of 0.75 cm. A bung is bored to fit the top and serves as a wt. platform. To conduct the test, the skin of the jelly is broken to a depth of 2.5 cm. and the bulb inserted, the tube being maintained vertical, and capable of sliding easily downward, by slipping it into a split smooth cork fixed in a clamp attached to a retort stand. The bulb travels slowly down through the mass by placing wts. on the platform, followed by Hg, which is dropped into the bulb from a buret until the bottom of the bulb is within 1 cm. of the bottom of the vessel. When that occurs the tube is removed and wiped dry, and, with the wts., Hg and cork, is weighed as a whole and recorded. "Specific strength" of jelly is detd. from the formula $(S-4)/B^2$, where S = wt. necessary to penetrate the jelly, and B is the wt. of bone-dry gelatin. The method is accurate to 5–7%, which is close enough for comparative work. W. H. BOYNTON

Dyeing leather, etc. (Ger. pat. 505,859) **23.** Dyeing skins, etc. (Ger pat. 474,934) **25.**

Dehairing hides. GEORGE D. MCLAUGHLIN, GEORGE E. ROCKWELL, FREDERICK O'FLAHERTY and JOHN H. HIGHBERGER (to Tanners' Council of the U. S. A.). U. S. 1,785,092, Dec. 16. See Brit. 327,132 (*C. A.* **24**, 5178).

Tanning extracts. FORESTAL LAND, TIMBER & RAILWAYS CO., LTD., and R. O. PHILLIPS. Brit. 332,935, Jan. 25, 1929. Pulp and tanning exts. are simultaneously obtained from tannin-contg. woods by the action of an aq. soln. prepd. with $NaHCO_3$ 1 and Na_2SO_3 3 parts.

Water-soluble condensation products suitable for use as tanning agents. I. G. FARBENIND. A.-G. Brit. 332,960, May 1, 1929. The process described in Brit. 320,056 (*C. A.* **24**, 2634) is modified by causing a haloaralkyl halide to act on a hydroxy-aromatic hydrocarbon, with the addn. of a metal or metal salt catalyst, and sulfonating the product. Examples are given.

Tanning. E. STIASNY. Brit. 333,221, Jan. 28, 1929. The material is treated with a liquor contg. a water-sol. complex compd. of Al in which at least one radical of a carboxylic acid, or of an acid synthetic tanning agent, and one sulfurous radical, are combined with the Al. Solns. may be used contg. Al sulfate "or oleum," Na_2SO_4 and one or more substances contg. carboxylic compds. acid such as those of acetic, oxalic, lactic or citric acids or synthetic tanning substances such as formaldehyde-condensation products of aromatic sulfonic acids or the like; and other compds. such as NaCl,

Na_2CO_3 or sulfonated castor oil may be present. The treatment may be in successive baths, each of which contains only a portion of the substances used, and the tanning may be followed by stuffing with sulfonated Neat's foot oil and egg yolk.

Tanning. SIDNEY LE F. VARVEL. Fr. 686,383, Dec. 10, 1929. Skins or leather are tanned by immersion in a tanning bath, the skins being connected to a source of continuous current which is connected at the other end to the liquid, and the current is completed by a commutator until the tanning operation is complete

Leather tanning. HERBERT WITTEK. Ger. 480,701, Aug. 13, 1925. Tanning material for leather is obtained by sulfonating the water ext. of crude tar and isolating the part sol. in water. Thus, the ext. is treated with concd. H_2SO_4, allowed to cool, and, after standing, treated with ice water.

Tanning leather such as chamois or buckskin. AUGUST ERNST. U. S. 1,784,828, Dec. 16. The cleaned limed skins are agitated in a bath contg. CH_2O, and there is then added a mixt. contg. soap, moellon degras, sod oil, Glauber's salt and $NaHCO_3$, followed by further agitation of the skins in the bath until tanned.

Leather treatment. EDWIN S. MIX (to Hickok Mfg. Co.). U. S. 1,785,966, Dec. 23. The hide is stretched in one direction during the tanning operations to cause the major portion of the fibers of the hide to arrange themselves in that direction, and the surface of the leather is combed in such general direction to cut the transverse surface fibers and release the surface fibers to project in the direction of the combing.

Impregnating leather with synthetic resin compositions. J. TAYLOR and A. V. KELLER. Brit. 333,759, Aug. 29, 1929. Leather (or ground leather waste for making molded products) is impregnated with a concd. soln. of a condensation product of urea or a deriv. or of phenolic compds. with formaldehyde or other suitable aldehydic compd. and the soln. is allowed to dry. Various details for prepg. the solns. used are given.

Finishing leather, rubber, etc. IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 686,381, Dec. 10, 1929. Leather, rubber or leather cloth is finished by the application of an adhering film of varnish prepd. by means of a resin formed by condensing a polyhydric alc. with a polybasic acid, the resin contg. also a fatty oil (including drying oils, semi-drying oils, castor oil as well as satd. fatty oils) or the corresponding fatty acid, or 2 or more of these added elements. The resin may also contain a cellulose ester or ether and (or) an aldehyde-phenol or aldehyde-urea resin.

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Water absorption of rubber compounds. H. A. WINKELMANN AND E. G. CROAKMAN. *Ind. Eng. Chem.* **22**, 1367–70(1930).— An accelerated base mixt. was compounded with different proportions of whiting, barytes, clay, ZnO, "thermatomic C" and gas black, resp., cured 20, 40, 60, 80, 100 and 120 min. at 141.7°, immersed in water at 28° and the % increases in wt. were detd. periodically for 30 days. The results may be summarized as follows: (1) With a given filler the water absorption is virtually independent of the proportion of filler added. (2) The water absorption diminishes with increase in the time of cure until it reaches a min. just after the optimum cure, following which it increases again (a tire tread mixt. showed the highest absorption at its optimum cure), showing in general that the water absorption of a vulcanizate varies with the time of cure. (3) Whiting and barytes increase the water absorption of overcured vulcanizates; the greatest water absorption was obtained with clay and ZnO; gas black had very little effect; and "thermatomic" C decreased the water absorption. (4) Salts such as metallic acetates increase water absorption, so such impurities in fillers (from the action of residual AcOH) may play a part in the water absorption of a vulcanizate. (5) Immersion of a tire tread vulcanizate in water for 30 days did not change the modulus or tensile strength but decreased the elongation, while the dried sample had the same modulus, a higher tensile strength, a lower elongation, the same resistance to tearing and a higher resistance to abrasion than before immersion. (6) The water absorption of a hard rubber diminished progressively with increase in the time of cure. (7) The water absorption of reclaimed rubbers cured with S varied considerably with the raw materials used and with the process of reclaiming. C. C. D.

Coating compositions containing nitrocellulose and an artificial rubber isomer, etc. (U. S. pat. 1,785,267) **26. Finishing rubber, etc.** (Fr. pat. 686,381) **29.**

Rubber. C. WALTER LEUPOLD. Ger. 505,825, July 25, 1928. Vulcanized rubber masses are produced by adding concd. sulfite-cellulose lye in addn. to the usual filling materials such as diphenylguanidine or MgO. The rubber so treated has a greater resistance to the action of light and air.

Rubber deposition from dispersions. DUNLOP RUBBER CO., LTD., and E. W. B. OWEN. Brit. 333,331, May 31, 1929. In making seamless multi-compartment articles such as purses, handbags or the like, formers with relatively adjustable parts are dipped into aq. dispersions of rubber or similar material, the formers are adjusted for the desired thickness of deposit, and coagulation of the deposited material is effected. Various details of app. and operation are described.

Coating metals with a thick homogeneous covering of rubber by electrophoretic methods. THE ANODE RUBBER CO., LTD. Ger. 505,824, May 2, 1926. Details are given of the app. for the pptn. of the rubber from a dispersion by an elec. current.

Preserving rubber. ALBERT M. CLIFFORD (to Goodyear Tire & Rubber Co.). U. S. 1,785,692, Dec. 16. About 1% of a compd. such as a dinaphthylnitrosoamine is added to the rubber. Cf. *C. A.* **25**, 233.

Preserving rubber. PAUL C. JONES (to B. F. Goodrich Co.). U. S. 1,784,838, Dec. 16. Rubber is treated with a tetraarylhydrazine in which at least one of the aryl groups is substituted, *e. g.*, with *N,N'*-di-*p*-anisyl-*N,N'*-diphenylhydrazine or a similar compd. 0.1–5.0%.

Treating rubber with hypochlorites, etc. E. HAZEL (to Naugatuck Chemical Co.). Brit. 333,391, Oct. 5, 1928. A latex (suitably one contg. formaldehyde and Nekal as preservative and stabilizing addns.) is treated with NaOCl or other suitable compd. of the general type formula M-halogen-O, in which M is H, an alkali or alk. earth metal or an org. radical such as Et, Am or *tert*-butyl. This treatment usually produces a permanent tackiness in the rubber laid down but when applied to a strongly ammoniacal latex a glazed non-tacky condition results. Creaming also may be facilitated and decompn. prevented. Various details and examples of treatment are given.

Rubber threads. DUNLOP RUBBER CO., LTD., E. A. MURPHY and D. F. TWISS. Brit. 333,005, June 13, 1929. Threads formed as described in Brit. 311,844 (*C. A.* **24**, 989–90) are passed through even-speed rollers when partially set, to produce flattened tape-like filaments or threads. The rollers may be rubber covered or engraved and the tapes may be coated with clay, whiting, etc., before drying, and may be used for winding golf-ball cores, etc.

Rubber articles. THE ANODE RUBBER CO. (ENGLAND), LTD. Fr. 686,285, Dec. 7, 1929 In the manuf. of articles from rubber or the like by drawing, immersion, impregnation, molding, electrophoresis, etc., starting directly from emulsions or aq. dispersions the emulsions or dispersions are mixed with variable amts. of one or more salts of hydrofluosilicic acid. Details of the process are given.

Reclaimed rubber. CHARLES H. CAMPBELL (to Peter Cooper Corps.). U. S. 1,786,149, Dec. 23. Rubber is reclaimed from rubber scrap by a devulcanizing process in which the rubber scrap is subjected to the action of cleavage products obtained from tanned leather during the process of devulcanization.

Rubberized textile sheets. HANS R. HAERTEL (to Thomas H. Dumper). U. S. 1,785,081, Dec. 16. Tacky rubber surfaces are coated with a soln. comprising a volatile solvent such as alc. and shellac and an ammoniacal soln. of a metal carbonate inert to rubber such as $MgCO_3$. U. S. 1,785,082 relates to the successive application of similar solns. U. S. 1,785,083 relates to the use of similar solns. but with application of the shellac soln. before application of the ammoniacal carbonate soln. U. S. 1,785,084 specifies use of shellac and $ZnCO_3$ dissolved in alc. and NH_3. U. S. 1,785,085 specifies successive use of shellac and a similar $ZnCO_3$ soln.

Liner fabric for use in rubber goods manufacture. PAUL BEEBE (to Goodyear Tire & Rubber Co.). U. S. 1,785,667, Dec. 16. A liner fabric is dipped in a soln. of soap in order to prevent adhesion.

Paving blocks with rubber tread portion. DUNLOP RUBBER CO., LTD., H. C. YOUNG, F. W. WARREN and F. H. TOOP. Brit. 333,047, July 29, 1929. A 3-layer block, with a tread portion of comparatively resilient rubber, a center layer of hard rubber of ebonite consistency and a base of bitumen and aggregate is formed with use of a rubber mixt. comprising crumb rubber, S and aq. rubber dispersion as described in Brit. 315,512 (*C. A.* **24**, 1764). Various details of manuf. are described.

Apparatus for testing cords such as those for tire manufacture. THOMAS B. BUFFUM (to Goodyear Tire & Rubber Co.). U. S. 1,785,690, Dec. 16. Structural features.

Rubber-vulcanization accelerators. I. G. FARBENIND. A.-G. Brit. 333,174, May

2, 1929. For accelerators, there are used condensation products of NH_3 and unsatd. aldehydes such as crotonic aldehyde, acrolein or substituted acrolein. Cf. *C. A.* 25, 234.

Vulcanization accelerators. The Rubber Service Laboratories Co. Ger. 504,923, Oct. 10, 1926. The accelerator consists of the condensation product of an aliphatic aldehyde with the reaction product of mercaptans or mercapto compds. and org. bases. Examples of suitable aldehydes are croton- or heptaldehyde, of a suitable base, guanidine and of suitable mercapto compds., benzoarylmercaptans.

Apparatus and gas-supply system for vulcanization of hollow rubber articles such as tire tubes and casings. Harold A. Denmire (to General Tire & Rubber Co.). U. S. 1,786,290–1, Dec. 23. Various details of app. and operation are described.

Vulcanizing organic isocolloids. Laszlo Auer and Nikita Strachovsky. Fr. 686,316, Dec. 9, 1929. Org. isocolloidal substances contg. acids of high mol. wt. or their derivs. are vulcanized by combining with the operation of sulfuration an application of steam, either during or after the sulfuration. In the application of the process to vulcanizing rubber, the rubber is first modified by treatment with appropriate agents, *e. g.*, as described in Fr. 652,796 or its patent of addn. 34,956.

Vulcanization of unsaturated organic compounds. Laszlo Auer and Paul Stamberger. Fr. 686,321, Dec. 9, 1929. Unsatd. org. compds. are vulcanized by first putting the S in dispersion in the substance to be vulcanized, which is then brought in contact with an aq. medium and submitted in this state to heat and pressure until the required degree of vulcanization is reached. The process may be applied to isocolloids by treating the isocolloids with vulcanization agents to obtain a first vulcanization, after which the above treatment is applied.

Rubber-like preparations. I. G. Farbenind. A.-G. (Carl Krauch and Martin Müller-Cunradi, inventors). Ger. 505,843, Oct. 21, 1927. Vehicle tires are formed of a rubber-like prepn. including polymerized butadiene. An example gives a mixt. of polymerized butadiene, soot, stearic acid, condensation product of aldol and α-naphthylamine, S, and piperidinepentamethylenedithiocarbamate. In another example, crude rubber is added.

Rubber-like product. Frederick C. Zobel. U. S. 1,786,281, Dec. 23. A mixt. of gum copal and hard wood-creosote oil (suitably in the proportions of 1 and 2 parts, resp.) is heated until a clear soln. is formed, and petroleum naphtha is then added to effect pptn. of a product which may be used for pencil mark erasers and has properties similar to rubber.

Rubber filling material. Max Buchner and Wilhelm Bachmann. Ger. 504,922, 1928. A highly active rubber filling material is prepd. from H_2SiO_3 by passing SiF_4 into water or aq. H_2SiF_6 in the presence of protective colloids such as gelatin, albumin, vegetable mucous, etc.

Gutta-percha, balata, etc. Willoughby S. Smith, Henry J. Garnett and John N. Dean. Fr. 686,535, Dec. 7, 1929. Gutta-percha, balata and like thermoplastic materials, natural or artificial, have their mech. properties improved and their fusion or softening point raised by heating them for a sufficient time at a temp. below that at which they would melt or soften. Cf. *C. A.* 24, 4960.

Treating gum exudates such as gutta-percha. Charles Martell (to Western Elec. Co.). U. S. 1,786,075, Dec. 23. A gum exudate such as gutta-percha is treated with a relatively small quantity of latex until a quantity of the gum in the latex has been absorbed by the gum exudate, which serves to improve the material.

CHEMICAL ABSTRACTS

Vol. 25. FEBRUARY 20, 1931 No. 4

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Instantaneous clamp for a universal support. A. BARBOT. *Bull. soc. chim.* [4], 47, 1331–2(1930).—A simple, rugged, inexpensive clamp consisting of 3 pieces is described. It is quickly adjusted to hold app. of many sizes. J. H. MOORE

Filter manufacturers and their products. ANON. *Chem. Age* (London) 23, 377–84(1930).—Notes are given on the products of leading manufacturers of filtration plants and the principles which guide their development. E. H.

A new simple arrangement for fractional distillation in the laboratory. W. PRAHL. *Chem. Fabrik* 1930, 517–9.—The neck of a common long-necked fractionating flask is filled with glass rings and carries a Liebig cooler and thermometer at the top. The side arm carries a cock and is connected to a vertical cooler with a receiver at the bottom. After boiling, equil. is established, the cock is opened to allow the desired fraction of vapor to pass to the vertical cooler. In this way the ratio of the reflux condensate to the distillate may be made very high and a good sepn. attained. Cf. *C. A.* 24, 4194. J. H. MOORE

Modified balance for approximate and quick weighing. E. KARRER. *Ind. Eng. Chem., Anal. Ed.* 3, 112–4(1931).—The balance is an ordinary beam balance with a scale placed high above the beam. A spring is mounted directly beneath the beam, and in the spring are 2 adjustable studs. These studs barely make contact with the spring in the balanced state. In making a weighing, the right-hand scale pan is depressed to a definite point and then released quickly and carefully. If the weights on the 2 pans are equal, the index will be deflected to a point that may be called zero on the scale but will travel to a shorter or greater distance if the weight on the right-hand pan is smaller or larger than the wt. of the object. The scale can be adjusted in units of wt., length or vol. Such a balance is useful and rapid when a large no. of similar weighings have to be made. W. T. H.

A new automatic cryostat. A. I. SCHATTENSTEIN. *Z. anorg. allgem. Chem.* 193, 187–90(1930).—Temps. down to —70° may be maintained in a Dewar vessel contg. acetone, a stirrer and a thermal regulator, which controls a relay which in turn operates a solenoid. The latter raises and lowers a silvered double-walled cylinder, cooled by CO_2, which is suspended just above the Dewar vessel and from the bottom of which a Cu cone extends. When the bath tends to warm up, the cone is lowered into the acetone. When the temp. is low enough, the solenoid causes the cone to rise. An example is given of a 2.5-l. flask maintained at —33° with variations of ±0.01°. L. P. HALL

A simple continuous dialyzer. HARRY A. AITKEN. *J. Biol. Chem.* 90, 161–3 (1931).—A simple continuous dialyzer is described which can be constructed for vols. of about 10 to 15 cc. as well as for larger vols. It is so arranged that a relatively small vol. of the soln. to be dialyzed covers a large surface of membrane so that the process of dialysis is very much accelerated. A. P. LOTHROP

Micro-absorption tube with mercury seals. RALPH T. K. CORNWELL *Ind. Eng. Chem., Anal. Ed.* 3, 4–5(1931).—The fragile nature of the Kemmerer-Hallett tube (*C. A.* 21, 720) is overcome. J. H. MOORE

A manometer for the measurement of small pressure differentials at high pressures. JAMES H. BOYD, JR. *J. Am. Chem. Soc.* 52, 5102–6(1930).—Pressure differentials of 1 in. Hg at 3000 lb. per sq. in. are measured with an accuracy of 1 part in 1000 by elec. means. The readings are direct, and calibration and the use of very clean Hg are unnecessary. J. H. M

A simple attachment to ordinary U-tube manometers for maintaining constant pressure. J. A. VAN DEN AKKER. *Rev. Sci. Instruments* 1, 684–6(1930).—By using a transparent oil in the manometer the liquid column serves as a cylindrical lens. A Se cell is placed back of the manometer at the desired point, and a screen with a 1.0 mm.

hole placed between cell and oil column. When the column is above the hole, parallel rays from a 32 c.-p. lamp are spread by the oil lens over a larger area of the cell surface than when the meniscus is below. A thermionic-valve circuit, relays and a solenoid translate the resultant current difference into the opening of a tire valve for admitting gas. GREGG M. EVANS

Reliability of pyrometers. H. MOORE. *Pottery Gas.* **56**, 81–5(1931).—A discussion of the radiation pyrometer, how it functions, the main essentials to be observed in its construction and the reliability of temp. measurements obtained when using an instrument of the lens type versus one of the focusing-mirror type. The latter apparently gave more reliable readings. Uniformity of temp. in the furnace was important if correct readings were desired. R. A. HEINDL

Conductivity water. G. W. TOMPKIN. *Chemist-Analyst* **20**, No. 1, 16–7(1931).—Satisfactory water was obtained by leading the water from the lab. still to a distg. flask which was fed automatically by a float valve consisting of a glass tube, partially closed, in which was a loose-fitting glass rod carrying the glass float welded to the rod. The steam was led into an Erlenmeyer flask which was submerged in a water bath, whereby the steam was partially condensed. An automatic siphon removed the water when the flask was full. W. T. H.

Precision leveling bulb. WENDELL P. MUNROE. *Chemist-Analyst* **20**, No. 1, 20 (1931).—In obtaining readings with a gas buret and leveling bulb with Hg as confining fluid, it was found difficult to match the levels accurately because of the larger surface in the bulb. To obviate this difficulty a bottle with side arm was used in place of the bulb, and the bore of the side arm corresponded to that of the buret. W. T. H.

Practical salt-water-spray tank. LEOPOLD PESSEL. *Chemist-Analyst* **20**, No. 1, 15–6(1931).—Drawings are shown and directions given for making a salt-water-spray corrosion cabinet to be used in accelerated corrosion tests of metals. W. T. H.

Spray nozzle. JOHN C. CASE. *Chemist-Analyst* **20**, No. 1, 20–1(1931).—A specially designed nozzle which is not likely to become clogged is described for the salt-spray test. W. T. H.

Device for holding glass stoppers in place. P. G. HORTON. *Chemist-Analyst* 20, No. 1, 21(1931).—In work demanding an all-glass app. it is sometimes necessary to hold stoppers in place against pressure from within. A device is shown for using pipe straps, plaster of Paris and bolts whereby a neat and tight joint can be made very easily. W. T. H.

Pipet of special size for standardizing volumetric solutions. JOHN E. S. HAN. *Chemist-Analyst* 20, No. 1, 21(1931).—Pipets delivering 42.75–47.25 cc. are recommended in place of the usual 50-cc. pipet. W. T. H.

Simple distilling apparatus. R. STEVENS GIBBS. *Chemist-Analyst* **20**, No. 1. 22–3(1931).—The still is made with a 30-cc. glass beaker, a 300-cc. beaker and a 3.5-inch funnel. The liquid from which the volatile constituent is to be collected is placed in the larger beaker, the smaller beaker is suspended in the beaker and above the small beaker is the funnel, which has the stem cut off and has the apex fused together. During the distn. the funnel is filled with ice, the vapors condense on the under side and the condensate drops into the smaller beaker. The funnel fits in a collar at the top of the larger beaker. W. T. H.

Device for estimation of density of gems and small amounts of solids. EUGENE W. BLANK. *Ind. Eng. Chem., Anal. Ed.* **3**, 9–11(1931).—The device consists of a weight buret and a sep. tube (12 cm. tall and of 0.6–0.8 cm. bore) with a capillary side tube (1.0 mm. bore) which is provided with 2 marks to show the level of liquid in the main tube. The tube is filled with a suitable liquid (*e. g.*, ether) until it reaches the lower mark in the capillary, a weighed portion of sample is added and then enough liquid from the wt. buret to bring the level to the upper mark in the capillary. By subtracting the wt. of liquid required from the wt. required when no added substance is present, the wt. of liquid displaced by the solid is obtained. Then, since its d. is known, it is easy to compute that of the solid. The results are shown to be good by comparing the values obtained in this way with some 20 different materials of known ds. W. T. H.

Mill for small samples. W. H. COOK, E. P. GRIFFING AND C. L. ALSBERG. *Ind. Eng. Chem., Anal. Ed.* **3**, 102–3(1931).—Microanalytical methods for the analysis of homogeneous material have been unavailable to biological chemists because of the difficulty in grinding and sampling very small samples without loss of substance or moisture. A mill is here described, which can be obtained from A. H. Thomas of Philadelphia, which is capable of reducing samples such as individual wheat leaves without loss. The principle is similar to that of the Wiley lab. mill. A rapid shearing

effect is obtained by a hard knife with 4 blades cutting against another blade placed in the wall of the grinding chamber. W. T. H.

The vacuum fractionation of phlegmatic liquids. K. HICKMAN AND W. WEYERTS. *J. Am. Chem. Soc.* 52, 4714–28(1930).—A new still-head for high-boiling liquids with the thermometer placed in a large bulb and an automanometer side tube sealed in near the thermometer, and a butyl phthalate outside manometer are described, which will give true b. ps. at low pressures. Exptl. data are given. J. H. MOORE

Apparatus for experimentation on gas at the ultra pressure of 6000 kilograms per square centimeter. JAMES BASSET. *Compt. rend.* 191, 928–31(1930).—A description, with 3 cuts, is given of an app. for studying the phys. and chem. properties of gases, and which has operated satisfactorily for several hundred hrs. with H at 4–5000 kg. per sq. cm., and at internal temps. up to 1000°. Cf. *C. A.* 21, 3492. J. H. MOORE

Shelf to increase ashing capacity of laboratory electric furnace. RAYMOND HERTWIG. *Cereal Chemistry* 7, 556(1930).—The shelf is made of asbestos board $^3/_{16}$" thick. It is perforated with numerous holes $^1/_4$" in diam. to permit free circulation of the air. Four narrow strips of the asbestos board are fitted to the shelf edges with dovetail joints. These serve to support the shelf and hold it firmly in position. A diagram shows the construction. L. H. BAILEY

Precision of color temperature measurements under various observing conditions; a new color comparator for incandescent lamps (JUDD) 2.

KIRSCHBAUM, EMIL: **Dechema Monographien. Nr. 12, Bd. 2.** Berlin: Verlag Chemie, G. m. b. H. 40 pp. M. 5.

Porcelain filter for laboratory work. STAATLICHE PORZELLAN-MANUFAKTUR. Ger. 509,931, May 14, 1927.

Rotary-cell filter. FIRMA R. FÖLSCHE. Ger. 509,930, June 13, 1926. Details of construction.

Sack filters. FÉLIX GINSBACH. Fr. 688,212, Jan. 14, 1930. Means for cleaning is described.

Filter unit for tube well filters. OTTO LAUBNER. U. S. 1,787,634, Jan. 6. Structural features.

Air filter. JULIUS LEDERER (to American Air Filter Co.). U. S. 1,788,164, Jan. 6.

Air filter. JAMES J. PREBLE (to American Air Filter Co.). U. S. 1,788,171, Jan. 6.

Air-filtering device. EUGENE L. BARNES. U. S. 1,787,135, Dec. 30. Structural features.

Air-filtering device. FRANK A. DONALDSON. U. S. 1,787,235, Dec. 30. Structural features.

Apparatus for filtering air or gases. LUDWIG HONIGMANN. Fr. 687,742, Jan. 6, 1930.

Apparatus for separating gases by liquefaction. SOC. L'AIR LIQUIDE (SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS GEORGES CLAUDE). Fr. 687,479, Mar. 15, 1929.

Liquid filter. ALFRED GRØNNING. Ger. 509,929, Aug. 14, 1927. Details of construction.

Rotary filter for liquids. HUGO KOSCHMIEDER. Ger. 506,961, April 27, 1926.

Drum suction filter for separating suspended matter from liquids. FILTRATION ENGINEERS, INC. Ger. 507,789, June 11, 1927.

Filter suitable for filtering "dry-cleaning" solvents. JOHN H. HILLS (to Bousman Mfg. Co.). U. S. 1,787,577, Jan. 6. Structural features.

Vacuum filter for pulp, pastes, etc. GEORGES ANTOINE ALLEMAND. Fr. 687,477, June 7, 1928.

Filter press. PIERRE L. DORNER. U. S. 1,788,086, Jan. 6.

Filter press. MASCHINENFABRIK SANGERHAUSEN A.-G. Ger. 509,928, May 4, 1928. Details of closure are given.

Filter presses. JEAN RAUX. Fr. 686,713, Dec. 16, 1929. The usual cotton or hemp filter cloths are replaced by metallic filtering screens.

Filter-press leaf. WM. H. BACHELDOR (to Standard Oil Co. of Ind.). U. S. 1,787,100, Dec. 30.

Filter sheets. FRED W. MANNING (to Filter Fabrics, Inc.). U. S. 1,786,669, Dec. 30. A finely divided filtering substance such as cellulose fiber, asbestos or fuller's earth is deposited on a moving web of sheet material such as scrim in an app. described, against the influence of gravity (as by suction). Cf. *C. A.* 25, 416.

Gas calorimeter. H. P. LUPTON. Brit. 333,960, May 29, 1929. The inlet water may have its temp. raised before entry into the calorimeter by means of the heated delivery water. Various details of construction are described.

Distillation apparatus using the heat of the sun. SOC. LA DISTILLATION. Fr. 686,847, Mar. 7, 1929.

Stirring device. SCHERING-KAHLBAUM A.-G. (Walter Baensch, inventor). Ger. 509,701, Feb. 10, 1929. Addn. to 489,931 (*C. A.* **24**, 2011). The device is specially applicable to the hydrogenation of liquid materials.

Spiral polymetallic thermometer. THERMEX S. A. Swiss 137,673, Feb. 16, 1929. Addn. to 124,551.

Viscometer. I. G. FARBENIND. A.-G. (Adolf Kämpf, inventor). Ger. 508,605, Jan. 12, 1928. Details are given.

Viscometer with interfitted cup and ball surfaces. ANTHONY G. M. MICHELL. U. S. 1,786,574, Dec. 30. Structural features.

Containers, apparatus, etc., made from phenol-aldehyde resins and perforated metal supports. SÄURESCHUTZ G. M. B. H. Ger. 509,148, April 27, 1929. Manipulative details of the manuf. are described.

X-ray tube. MONTFORD MORRISON (to Westinghouse Elec. & Mfg. Co.). U. S. 1,787,699, Jan. 6.

Röntgen-ray tubes. F. ROTHER. Brit. 334,149, Dec. 24, 1929. Various details are described of tubes which may have a cathode of light metal such as Be or its alloys and an anticathode of pure radioactive metal such as U, Th or their alloys freed from gas.

Glowing-cathode Röntgen-ray tube. SIEMENS-REINIGER-VEIFA GES. FÜR MEDIZINISCHE TECHNIK M. B. H. Ger. 508,913, Mar. 14, 1928.

Light source for making photographic records of light-wave variations corresponding to electrical variations. THEODORE W. CASE (to Case Research Laboratory, Inc.). U. S. 1,788,355, Jan. 6. A bulb contg. inert gas such as He with a small proportion of N contains also an anode and a cathode, the end portion of which is surrounded by a spaced tube of insulating material, the entire exposed portion of the cathode being coated with an alk. earth material such as CaO and BaO which extends into and substantially closes the open end of the tube. Various structural details are described. Cf. *C. A.* **24**, 1587.

Preparing high-emitting low-temperature cathodes in electron tubes having metal shells with glass seals. FREDERICK S. MCCULLOUGH. U. S. 1,787,082, Dec 30 Various details of manuf. are described.

Electron-emitting filament. WM. B GERO (to The Canadian Westinghouse Co., Ltd.). Can. 306,285, Dec. 2, 1930. A refractory metal powder of the W, Mo, Ta class is compacted about a formed coherent body of Th, heat-treated to effect consolidation and then mechanically worked to filamentary form. Cf. *C. A.* **24**, 24.

Electron-emission material. JOHN W. MARDEN and HARVEY C. RENTSCHLER (to Westinghouse Lamp Co.). U. S. 1,787,694, Jan. 6. An electron-discharge device is provided with an active cathode such as Mo contg. about 1% of V, which serves to give high emission at moderate temps. for long periods.

Apparatus for feeding gases and vapors to illuminating tubes, etc. RALPH W. LOHMAN. U. S. 1,786,626, Dec. 30. Structural features.

Apparatus for gas analysis. AKTIEBOLAGET CARBA. Fr. 686,698, Dec. 16, 1929 An app. for the analysis of gas, *e. g.*, for the detn. of the content of CO_2 in furnace gases, etc., is provided with a gas filter of solid cryst. material, the exterior surface of which is sol. in water. The solid impurities in the gas are retained and afterward washed away by the detachment of the exterior surface of the substance due to its soln. in the moisture contained in the gas, the arrangement being such that the gas leaves the filter with a practically const. content of residual moisture. The filter is preferably cylindrical and has several filtering layers, the first of which is formed of cooking salt and the rest of wadding, etc.

Gas purifier. ALOYS SCHIRP. Ger. 507,518, Feb. 9, 1928. The gas current is propelled through a laminated filter by a fan.

Gas-washing apparatus. PNEUMATIC CONVEYANCE & EXTRACTION (1929), LTD Ger. 508,571, June 11, 1927. Details of construction.

Column for washing and absorbing gases. THE BARTLETT HAYWARD CO. Ger 507,517, Dec. 9, 1928. See Brit. 307,453 (*C. A.* **23**, 5066).

Apparatus for separating constituents of gases by adsorption in activated carbon or other materials. OSCAR L. BARNEBEY (to American Solvent Recovery Corp.). U. S. 1,787,714, Jan. 6. Structural features.

Specific-gravity balance (with a pair of hollow shells) suitable for use with gases. DAVID O. LIMA. U. S. 1,787,256, Dec. 30. Structural features.

Apparatus for liquefying gases by expansion. AUTOGEN GASACCUMULATOR KRÜKL & HANSMANN G. M. B. H. Ger. 507,799, Mar. 11, 1928. Addn. to 505,900 (*C. A.* **25**, 549).

Apparatus for effecting reactions between gases and liquids. WILHELM A. BODAMER. Ger. 509,367, Oct. 3, 1926. The app. comprises liquid-atomizing nozzles mounted on one or more rotary or stationary hollow shafts in a casing to which the gases are supplied.

Countercurrent apparatus for treating gases with liquids. CARL FRANKLIN BRAUN. Ger. 509,402, Mar. 5, 1927. See Brit. 291,527 (*C. A.* **23**, 1022).

Apparatus for introducing gas into liquids to form bubbles or foam. SCHAUMBAD— G. M. B. H. Ger. 507,621, Feb. 22, 1929.

Apparatus for treating liquids with liquids or gases. WALTHER FELD & Co. G. M. B. H. and RICHARD GISNER. Ger. 508,964, Feb. 5, 1929. Addn. to 507,315 (*C. A.* **25**, 441).

Apparatus for degassing liquids. SOCIETÀ ITALIANA PIRELLI. Ger. 508,904, Aug. 17, 1927.

Plate atomizer for cooling liquids, especially sulfuric acid. JACOB LÜTJENS. Ger. 507,886, Nov. 12, 1927.

Plate atomizer for liquids. JACOB LÜTJENS. Ger 508,794, May 8, 1928. Addn. to 507,886 (preceding abstr.). Further details of the device, which is particularly applicable for the *chamber process of mfg.* H_2SO_4, are given.

Centrifugal purifiers for liquids. JAMES W. ADAMS Fr 687,317, Dec. 27, 1929.

Apparatus for mixing liquids of different specific gravities. WALTHER FELD & Co. G. M. B. H. and RICHARD GISNER. Ger. 507,519, Feb. 5, 1929. The app. is designed to cause countercurrents of liquids to mix temporarily for the purpose of washing or absorbing.

Apparatus for determining the specific gravity of liquids. BAYERISCHE STICKSTOFF-WERKE A.-G. (Josef Merzkirch, inventor). Ger. 508,825, April 28, 1928. Details are given.

Apparatus for determining specific gravity of oils, etc. ALLEN A. VAN ORSDALE (to Brown Instrument Co.). U. S. 1,787,132, Dec. 30. Structural features

Valve for maintaining constant liquid height in tanks. CLARENCE F. PEITZMAN. U. S. 1,787,420, Dec. 30. Structural features.

Apparatus (with troughs and stirrers) for effecting evaporation of liquids or crystallization of salts, etc. RICHARD A. STOKES and EDWIN G. L. ROBERTS (to E. M. S. Industrial Processes, Ltd.). U. S. 1,788,352, Jan. 6 Various details of app. and operation are described.

Countercurrent columns for distillation and fractionation of high-boiling liquids. CARL H. BORRMANN. Ger. 509,927, May 13, 1928.

Apparatus with superposed evaporating trays suitable for distillation of oils and liquid solvents. LOUIS J. SIMON. U. S. 1,787,399, Dec. 30. Structural features.

Apparatus for distillation of hydrocarbons. CHARLES G. STUPP (to The Barrett Co.). Can. 304,942, Oct. 21, 1930.

Distillation apparatus for difficultly vaporizable liquids. I. G. FARBENIND. A.-G. (Hans A. von Staden and Albert Berenbruch, inventors). Ger. 508,393, Sept. 12, 1926. The liquid is sprayed by a rapidly rotating disk against the heated walls of the distn. vessel. Cf. *C. A.* **24**, 3931.

Device for dissolving solid materials. GUSTAV STOLZENWALD. Ger. 509,814, Jan. 7, 1930. The device is especially applicable to the *manuf. of* $CuSO_4$. The Cu is placed between two perforated plates and treated with acid. Air or vapor may be admitted.

Rotary drier. WM. A. HARTY and FRANK W. MOORE (to Harmor & Co., Inc.). U. S. 1,787,197, Dec. 30. Structural features.

Rotary drying drum with internal trickle plates. ALBERT GERLACH. Ger. 509,686, July 6, 1927.

Air heater for drying apparatus. MAX FIEDLER. Ger. 508,378, May 2, 1928.

Method and plant for drying and after-heating pulverulent materials. P. ROSIN. Ger. 509,361, Mar. 10, 1929. The materials are conveyed by hot gases.

Multi-stage drying apparatus. WERNER BRUNNSCHWEILER. Ger. 506,267, Feb. 9, 1927. Addn. to 505,017 (*C. A.* **24**, 5544).

Tray-type drying apparatus with lateral access of air. FRITZ HAAS. Ger. 508,465, April 12, 1929.

Channel drier for simultaneously drying goods of different sorts. FRITZ HAAS. Ger. 508,307, Feb. 12, 1928.

Method of operating vacuum drying apparatus including two air pumps and an interposed condenser. JULIUS PINTSCH A.-G. Ger. 508,464, Oct. 24, 1929.

Apparatus for drying filter cakes. PROCTOR & SCHWARTZ, INC. Fr. 681,373, Dec. 28, 1929.

Drying centrifuge with superposed conical covers. FRIED. KRUPP A.-G. Ger. 509,698, Feb. 20, 1926.

Plant for drying, moistening or disinfecting vegetable or fibrous materials, or removing dust therefrom. FRANZ OTT. Ger. 508,308, April 28, 1928. The plant is of the kind in which the materials are conveyed through a treating chamber between two endless bands.

Automatically regulating evaporating plant. ARCA-REGLER A.-G. Ger. 509,926, Mar. 3, 1926. Details are given.

Steam-heated apparatus comprising a number of digesters, evaporators, driers, etc., arranged in parallel. CURT ROSENBLAD. Ger. 508,255, Dec. 23, 1927. Details of the regulation of the steam supply are described.

Dehydrating press. HENRY M. HALLS. U. S. 1,787,821, Jan. 6. Structural features.

Apparatus for disseminating (from aircraft) insecticides or other materials in finely divided or powdered form. JOHN C. SAVAGE. U. S. 1,787,397, Dec. 30. Structural features.

Sedimentation apparatus or thickener. BERT E. DUTTON (to Dorr Co.). U. S. 1,787,437, Jan. 6. Structural features.

Decantation apparatus; water-softening apparatus. J. CASTEELS. Belg. 367,529, March 31, 1930. The liquid to be treated is discharged with a certain speed into the mass of previous deposits, so as to mix it intimately with them and take advantage of their catalyzing and activating action. The liquid is brought into a reservoir placed at a higher level than the decantation tank and is discharged through one or more tubes at the surface of the deposits which have settled at the bottom of the decantation tank.

Apparatus for separating ground solid materials of different degrees of fineness by air currents, etc. HENRY G. LYKKEN. U. S. 1,787,079, Dec. 30. Structural features.

Apparatus for separating coal and slate or other solids of different specific gravities by air currents, vibration and gravity. KENNETH DAVIS (to Peale-Davis Co.). U. S. 1,786,738–9–40, Dec. 30. Structural features and details of operation are described.

Apparatus for grading materials by air currents. THOMAS J. STURTEVANT (to Sturtevant Mill Co.). U. S. 1,788,361, Jan. 6. Structural features.

Apparatus for feeding reagents in ore flotation or other operations. GEO. G. THOMAS (to American Cyanamide Co.). U. S. 1,787,289, Dec. 30. Various details of construction and operation are described.

Fillers for towers, columns, etc. GERTRUD EPPINGER NÉE HELLNER. Ger. 508,062, Sept. 11, 1928. Fillers for washing towers, reaction vessels, fractionating columns, etc., are made of a synthetic resin, with or without a filling material.

Reaction columns. CHEMISCHE FABRIK CURTIUS A.-G. Fr. 688,139, Jan. 13, 1930. In reaction columns such as those used for the *manuf. of* H_2SO_4, a layer of filling material of fine grain is placed above and below a layer of coarser grain.

Fillers for absorption vessels, heat exchangers, etc. STELLAWERK A.-G. VORM. WILISCH & Co. Ger. 509,403, Apr. 30, 1927. Constructional features are described.

Distributing agent. SOC. ANON. POUR L'IND. CHIM. À BÂLE. Ger. 506,838, May 24, 1927. The distn. residue from benzaldehyde rectification is sulfonated, treated with $CaCO_3$ or Na_2CO_3 and the product used as a distributing agent.

Apparatus for making cement and other powdered or granular products. ROBERT POURBAIX. Fr. 687,624, Jan. 3, 1930.

Container for corrosive substances. FRANCIS H. BRAMWELL (to Imperial Chemical Industries, Ltd.). U. S. 1,787,101, Dec. 30. A container suitable for effecting evapns. or reactions is made with spaced walls, an outer wall which may be formed of iron or steel and an inner wall which is perforated and is provided with a non-corrodible lining such as Pb or rubber.

Apparatus for degreasing metallic objects by fat solvents. CHEMISCHES WERK ZÜRICH A.-G. Swiss 140,018, July 5, 1929. Addn. to 134,375 (*C. A.* 24, 1552).

Apparatus for testing constructional material by oscillations of flexure of test-pieces. GERD S. V. HEYDEKAMPF (to Otto Föppl). U. S. 1,787,525, Jan. 6. Structural details.

Device for preventing carrying over of air by fire-quenching gas currents. WALTER KIDDE & Co., INC. Ger. 506,631, July 30, 1924.

Furnace. C. SEMAL. Belg. 368,613, April 30, 1930. Structural features relating to a furnace for the combustion of liquid or gaseous fuels.

Grate furnace, with supplementary burners for pulverulent, liquid or gaseous fuel. FRITZ SIEDLE. Austrian 119,594, May 15, 1930.

Grate furnace, adapted for the alternate use of different fuels. BÜTTNER-WERKE A.-G. (Otto Engler, inventor). Ger. 508,069, Oct. 24, 1928.

Trough-shaped furnace with inclined auxiliary hearth. OTTO SCHENK and ROBERT KIESSLING. Ger. 507,668, Jan. 8, 1928.

Incinerating furnace. FRANCIS C EVANS. Ger. 508,981, June 29, 1929.

Roasting furnace with a broad traveling grate. WALTHER & CIE. A.-G. and MAX BIRKNER. Ger. 506,866, Aug. 15, 1925.

Partitioned rotary-tube furnace for heating solids in a series of stages. CONTINENTALE "L. & N." KOHLENDESTILLATION A.-G. Ger. 508,388, Mar. 23, 1928.

Rotating furnace for drying or baking mineral or organic materials. ALFRED BEAU. Fr. 686,708, Dec. 16, 1929.

Rotary, tiltable furnace heated by means of liquid fuel. "MÉTAF," SOC. ANON. Belg. 369,790, May 31, 1930. The furnace consists of 2 concentric cylinders, the inner one being rotatable about its longitudinal axis while the other one is fixed, and the combination can be tilted about a horizontal transverse axis. The combustion chamber is the space between the 2 cylinders; the burners are placed above the outer cylinder.

Muffle furnace with a generator below the muffle. PHILIPP HERRMANN. Ger. 506,824, June 24, 1927.

Fuel-heated muffle furnace, with supplementary electric heating. ALLGEMEINE ELEKTRIZITÄTS-GES. (Viktor Paschkis, inventor). Ger. 509,288, Feb. 9, 1929.

Furnaces burning powdered fuel. SOC. ANON. DES FOYERS AUTOMATIQUES. Fr. 687,603, Jan. 2, 1930.

Burner for powdered fuel. BABCOCK & WILCOX, LTD. Fr. 688,164, Jan. 13, 1930.

Fuel-dust furnace. ELEKTROWERKE A.-G. (Bernhard Krämer, inventor). Ger. 508,919, Sept. 3, 1927. Details of construction.

Coal-dust furnace. ZEITZER EISENGIESSEREI UND MASCHINENBAU A.-G. Ger. 509,961, Aug. 10, 1928. Details of an upright mixing chamber.

Coal-dust furnaces. ALLGEMEINE ELEKTRIZITÄTS-GES. (Corn. Happersberger and Max Kaplan, inventors). Ger. 509,797, Feb. 26, 1928. Details of a measuring and signaling device for the coal-dust distributor are given.

Burner for coal-dust furnace. KARL HUFSCHMIDT. Ger. 508,590, Feb. 7, 1928. Details of construction.

Coal-dust combustion apparatus for rotary furnace. L. & C. STEINMÜLLER. Ger. 508,238, Mar. 10, 1929.

Burners for heavy fuel. PAUL G. LINKE. Fr. 688,345, Jan. 16, 1930. Means is given for lighting and automatically feeding the burners.

Heavy-oil furnace. CHARLES PERDRISAT. Swiss 140,364, July 10, 1929.

Burner for heavy oil. KINICHI TANIMURA. Fr. 688,169, Jan. 13, 1930.

Regenerative furnace fired with liquid fuel. EDUARD MEZGER. Ger. 508,408, May 28, 1926.

Change-over valve for regenerative furnaces. MAX SCHNURPFEIL. Ger. 508,265, July 13, 1929.

Grating stones for storing heat in regenerative furnaces. WILHELM SCHWIER. Ger. 509,501, May 9, 1926.

Gas or oil burner. WM. A. J. KREAGER. U. S. 1,787,632, Jan. 6.

Furnace-gas burners. LUDOVIC HUPEZ. Fr. 687,453, Dec. 31, 1929.

Gas burner. H. GUHL. Brit. 334,070, March 29, 1929.

Gas-burner safety device for closing the supply valve when the flame is extinguished. JOHN W. MOOMAU (one-half to George W. Strauss). U. S. 1,788,063, Jan. 6.

Time-switch apparatus for gas burners. GUY B. COLLIER. U. S. 1,787,422, Dec. 30. Structural features.

Forwarding the fuel or roasting charge in a multi-stage roasting furnace. AKT.-GES. DANSK SVOVLSYRE- & SUPERPHOSPHATE-FABRIK and KAI WARMING. Ger. 506,-982, May 31, 1929.

Regulating the under-blast of furnaces. CHARLES H. SMOOT. Ger. 509,540, Oct. 9 1927.

Device for supplying additional air in furnace plant. EDUARD WEGMANN. Swiss 137 419, May 3, 1929.

A device for the introduction of air or an air-steam mixture into the combustion zone of a furnace. STELIAN W. WASILIKOTY. Ger. 509,959, Oct. 13, 1927.

Heat recuperator. KOHLENVERADLUNG A.-G. Ger. 508,409, July 10, 1928.

Heat exchanger. MASCHINENFABRIK ING. HANS SIMMON. Austrian 119,576, May 15, 1930. Addn. to 113,190 (*C. A.* **23**, 4109).

Heat-exchange apparatus. ARTHUR E. PEW, JR. (to Sun Oil Co.). U. S. 1,787,086, Dec. 30. Structural features.

Heat-exchange device. CLIFFORD E. SCOTT (to McQuay Radiator Corp.). U. S. 1,788,068, Jan. 6.

Electrical heating apparatus suitable for heating water in tanks. SIMON J. LONERGAN (to Bastian-Morley Co.). U. S. 1,787,450, Jan. 6. Structural features.

Electrical heater for water, dye liquors, etc. F. FOY. Brit. 333,869, Feb. 19, 1929. Structural features.

Electric heater for heating bad-conducting liquids to high temperatures. ALLGEMEINE ELEKTRIZITÄTS-GES. (Victor Paschkis, inventor). Ger. 508,915, Sept. 5, 1928.

Device for electrically heating gases and liquids. I. G. FARBENIND. A.-G. (Emil Fendt and Carl Schörg, inventors). Ger. 507,827, Mar. 16, 1927. The heating elements surround a tube through which the fluid is passed.

Acetylene generator. CHARLES DAVID. Fr. 686,826, Dec. 18, 1929.

High-pressure acetylene generators. EMIL WOLF, APPARATEFABRIK. Ger. 507,563, Oct. 11, 1929. Details of a valve for supplying water to the CaC_2.

Filling mass for high-pressure acetylene containers. AUTOGEN GASACCUMULATOR A.-G. Ger. 509,503, May 11, 1928. Horn meal is used as the filling material. Cf. *C. A.* **24**, 1205.

Thermostat suitable for valve or electric-circuit control, etc. JOHN J. KENNEY. U. S. 1,786,852, Dec. 30. Structural features.

Thermostatic device suitable for oil stoves. GEO. CRAIG. U. S. 1,787,146, Dec. 30. Structural features.

Thermostatic mixing valve for hot and cold water, etc. JAMES J. LAWLER. U. S. 1,788,112, Jan. 6. Structural features.

Thermostatic fan control for engine-cooling systems, etc. WALTER J. HUGHES. U. S. 1,787,041, Dec. 30. Structural features.

2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

Arnold Schmidt. A. HOENIG. *Z ges. Schiess- Sprengstoffw.* **25**, 403–4(1930).—Obituary. C. G. STORM

Franz Wald. J. BABOROVSKY. *Chem.-Ztg.* **54**, 905–6(1930).—Obituary. E. H

Balancing chemical equations. J. R. STONE. *Chemist-Analyst* **20**, No. 1, 11–4 (1931).—The method of balancing equations of oxidation and reduction used at Hiram College is explained. It is essentially that proposed by O. C. Johnson in 1889. W. T. H.

The course of climbing crystals. HANS ERLENMEYER. *Helv. Chim. Acta* **13**, 1006–8(1930).—The climbing of KCl crystals was investigated. Illustrations are given of needle or hair crystals up to 1 cm. in length which under the microscope are shown to have a capillary hollow space. Other crystal forms are also illustrated, including the customary cubic crystals with edge length up to 7.5 mm. The existence of the capillary hollow space is a possible explanation for the creeping of these crystals. M. McM.

Application of the ultra-short-wave method to the measurement of small capacities and dielectric constants. D. V. GOGATE AND D. S. KOTHARI. *Indian J. Physics* **5**, 417–28(1930); cf. *C. A.* **24**, 547.—The exptl. arrangement and method of calcn. of results are given in detail. The method is specially suited for accurate detn. of the temp. coeff. ARTHUR FLEISCHER

The dielectric constant of liquids. III. Aqueous solutions of some organic compounds. G. DEVOTO. *Gazz. chim. ital.* **60**, 520–30(1930); cf. *C. A.* **24**, 4194.—A further study is made of the influence of substances with high elec. moment on the dielec. const., ϵ, of solvents, cf. Blüh, *C. A.* **18**, 618; Fürth, *C. A.* **17**, 1579; Walden and Werner, *C. A.* **22**, 1718; Hedestrand, *C. A.* **22**, 3571; Thiel and Horn, *C. A.* **23**, 1027. Substituents in amino acids, especially NH_2, were studied. The app. was that of D. and Stevenson, *C. A.* **24**, 3934, which measures ϵ independently of cond. At 25° $d\epsilon/dc$ was found: for BzOH —67, $PhCONH_2$ —4.1, $(NH_2)_2CO$ 3.4, $(NH_2)_2CS$ 4.0, PhOH —6.6, $PhNH_2$ —7.6, PhNHAc —4, MeCN —1.7, $NH_2CH_2CO_2H$ 26.4, $PhNHCH_2CO_2H$ 32, $NH_2CHMeCO_2H$ 27, $NH_2C(CH_2CO_2H)HCO_2H$ 27, $NH_2C(CH_2CONH_2)HCO_2H$ 28. The CO_2H group depresses ϵ distinctly but OH, NH_2, CN and $CONH_2$ do not exert

specific effects. The close agreement of $d\epsilon/dc$ for the 5 amino acids is readily explained. From the acid and basic dissocn. consts. of aliphatic amino acids Bjerrum (*C. A.* **17**, 2379) concluded that the equil. $NH_2CH_2CO_2H \longrightarrow NH_3{}^+CH_2CO_2{}^-$ is displaced completely to the right. If there are the same no. of dipoles in the soln. and if the elec. charge and distance between poles are equal, the elec. moment and $d\epsilon/dc$ are approx. equal. The specific structure of the acid is then of secondary influence only because the elec. moment of the electron charge is 10 to 20 times the moment estd. for a mol. of the $NH_2CH_2CO_2H$ type. For $NH_3{}^+CH_2CO_2{}^-$ μ is approx. 30×10^{-18} while for $NH_2CH_2CO_2H$ $\mu < 3 \times 10^{-18}$, if the distance between 2 poles is assumed to be 6 A. U. Substituents alter these values by 1 or 2×10^{-18}. When the polar distance can be detd. accurately, calcn. of μ will define experimentally the relation between elec. moment and ϵ in a polar solvent. Hedestrand showed that the dielec. coeffs. of α- and β-alanine are 22 and 40.5, resp., the difference representing the effect of increasing the dipole arm by the length of the CH_2 group. If the 18 units corresponding to CH_2 groups are subtracted from the dielec. coeff. of α-alanine, $d\epsilon/dc$ is 3.5 to 4.0, which corresponds to an acid $NH_3{}^+CO_2{}^-$. This is carbamic acid in its polar form. Since the coeff. for urea is 3.5 to 4.0, urea in H_2O has the form $NH_3{}^+C(:NH)O^-$. Similarly thiourea is $NH_3{}^+C(:NH)S^-$. The coeff. of aspartic acid is of the same order of magnitude as the coeffs. for monobasic amino acids. The dissocn. consts. of the 2 carboxyl H atoms are distinctly different and the H atom farther from the NH_2 group is the more dissocd. C. C. DAVIS

The dielectric polarization of liquid mixtures. L. M. DAS AND S. C. ROY. *Indian J. Physics* **5**, 441–62(1930).—The moments of CCl_4-C_6H_5Cl and CCl_4-C_6H_5Br mixts. were detd. from 10° to 60°. The ds. were detd. in a special pycnometer. The curves are regular and the substances show the simplest type of assocn., increasing with concn. and temp. The results agree with those of Hojendahl and Smyth and Morgan. ARTHUR FLEISCHER

Change of the dielectric constant of ethyl ether with temperature. J. MAZUR. *Nature* **126**, 649(1930).—The dielec. const. of Et_2O, measured with high-frequency oscillations, increases from 4.18 at 30.6° to 12.39 at —105.4°. It then decreases very rapidly, and shows a distinct change at the m. p. Below —118.9° it has a nearly const. value of 2.04. ARTHUR FLEISCHER

Two modifications of liquid ethyl ether. M. WOLFKE AND J. MAZUR. *Nature* **126**, 684–5(1930); cf. preceding abstr.—Heating curves show that a change in liquid Et_2O occurs at —105.4°. This is the second case of liquid-phase modification observed (cf. Keesom and Wolfke, *C. A.* **22**, 1070). ARTHUR FLEISCHER

Polar characteristics of the COOH group in several fatty acids and in benzoic acid. (Dipole moment, association, solubility and electrochemical behavior.) GUNTHER BRIEGLEB. *Z. physik. Chem.*, Abt. B, **10**, 205–37(1930).—Dielec. measurements were made on C_6H_6 solns. of acetic, formic, propionic, butyric, isovaleric and benzoic acids at various concns. The dipole moments were calcd. on the basis of a double mol. in each case because these substances are strongly assocd. in C_6H_6. Dipole moments are HCOOH, 1.45×10^{-18}; AcOH 1.04; PrOH 0.88; BuOH, 0.93; isovaleric acid, 0.89; BzOH, 0.56. The effect of H_2O on the dielec. measurements was studied also. The soly. of H_2O in the solns. was detd. WILLIAM E. VAUGHAN

The magneto-optical dispersion of organic liquids. I. The magneto-optical dispersion of normal butyl alcohol, isobutyl alcohol and propionic acid. EMLYN STEPHENS AND E. J. EVANS. *Phil. Mag.* [7], **10**, 759–85(1930); cf. *C. A.* **21**, 2095; **22**, 2102.—The indices of refraction and dispersion were measured at 13° in visible and ultra-violet light. For BuOH, n varied from 1.400 at 0.6678μ to 1.441 at 0.2805μ, for iso-BuOH 1.396 at 0.6678μ to 1.438 at 0.2766μ and 1.387 at 0.6678μ to 1.419 at 0.3008μ. The results are expressed by the equation $n\delta\lambda^2 = K[\lambda^2/(\lambda^2 - \lambda_1^2)]^2$, where K is a const., δ is Verdet's const., λ is the wave length of the light used and λ_1 is the wave length corresponding to the free period of the resonators. Values of λ_1 and K are, resp., 0.1149μ and 0.005516 for BuOH, 0.1150μ and 0.00569 for iso-BuOH and 0.1051μ and 0.00500 for propionic acid. The magneto-optical dispersion of each liquid is caused by one band. If natural dispersion is due to the same band the equation reduces to $n^2 - 1 = b_0 + b_1/(\lambda^2 - \lambda_1^2)$, which is experimentally verified. b_0 and $b_1 \times 10^{10}$ are, resp., 0.9396 and 0.899 for BuOH, 0.9293 and 0.892 for iso-BuOH, and 0.9041 and 0.871 for propionic acid. An equation is derived from Larmor's theory for calcg. e/m. For BuOH e/m is 1.07×10^7, for iso-BuOH 1.11×10^7, and for propionic acid 1.00×10^7 e. m. u. K and λ_1 increase as the mol. wt. of the alc. increases. The position of the absorption band is displaced about 0.0016μ toward the red by the addn. of a CH_2 group. A. T.

The mixing of gases for reaction. T. H. CHILTON AND R. P. GENEREAUX. *Trans. Am. Inst. Chem. Eng.*, New Orleans Meeting (Advance copy) 1930, 19 pp.; *Chem. Met. Eng.*

37, 755-8(1930).—In technical gas reactions thorough mixing of the gases before reaction is usually essential for best efficiency. Various methods of mixing gases were studied. The exptl. method consisted in observing the flow of 2 streams of gas (generally air) in glass tubes, with smoke added to make one stream visible. The quality of mixing was judged by the distance downstream from the point of entrance at which the smoke appeared to be completely diffused. Mixing was considered good, for instance, when apparently completed within two or three diameters, and poor when it was evidently incomplete in this distance. Of course, after passage through a sufficient length, 15 or 20 diameters, the smoke appeared to be diffused in all cases. With an ordinary T-connection good mixing can be obtained by making the mass velocity of the added stream 2 to 3 times that in the main stream. Other directions or positions across the diam. have no advantage over this simpler method. C. L. MANTELL

The specific heats of gases at high pressures. II. Method and apparatus at high temperatures. NORMAN W. KRASE AND B. H. MACKEY. *J. Am. Chem. Soc.* 52, 5111-4(1930); cf. *C. A.* 24, 1554.—A const.-temp., adiabatic, flow *calorimeter* for measuring sp. heats of gases at high pressures and temps. is described. Typical sp. heat data for N at 500 atms. between 30° and 150° are given. P. H. EMMETT

The temperature variation of the viscosity of liquids and its theoretical significance. M. P VENKATARAMA IYER *Indian J. Physics* 5, 371-83(1930).—Raman's formula, $\eta = Ae^{B/T}$, for the change of the coeff of viscosity of liquids with temp. held for 87 diverse liquids with few exceptions The const. A is comparable with the viscosity of the vapor state and B is of the same order of magnitude as W/R, where W is the mol latent heat of fusion. The relationship between the consts. and chem. constitution is discussed. H. W. WALKER

Viscosity data in graphical form. RAYMOND P GENEREAUX. *Ind. Eng. Chem.* 22, 1382-5(1930).—Plots are shown whereby viscosities of liquids and gases may be read off at any desired temp. MALCOLM DOLE

Phenomena of adhesion on spherical objects. LOUIS AND SYKORA. *Ann combustibles liquides* 5, 565-72(1930).—The amt. of oil adhering to a spherical object increases with the viscosity and the d of the oil. For various materials the degree of change is not the same There are factors other than the phys. ones of the liquid and the solid concerned in the phenomena of adhesion. E. SCHOTT

Natural optical activity of liquids. HARALD VOLKMANN. *Z. physik. Chem.*, Abt. B, 10, 161-88(1930).—The dependence of rotation upon the refractive index as required by the Born-Gans theory of natural optical activity is confirmed by measurements made on solns. of *d*-limonene The solvents were common org. liquids. Expts were made with materials showing deviations from theory (menthone and camphor) and the discrepancies are attributed to forces acting between the mols., which are polar WILLIAM E. VAUGHAN

Connection between the melting curve and the composition of a binary mixture. K. POSTHUMUS. *Rec. trav. chim.* 49, 885-914(1930).—A theoretical treatment of the question of the mol. compn. of liquid mixts The original constituents of a binary mixt are assumed to combine to form a single new molecule, and the problem is developed from the standpoint of 3 component mixts. J. H. REDDY

Binary systems. II. J. H KOERS AND F. E. C. SCHEFFER. *Rec. trav. chim* 49, 915-54(1930); cf. *C. A.* 24, 4436.—Solid-liquid-gas equilibria, in which the solid contains 2 components are discussed in respect to (1) the change of free energy with the mole fraction, (2) direction of the curves and their significant points, (3) quadruple points. J. H. REDDY

Molecular and atomic volumes. XXIX. Three principles in the volume relationships of solid materials. WILHELM BILTZ. *Z. anorg. allgem Chem.* 193, 321-50 (1930).—A review of B.'s previous work with bibliography. Three principles are enunciated and illustrated: the principle of additivity, that of the influence of arrangement and method of combination on vol., and that of equality of vols. Two appendices treat of the existence of polymorphic modifications, and of the relation between atomic vol. and atomic structure. **XXX. The volume of crystallized nitrogen oxides at low temperatures.** WILHELM BILTZ, WERNER FISCHER AND ELISABETH WÜNNENBERG *Ibid* 351-66.—Ds. were detd. by a gas-volumetric method for N_2O, NO, N_2O_3 and N_2O_4, for N_2O_5, a pycnometer with liquid O_2 was used. The following values were obtained for d_{-195} and mol. vol., resp.: N_2O 1.604, 27.4; NO 1.566, 19.3; N_2O_3 1.782, 42.7, N_2O_4 1.979, 46.5; N_2O_5 2.175, 49.6. T. H. CHILTON

The vapor pressure of lithium. A. BOGROS. *Compt. rend.* 191, 800-1(1930); cf. *C. A.* 24, 5552.—The vapor pressure of Li was measured by the method of *C. A.* 24, 3708 and found to be 1.3, 2.2 and 3 mm. at 459°, 470° and 480°, resp. The following for-

mula holds between 450° and 575°: $\log p_{mm.} = -(6173/T) + 5.44$. The sepn. of two *isotopes* of Li is considered. M. McMAHON

Optical constants of manganese distilled in vacuum. J. B. NATHANSON. *J. Optical Soc. Am.* **20**, 593–6(1930).—A mirror made of Mn distd. *in vacuo* was used. The Mn was approx. 99.9% pure. The refractive index and the coeff. of absorption were detd. for wave lengths 4600 to 6800 A. U. From these the reflecting power was calcd. WILLIAM E. VAUGHAN

Freezing and flow points for glycerol, Prestone, denatured alcohol and methanol. J. C. OLSEN, AUSTIN S. BRUNJES AND J. W. OLSEN. *Ind. Eng. Chem.* **22**, 1315–7 (1930); cf. *C. A.* **20**, 96.—Aq. solns. having the same compn. by vol. give f. ps. in the ascending order MeOH, Prestone, denatured EtOH, glycerol (U. S. P.) and 60% glycerol. The f. p. curves for denatured EtOH and Prestone are very nearly alike up to a compn. of 40% by vol. The temp. at which a mixt. will still flow through an orifice 0.25 in. in diam. when crystals are present is usually only a few degrees lower than the f. p. of the corresponding liquid. CORNELIA T. SNELL

Activation energy of adsorption processes. HUGH S. TAYLOR. *J. Am. Chem. Soc.* 52, 5298–9(1930).—Preliminary statement. C. J. WEST

Catalysis and sorption. ERWIN SAUTER. *Kolloid-Z.* **49**, 450–8(1929).—A review; cf. *C. A.* **25**, 246. A. FLEISCHER

Adsorption from solution by ash-free adsorbent charcoal. VI. Adsorption of invertase. ELROY J. MILLER AND SELMA L. BANDEMAR. *J. Phys. Chem.* **34**, 2666–92 (1930); cf. *C. A.* **21**, 3147.—Samples of invertase from a com. soln. and from one specially prepd. (Hudson's method) were treated with purified blood charcoal. This was next boiled 1 hr. with sucrose soln. at p_H 4.0–4.2. The extent of inversion was detd. by the Schaffer-Hartmann technic. Com. invertase was almost completely adsorbed and 75–100% inactivated. The purified material reacted differently because of its lower acidity. Samples tested at various times during 2.5 years gave similar results but thereafter deterioration was rapid, perhaps because of increase in yeast gum. Gum arabic had the same effect on freshly prepd. invertase. Since this material, as usually prepd., is colloidal, the physical conditions during prepn. must be rigidly controlled. Many seemingly contradictory reports can be reconciled on the basis of adsorbed acids, alk. impurities, etc., in the charcoal. B. A. SOULE

The sorption of water vapor at low pressure by activated charcoals. I. A. J. ALLMAND AND R. B. KING. *Proc. Roy. Soc.* (London) **A130**, 210–7(1930).—The adsorption of H_2O vapor at 25° was measured for 6 specimens of activated charcoal at pressures between 0.1 and 0.001 mm. The final isotherms apparently were reversible. Two of the samples exhibited apparent satn. at about 0.02 mm. The value for the heat of adsorption of H_2O vapor on one sample of the charcoal as calcd. approx. from adsorption data taken at several temps. increased with decreasing amt. of material adsorbed, and was about 17,400 cals. per mol. for the adsorption of 3.28 mg. of water vapor per g. of charcoal. P. H. EMMETT

The sorption of carbon tetrachloride at low pressures by activated charcoals. IV. A. J. ALLMAND AND A. PUTTICK. *Proc. Roy. Soc.* (London) **A130**, 197–209(1930); cf. *C. A.* **25**, 244.—Increase in the adsorptive capacity of charcoal by prevacuation apparently is caused by removal of adsorbed O_2 rather than by increase in the total adsorptive surface of the charcoal. CCl_4 charged at a pressure of 1 mm. cleans up O adsorbed on chemically activated charcoal. Isotherms for the adsorption of CCl_4 on charcoal appear to be discontinuous. P. H. EMMETT

The swelling of charcoal. I. Preliminary experiments with water vapor, carbon dioxide, ammonia and sulfur dioxide. D. H. BANGHAM AND NAZIM FAKHOURY. *Proc. Roy. Soc.* (London) **A130**, 81–9(1930).—The linear expansion of a charcoal rod was measured simultaneously with the quantity of gas adsorbed by it. The linear expansion, x, is related to the amt. of gas adsorbed by the equation $x = ks/(S - s)$, where k and S are consts. and s is wt. of gas taken up per unit wt. of absorbent. The values of the latter const. for the four gases examd. represent nearly equal vols. of the normal liquids. The expansion caused by the adsorption of a given quantity of gas increases with temp. The expansion is represented as resulting from the pressure exerted by the adsorbed mols. at sharp reëntrant angles in the surface of the adsorbent. P. H. EMMETT

Surface tension of soap solutions and its relation to the thickness of adsorbed films. RONALD BULKLEY AND F. G. BENEDICT. *Bur. Standards J. Research* **5**, 951–6(1930).—The surface tension of solns. of Na oleate, palmitate and stearate when measured in the absence of CO_2 show no sharp min. as reported by Wilson and Ries (*C. A.* **18**, 924), but show a gradual decrease in value with time. This makes it unnecessary to adopt the

conclusion of Wilson and Ries that the surface of a soap soln. is a film with the properties of a plastic solid. MALCOLM DOLE

Wetting tension. WALTER HALLER. *Kolloid-Z.* **53**, 247–55(1930).—A review. A. FLEISCHER

The generality of the colloidal state. P. P. VON WEIMARN. *Kolloid-Z.* **53**, 246–7 (1930).—Polemical with Freundlich, (*C. A.* **24**, 3703). V. was the first to recognize the generality of the colloidal state. ARTHUR FLEISCHER

The dynamics of molecular movement. FRANZ RUSCH. *Z. physik. chem. Unterricht* **42**, 97–105(1929).—This is a math. paper dealing with the pressure law and the energy of ideal gases, dynamics of Brownian movement and the rotation of colloidal particles due to mol. impacts. M. BEBER

The stabilizing action of adsorption layers of surface-active substances on disperse systems. II. The stability of bubbles and drops at interfaces. P. REHBINDER AND E. WENSTRÖM. *Kolloid-Z.* **53**, 145–58(1930); cf. *C. A.* **24**, 2932.—The stability of bubbles of air for the interface soln.-gas was measured at 20°, in aq. AmOH, Na oleate and saponin solns. of varying concns. and with varying ages of the surface. The stability of bubbles was measured at dye soln.-Hg interface, saponin soln.-Hg, aq. saponin-toluene and stearic acid soln. in toluene-0.1 *N* NaOH. Foam stability in aq. saponin and AmOH solns. was measured. The bubbles showed a max. stability before the max. satn. of the adsorption layer occurred. The concn. at the max. is characteristic of the stabilizer and corresponds for different interfaces. This is true for stabilizers, such as saponin, which form solid surface films. ARTHUR FLEISCHER

The adherence capacity and sediment volume of microscopic particles. A. v. BUZÁGH. *Kolloidchem. Beihefte* **32**, 114–42(1930); cf. *C. A.* **24**, 3413, 4684.—Sediment vols. of homodispersed quartz of various-sized particles suspended in pure H_2O and in salt solns. show that in pure H_2O the vol. is independent of particle size but that in electrolytes the sediment vol. is greatly affected and increases with decreasing particle size. With large particles (radius > 100μ) the sediment vol. is no longer affected by solns. of electrolytes. The relation of sediment vol. to particle size is more pronounced the greater the adherence capacity. Alcs. of the aliphatic series increase the adherence capacity of quartz particles with increasing concn. In Et_2O, $CHCl_3$, CCl_4, C_6H_6 and toluene the sediment vols. of quartz particles are greater the greater the adherence capacity. The sine of the *break angle* of the sediment of quartz particles (16μ) in gelatin soln. increases up to a gelatin concn. of 0.01% and then decreases to a const. value at 0.025–0.050%. The protective action of lyophilic colloids is interpreted in the light of these expts. L. T. FAIRHALL

Measurement of polarization of the Tyndall beam of aqueous suspensions as an aid in determining particle size. THEODORE HATCH AND SARAH P. CHOATE. *J. Franklin Inst.* **210**, 793–804(1930).—It was previously shown (*C. A.* **23**, 3614) that the size distribution in particulate matter can be defined in terms of two statistical parameters: (1) the geometric mean diam. M and (2) the standard geometric deviation σ. The degree of polarization of the light scattered by aq. suspensions of finely divided quartz, granite or calcite (diam. 0.001–0.05 mm.) is a function of the arithmetic mean diam. and hence also of M and σ. This expression can be combined with that for the Tyndall beam strength (previously shown to be a function of M and σ) to det. both M and σ. The av. deviation of the calcd. from the experimentally detd. values of M and σ is about 10% for the above suspensions. OSCAR T. QUIMBY

Cataphoretic and nephelometric measurements on kaolin suspensions. ADOLF REIFENBERG. *Kolloid-Z.* **53**, 162–70(1930); cf. *C. A.* **23**, 2129.—The cataphoretic velocity and the amt. of kaolin transported to the anode space were measured for a kaolin suspension with particles 3.2μ *size*, in the presence of NH_4OH, $Ca(OH)_2$, NaOH and Na_2HPO_4. The concn. change was carried out nephelometrically by comparison with known suspensions. The greatest amt. was transported at the highest cataphoretic velocity at an optimum concn. of the electrolyte. The largest amts. are transported in the NaOH soln. ARTHUR FLEISCHER

Physicochemical properties of acid clay. V. Decolorization of petroleums by adsorption (1), (2), (3). KYÜHEI KOBAYASHI AND KEN-ICHI YAMAMATO. *J. Soc. Chem. Ind. Japan* **33**, Suppl. binding, No. 11, 428, 429–30, 430–1(1930); cf. *C. A.* **24**, 2352–3.—The Freundlich adsorption formula $x/m = \alpha C^{1/n}$, in which x = quantity of dissolved substance adsorbed, m = quantity of adsorbent, and α and n are consts., applies during the decolorizing of various petroleum distillates with Japanese acid clay. Decolorization takes place mainly by adsorption. The Freundlich formula applies also to the action of fuller's earth, Florida earth, German activated clay, SiO_2 gel, and Norit C, and holds true with C_6H_6 soln. of oil yellow and kerosene soln. of resins extd. from

machine oil. The orders of decolorizing action of acid clays, etc., upon different series of crude petroleums, their distillates, etc., are parallel to each other. Decolorizing powers of acid clays upon H_2O soln. of methylene blue or C_6H_6 or kerosene soln. of oil-sol. dyes, are not parallel to the case of petroleum distillates. An asphalt-kerosene soln. is adopted for evaluating acid clay. Decolorizing power of acid clay on petroleum is increased slightly by temp. rise from 15–95°. Acid clay dried at 125–50° has the greatest decolorizing action on petroleum. E. M. SYMMES

The reaction velocity in the formation of colloidal gold solutions by reduction with *d*-glucose and *d*-galactose. AUGUST L. BERNOULLI, MAX SCHENK AND RAHEL PINCZUK. *Helv. Chim. Acta* **13**, 1236–54(1930).—In the reduction of $HAuCl_4$ solns. by *d*-glucose and *d*-galactose, the rotation decreases rapidly with the time until an equil. is reached, where the rotation has a limiting value exactly proportional to the initial concn. of the sugar The sp. rotation for an equil. can be calcd. from Biot's law. The end value of the rotation and also the state of equil. are independent of the initial concn. of the $HAuCl_4$. Both sugars give similar results but *d*-galactose reduces more readily than glucose. The reaction is of the first order. The velocities $K_1 = (1/t)\ln[\varphi_0 - \varphi_\infty)/(\varphi - \varphi_\infty)] = 1.8356$ for galactose and 0.3191 for glucose. MARY E. LEAR

A study of the influence of hydrolysis temperature on some properties of colloidal ferric oxide. III. Viscosity and hydration. GILBERT H. AYRES AND C. HARVEY SORUM. *J. Phys. Chem.* **34**, 2826–40(1930); cf. *C. A.* **25**, 450.—Viscosity in sols prepd. at various temps. decreases with increasing temp. of prepn. Samples of stock sols heated to various temps. show lower viscosity and flocculation values, the higher the temp. to which they have been heated. Complete pptn. is effected at temps. of 170° to 190°. Both the relative viscosity and the flocculation value of the sols decrease on adding alc. or acetone. Since viscosity measurements indicate the degree of hydration and since the viscosity and flocculation value vary in the same manner with changes in temp. and with addn. of dehydrating agents, it is concluded that hydration is a factor in the stability of the Fe_2O_3 sols studied. **IV. Variation of density and relative viscosity with sol concentration.** *Ibid* **35**, 412–6(1931).—The d. of Fe_2O_3 sols varies linearly with the concn. of the dispersed phase and is not influenced by the temp. of prepn. of the sol. The viscosity of these sols increases with their concn. P. H. EMMETT

Fact and theory in colloid filtration. J. A. PICKARD. *Chem. Age* (London) **23**, 376–7(1930). E. H.

Amphoteric hydrated oxides, their aqueous solutions and crystalline compounds. X. The hydrolysis process and aggregation products in aqueous ferric salt solutions. GERHART JANDER AND AUGUST WINKEL. *Z. anorg. allgem. Chem.* **193**, 1–28(1930); cf. *C. A.* **24**, 1810, 3941, 4689.—Measurements were made of the diffusibility of solns. of $Fe(ClO_4)_3$ contg. $HClO_4$ and $NaClO_4$. The theory presented in the earlier paper is amplified. The diffusion coeff. is detd. for various H-ion concns. The hydrolysis gives rise to a series of intermediate products between monomol. $Fe(ClO_4)_3$ and polymol. $[Fe(OH)_3]_n$. The optical absorption of the ferric salt solns. at various H-ion concns. was detd. for wave lengths 2400 to 6000 A. U. In *N* $HClO_4$ the equil. mixt. contains $Fe(ClO_4)_3$, $Fe(ClO_4)_2OH$ and $(ClO_4)_2Fe.O.Fe(ClO_4)_2$. Other complex products are discussed. WILLIAM E. VAUGHAN

The precipitation potential of arsenic sulfide hydrosols in the presence of an excess of arsenic trioxide. SACHINDRA N. MUKHERJI. *Kolloid-Z.* **53**, 159–62(1930).—The cataphoretic velocity of As_2S_3 sols to which varying quantities of As_2O_3 were added was measured at 35° with added KCl and $BaCl_2$. In the absence of electrolyte the velocity decreases with increase in As_2O_3 content; in the presence of KCl the curve shows a max.; in the presence of $BaCl_2$ there is a decrease in the velocity with increasing $BaCl_2$ concn. ARTHUR FLEISCHER

The scattering of light in aqueous sodium silicate solutions. L. L. BURGESS AND K. KRISHNAMURTI. *Trans. Faraday Soc.* **26**, 574–7(1930); cf. *C. A.* **24**, 1578.—Technical Na silicate solns. with SiO_2/Na_2O ratios of 2:1 to 3.95:1 were dild. to 2 *M* with respect to SiO_2 and filtered to remove suspended matter. The light scattering of the 2.5:1 soln. was very slight, and increased with SiO_2 increase, at first, slowly and then very rapidly, indicating formation of colloidal complexes at the higher SiO_2/Na_2O ratios. ARTHUR FLEISCHER

Colloid-chemical studies on dyestuff sols. I. Sol formation of the Congo acids by washing peptization. R. TANAKA. *Kolloid-Z.* **53**, 200–5(1930); cf. *C. A.* **24**, 3649.—To prep. a concd. Congo-red sol, ppt. 1 l. of 0.5% Congo-red soln. by adding 250 cc. 0.1 *N* HNO_3 with rapid stirring. After several days' storage, decant the clear soln. and replace with water. Repeat this procedure till a strong blue color appears. Then dialyze the soln. for 10 days. Filter paper should be avoided because of the

introduction of small quantities of alkali, which cause a change in color. Cond. measurements at 25° show that peptization occurs when the cond. of the wash water reaches 0.000316 mho. Filtration velocity and viscosity measurements show that a swelling occurs before peptization. ARTHUR FLEISCHER

The observation of cataphoresis in nitrocellulose solutions. E. A. LANTZ AND O. A. PICKETT. *Ind. Eng. Chem.* 22, 1309–11(1930).—Cataphoresis was observed in nitrocellulose solns. by the method of Humphrey and Jane (*C. A.* 21, 846). The nitrocellulose was neg. charged. This charge was greatest in $(CH_3)_2CO$ and least in AcOAm. It decreased as the soln. aged, becoming negligible after a period of several weeks. CORNELIA T. SNELL

Solutions of gallic acid and tannin; influence of colloids on the crystal form and the solubility of gallic acid. L. E. STEENHUISEN. *Pharm. Weekblad* 67, 1269–81(1930).—Colloids such as tannin, gelatin, saponin and caramel materially increase the soly. of gallic acid in H_2O. When crystd. from such solns., crystals of gallic acid differ in form from those that sep. from pure solns. A modification of Flech's $Cu(OAc)_2$ method is proposed for volumetric *detn. of tannin* and *gallic acid*. A. W. DOX

Absorption of water by gelatin. IV. The influence of temperature. DOROTHY J. LLOYD. *Biochem. J.* 24, 1460–71(1930); cf. *C. A.* 23, 5082.—An examn. of the slope of the curves of swelling of gelatin, in the presence of various electrolytes and over a range of temp. from 0° to 25° shows that in any investigation of gelatin as a colloidal jelly only exptl. data obtained at lower temps. is of value. **V. Influence of calcium hydroxide.** WINIFRED B. PLEASS. *Ibid* 1472–8.—Gelatin swells more at higher temps. than at low. The p_H value at which max. swelling occurs depends on the temp. At 0° the max. occurs at p_H 11.5 and at 25° at p_H 10.5. The magnitude of swelling in solns. of $Ca(OH)_2$ is always less than that of the swelling in solns. of NaOH at the same temp. and p_H. BENJAMIN HARROW

General regularities of gelatin swelling in electrolyte solutions. K. RUDSIT. *Kolloid-Z.* 53, 205–18(1930).—In HCl and NaOH solns. 2 minima are found at p_H 4.7 and 8.0. Very close to the neutral point, a max. is found. This max. represents the p_H at which the swelling effects of the H and OH ions are equal, and is named the *isoergic point*. Swelling increases with temp., the effect being greater in HCl than in NaOH solns. because of the soly. of gelatin in NaOH with increasing temp. Swelling of gelatin in NaCl solns. at 0° is very similar to the acid-alkali behavior. In very acid or alk. solns. NaCl decreases the amt. of swelling. Comparison at like p_H shows that a salt may swell one colloid and shrink another. The results for various gelatins were independent of the p_H. Many measurements were made in the presence of LiCl, KCl and $CaCl_2$. ARTHUR FLEISCHER

X-ray studies of the structure of gelatin micelles. K. HERRMANN, O. GERNGROSS AND W. ABITZ. *Z. physik. Chem.*, Abt. B, 10, 371–94(1930).—Earlier work on substances of complex mol. structure, particularly gelatin, by x-ray methods is briefly reviewed. The work here reported is a study of the ring diffraction patterns obtained by the Debye-Scherrer method. The diffraction pattern of dry gelatin contains two more rings than were formerly known, making six in all. The diffraction angles and corresponding values of d, calcd. according to the Bragg equation, are given. The ring pattern for H_2O-soaked gelatin differs considerably from that given by dry gelatin and varies with the content of H_2O. Four rings were observed for which the values of d are given corresponding to the concn. of H_2O. Finally the effect of stretching films of gelatin was investigated. A complex diffraction pattern results in which part of the rings are replaced by symmetrically placed spots. The structural form for gelatin was worked out on the basis of the x-ray data, corresponding to that required by Meyer and Mark for other substances of complex mol. constitution. C. J. HUMPHREYS

The constitution of the soluble protein substances as reversible, dissociable component-systems. S. P. L. SØRENSEN. *Kolloid-Z.* 53, 170–99(1930); cf. *C. A.* 25, 245.—The prepn., soly. in $(NH_4)_2SO_4$ solns., and fractionation of egg albumin, horse serum albumin, horse serum globulin, casein and wheat gliadin are reviewed. The dissocn. tendency is defined by $\Delta s/(\Delta Z s_1)$, where s is the soly., Z is the amt. of protein and s_1 the soly. when 1 g. of protein is in equil. with a soln. contg. 100 g. of H_2O. The dissocn. tendency of egg albumin is very slight, while that of horse serum globulin is the highest yet found. Soly. expts. on sol. proteins are in reality distribution expts. between an aq. and a solid phase. ARTHUR FLEISCHER

The molecular constitution of certain intermetallic solid solutions at temperatures below that of the eutectic examined thermodynamically. F. H. JEFFERY. *Trans Faraday Soc.* 26, 587–8(1930); cf. *C. A.* 24, 2660. ARTHUR FLEISCHER

The molecular constitution of the solid solution of tin in lead at temperatures below

that of the eutectic. F. H. JEFFERY. *Trans. Faraday Soc.* 26, 588–90(1930); cf. preceding abstract.—The equation previously developed can be applied up to a content of 15% Sn as a dil. soln. Application to the data obtained by the elec. resistance method indicates that the Sn and Pb are present as monatomic mols. The fact that the equation can be applied at temps. from 180° to 130° is inconsistent with the assumption of an isothermal at 149–50° in the field investigated. ARTHUR FLEISCHER

Solid solutions, isomorphism and symmorphism among the oxides of bivalent metals. III. The systems: MnO–CdO and MnO–MgO. L. PASSERINI. *Gazz. chim. ital.* 60, 535–43(1930); cf. *C. A.* 23, 4124.—The possibility of forming solid solns. depends upon the difference between the diams. of the metal ions. For the other systems of bivalent-metal oxides already examd., complete soly. is found up to differences of approx. 13%, whereas for differences of 14–25% the soly. is only partial, and for greater differences no solid solns. are formed. For oxides that form partial solns., the quantity dissolved increases with decrease in the difference between the diams. of the metal ions. A variation was also found in the quantity of each of the 2 oxides dissolved to form the system, according to the ionic diams. of the metals, the oxide with the metal of greater diam. dissolving greater quantities than the other oxide. To confirm this generalization and to establish the limits of soly., the systems MnO–CdO and MnO–MgO were studied with x-rays. The relatively great difference in the atomic diams. of the component oxides suggested that the systems would show partial soly. With the system MnO–CdO, products obtained at higher temps., at which the vapor pressure of CdO facilitates diffusion, also were investigated. With both MnO–CdO and MnO–MgO, the solid solns. were prepd. by calcining at about 350° (and also at 700° for MnO–CdO) the solid solns. of the hydroxides obtained by simultaneous pptn. with KOH from solns. of the metal chlorides. For MnO–CdO, the products obtained at 350° with 10, 20, 35, 50, 65, 75 and 90% MnO were examd. In this case there is partial miscibility, and the MnO dissolves a max. of 21% of CdO and the CdO a max. of 26% of MnO. Heating the products with 25, 60, 65 and 75% of MnO to 700° resulted in an increase in the solvent power of the CdO, which became capable of dissolving 53% of MnO at this temp. For the system MnO–MgO, the products with 25, 50 and 75% of MnO were examd. Here, too, partial soly. was found, and the 2 limiting solid solns. contained 31% of MgO in MnO and 26% of MnO in MgO, resp. C. C. DAVIS

Solid solutions, isomorphism and symmorphism among oxides of tervalent metals. The systems: Al_2O_3–Cr_2O_3, Al_2O_3–Fe_2O_3 and Cr_2O_3–Fe_2O_3. L. PASSERINI. *Gazz. chim. ital.* 60, 544–58(1930); cf. preceding abstr.—The 3 systems were examd. with x-rays by the powder method. The solid solns., like the pure oxides, crystallize in the rhombohedric system. The products examd. were prepd. by calcining at approx. 600° the mixts. of hydroxides pptd. by an alk. hydroxide from solns. of the chlorides or sulfates. For Al_2O_3 the hexagonal cell showed $c/a = 1.366$, $a = 4.740 \pm 0.005$ A. U., $c = 6\,478 \pm 0.007$ A. U., $v = 125.1 \times 10^{-24}$ cc., d. 4 075; and the rhombohedric cell $a = 5.13 \pm 0.005$ A. U., $\alpha = 55°6' \pm 5'$. For Cr_2O_3 the hexagonal cell showed $c/a = 1.374$, $a = 4.950 \pm 0.005$ A. U., $c = 6.806 \pm 0.007$ A. U., $v = 143.4 \times 10^{-24}$ cc., d. 5.283, and the rhombohedric cell $a = 5.38 \pm 0.005$ A. U., $\alpha = 54°60' \pm 5'$. For Fe_2O_3 the hexagonal cell showed $c/a = 1.366$, $a = 5.020 \pm 0.005$ A. U., $c = 6.860 \pm 0.007$ A. U., $v = 148.6 \times 10^{-24}$ cc., d. 5.355, and the rhombohedric cell $a = 5.43 \pm 0.005$, $\alpha = 55°6' \pm 5'$. With Al_2O_3–Cr_2O_3 and Al_2O_3–Fe_2O_3 the miscibility of the component oxides is limited at the temps. studied, and the smaller the difference between the diams. of the metal ions, the greater the max. proportion of oxides dissolved. The axial ratios of the solid solns. formed are intermediate between those of the pure oxides. With Cr_2O_3–Fe_2O_3 there is complete miscibility in the solid state, and the axial ratios, deformations of the lattices and the d. are, within the limits of exptl. error, linear functions of the compn. The soly. in the solid state of the oxides of tervalent metals follows laws similar to those which govern the behavior of oxides of bivalent metals. C. C. DAVIS

Method for the determination of molecular weights in liquid ammonia. HAROLD H. STRAIN AND JAMES H. C. SMITH. *J. Am. Chem. Soc.* 52, 5291–3(1930).—The principle used is that 2 solns. in the same solvent confined with a common vapor phase will come to the same mol. concn. by diffusion of the vapor. With liquid NH_3 the time required to reach equil. was about 150 hrs. The rate of transfer varied from 0.1 to 1.0 cc. per day. That the method is correct in principle is shown by the fact that solns. contg. the same solute reached the same mol. concn. NH_4Cl appears to exist in the dimol. form in liquid NH_3. The low value for fructose is probably due to its reaction with the solvent. Results are given for 23 expts. C. J. WEST

Osmotic behavior of strong electrolytes in solution and the hydration of their ions. K. JAJANS AND G. KARAGUNIS. *Z. angew. Chem.* 43, 1046–8(1930).—A summary of an

investigation which will be published in detail in *Z. physik. Chem.* The molar depression of the f. p. of alkali halides in aq. soln. ($1M$/1000 g. H_2O) shows the same stepwise variation as their soly., heats of soln., tendency to form hydrates and osmotic coeffs. In general as the sepn. of ions of the crystal lattice by H_2O becomes easier, the ion-pair in soln. can be more easily sepd. and the osmotic activity increases. The relative hydrophilic action of the ions is the deciding factor in the osmotic activity of these salts. The greatest osmotic action is evidence by LiI, which has the smallest cation with the greatest hydration energy and the largest halogen-ion with the smallest hydration energy.
E. R. SCHIERZ

Diffusion, osmosis and osmotic pressure. WARREN C. HAWTHORNE. *Sci. Monthly* 1930, 535–42.—A review. E. H.

The conductivity and viscosity of solutions of lithium nitrate in certain binary alcoholic systems. J. L. WHITMAN AND D. M. HURT. *J. Am. Chem. Soc.* 52, 4762–70 (1930); cf. *C. A.* 22, 4034.—Measurements were made of the conductivities of $LiNO_3$ at 25° in the mixed solvents contg. various proportions of the following components: H_2O, EtOH, PrOH and iso-PrOH. The viscosities and ds. of the same pure solvent systems at 25° were also detd. LOUISE KELLEY

The effect of concentration and potential on the conductance of electrolytes in aqueous solutions in the presence of cane sugar. H. POSSNER. *Ann. Physik* [5], 6, 875–902(1930).—This investigation is an attempt to test the *Debye-Onsager* theory in a solvent of high viscosity by measuring the effect of concn. and external field (Wien's voltage effect) on the cond. The equiv. conductivities at 18° of KCl, NaCl, LiCl, K_2SO_4, Li_2SO_4, $MgSO_4$, $K_3Fe(CN)_6$, $K_4Fe(CN)_6$ and $Ba_3(Fe(CN)_6)_2$ in 50, 61.5 and 67% cane sugar solns. in equiv. concns. from 0.326 to 0.00064 were detd. by the Kohlrausch method with bright Pt electrodes. The higher the valence of the ion pair in the salt the lower is the concn. at which the cond. deviates from the straight-line relation. For salts of the univalent elements the relation holds for relatively high concns. Within the region in which the sq.-root law obtains the experimentally detd. values agree with those demanded by theory. The relatively high mobility of ions in concd. sugar solns. is attributed to decrease in ion radius resulting from decrease in hydration of the ion. By use of Wien's null method (cf. *C. A.* 23, 1043) it is found that, in the region where the sq.-root law holds and for fields of 100 kv./cm., the exptl. values ($A.10^{11}$) of the Wien effect agree with those calcd. by the *Onsager-Blumtritt* formula. At higher concns. and at higher potentials large deviations occur. The limiting effect is not reached, indicating that assocn. does not occur at the concns. studied. The dielec. const., D, for 67, 61.5 and 50% sugar solns., detd. by Nernst's compensation method, is 45, 50 and 60, resp. E. R. SCHIERZ

Spectrometric determination of the effect of a neutral salt on the dissociation of acetic acid. N. V. SIDGWICK AND L. A. WOODWARD. *Proc. Roy. Soc.* (London) A130, 1–16(1930).—By means of simple and flicker photometers with which color changes of methyl orange were measured, the H-ion concns. in AcOH and in AcOH plus KBr were measured and the dissocn. const. for AcOH was calcd. MALCOLM DOLE

A method of measuring the resistance of electrolytes at low frequencies. Comparison of electrolytic resistance at low and radio frequencies. J. A. C. TEEGAN. *Indian J. Physics* 5, 463–71(1930).—A new method of using the Hartley circuit is applied to the detn. of the resistances of $CuSO_4$ and NaCl solns. from 0.1 to 1 N with frequencies from 0.2×10^6 to 10^6. With Au electrodes no difference from the ordinary resistance could be detected with varying frequency. With Cu electrodes there was a gradual increase up to 10%. ARTHUR FLEISCHER

Recent developments in the colorimetric determination of hydrogen ions. F. R. MCCRUMB AND W. R. KENNY. *J. Soc. Chem. Ind.* 49, 425–6T; 427–31T(1930).—Of 40 indicators recommended for detg. the p_H of alk. solns. not more than 6 are reliable In most cases the colorimetric method can be made to satisfy the requirements of scientific accuracy or practical utility. The effects of foreign salts, temp. changes, proteins, buffer action, dichromatism and "off colors," and sp. reactions with the indicators themselves are discussed and illustrated by expts. W. T. H.

Concentration cells in ethyl alcohol. V. Cells without liquid junctions. J. R. PARTINGTON AND H. G. SIMPSON. *Trans. Faraday Soc.* 26, 625–34(1930); cf. *C. A.* 24, 2659.—Cells of NaI in EtOH without liquid junction were measured over the concn. range 0.002 to 0.1 N. The results indicate a much higher value for the activity coeff. than predicted on the basis of the Debye inter-ionic attraction theory. The observed e. m. fs. can be calcd. after correction of the concns. for the undissocd. fraction as detd. by the cond. ratio. MALCOLM DOLE

The acid and base constants of glycine from cells without liquid junction. HER-

BERT S. HARNED AND BENTON B. OWEN. *J. Am. Chem. Soc.* **52**, 5091–102(1930).—From the e. m. f. of cells without liquid junction contg. 0.1 *M* Na glycinate and glycine-HCl, the apparent dissocn. const. of glycine at 25° are $k_A^0 = 4.92 \times 10^{-3}$ and $k_B^0 = 5.56 \times 10^{-6}$. The activity coeffs. of the 0.1 *M* amphanion and amphcatin in NaCl soln. were calcd., their logarithms being linear functions of the ionic strength.
G. M. MURPHY

The ignition of mixtures of hydrogen and oxygen by quartz or porcelain at low pressures. HUBERT N. ALYEA AND F. HABER. *Z. physik. Chem.*, Abt. B, **10**, 193–204 (1930).—Combination of H and O at low pressures (10 to 200 mm. Hg) and at temps. ranging from 440° to 560° in quartz or porcelain vessels takes place at the walls. In a "wall-free" space or at Al walls the gases do not react. A porcelain surface that has been treated with H for a long period loses part of its ability to promote the reaction. Treatment of the surface with O increases its activity. WILLIAM E. VAUGHAN

Influence of foreign materials upon the reactivity of crystals in the molten condition. J. ARVID HEDVALL AND WALTER ANDERSSON. *Z. anorg. allgem. Chem.* **193**, 29–46(1930).—The influence of 0, 0.1, 1.0 and 5.0 mol.% $BaCl_2$ on the reaction, $BaO + PbCl_2 = BaCl_2 + PbO$, over the temp. range 228° to 298° was studied. The data reveal the inhibiting effect clearly. The reaction, $2CuCl + BaO = BaCl_2 + Cu_2O$, was also studied. Varying amts. of NaCl, KCl, RbCl and CsCl were added. The temp. ranged from 126° to 284°. The reaction velocity does not vary linearly with the amt. of the addn. Three cases are discussed: (1) formation of a solid soln. between the foreign body and one of the reactants, (2) non-formation of such a solid soln. and (3) formation of a melt. Extensive bibliography. WILLIAM E. VAUGHAN

The equilibrium between cerous and perceric salts. G. LEJEUNE. *Compt. rend.* **191**, 665–7(1930).—When a dil. alk. soln. of a Ce^{III} salt is oxidized by a current of air a brown color appears. In a partially oxidized soln., a Pt electrode shows a const. and reproducible potential. When compared with the potentials calcd. by the Nernst formula, the values indicate that the valence changes by one only. The product of the oxidation, therefore, must be the ion CeO^{IV} rather than Ce^{VI}. H. F. JOHNSTONE

Experimental investigation into equilibrium relations between a plastic crystalline solid and its solution. B. LOCKSPEISER. *Trans. Faraday Soc.* **26**, 605–23(1930).—The soly. of I in contact with its satd. soln. was detd. from room temp. to 92°. Curves were detd. by raising and lowering the temp. continuously. The results point to an actual thermodynamic irreversibility. The conditions varied with the history of the system. The shape of the curve of the approach from a displaced position toward equil. at a certain temp. is such that equil. conditions cannot be those of thermodynamic reversibility. The calcn. of the heat of soln., thermodynamic reversibility being assumed, leads to a temp. coeff. so large as to be inadmissible. ARTHUR FLEISCHER

The solution velocity of oxygen in water. III. SUSUMU MIYAMOTO AND TETSUO KAYA. *Bull. Chem. Soc. Japan* **5**, 321–5(1930); cf. *C. A.* **24**, 5575.—The diam. of the tube through which O_2 was bubbled into Na_2SO_3 soln. was varied from 0.23 to 0.49 cm., and it was found that the soln. velocity varied inversely as the product of the diam. and the velocity of rise of the bubbles (which was approx. const.). T. H. CHILTON

Chemical equilibrium between methanol, carbon monoxide and hydrogen. ÉTIENNE AUDIBERT AND ANDRÉ RAINEAU. *Ann. combustibles liquides* **5**, 454–61(1930); cf. *C. A.* **23**, 1385.—With enough time of contact the following reactions take place: $CO + 2H_2 = CH_3OH$; $2CO + 2H_2 = CO_2 + CH_4$ and $CO + 3H_2 = CH_4 + H_2O$. The reaction const. for the first reaction under the above conditions can be detd. and from the expts. the following relation is found: $\log K = -35.38 + \frac{6806}{T} + 7.22 \log T$.
E. SCHOTTE

The thermal hydrogen-oxygen combination. Formation of hydrogen peroxide and the influence of surface nature. ROBERT N. PEASE. *J. Am. Chem. Soc.* **52**, 5106–10 (1930).—The H_2-O_2 reaction studied by the flow method at 550° and 1 atm. in Pyrex vessels shows H_2O_2 formed in readily detectable amt. along with H_2O. The former may be the primary reaction product. At low pressures, the mixt. becomes explosive and unstable but does not yield H_2O_2. The reaction may be partially suppressed by broken Pyrex in the vessel or a coating of KCl on the walls. G. M. MURPHY

The melting curve of sodium chloride dihydrate. An experimental study of an incongruent melting at pressures up to twelve thousand atmospheres. L. H. ADAMS AND R. E. GIBSON. *J. Am. Chem. Soc.* **52**, 4252–64(1930).—The temp. of incongruent melting of $NaCl.2H_2O$ was detd. for pressures up to 12,000 bars. Starting at 0.1° for atm. pressure, the curve rises to 25.8° at 9500 bars and then drops. The vol. change

was measured for various pressures. The heat of fusion was calcd. as 32 cal./g. of $NaCl.2H_2O$. C. L. READ

Catalytic activity of cadmium. R. J. HARTMAN AND O. W. BROWN. *J. Phys. Chem.* 34, 2651-65(1930).—A study is made of the conditions under which Cd most effectively promotes reduction of nitrobenzene to aniline by H. An Fe tube, jacketed with molten Pb-Sn alloy, was used as a reaction chamber. Roasted at 250° and then reduced by H at 300°, $Cd(OH)_2$ is slightly more efficient than CdC_2O_4 similarly treated. The optimum reaction temp. is 319°; the rate of flow of H is 6.2 l./hr.; that of $C_6H_5NO_2$ is about 0.38 g./hr./g. of catalyst. Shredded asbestos is slightly better than pumice as a support because it carries more Cd per unit wt. B. A. SOULE

The heats of dilution of potassium chloride in sucrose and urea solutions as solvents below 0.1 *M* at 25°. E. LANGE AND A. L. ROBINSON. *J. Am. Chem. Soc.* 52, 4218-24(1930); cf. *C. A.* 24, 4984.—Data are given for the integral heats of dilu. of KCl in concns. of 10^{-1} to 10^{-4} at 25° in 15% sucrose and 5% urea solns. The curves are of the same general nature as those for a no. of 1–1 type salts in H_2O but they deviate from that of KCl in pure H_2O. These differences are ascribed to differences in dielec. properties of the solvents. C. L. READ

The heat of formation of fluorine oxide. H. v. WARTENBERG AND GERTRUD KLINKOTT. *Z. anorg. allgem. Chem.* 193, 409-19(1930); cf. *C. A.* 24, 3722.—The heat of formation of F_2O was estd. from 3 different reactions to be −11,000 cal. (± 2000) Some reactions of F_2O are described. It absorbs ultra-violet light but is not decompd by it. T. H. CHILTON

Chandrasekhara Venkata Raman. L. LORENZ. *Chem.-Ztg.* **54**, 946–7(1930).—A biographical note with a brief discussion of the Raman effect. E. H.

Causality in the behavior of electrons. J. STARK. *Ann. Physik* [5], **6**, 681–99 (1930); cf. *C. A.* **24**, 1571, 5600.—Stark replies to Sommerfeld's criticisms and discusses dynamic causality for atom electrons in the stationary state, causality in elementary light emission, phases of atom electrons in the splitting off of a light whirl, and the problems of the structure of electrons. H. W. WALKER

Combustion radiation and the Planck quantum theory. WALTER J. WOHLENBERG. *Mech. Eng.* **52**, 852–4, 913–8, 981–3, 1075–80(1930).—From the heats of combustion of C, CO and H it is calcd. that max. frequencies of emission during combustion are,

resp., 1.211×10^{15}, 7.26×10^{14}, and 7.28×10^{14}, all near the high-frequency border of the infra-red spectrum. Using statistical methods, the second law of thermodynamics and the quantum theory, W. shows that the radiations which may occur outside of the infra-red are negligibly small and can have no special characteristics except for a fraction too small to be measured. The Planck formula is applied to combustion in boilers.
L. P. HALL

Heat of formation and electronic properties of the atom. R. D. KLEEMAN. *Z. anorg. allgem. Chem.* 193, 106–12(1930); cf. *C. A.* 23, 2880; 24, 1571, 5599.
L. P. HALL

A chart of consecutive sets of electronic orbits within atoms of chemical elements. VLADIMIR KARAPETOFF. *J. Franklin Inst.* 210, 609–24(1930).—The results of previous phys. studies on the probable no. of electronic orbits and their characteristics are represented in the form of graphical charts for the 92 known chem. elements. An empirical rule is derived for electronic orbits whereby elements form periodic groups with recurrent chem. properties.
M. MCMAHON

The Laue photographs of iridescent crystals of potassium chlorate. S. C. SIRKAR. *Indian J. Physics* 5, 337–43(1931).—Laue photographs of colored, thick twinned and heated crystals of $KClO_3$ are identical, showing that on heating a single crystal twinned strata appear and that the strata are also present in the colored crystals. This is x-ray analysis support for Lord Rayleigh's theory of the iridescence of these crystals
H. W. WALKER

Crystal lattice distortion and reactions in the solid state. J ARVID HEDVALL. *Z. Elektrochem.* 36, 853–61(1930): cf. *C. A* 24, 2673.
JOHN R. HILL

The quantitative determination of radium by the emanation method. RALPH G FULTON. *J. Assoc. Official Agr. Chem.* 13, 497–503(1930).—The method proposed by Sale (*C. A.* 19, 3145; 21, 3422) for examg. radioactive material was applied to a water sample, a sol. salt sample and a refractory substance, and was found to be reliable. Several modifications in technic resulting in simplicity and convenience, without loss of accuracy, are suggested. The method was checked by the Schlundt and Moore method (*J. Phys. Chem.* 9, 320(1905)) and by Barker's bisulfate fusion method (*C. A.* 12, 1942), both of which are in general use at the Univ. of Missouri in making Ra assays. The procedure was extended to include other refractory substances and was found to give accurate results.
A. PAPINEAU-COUTURE

The effect of heating upon radioactive deposits. W. SEITH AND A. H. W. ATEN, JR. *Z. physik. Chem.*, Abt. B, 10, 296–8(1930).—The effect of heating radioactive films of Th deposited by distn upon surfaces of Pt foil has been investigated. At temps. as high as 550° the uniform distribution of material is modified by the appearance of small aggregates although a uniform background remains. Upon heating to 700° the background disappears and all the matter is brought into these sep. aggregations, some of which appear on parts of the surface not originally covered. A deposit formed upon quartz glass is more permanent. The explanation presumably lies in the formation of a silicate with the radioactive material. By aid of these phenomena evidence has been produced to show that a kinetic interchange occurs between the Pb ions of a Pb oxide surface and those of a Pb chloride film deposited upon it. C. J. H.

Energies of electrons in gases. J. S. TOWNSEND. *Phil. Mag.* [7], 9, 1145–73 (1930).—Equations and calcns. are made for the energy distribution based on the measurements for He and Ne. Cf. Townsend and Bailey (*C. A.* 18, 16) and Bailey (*C. A.* 18, 1083).
ARTHUR FLEISCHER

The behavior of methane molecules and argon atoms in collisions with very slow electrons. HENRY L. BROSE AND J. E. KEYSTON. *Nature* 126, 806–7(1930).—Measurements using Ramsauer's method lead to Q-$\sqrt{V}$ curves (Q = cross section, V = voltage) for CH_4 and A which are very much alike, leading to the hypothesis that a mol. of CH_4 in collisions with slow electrons behaves like an A atom. Z/p *vs.* k curves obtained by Townsend's drift velocity method do not agree (Z is the elec. force, p the gas pressure, and k the electronic temp. factor); this shows the hypothesis is untenable.
ARTHUR FLEISCHER

The capture of electrons by ions. G. WATAGHIN. *Atti accad. Lincei* 11, 993–7 (1930).—Davis (*C. A.* 24, 1029) and Barnes (*C. A.* 24, 3164) have shown that the probability of capture of an electron by an ion is a max. when the kinetic energy of the electron with respect to the He nucleus = 0. W. derives an equation *for the frequency of the light emitted in the process of combination* using the method of Schrödinger together with the equations of Dirac (*C. A.* 23, 3400; 24, 2040, 5602), and the perturbation theory. There is an emission of a quantum of light for every electron captured, and

the frequency is double the resonance frequency, $\nu' = 2E_n/h$, where E_n = the energy of the nth term of He^+. A. W. CONTIERI

Search for radiation accompanying the scattering of comparatively slow electrons at the surface of incandescent solids. ERIK RUDBERG. *Proc. Roy. Soc.* (London) **A129**, 652–6(1930); cf. *C. A.* **24**, 3431.—The energy distribution curves for electrons scattered from incandescent solids show characteristic maxima, different for each substance. A search was made for radiation accompanying the scattering. Anodes of CaO, SrO, BaO, Cu and Ag were bombarded with electrons of 600 v. and a current of 5 ma. The solids being kept incandescent, exposures up to 24 hrs. were made in the visible and ultra-violet region above 2300 A. U. Hg-arc lines and the ultra-violet OH bands were obtained but there was no evidence of any other radiation, indicating that the inelastic collisions with the target are not accompanied by radiation. G. M. MURPHY

The emission law for nickel. WASHINGTON DEL REGNO. *Atti accad. Lincei* **11**, 989–93(1930).—Using a technic similar to that used in the study on the emission of Bi (*C. A.* **24**, 3708), R. has measured the emission of Ni, as plates, as well as after wire-drawing, and other mech. working, for temps. between 344° and 643°. Thus a value of n in the emission law $E = KT^n$ (Stefan-Boltzmann) of 4.588 ± 0.031 was obtained, which agrees very well with values detd. by Suydam (4.648), Schmidt and Futherman (4.814), and Barnes (4.77). A. W. CONTIERI

Radiometer pressure and accommodation coefficient. MARTIN KNUDSEN. *Ann. Physik* [5], **6**, 129–85(1930).—Radiometer forces have been studied under such conditions that all quantities, on which the radiometer force might depend, especially the temp., were measured. The significance of the accommodation coeff. for the radiometer pressure has been shown. It follows from measurements at low pressure that the accommodation coeff. for the internal energy of a diat. gas can be equated, in the case examd., to the accommodation coeff. for the translatory energy. F. U.

Effect of temperature on the ionization current of ceresin. D. N. NASLEDOV AND P. V. SHARAVSKII. *Ann. Physik* [5], **6**, 574–80(1930).—The thermostat used has been described. The magnitude of the ionization current I_t as a function of the temp. may be expressed by the equation $I_t = I_0e^{at}$. (a = const., I_0 = current at 0°, t = cent. temp.) The amts. of electricity given off by the dielec. (ceresin) during discharge also increased with temp., indicating an increase in the no. of ions in the dielectric due to temp. FRANK URBAN

Temperature classification of the spectra of europium, gadolinium, terbium, dysprosium and holmium, λ3850 to λ4700. ARTHUR S. KING. *Astrophys. J.* **72**, 221–55(1930).—The furnace, arc, and spark spectra of Eu, Gd, Tb, Dy and Ho have been examd. in the range 3850 to 4700 A. U. to obtain data to aid in the classification of these spectra. Many new lines not hitherto recorded, which appear in the furnace spectra, have been measured. The lines of the neutral atoms of Gd, Tb and Dy are relatively strong in the furnace, and both Eu and Dy have easily reversed lines of high intensity which show at low furnace temps. In the spectra of Eu, Tb and Ho, all of odd at. no., many lines with hyperfine structure occur, whereas none appears in the spectra of Gd and Dy, of even at. no. C. C. KIESS

Multiplet intensities in the solar spectrum. R. VAN DER R. WOOLLEY. *Astrophys. J.* **72**, 256–66(1930).—The contours of solar absorption lines, which appear to be unaffected by blending, in the interval from 4500 to 4600 A. U., have been measured with a microphotometer for the purpose of comparing their intensities with those deduced from quantum theory. Among these lines is the Ti I multiplet $a^4F-y^4F^\circ$ of which the observed intensities in emission are in agreement with the theoretical values. The observed solar intensities, however, diverge from the theoretical and observed lab. values, the weaker lines being relatively stronger in the solar spectrum. C. C. K.

Intensities in stellar spectra of a triplet of Si III. OTTO STRUVE AND C. T. ELVEY. *Astrophys. J.* **72**, 267–76(1930).—The intensities of the Si III triplet at 4553, 4568 and 4575 A. U. were measured in absorption in stellar spectra and in emission in the spectrum of a condensed spark discharge between Si electrodes. The lines represent the term combination $^1S-{}^1P$ for which the theoretical intensity ratios are 5:3:1. The intensity ratios observed for the lines in emission are 4.0:2.4:1, while in absorption the ratios 2.1:1.4:1.0 were found, which are nearly equal to $\sqrt{5}:\sqrt{3}:\sqrt{1}$. This square-root relationship is discussed theoretically and is shown to indicate that the absorption coeff. is due to radiation damping, and lends support to the hypothesis that the dish-shaped contours observed for the absorption lines in early type stars are due to rotation and not to an unusual form of the absorption coeff. C. C. KIESS

The modifications effected in the fine structure of a spectral line by molecular diffu-

sion. A study of the effect as a function of the angle of diffusion. MICHEL VACHER. *Compt. rend.* **191**, 1121–3(1930).—The broadening of a spectral line by diffusion, first detected by Cabannes, was examd. with the Fabry-Perot interferometer in the 4358 A. U. line of Hg diffused by benzene. The observations were made at angles of diffusion of 30°, 90° and 150°. It was found: (1) that the short-wave-length edge of the diffused ray was not sensibly altered in position; (2) that the broadening increased with the angle of diffusion; (3) that the center of gravity of the diffused ray was shifted toward the red by amts. of the order of 0.01 A. U. increasing with the angle of diffusion. It seems that the diffused ray consists of 2 components, of which one is unaffected by the diffusion process, but the other is displaced toward the red but is too wide to be sepd. from its companion. The effect is analogous to a Compton shift or a Doppler-Fizeau effect and is regarded as a new phenomenon. C. C. KIESS

The fine structure of a spectral ray after molecular diffusion. JEAN CABANNES. *Compt. rend.* **191**, 1123–5(1930).—The theory of the mol. diffusion of light requires the exciting ray of wave length λ to be replaced in the diffused ray by 2 lines of sensibly equal intensities and of wave lengths $\lambda \pm d\lambda$, where $d\lambda = (2un/c) \sin(\theta/2)$, u and c/n being the velocities of sound and light, resp., in the diffusing medium, and θ being the angle of diffusion. Although the results found by Vacher (see preceding abstr.) for $d\lambda$ do not differ much from those given by the above formula, yet his expts. show dissymetries not accounted for by the theory and of which the cause is not clear. C. C. KIESS

The structure of the spectrum of singly ionized zirconium. C. C. KIESS AND HARRIET K. KIESS *Bur. Standards J. Research* **5**, 1205–41(1930).—Seventy-five % of the lines observed in the spectrum Zr II have been classified as combinations between doublet and quartet terms which, without exception, are those required theoretically. All the terms except one which can result from the interaction of 3 electrons occupying $4d$, $5s$ and $5p$ orbits have been found. Only a few of the terms arising when one of the electrons migrates to a $5d$ or $6s$ orbit have been found. Some of these form Rydberg series with the low terms. From 10 series-forming pairs of terms with either ^1F ^1G or ^1D of Zr III as limit (*C. A.* **24**, 5620) a value of 113,175 cm.$^{-1}$ has been found for $a^4F_{1\frac{1}{2}}$, the deepest term of Zr II. This yields an ionization potential of 13.97 v. for the ion Zr^+. The terms permit the calcn. of many faint lines which have been identified with unknown lines of the solar spectrum but do not appear in lab. sources. C. C. K

The modification of intensities in the mercury arc spectrum. ERNST LÜBCKE *Wiss. Veröffentlich. Siemens-Konzern* **9**, 246–51(1930); cf. *C. A.* **24**, 2044.—A change of color has been observed in the light emitted by a Hg arc lamp due to cooling of the cathode and of the space of the immediate vicinity. An examn. of the spectrograms made with and without cooling indicates that this color change is due to a strengthening of the lowest singlet terms and a weakening of the lowest triplet terms. Measurements of the potential distribution and of the space temp. and electron temp. indicate that the modification of the spectrum is due to the elevation of the temp. of free electrons. The investigations are being continued in order to det. whether these spectrophotometric research methods are suited to quant. measurements in gas discharge. These include velocity of electrons, their distributions and free paths, also some properties of atoms, which cannot be studied by purely elec. methods, because of the disturbing effect of the elec. discharge. C. J. HUMPHREYS

Interference measurements in the first spectra of krypton and xenon. C. J. HUMPHREYS. *Bur. Standards J. Research* **5**, 1041–55(1930); cf. *C. A.* **24**, 1286, 1287.—The wave lengths of the stronger arc lines of Kr and Xe have been redetd. by the use of Fabry-Perot étalon interferometers. The secondary standards of Ne photographed simultaneously with the Kr or Xe spectrum furnished the comparison. Interferometer measurements of a sufficient no. of Kr lines have been made to permit fixing the relative values of all the $1s$, $2p$ and $3p$ terms to a high degree of precision. The accuracy of the term values is such that the av. deviation of calcd. term combinations from the observed wave nos. is 1 part in 20,000,000. The corresponding set of terms in the Xe spectrum, except $2p_{10}$, was detd. also with increased precision from interference measurements. In addn. to these, 4 of the $4p$ terms have been recalcd. Nearly $^3/_4$ of the combinations permitted by the selection rule have been observed. The exact location of the combinations in the infra-red region not photographically accessible can now be predicted with certainty. With the resolving power employed none of the Kr lines showed hyperfine structure. It is apparent from the extremely small variations of the "constant differences" that the intensities of any unobserved satellites are too low to affect the wave lengths. Five of the Xe lines showed satellites. Further work in the examn. of the lines of both spectra for hyperfine structure is in progress

The close agreement of these results with those of other observers as well as the small differences between sep. observations indicates that the wave lengths of the radiation emitted by Kr or Xe are reproducible within the limits set by the probable error of interferometer comparisons. For the intense green and yellow lines of Kr, for which Perard at the International Bureau obtained wave lengths 5570.2892 and 5870.9154 A. U., H. obtains 5570.2890 and 5870.9153 A. U. C. J. HUMPHREYS

The effect of pressure on absorption of spectral lines. SNEHAMOY DATTA AND SATYENDRA NATH ROY. *Indian J. Physics* **5**, 365–70(1930).—Absorption spectra of K vapor at pressures from 1 cm. to 60 cm. show increasing continuous absorption with increasing pressure. A mixt. of N_2 and K shows the same effect. G. M. MURPHY

The Zeeman effect and the absorption coefficients of the hyperfine structure of the mercury resonance line. S. MROZOWSKI. *Nature* **126**, 684(1930).—The Hg resonance line 2537 A. U., was measured in absorption in magnetic fields from 0 to 8 kilogausses. The results can be reconciled with McNair's results (cf. *C. A.* **22**, 2714). A. F.

Photoionization of cesium vapor by absorption between the series lines. C. BOECKNER AND F. L. MOHLER. *Bur. Standards J. Research* **5**, 831–42(1930).—Relative ionization as a function of wave length in Cs, and as a function of pressure and temp. and the effect on the ionization of Cs by foreign gases were detected and measured by means of the neutralizing effect of pos. ions on a thermionic current limited by electron space charge. The theory of the cause of ionization is discussed with the possible conclusion that absorption leads to a highly excited neutral mol. which spontaneously passes to a state of the mol. ion. MALCOLM DOLE

Determination of the abundance ratios of isotopes from band spectra. G. STENVINKEL. *Nature* **126**, 649(1930).—A temp. rise should produce a change in the abundance ratio due to the change in the vibrational states of the mol. Correct values of the abundance ratio are obtained by intensity measurements on absorption bands of mols. in the normal state. ARTHUR FLEISCHER

Dissociation energies calculated from predissociation spectra and the dissociation energy of O_2. GERHARD HERZBERG. *Z. physik. Chem.*, Abt. B, **10**, 189–92(1930).—The discrepancy between the dissocn. energy of O_2 calcd. from predissocn. spectra of NO_2 and SO_2 and calcd. from the analysis of the O-atom spectra is explained on the basis that the long-wave-length limit of the diffuseness in the band spectra of NO_2 and SO_2 corresponds to the dissocn. of mols. with considerable kinetic energy and not to the beginning of the superimposed continuous spectrum. The value of 117,300 cals (5.09 v.) is considered correct. The energy for the sepn. of the first O atom from NO_2 is 71,500 cals. (3.1 v.) The long-wave-length limit of the predissocn. spectra gives only upper limits for the dissocn. energy. WILLIAM E. VAUGHAN

Investigations in the infra-red region of the spectrum. I. Introductory and experimental. C. R. BAILEY, A. B. D. CASSIE AND W. R. ANGUS. *Proc. Roy. Soc.* (London) **A130**, 133–41(1930).—A description is given of the app. and the exptl. procedure adopted for obtaining precision measurements of infra-red absorption bands with prisms of quartz, fluorite and sylvine. **II. The absorption spectrum of sulfur dioxide.** *Ibid* 142–56.—The method described above has been applied to a reinvestigation of the absorption spectrum of SO_2 in the region from 1 to 22μ. Bands were measured at 16.494, 8.680, 7.347, 5.345, 4.338 and 4.003μ, all of which, except the first, had been reported previously by Coblentz. The partial resolution of some of the bands has allowed the recognition of *P* and *R* branches from which the following properties of the SO_2 mol. have been derived.: (1) the S and 2O atoms lie at the vertices of an isosceles triangle of which the sides S—O and O—O measure 4.8 and 2.0×10^{-8} cm., resp., and the angle OSO equals 24°; (2) the moments of inertia in g. sq. cm. $\times 10^{-39}$ are 55, 50 and 4.7; (3) the vibration frequencies in cm^{-1} are 606, 1152 and 1361, of which the last 2 agree with Raman shifts. C. C. KIESS

Infra-red sensitivity of cesium oxide photoelectric cells. JAMES W. BALLARD. *J. Optical Soc. Am.* **20**, 618–23(1930).—The relative spectral sensitivities of Cs oxide photoelec cells to visible and infra-red regions were detd. The results for the region from 5000 to 8000 A. U. check previous workers. The sensitivity drops from the max. at approx. 7750 A. U. to zero at 12,000 A. U. Curves are given. W. E. V.

The Raman effect in liquids with rotatory power. A. KASTLER. *Compt. rend.* **191**, 565–6(1930).—Investigation of the mol. asymmetry in the Raman spectra of optically active materials, in natural and circular light, indicates that the mol. asymmetry which is found in the transmission and absorption of light does not appear in Raman spectra. M. McMAHON

The Raman effect. Its significance for physics and chemistry. S. BHAGAVANTAM. *Indian J. Physics* **5**, 237–307(1930).—A review of the Raman effect including its re-

lation to spectroscopy, mol. and crystal structure, valence and phys. and org. chemistry. A complete *bibliography* to June, 1930, is given under 26 sections; an author and substance index is also included and a list of earlier papers on light scattering. G. M. M.

The behavior of silicon dioxide under the influence of slow cathode rays. H. PETERS AND TH. SCHULTES. *Z. Elektrochem.* 36, 837–9(1930).—Red light produced on glass walls by high-frequency electrodeless discharge in a high vacuum is identical with the red fluorescence of glass caused by slow cathode rays. The spectrum consists of a continuous band in the red from 723 to 589 mμ with 2 maxima at 642 and 628 mμ. There is also a bright band in the green and violet with maxima at 560 and 479 mμ, resp. The origin of the phenomenon is not restricted to a gaseous or water layer but indicates a rearrangement of the SiO_3 group. J. R. H.

Remarks on the photochemistry of associated states. FRITZ WEIGERT. *Z. physik. Chem.*, Abt. B, 10, 241–63(1930).—A no. of phenomena may be physically verified which are characteristic of assocd. mol. states. The primary effects consist of frequent optically demonstrable mech. disruptions of complexes and micellae which are held together by van der Waals' forces. Induced chem. effects may also be observed. The appearance of primary and induced photodichroism is an indication that the form of the detached spheres within the micellae depends upon the wave form of the exciting light, a phenomenon for which no successful phys. explanation has been found. The appearance of this photodichroism, which is especially exact and easy to measure, is the very thing which affords a special insight into the peculiar character of the disruption process, further study of which is expected to yield valuable conclusions as to the structure of assocd. systems and micellae, as to the nature of the optical deformation of adjoining mol. groups, and probably also concerning some biol. problems. In connection with these characteristic "photomicellar" processes, certain "photomolecular" phenomena within individual mols. of the assocd. system are possible under suitable conditions which do not differ from those generally known. C. J. H.

The photochemical combination of chlorine and hydrogen. TEIJI ICHIKAWA. *Z. physik. Chem.*, Abt. B, 10, 299–336(1930).—Exptl. details are given of a method by which the velocity of reaction in the photochem. combination of Cl and H may be studied by aid of a photographic recording app. The Draper expansion has been investigated in a more precise way, and it is shown to be a small explosion. The primary reaction is explained by analysis of the reaction-velocity curves. Certain evidence of a chain reaction has been found. The length of the chain and its duration have been calcd. Further discussion is given of some previously proposed mechanisms regarding the nature of the primary reaction, and a new mechanism is suggested in which the building of the complex mol. $H_2O.Cl_2$ plays a prominent part in the primary reaction. C. J. HUMPHREYS

The mechanism of the synthesis of the nitrogen oxides. LOUIS A. M. HENRY. *J. Phys. Chem.* 34, 2782–91(1930).—The reaction between N and O was studied at low temp. and pressure under the action of the Geissler, electrodeless and dark electronic discharge. The best yields of NO_2 were obtained at liquid-air temp. with a luminous discharge, and a ratio $N_2:2O_2$. The synthetic reaction is probably between at. N and mol. O_2. B. A. SOULE

Inhibition and mechanism of photochemical reaction in Eder's solution. E. SHPOLSKII. *Nature* 126, 647–8(1930).—Sensitizers for the ordinary photochem. reaction are inhibitors for Eder's reaction in the presence of x-rays. $KMnO_4$ inhibits the reaction till it has been used up, after which HgCl ppts. $FeCl_3$ in concns. above 0.01 g./cc., UO_2 acetate and $UO_2(NO_3)_2$ inhibit the reaction by an increase in the H ion concn. Uranin, eosin, erythrosin and quinine bisulfate are very strong inhibitors, the inhibitory property increases at the same rate as the sensitizing effect with ordinary light. Eder's reaction is probably a chain reaction. ARTHUR FLEISCHER

Gas luminosity produced by a heterogeneous reaction. W. FRANKENBURGER AND W. ZIMMERMANN. *Z. physik. Chem.*, Abt. B, 10, 238–40(1930).—LiN_3 was produced by passing O-free N over Li heated to 500–600°. Passage of N containing very small quantities of O over the nitride produced a glow in the gas in immediate contact with the solid. The glow was red, in many cases blue, and also showed the yellow Na lines when examd. spectroscopically. The blue-green belongs to a band system that extends from the green into the violet. Active N produced in a special app. gives the red Li lines but not the green color. The phenomenon is explained on the basis of the formation of intermediate "active products" which lose their energy by collisions of the second kind and return to a normal state, the bodies with which they collide (Li and Na) giving rise to emission spectra. WILLIAM E. VAUGHAN

The displacement by ultra-violet light of the explosion limit in a chain reaction.

C. N. HINSHELWOOD AND K. CLUSIUS. *Proc. Roy. Soc.* (London) **A129**, 589–98(1930).—Mixt. of PH_3 and O_2 at ordinary temp. react explosively between 2 sharply defined pressure limits. The lower limit is diminished by ultra-violet light of 2500–2800 A. U. The effect is due to the formation of a small quantity of an active substance from the PH_3. The conditions of formation and decay of the active substance are investigated; it does not decay immediately when the illumination ceases. The max. concn. in the photostationary state is deduced, and the efficiency of collisions with the walls of the vessel in destroying it is calcd. This is an example of a chain reaction in which the existence of material rather than energy chains can be experimentally detected.
G. M. MURPHY

Effect of light on the ferrocyanide-ferricyanide iodine-iodide equilibrium. ROSCOE G. DICKINSON AND S. FREDERICK RAVITZ. *J. Am. Chem. Soc.* **52**, 4770–8(1930).—When a ferrocyanide-ferricyanide iodine-iodide soln. is illuminated with light absorbable by I_3^- but not by the complex cyanides, reduction of ferricyanide and oxidation of iodide occur. The quantum yield is substantially the same as that in the oxidation of Fe^{++} in iodine-iodide solns. D. and R. discuss some possible mechanisms of the reaction.
LOUISE KELLEY

Dependence of velocity of photochemical reaction on primary intensity of illumination. E. GAVIOLA. *Anales asocn. quím. Argentina* **18**, 133–6(1930); cf. *C. A.* **24**, 5225. Klumb and Pringsheim, *C. A.* **23**, 1570.
E. M. SYMMES

A photochemical reaction between sulfur and yellow arsenic. CH. HAENNY. *Helv. Chim. Acta* **13**, 725–30(1930).—Yellow As is prepd. by rapidly cooling vapors of As in the dark. A study is made of the photochem. reaction between the yellow As and S dissolved in CS_2 which results in the formation of insol. sulfides whose properties are neither those of a mixt. of these elements nor those of known As sulfides. The compn. of the product obtained varies in relation to the parts of S and As dissolved and indicates the existence of new As sulfides similar to sulfides of P.
M. Mc. M.

Oxido-reductions with chlorophyll and other sensitizers. FERDIN AND ALLISSON. *Helv. Chim. Acta* **13**, 788–805(1930).—The replaceability of chlorophyll and other photodynamic pigments in photochem. oxidation-reduction reactions is illustrated with new examples. Pt hydride can react as a reducing substance in sensitized oxidation-reduction reactions. O-H mixts. react with or without platinum black in the presence of numerous sensitizers, especially with chlorophyll.
M. MCMAHON

Transmitted structural blue in microsopic objects. CLYDE W. MASON. *J. Phys. Chem.* **35**, 73–81(1931).—On the basis of exptl. work with various-size particles and structures M.'s conclusions are that the uniform size particles of structures finer than about 0.4μ scatter light inversely as λ^4 and are not resolvable with axial illumination. They exhibit Tyndall blue and transmit yellow or orange, even with relatively diffuse illuminations. Uniform size particles or structures between about 0.4μ and about 0.7μ scatter red light and diffract blue in maxima at such angles as to be resolvable with blue light and axial illumination. If they are of bold outlines or surrounded by a medium of widely different n, they exhibit transmitted blue and scatter yellow or orange, even with a slightly diffuse illumination. Uniform sized particles or structures coarser than about 0.7μ diffract all wave lengths, the red more than the blue. If of good contrast, they exhibit transmitted blue provided the numerical aperture of the objective is such as to include only the blue end of the diffracted spectra obtained with a narrow axial illuminating cone. Transmitted blue, which is lost in diffuse light, is apparent to the naked eye with specimens coarser than 0.4μ. It is due to the greater deviation of red than blue, either by scattering or by diffraction. Transmitted blue, visible to the naked eye, exhibited by suspensions of fine particles, is probably explainable by the above reasoning.

4—ELECTROCHEMISTRY

COLIN G. FINK

High-speed steel treated in a special electric furnace. E. N. BROOKINGS. *Iron Age* **126**, 1295–8, 1360(1930).—Details of construction and operation, with reference to timing and temp. control, are given for the all-elec. equipment used in heat-treating high-speed steel parts. C. L. READ

Preparation of metal powders by electrolysis of fused salts. II. Thorium. F. H. DRIGGS AND W. C. LILLIENDAHL. *Ind. Eng. Chem.* **22**, 1302–3(1930); cf. *C. A.* **24**, 2953.—Metallic Th was prepd. by the electrolysis of $KThF_5$ in a bath of equal parts of fused NaCl and KCl at a temp. of 750–75°. A Mo cathode was used. The deposit on the cathode consisted of Th metal interspersed with solidified salts, which were removed by dissolving in H_2O. The purified powder has been used for making x-ray targets, sheet and wire by the methods described earlier (*C. A.* **21**, 841). Electrolytic Th is very soft; well-annealed samples have a hardness as low as D-10 on the Rockwell scale. Bars may be cold-worked without intermediate annealing. The metal prepd. by electrolysis contained C 0.019 ± 0.005, Si 0.045 ± 0.01 and Fe 0.005%. The quantities of other impurities were negligible. It compares favorably with the best samples produced by the Ca-$CaCl_2$ reduction of ThO_2. LOUISE KELLY

Manganese in electrolytic zinc practice. OLIVER C. RALSTON. *Eng. Mining J.* **130**, 606–8(1930); cf. *C. A.* **25**, 253.—The litigation over the Canadian patent of A. G. French dealing with electrolytic recovery of Zn and Mn from ores contg. both has been critically reviewed. Mn in the soln. does not make the cathode deposit more regular. Less Pb is found in the cathodes in the presence of Mn, but the evidence needs confirmation. The claim that Mn pptg at the anode will depolarize it has been found groundless. A coating of MnO_2 over a Pb anode has little protective effect against corrosion. The usual current efficiency in MnO_2 deposition, under normal Zn plant operating conditions, is little better than 1%. The true benefit derived from the proper use of Mn is in leaching and purification prior to electrolysis rather than in the electrolytic part of the cycle. A marked benefit of the litigation lies in the testimony of a large no. of expert Zn metallurgists, indicating what portions of modern electrolytic Zn practice are old and what are novel. W. H. BOYNTON

A study of the cadmium-lead chloride voltaic cell. RUDOLF J. PRIEPKE AND WARREN C. VOSBURGH. *J. Am. Chem. Soc.* **52**, 4831–7(1930).—The two different values found for the e. m. f. of the cell, Cd (Hg) | $CdCl_2$ (satd.) | $CdCl_2$ (satd.), PbCl (satd.) | Pb (Hg), *i. e.*, 0.1407 v. and 0.1372 v., resulted from the use of $CdCl_2.5H_2O$ and $CdCl_2.H_2O$, resp. JOHN R. HILL

The electrochemical production of sodium hyposulfite. MARK RABINOVICH AND A. S. FOKIN. *Z. Elektrochem.* **36**, 839–45(1930).—$Na_2S_2O_4$ is prepd. by reduction of SO_2 with Na-Hg. The hyposulfite can be concd. to the satn. point so that during the electrolysis crystals of $Na_2S_2O_4.2H_2O$ are collected. The current output is about 70 to 80%. The loss is mainly a result of the decompn., $2Na_2S_2O_4 = Na_2S_2O_3 + Na_2S_2O_5$. This loss can be reduced considerably by the presence of Na_2SiO_3. JOHN R. HILL

The electrochemical production of formates from carbonic acid. MARK RABINOVICH AND ARKADIJ MASHOVETZ. *Z. Elektrochem.* **36**, 846–50(1930).—H_2CO_3 is reduced to formates by the use of a combined Pb-Na amalgam. This amalgam is obtained in the course of the electrolysis from NaOH or Na salts with a Pb amalgam electrode. JOHN R. HILL

The production of electrolytic hydrogen and oxygen. A. E. R. WESTMAN. *Can. Chem. Met.* **14**, 338–45, 350(1930).—Electrolytic H_2 is being used in *fertilizer manuf.*;

no urgent need for large quantities of O_2 has developed. Cell design, the prepn. of cost data, the cost of power and quantity production costs are discussed and lead to the following conclusions regarding quantity production, continuous power being used: (1) Quantity production permits a decrease in costs other than power costs. (2) With available equipment most of the economies of quantity production were obtained in a plant with an output of 3,000,000 cu. ft. of total gas (2 vols. H, 1 vol. O)per 24 hrs. (3) For a capacity of 3,000,000 cu. ft. per 24 hrs. with cells operating at 2.0 v. and 100% load factor, the cost exclusive of, power was 15.3¢ per 1000 ft. of total gas; the power cost equaled the other cost when the a. c. power rate was 0.16¢ per kw.-hr. and was twice the other costs when the a. c. power rate was 0.32¢ per kw.-hr. (4) The fixed charges differed little and represented about half the cost, exclusive of power, of a plant producing 3,000,000 cu. ft. per 24 hrs. (5) Further economies could be effected with larger cells and larger rectifiers and by developing cheaper methods of fabrication. Conclusions are given also for off-peak production. W. H. B.

Gaseous combustion in electric discharges. VI. Effect of diluents upon the cathodic combustion of carbonic oxide "detonating gas." G. I. FINCH AND W. L. PATRICK. *Proc. Roy. Soc.* (London) A129, 656–71(1930); cf. *C. A.* 25, 458.—When an elec. discharge passes through dry or moist CO-O_2 detonating gas mixts. dild. with N_2, He, A, CO or O_2, the CO burns at a rate which is directly proportional to the current. Diln of dry detonating gas with CO or O_2 within certain limits has a slight effect on the rate of combustion at a non-sputtering cathode. At sputtering cathodes and with dry gas, the rate of combustion is inversely proportional to the amount of N_2, He or A and increases with O_2 or pressure increase. The rate at non-sputtering cathodes and with moist gas increases with CO and decreases with increasing pressure. At sputtering cathodes with moist gas, the rate is independent of pressure; CO and O_2 increase the rate. H_2O_2 and H_2 are formed with moist gas. Autoxidation takes place within the cathode zone. The fundamental mechanism of the direct combustion of CO by O_2 consists in the union of CO mols. with O atoms in pure or indirect triple collisions. Metal atoms combine with O_2 mols. to form loose complexes which readily oxidize CO. **VII. The effect of dilution with hydrogen on the cathodic combustion of carbonic oxide-oxygen mixtures.** *Ibid* 672–85.—A mixt. of CO, O_2 and H_2 burns cathodically at a rate that is proportional to the current. Electrolytic gas burns more rapidly at a non-sputtering cathode than dry gas. The combustion products at a non-sputtering cathode contain more H_2O_2 than at a sputtering cathode. H_2 is a more powerful promoter of the combustion than steam. At a Au cathode, the rate of combustion is nearly independent of the pressure for certain mixts. The preferential combustion of CO is greater with decreasing pressure. H_2 burns, first, to active steam and H_2O_2, both of which oxidize CO more readily than does O_2; H_2O is reduced to active hydrogen, H_2O_2 to inactive steam. Sputtered metal atoms decompose H_2O_2 to inactive steam. Increasing pressure or O_2 concn. favors the combustion of H_2 to H_2O_2; decreasing pressure or O_2 concn. or increasing H_2 concn. favors the combustion of H_2 to active steam. G. M. MURPHY

Decomposition of methane with carbon dioxide and water vapor in the electric discharge. K. PETERS AND A. PRANSCHKE. *Brennstoff-Chem.* 11, 473–6(1930); cf. *C. A.* 23, 4326; 25, 399.—At 5000–6000 v. in the discharge tube previously described and with rates of gas flow to 800 l./hr., CH_4—H_2O and CH_4—CO_2 mixts. have been almost completely decompd. to CO and O_2. Sepn. of C did not occur, but at intermediate voltages a large part of the CH_4 formed C_2H_2. Tabulated data show that by varying the proportions of the mixt. used, variations over a wide limit are possible in the resulting gas. Curves show the relationships between c. d., CH_4 content and the production of CO and C_2H_2. F. W. JUNG

Achievements in electrical engineering during 1930. C. K. LEE AND H. N. BLACKMON *Elec. J.* 28, 2–41(1931).—This review includes chapters on water power, hydrogen for cooling, lightning arresters, de-ion circuit breakers, mechanically made wrought Fe, photoelectric cells, ultra-violet lamps and nitriding furnace. Dry-cell electric batteries. WM. F. HENDRY (to National Carbon Co.). U. S. 1,786,945, Dec. 30. Various details of manuf. are described.

Storage battery. CARL J. DUNZWEILER (to Willard Storage Battery Co.). U. S. 1,786,742, Dec. 30. Structural features.

Storage battery. GEO. E. PETROSKY. U. S. 1,786,961, Dec. 30. Cap and vent construction.

Storage batteries. GABRIEL A. CAPMAN. Fr. 686,877, Mar. 11, 1929. Channels are provided in the armatures to allow the electrolyte to wet the active material on the surface of the armature. If the channels are not capillary, they are filled with glass wool, etc.

Storage batteries. I. G. FARBENIND. A.-G. Fr. 688,075, Jan. 13, 1930. Storage batteries, particularly those having an alk. electrolyte have the spaces between the electrodes or between the electrodes and the walls filled with a permeable cloth, preferably of asbestos.

Storage battery. WILLARD L. REINHARDT (to Willard Storage Battery Co.). Can. 304,849, Oct. 14, 1930. The life of neg. pole plates of storage batteries of the lead-acid type is increased by incorporating in the plates a small amt. of a substance which is composed chiefly of humic acid, but which may contain addnl. substances, namely ulmic acid, opocunic acid and crenic acid.

Storage battery. M. WUILLOT. Belg. 365,630, March 31, 1930. The plates of the battery are not immersed in the electrolyte, the latter being in the bottom of the container and being brought into contact with the plates by means of separators made of absorbent material, the lower part of which dips into the electrolyte. The separators are placed on both sides of the plates.

Galvanic batteries. FRITZ RITTINGHAUS. Ger. 508,954, April 11, 1926. A covering layer of paraffin, petrolatum and petroleum oils is provided.

Carbon cap for galvanic elements. GEBR. KLEINMANN. Ger. 508,972, Dec. 1, 1929.

Selenium cells. SOC. CARL ZEISS Fr. 687,651, Jan. 3, 1930. The Se is deposited on 2 Pt electrodes fixed on a hard support such as glass or quartz, and between the 2 electrodes a furrow is made by corrosion of the glass and filled with Se.

Accumulators. WILHELM PETRI. Ger. 508,779, April 15, 1928. Details of finely reticulated plates.

Porous separator for accumulators. HARRY WEHRLIN. Ger. 508,970, June 1, 1929.

Regenerating sulfated lead accumulator plates. JEFIM FRIGELSON. Ger. 508,789, Jan. 14, 1928. The plates are subjected to periodic chargings and dischargings of short duration till the sp. gr. of the electrolyte reaches a desired value.

Electric resistances. H. ANDRE. Brit. 334,093, Oct. 5, 1928. In an electrochem. rectifier with solid contacting electrodes, one of the electrodes is porous and is impregnated with a chem. regenerating agent which maintains or restores the original chem. compn. of the electrodes. The anode may be Ag_2S, the cathode an oxidizable metal and the regenerating substance H_2SO_4. Numerous details of manuf. are described.

Dry rectifiers. ERNST PRESSER. Ger. 509,826, Mar. 28, 1928. The electrodes of dry rectification valves are coated with $Cu_2FeC_6N_6$.

Metal electrical contacts on materials such as copper oxide layers or dry rectifiers. SIEMENS-SCHUCKERTWERKE A.-G. Brit. 334,140, Dec. 5, 1928. Layers such as those of Zn applied to materials such as active layers of Cu oxide are prevented from loosening by applying materials such as japan varnish mixed with Pb_3O_4 or PbO_2 or oxide of Fe or of Mn, and the adhesion of the metal layer may be further improved by preliminarily applying to the underlying material a thin layer of finely divided graphite before applying the Zn or other metal.

Electric resistance unit suitable for high-temperature devices. CARROLL H. BOYLES. U. S. 1,788,146, Jan. 6. A mixt. formed of C 46–80, B carbide 52–12 and Na silicate 2–8% is molded under high pressure and then heated to about 650–760° for 24–48 hrs. Around this product there is molded a casing formed from corundum 85–98 and Na silicate 15–2%, which is subjected to high pressure and heated to about 980–1090° for 18–36 hrs.

Face plates for electrical contacts. CLEMENS A. LAISE (to Eisler Elec. Corp.). U. S. 1,788,243, Jan. 6. Face plates such as those of ignition contacts, x-ray targets or spark-plug points are formed of a hard, compact alloy of W together with V, Si and Th in small proportions.

Apparatus for electrodeposition of metals. COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 688,070, Jan. 13, 1930.

Electrodeposition of chromium. RAWAS-MAATSCHAPPIJ (Rudolf Appel, inventor). Ger. 509,023, May 9, 1926. A bath is used comprising CrO_3 about 50 and an alkali disulfate 0.5–1 g. per l. The CrO_3 is free from H_2SO_4 but contains a small quantity of dichromate. Suitable conditions are a temp. of 35–40°, a voltage between 3 and 4, and a c. d. of 6 amps. per sq. dm.

Electroplating. HERMANN PFANHAUSER. Ger. 508,157, Jan 3, 1928. See Austrian 114,527 (*C. A.* **24**, 791).

Electroplating apparatus with a rotatable electrode-cleaning brush. KAZIMIERZ BARANOWSKI (to Wladimir J. Einstein). U. S. 1,786,592, Dec. 30. Structural features.

Movable electroplating pad. PETER J. F. BATENBURG and CYRIL J. ATKINSON (Atkinson to Batenburg). U. S. 1,787,431, Jan. 6. Structural details.

Plating metals. FIRMA OTTO KALTENBACH. Ger. 507,623, June 6, 1928. A method is described of locally thickening electrochemical deposits of metals at places where the wear is greatest, by directing the streamlines of the current by wires, etc.

Chromium plating. JOHN A. HANLEY and WALTER L. PINNER (to General Spring Bumper Corp.). U. S. 1,787,477, Jan. 6. An article such as one with a Ni surface, which is to be Cr plated, is cleaned as anode in an alk. bath, dipped in an acid bath, rinsed, and placed immediately in a Cr plating soln., and the current is turned on when the article has been in the soln. about 5 sec.

Electrolyzer operating under pressure. J. E. NOEGGERATH. Ger. 508,480, Dec. 22, 1926. Details of the pressure-equalizing means are described.

Apparatus for the electrolysis of water. GEORGES LAMBERCIER. Fr. 687,297, Dec 27, 1929.

Metals and alloys. WALTER B. HAMILTON and THOMAS A. EVANS. Fr. 688,442, Jan. 18, 1930. Metals and alloys are made by reducing appropriate mixts. in a high-frequency elec. furnace, in which one or more priming conductors carried by induction to a sufficient temp. is introduced into the reaction mass so that the reduction is started and continues in an appropriate manner.

Aluminum. COMPAGNIE DE PRODUITS CHIM. ET ÉLECTROMÉTALLURGIQUES ALAIS, FROGES ET CAMARGUE. Fr. 686,914, Mar. 15, 1929. In the prepn. of baths used in the manuf. of Al by electrolysis, cryolite is replaced wholly or partly by a mixt. of AlF_3, dry or damp, and Na_2CO_3 or K_2CO_3, or NaOH or KOH.

Aluminum. OSCAR M. HENRIQUES and THOMAS ARNE THOMSEN. Fr. 688,567, Jan. 29, 1930. Al is made by electrolysis of a salt of Al in an anhyd. electrolyte. The active surface of the cathode is partially or wholly covered by an amorphous, cryst., granular or powd. substance betweeen or on the particles of which the pptn. or sepn. of the Al takes place. An example is given of electrolysis of a molten mixt. of NaCl and $AlCl_3$, the $AlCl_3$ being in excess so that it covers the electrode in a solid form.

Pure alumina by electrothermal reduction of impurities in crude materials such as bauxite. HANS SIEGENS. U. S. 1,787,124, Dec. 30. At the beginning of the process a furnace is charged with a raw material contg. less C admixed with it than necessary for reduction of impurities present, followed by charging with mixts. of raw material contg. increasing amts. of C until the theoretical proportion of C for the reaction mixt. is reached, and the charging process is finished with mixts. contg. C in excess sufficient to supply an excess of C in the reaction mixt. Liquid pure alumina is tapped at a time when such an amt. of free C is still present in the melt that a sample drawn is still light gray but not white and CO is developed by the melt, so that during the last period of the heating a non-oxidizing atm. is present directly over the surface of the melt.

Magnesium. I. G. FARBENIND. A.-G. Fr. 687,744, Jan. 6, 1930. In the manuf. of Mg by electrolysis of $MgCl_2$ in an electrolyte composed of a fusion bath heavier than Mg, a partition of non-conducting material is dipped into the electrolyte, and the electrodes are placed so as to reach nearly to the bottom of the bath, so that the distance

between the lower end of the partition and the bottom of the bath is at least twice the distance of that between the electrodes and the bottom.

Iron foil. JOHN R. CAIN (to Richardson Co.). U. S. 1,787,139, Dec. 30. After electrodeposition of Fe on a base of bright clean Cu, the Cu is removed electrolytically in a cyanide soln., thus producing an Fe foil with a polished appearance.

Thorium. EDMUND S. DAVENPORT (to Westinghouse Lamp Co.). U. S. 1,787,672, Jan. 6. Th is rendered resistant to atm. corrosion by anodic treatment in an electrolytic bath comprising glacial HOAc contg. an ionizable constituent such as HNO_3 capable of yielding O at the anode.

Acetylene. I. G. FARBENIND. A.-G. Fr. 687,973, Jan. 10, 1930. See Brit. 332,917 (*C. A.* 25, 462).

Acetylene and hydrogen from methane by electric-arc treatment. I. G. FARBENIND. A.-G. Fr. 687,884, Jan. 9, 1930. See Brit. 332,057 (*C. A.* 25, 39).

Apparatus for making hydrogen peroxide by electrolysis under pressure. I. G. FARBENIND. A.-G. (Georg Pfleiderer and Johannes Eckell, inventors). Ger. 508,091, June 25, 1929.

High-temperature electric furnace for three-phase current. ELEKTRO-SCHALTWERK A.-G. Ger. 509,182, May 12, 1928.

High-frequency electric furnace with concentric coils above the crucible. SIEMENS-SCHUCKERTWERKE A.-G. (Gustav Karkutsch, inventor). Ger. 509,537, Sept. 16, 1926.

Induction furnace. ALLGEMEINE ELEKTRICITÄTS GES. Ger. 509,726, Jan. 1, 1927. Details of construction are given.

Electric induction furnaces. ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Fr. 687,379, Dec. 28, 1929. A metal ring is placed in the upper part or at the mouth of the crucible and its section is such that it is not fused by the eddy currents while the inductor is charged.

Electric induction furnace. SOC. GÉNÉRALE D'APPLICATIONS ÉLECTROTHERMIQUES. Fr. 686,870, Mar. 9, 1929.

Electric induction furnaces. SOC. GÉNÉRALE D'APPLICATIONS ÉLECTROTHERMIQUES Fr. 687,924, Mar. 27, 1929. A method of cooling is given.

High-frequency induction furnace. SIEMENS & HALSKE A.-G. (Wilhelm Esmarch, inventor). Ger. 507,556, June 11, 1927.

Electric induction furnaces for treating metals. CHARLES MOHR. Fr. 687,529, Mar. 23, 1929.

Electric muffle furnaces. DELIOT ET CHEMINAT. Fr. 687,332, Dec. 27, 1929.

Muffles and heating elements for electric resistance furnaces. ÉTABLISSEMENTS BEKSO. Belg. 368,592, April 30, 1930. Constructional features.

Electrically heated furnace for treating zinc ores. ST. JOSEPH LEAD CO. Fr. 687,350, Dec. 28, 1929.

Electromagnetically operated hydraulic regulator for electric arc furnaces. LEONE TAGLIAFERRI. Swiss 138,139, Mar. 20, 1929.

Electric device for controlling the temperature of furnaces. SIEMENS-SCHUCKERTWERKE A.-G. (Rudolf Crundmann, inventor). Ger. 507,828, Nov. 15, 1927.

Electric annealing and hardening oven. HERAEUS-VACUUMSCHMELZE A.-G. and WILHELM ROHN. Ger. 508,009, Mar. 9, 1926.

Electrically heated hardening, etc., ovens. SIEMENS-SCHUCKERTWERKE A.-G. (Johann Schnepf, inventor). Ger. 509,286, Aug. 6, 1927. Heating elements are arranged at the bottom of the oven so as to effect a circulation of air and equalization of the oven temp.

Alternating-current melting furnace, with electrodes and single-phase transformers. AKT.-GES FÜR STICKSTOFFDÜNGER (Werner Krauss, inventor). Ger. 509,421, Dec. 9, 1927.

Furnace electrodes. I. G. FARBENIND. A.-G. (Robert Suchy, Karl Staib and Wilhelm Moschel, inventors). Ger. 508,190, Dec. 24, 1927. Combustion of C-furnace electrodes, particularly electrolytic electrodes, is prevented by impregnating or coating the baked electrodes with H_3PO_4.

Electric purification of gases. SIEMENS-SCHUCKERTWERKE A.-G. Fr. 686,759, Dec. 17, 1929. In the elec. purification of gases, particularly *blast-furnace gases*, the gases are heated before entering the elec. field and are afterward moistened by injecting a liquid such as water, so that the particles in suspension in the gas possess sufficient conductibility for sepn. Cf. *C. A.* 24, 4994.

Treating gases containing hydrocarbons. I. G. FARBENIND. A.-G. (Gustav Wiet-

zel and Alfred Starke, inventors). Ger. 507,920, Feb. 9, 1926. App. for subjecting the gas to an elec. arc is described.

Apparatus for electrical precipitation of suspended particles from gases. CRANDALL Z. ROSECRANS (to Leeds & Northrup Co.). U. S. 1,787,955, Jan. 6. Structural features.

Electric gas purifiers. SIEMENS-SCHUCKERTWERKE A.-G. (Carl Hahn, inventor). Ger. 507,914, Aug. 7, 1925. The electrodes are formed of coiled wire with barbs projecting at all angles.

Electric gas purifier. SIEMENS-SCHUCKERTWERKE A.-G. (Fritz Müller, inventor). Ger. 507,915, April 1, 1926. Details of cleaning the insulators by air.

Electric gas purifiers. SIEMENS-SCHUCKERTWERKE A.-G. (Hans Höfler, inventor). Ger. 507,916, July 3, 1926. Details of a protective cover for the lead-off column.

Electric gas-purifier with upright tubular dust-precipitating electrodes. METALLGESELLSCHAFT A.-G. Ger. 507,521, May 29, 1929.

Electric gas-purifying plant. SIEMENS-SCHUCKERTWERKE A.-G. Ger. 508,572, June 11, 1927. Addn. to 505,673 (*C. A.* **25**, 464). App. for the sepn. of combustible particles as described in 505,673, has the explosion flap balanced by a spring.

Gas-distributing device for electric gas cleaner. SIEMENS-SCHUCKERTWERKE A.-G. Ger. 509,404, June 17, 1925.

Arc-quenching material. GODFREY STEERUP (to Electrical Engineers Equipment Co.). U. S. 1,786,581, Dec. 30. A conductor-bedding material suitable for use in fuses or other elec. app. is composed of an arc-quenching volatile liquid such as CCl_4 and a metallic soap of naturally solid consistency such as Al stearate and palmitate (the liquid used being volatile at temps. occurring adjacent to fuse elements as the latter heat up under load).

Electric signals. MAX VOLMER. Fr. 688,017, Jan. 11, 1930. Electroösmosis of an appropriate liquid is used for the indication of elec. signals.

Leading-in wire. JOHN H. RAMAGE (to Canadian Westinghouse Co., Ltd.). Can. 305,419, Nov. 4, 1930. A leading-in wire for incandescent elec. lamps is electroplated with Cr and the plating sintered to the wire by heat-treating the wire under a layer of Cr powder in the presence of flowing dried H or other inert gas.

Vacuum-tube lamp. PATENT-TREUHAND-GES. FÜR ELEK. GLÜHLAMPEN M. B. H. (Kurt Wiegand, inventor). Ger. 509,372, Nov. 4, 1926. A vacuum-tube lamp for irradiation purposes has a casing transparent to ultra-violet rays and an atm. comprising N and Hg, with or without H.

5—PHOTOGRAPHY

C. E. K. MEES

Note on Silberstein's "quantum theory of photographic exposure." F. C. TOY. *Phot. J.* **70**, 393(1930); cf. *C. A.* **24**, 4214.—Measurements of photographic effects cannot give information as to the structure of the incident radiation. It is pointed out that the results described do not necessarily support the view that x-rays are discrete in structure and that one x-ray "dart" striking a grain is sufficient to make it developable. The results are to be expected from the existing knowledge of photographic sensitivity. **Reply.** A. P. H. TRIVELLI. *Ibid* 438(1930). A. B.

Photography on copper. T. J. BAKER. *Nature* **126**, 279(Aug. 23, 1930).—A sheet of brass or Cu has deposited on it a thin electrolytic coat of Cu. The sheet is then immersed in a boiling soln. of $CuCl_2$ or $CuSO_4$ and NaCl. If the deposit is not uniform the surface is scratch-brushed and again immersed. The coat is salmon pink in color and perfectly adherent. B. failed to "fix" prints obtained on this film.

Study of various influences on the sensitivity of photographic plates. O. MASAKI. *Sci. ind. phot.* [2], **1**, 231(1930).—The effect of heat and of fogging exposures by means of visible light and x-rays has been investigated. Plates exposed at 80° show increased sensitivity as compared with those at 15°, the effect being more noticeable for long wave lengths (7000 A. U.). The inertia of panchromatic and slow plates is diminished by heat while it is increased for orthochromatic and ordinary plates. The increased sensitivity does not immediately disappear on cooling. It is difficult to distinguish between the effect of heat and of drying. The inertia of the plates decreases quite rapidly between 30° and 70°, the color sensitivity of panchromatic plates also increasing. The density obtained on exposure with an addnl. fogging exposure is greater than the sum of the densities of the sep. exposures. This effect is greatest for

panchromatic plates and is a max. when the exposure immediately follows the preliminary one. For one plate a preliminary exposure giving a density of 0.4 produces the max. sensitivity. X-rays have a desensitizing effect which is greater when exposure to them displaces toward the longer wave length the spectral absorption of AgCl, AgBr and AgI. The photoconductivity decreases with increasing temp., but its max. is displaced at the same time toward the longer wave lengths. L. A. STAIB, JR.

Influence of temperature on the characteristic curve (gradation) of the photographic plate. N. BARABASCHEFF AND B. SEMEJKIN. *Astron. Nachrichten* **236**, 354 (1929); *Z. wiss. Phot.* **28**, 221(1930).—The influence of the variation of the temp. of exposure on the image developable under standard conditions was tested by exposing first one portion of a plate at an ordinary room temp., and then the other portion at a relatively low temp., before developing. "The higher temp. ranged from 15.6° to 18.8° and the lower—that of the observatory meridian room—from —7.7° to —4.0°. The exposures, of 5 or 10 min. duration, corresponding approx. to the lower half of the characteristic curve, were made by means of a metal filament lamp and a tube photometer; 45 min. was allowed in the meridian room for the plate to cool, and 40 min for it to warm up again before the development (which was in 1:19 rodinal for 7 min) in the other room. Various possible errors in exposing were carefully checked, and found smaller than the errors of observation. The plates used were Agfa "Extra-Rapid" (which were somewhat stale) and the Russian "Kino-Trest." The curves obtained for the exposures at the higher temps. were found invariably to be the higher The authors conclude that the density differences are considerable enough to render it necessary when working under conditions as extreme as these, to calibrate the plate for the actual temp. of exposure. E. R. B.

Desensitization of panchromatic emulsions. LÜPPO-CRAMER. *Kinotechnik* 11, 566(1929).—The effect of certain dye desensitizers on dye-sensitized photographic emulsions is to remove all or part of the color sensitivity, leaving a blue and green sensitivity comparable to that of the mother emulsion. This effect and the removal of a certain amt. of fog has resulted in some cases in an enhanced green sensitivity. The color sensitivity caused by ripening in emulsions having no sensitizing dye is resistant to pinakryptol green, but not to chromic acid. The action of the desensitizing dye on dye-sensitized emulsions appears to be a process of adsorption displacement rather than destruction of the dye sensitizer. C. E. IVES

Photographic sensitizers for the infra red. C. E. K. MEES. *Nature* **126**, 471 (1930).—A recent statement that the recent developments in infra-red spectrography arose from the needs of the motion picture industry is corrected. Neocyanine, the sensitizing dye used in the prepn. of infra-red sensitive photographic materials, was accidentally discovered by H. T. Clarke during the prepn. of cryptocyanine, which had been discovered at the Bur. of Chemistry in Washington.

Adsorption as the primary process of photographic development. P. WULFF AND K. SEIDL. *Z. wiss. Phot.* **28**, 239(1930).—Isomers of org. developers, such as resorcinol, phloroglucinol and *m*-aminophenol which are not developers, form insol. unstable salts with Ag ions in alk. soln. These isomers prevent the developing action of hydroquinone, pyrogallol and *p*-aminophenol. Resorcinol is adsorbed in alk. soln. as the anion to AgBr. The adsorption is diminished by Br^-, Cl^-, SO_3^{--} and is increased by Ag^+ and Tl^+. With the exception of SO_3^{--} the action of these ions is similar to their action in the hydroquinone developer. The adsorption density of resorcinol is approx detd. for different concns. Sheppard's theory, according to which photographic development is detd. by the decompn. of the adsorption complex, is supported by these expts. A. P. H. TRIVELLI

Penetration of the developer into the emulsion film. R. E. LIESEGANG. *Atelier Phot.* **37**, 53(1930).—The penetration of a dissolved substance into the emulsion film may be illustrated by the expt. of partially bleaching a developed Ag image on a paper support with a soln. of I. The result is a negative because of the dark-blue compd. formed by the unconsumed I which reaches the starch in the support. In the Eberhard effect—the mutual contrast-increasing action at the boundary of neighboring dissimilar exposures—there occurs a flank attack, as it were, on the nearest more fully exposed material by the developer that has penetrated into the emulsion film of the less-exposed area. E. R. BULLOCK

Action of long-wave radiation of a spark upon the photographic layer. M. LEVITSKII. *Physik. Z.* **31**, 769–71(1930).—Radiation of extremely long wave lengths was focused on a photographic plate after being filtered through black paper. The emulsion was first given a weak exposure to sunlight and then after exposure to the long-wave radiation, solarization was observed. The effect was easily observed for old photographic

materials, but new materials generally failed to show the phenomenon. The wave lengths which produced the effect were found to be 75–80, and 135–140μ—the wave lengths which correspond to ionic vibration in AgCl and AgBr, resp. M. E. RUSSELL

Solarization phenomena. III. Silver quantity, covering power, grain number and mass in the region of solarization. H. ARENS AND K. KIPPHAN. *Z. wiss. Phot.* **28**, 229 (1930); cf. *C. A.* **25**, 42.—Plates with peptized AgBr were investigated in the region of solarization with chem. and phys. development. With chem. development grain no. and size decrease with the density. In the region of solarization grains become less developable. Phys. development gives the same results as chem. development with the exception of the grain size, which increases with chem. development. Solarization with phys. development, therefore, depends mainly on a diminishing of grain no. The covering power increases with chem., and decreases with phys., development in the region of solarization. At max. density the grain no. is the same with phys. development as the total no. of Ag halide grains; with chem. development it is less. The max. size of developable specks was found to be 1.7×10^{-6} cm. A. P. H. TRIVELLI

Silver bromide collodion. III. LÜPPO-CRAMER. *Phot. Korr.* **66**, 141 (1930).—Continuing the expts. previously reported, the author finds that the great diminution in the fog produced by the prolonged action of water solns. of certain colloids on bromide collodion emulsion plates, as compared with distd. water, is assocd. with a considerable (though not immediate) reduction in sensitivity brought about by such solns. Among colloid solns. newly tried were: tea, coffee, beer, mustard seed ext., pure albumin (1%) and peptone (0.5%). Peptone treatment, when followed by drying, produces a not inconsiderable increase in sensitivity, without fog. Tea, etc., and certain basic dyes exert a weakening action on a latent light image already impressed, but none as far as could be detd. on the latent fog produced by long bathing in distd. water. On AgBr gelatin plates, even with 20-hr. treatment, all the agents named are without influence. E. R. BULLOCK

The Herschel effect. J. NARBUTT. *Z. wiss. Phot.* **28**, 191 (1930).—Na^+, NH_4^+, Mg^{++}, Zn^{++}, Cd^{++}, Al^{+++}, Pb^{++}, UO_2^{++}, Mn^{++}, Co^{++}, Ni^{++}, CH_3COO^-, NO_3^-, NO_2^-, F^- and SO_4^{--} cause no, or very little, decrease in the sensitivity of Satrox paper. K^+ causes a pronounced decrease in sensitivity. Cr^{+++} and Fe^{++} decrease the sensitivity still more and Fe^{+++} and Cu^{++} decrease it most of all. Of the halogen ions I^- diminishes the speed most of all, and Cl^- moderately. There is no speed difference with F^-. The Herschel effect increases very strongly with Cu^{++}, Fe^{+++} and VO^{++}. I^- increases the Herschel effect most and F^- seems even to decrease it. The Herschel effect is much stronger on wet paper than on dry, especially in the presence of Fe^{++} and VO^{++} salt soln. Red sensitizers removed the Herschel effect. Oxidizing solns. and desensitizers are sensitizers for the Herschel effect even on panchromatic plates. In red light, oxidizing solns. and desensitizers remove the latent image previously obtained in red light. The same could be done with green light, even if the previous exposure was made in white or red light. In general, any radiation was able to destroy the latent image of a previous radiation, if an oxidation soln. or a desensitizer was applied between the exposures. A. P. H. TRIVELLI

The jelly strength of photographic gelatin. J. P. LAWRIE. *J. Soc. Chem. Ind.* **49**, 403–4T (1930).—L. attempts to ascertain the cause of irregularity in jelly strength detns., using the Tracey tester, which measures the load required to break the surface of the gel. With const. soaking conditions, the jelly strength varied greatly with the temp. at which the gelatin was dissolved. Reproducible results could not be obtained even with careful control of time and temp. Different operators also obtained varying results. It is concluded that a properly equipped thermostat room is essential for producing comparable results. S. S. SWEET

The actinicity and color temperature of magnesium ribbon and flashlight. H. ARENS AND J. EGGERT. *Z. wiss. Phot.* **28**, 169 (1930).—The assumption of Eder (cf. *C. A.* **25**, 44) that his values of the actinicity of Mg ribbon light for pure AgBr without glass filtering has been set 10 times too low is explained by the fact that Beck and Eggert work under different exptl. conditions. The actinicity of flashlight is, in most cases, higher than that of ribbon light. The color temp. of flash light is, in agreement with Eder's results, about 3350°K. A. P. H. TRIVELLI

Light source for making photographic records of light-wave variations corresponding to electrical variations (U. S. pat. 1,788,355) **1**.

GABRIEL, LEONARD C.: **Bromoil and Transfer.** London: Sir Isaac Pitman and Sons, Ltd. 7s. 6d., net. Reviewed in *Pharm. J.* **125**, 516 (1930).

Photography. I. G. FARBENIND. A.-G. (Konrad Hebbel and Alfred Miller, inventors). Ger. 509,762, Apr. 11, 1929. Reflex prints are obtained by treating exposed Ag halide gelatin plates, before fixing, with H_2O_2 or other peroxides. The Ag-contg. parts of the plate are thus cleared, leaving the parts still contg. Ag halide sensitive to light. Cf. *C. A.* **25**, 465.

Color photography. W. VAN D. KELLY. Brit. 333,931, May 23, 1929. A film for color photography has a transparent base with 2 emulsion coatings on one side sepd by a stratum of gelatin contg. a color-filtering dye consisting of a combination of benzidine or its homologs with the sulfonic acids of naphthol or naphthylamine such as Congo red or benzopurpurine. The layers may be differently color-sensitive, different color images being produced in the layers followed by bleaching of the dye with Na hyposulfite. Brit. 333,933 describes coloring of the surface of an emulsion with dyes such as Congo red or benzopurpurine for use in color photography, as when exposing 2 plates or films with their sensitive surfaces in contact. Brit. 333,932 relates to details of construction of a camera suitable for use with superposed films.

Color photography. F. LIERG. Brit. 334,004, July 2, 1929. Two or more Ag halide emulsions of different color sensitivities are superposed, with or without an intermediate layer of gelatin, and one or more of the layers contain substances which enable the Ag images to be converted into colored images independently; *e. g.*, Cu carbonate may be added to one layer and $Fe(OH)_3$ or Mn carbonate to the other, and after developing and fixing the Ag images are treated with $K_4FeC_6N_6$, then dipped in HCl (Cu ferrocyanide being formed in one layer and Prussian blue or Mn ferrocyanide in the other). The Cu ferrocyanide is treated with a thiocyanate soln. to form a red image and when Mn ferrocyanide has been formed a malachite green image is produced by treatment with alkali and a soln. of leucomalachite green. Various other details and modifications of procedure are also described. Cf. *C. A.* **25**, 465.

Color photography. SPICERS, LTD., J. N. GOLDSMITH, T. T. BAKER and C. BONAMICO. Brit. 333,865, June 1, 1929. In applying a multicolor screen to a film of celluloid, cellulose acetate compn. or other cellulose ester material, the surface of the film is treated with a liquid alk. reagent (such as a 0.5–5% soln. of KOH in "methylated spirit") which renders it capable of absorbing dyes or colors.

Selective filter for color photography with a film with lenticular elements. SOCIÉTÉ FRANÇAISE CINÉCHROMATIQUE (Procédés R. Berthon). Ger. 507,595, June 11, 1929. The filter consists of four strips of gelatin, celluloid, etc., of which the outer strips are of the same color and the inner strips of different colors from each other and from the outer strips.

Combined black and white and colored image photography. WM. V. D. KELLEY (to Kelley Color Films, Inc.). U. S. 1,787,201, Dec. 30. A transparent carrier is coated on one side only with gelatin having a reduced Ag image of the "minus reds" in the original subject and a toned color representation of the red in the original subject.

Photographic emulsions. RUDOLF J. KONECNY. Fr. 687,074, Dec. 21, 1929. A gelatinous ultramicroscopic photographic emulsion is made by causing colloidal Ag to react with HBr or HI in a detd. concn. by means of a chem. catalyst. Thus, gelatin is dissolved in heated redistd. water and c. p. colloidal Ag is added and the mixt. constantly stirred, and KBr or KI is added. The soln. is transferred to a dark room and HBr or HI is added and the mixt. passed through an ultra-filter. After filtration a reserve of gelatin is added and the emulsion is dried on plates, etc. A table showing the proportionate amts. of the different ingredients is given.

Photographic reducers. I. G. FARBENIND. A.-G. Brit. 334,144, Nov. 29, 1928. See Ger. 486,324 (*C. A.* **24**, 1809).

Photographic designs on metal articles. F. W. MILLER. Brit. 333,930, May 23, 1929. The whole of the surface of the article is coated with a non-sensitized resist such as shellac varnish and to this there is applied an exposed but undeveloped photographic transfer such as a carbon print, unexposed parts of the transfer are washed out and the uncovered parts of the resist are removed. The exposed metal may then either be etched (as with $FeCl_3$ soln., to produce a design in intaglio) or has metal deposited on it to form a relief design, or may be first etched and then treated for metal deposition to form an inlaid design.

Engraving photographic pictures on printing cylinders. PIERRE BONNAUD and LOUIS M. A. JOURDAN (to Nashua Mfg. Co.). U. S. 1,788,229, Jan. 6. A screen negative taken on paper having a coating of gelatino-bromide Ag is rendered insol. in the portions acted on by light, and the screen negative is wrapped about the surface of a cylinder to be engraved with the sensitive coating of the negative in contact with the cylinder and the insol. portions of the screen negative are caused to adhere firmly

to the cylinder, and superposed on the screen negative there is wrapped on the cylinder a negative of the photographic picture to be engraved, and the surface of the cylinder is etched with acid.

Etched rollers for photographic contact copies. ALEXANDER TAUSZ and FRANZ STĚHLIK. Ger. 507,732, Dec. 15, 1928. Details are given.

Photomechanically produced plates for two or more color-printings. ULLSTEIN DRUCKEREI G. M. B. H. and JULIUS BEKK. Ger. 507,731. May 17, 1929. Details are given.

Machine for automatically developing, washing, fixing and drying photographic prints. MAURICE CUENDET. Swiss 137,768, April 11, 1929. Details of construction.

Apparatus for making photographic duplicates of printing, drawings, etc., by the aid of a photoluminescent light carrier. MANO ZIFFER VON TESCHENBRUCK. Swiss 137,769, May 18, 1929. Details are given.

Light-sensitive layers. I. G. FARBENIND. A.-G. Fr. 688,591, Jan. 21, 1930. Light-sensitive layers for use in photography are formed of small particles of the same or different materials and of equal or different sensitiveness to light. These layers are made by adding to colloids or their solns. substances sensitive to light and substances which are insol. in water and insensitive to light. They are reduced by a dry or wet method to fine particles and spread on a suitable support. Several examples are given.

Ultra-violet rays. SOC. DES ÉTABLISSEMENTS GAUMONT (SOC. ANON.). Fr. 686,905, Mar. 14, 1929. Nitrophenols, such as *p*-nitrophenol, are used in films, photographic screens, etc., for absorbing ultra-violet rays. The addn. of acids such as H_2SO_4 renders them perfectly transparent in the visible spectrum.

Transparent paper suitable for use as a photographic film. VIKTOR BAUSCH, JR. U. S. 1,787,564, Jan. 6. Paper is impregnated under pressure with a phenol aldehyde condensation product contg. a hardening agent and an excess of the product is applied to both faces of the paper so as to form a smooth coating on them, followed by heating to form a hard surface on the coating. An arrangement of app. is described.

Apparatus and procedure for tinting selected areas of motion picture films (leaving untinted sound record areas). JOHN G. JONES (to Eastman Kodak Co.). U. S. 1,787,824, Jan. 6. U. S. 1,787,825 (LLOYD A. JONES, to Eastman Kodak Co.) also relates to similar subject matter.

Combined sound record and color motion picture record films. FRED M. BISHOP (to Eastman Kodak Co.). U. S. 1,788,010, Jan. 6. Structural features.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

Chemistry of germanium. V. Complex compounds of germanium. ROBERT SCHWARZ AND HERMANN GIESE. *Ber.* **63B**, 2428–32(1930); cf. *C. A.* **24**, 3189.—$H_4[Ge(Mo_2O_7)_6].28H_2O$ and $H_8[Ge(W_2O_7)_6].28H_2O$ have been prepd. The former is green yellow. The W acid gives 2 stereoisomeric K salts but only one free acid appears to exist. The Mo acid gives the same color reaction with alk. $SnCl_2$ as does the silicomolybdic acid (*C. A.* **23**, 2906). W and Ge can be sepd. by distg. the complex acid from 70% H_2SO_4 in a HCl stream. The Mo and Ge are sepd. by heating to 500° and vaporizing the Mo as MoO_3 in an O_2 stream at 1000°; GeO_2 remains. Even at —72° no complex of $GeCl_4$ and HCl exists. V. F. HARRINGTON

Heteropolyacids of germanium. I. ALFRED BRUKL. *Monatsh.* **56**, 179–83 (1930).—A complex acid with the formula $GeO_2.12WO_3.32H_2O$ has been prepd. This is easily sol. in H_2O, crystg. in well-formed octahedral, faintly yellow crystals. These are stable up to red heat, the H_2O going off first. Alkalies decomp. the acid into its constituent parts. The NH_4, Rb and Cs salts are difficultly sol., but a very sol. tetrabasic Na salt having the formula $Na_4H_4[Ge(W_2O_7)_6].19H_2O$, a Ba salt $Ba_2H_4[Ge(W_2O_7)_6].14H_2O$ and a Ag salt, $Ag_4H_4[Ge(W_2O_7)_6].7H_2O$ are formed. G. E. E.

A study of peraluminates of alkali and alkaline earth metals. J. PRÁŠEK. *Collection Czechoslov. Chem. Comm.* **2**, 653–64(1930).—By the addn. of H_2O_2 to a soln. of the aluminate, the following compds. were obtained: $K_2O.O.Al_2O_3.8H_2O$, $K_2O.2.OAl_2O_3.8H_2O$, and the corresponding Na compds. By mixing a soln. of alk. earth chloride contg. H_2O_2 with alkali aluminate, there were pptd. $Li_2O.2O.2Al_2O_3.28H_2O$, and $Li_2O.20.4Al_2O_3.25H_2O$; $MgO.2O.Al_2O_3.10H_2O$, and the corresponding compds. of Ca, Sr and Ba. By shaking the last named with excess of hydroxide, $4CaO.2O.Al_2O_3.15H_2O$, $3SrO.2O.Al_2O_3.20H_2O$, $3BaO.2O.Al_2O_3.20H_2O$ were obtained. These peraluminates are

stable at ordinary temp., but lose O_2 at 110°; with dil. acids, H_2O_2 is liberated. The alkali compds., which are sol., ionize thus: $2K^+ + [Al(OH)_3O_2H]^- + [Al(OH)_4]^-$.
T. H. CHILTON

The chloro-, bromo- and iodo-aluminates of lime. (MLLE.) FORET. *Compt. rend.* 191, 711–3(1930).—The bromo- and the iodo-aluminates of lime are double salts analogous to the chloro-aluminate of lime. To obtain the double salt free from tricalcium aluminate, a concn. of a Ca salt or compd. represented as $(A)_2Ca$ in about 3 times the theoretical amt. is required. Drying with $CaCl_2$ is preferred. Tables are given showing figures in mols. per l. for CaO, $CaBr_2$, Al_2O_3, of various double salts. A. W. E.

The constitution of the borates. FRIEDRICH L. HAHN. *Z. anorg. allgem. Chem.* 193, 316–20(1930).—The following considerations based on the properties of the boric acids and the polyborates and on the accepted constitution of other polyacids lead to the structure of the borates: (1) B is tervalent. (2) B can act as the central atom of a binary or ternary complex, *i. e.*, such groups as —F,—OH,—OR,—O—R—O— and —O—O— may be attached to the central B atom; the charge of the complex, and thus the basicity of the corresponding acid, equals the sum of the charges on the groups less 3. (3) In the polyborates the groups attached to the central B are anions of lower boric acids. (4) O atoms attached to the central atom occupy only 1 coördination position. The monoborates, therefore, have the structures: $B(OH)_4^-$, $OB(OH)_2^-$, O_3BOH^{---} or BO_3^{---}; the tetraborates, $OB[B(OH)_4]_3^{--}$ or $OB[OB(OH)_2]_3^{--}$; the pentaborates, $B[B(OH)_4]_4^-$, $B[OB(OH)_2]_4^-$, etc.; and the perborates, $(OH)_2B(—O—OH)^-$, $OB(OH)(—O—OH)^-$ or $(OH)_2B$  .
H. F. JOHNSTONE

Alkaline pentaborates. A. P. ROLLET AND L. ANDRES. *Compt. rend.* 191, 567–9 (1930).—K, Rb and Cs borates have identical formulas $5B_2O_3.M_2O.8H_2O$ and all crystallize in the orthorhombic system. Their soly. in H_2O decreases from K to Cs.
M. MCMAHON

The structure of aluminum chloride. V. E. LASHKAREV. *Z. anorg. allgem. Chem.* 193, 270–6(1930).—The unit crystal of $AlCl_3$ as detd. by the Debye method consists of a hexagonal structure with the parameters $a = 3.475 \pm .0.007$ A. U. and $c/a = 2.45_9 \pm 0.01$. The approx. coördinates of the Cl and Al ions are, resp., (000); ($^1/_3$ $^1/_3$ $^1/_3$); ($^2/_3$ $^1/_3$ $^1/_3$); and (0 0 $^1/_2$). The structure belongs to class D_{3d}.
H. F. JOHNSTONE

The structure of the chlorites. LINUS PAULING. *Proc. Nat. Acad. Sci.* 16, 578–82(1930).—Data obtained from oscillation and Laue photographs of specimens of penninite and clinochlore, of compn. approximating the formula $Al_2Mg_5Si_3O_{10}(OH)_8$, lead to a monoclinic unit of structure with $a = 5.2-5.3$ A. U., $b = 9.2-9.3$ A. U., $c = 14.3-14.4$ A. U., $\beta = 96°50'$, contg. 2 mols. as written above. The lattice is apparently end-centered on (001), the space group being C_{2h}^3. The chlorites are composed of alternating mica and brucite layers, each of which is sym. Their general chem. formula is $X_mY_4O_{10}(OH)_8$, where $4 \leq m \leq 6$; the constituent X of coördination no. 6 varies between Mg_5Al and Mg_4Al_2 with Fe^{++} and Mn^{++} sometimes partially replacing Mg^{++} and Fe^{+3} replacing Al^{+3}; the constituent Y_4 of coördination no. 4 varies within the range between Si_3Al and Si_2Al_2.
H. F. JOHNSTONE

Oxidation of chlorites to chlorates by means of permanganate. G. R. LEVI AND D. GHIRON. *Atti accad Lincei* 11, 1005–8(1930).—Chlorites are oxidized by permanganates in neutral soln. but the reaction is stopped by the alkali formed: $3\ ClO_2^- + 2\ MnO_4^- + H_2O \longrightarrow 3\ ClO_3^- + 2\ MnO_2 + 2\ OH^-$. However, if $Ca(ClO_2)_2$ is used and a salt of Ca, Mg or Zn added to neutralize the OH ions as formed, then the reaction is quant. This reaction was studied as a possible means for detg. chlorites, chlorate, hypochlorite and chlorides in the presence of each other.
A. W. CONTIERI

Bismuth salts and sodium phosphate. ORESTE CALCAGNO. *Anales oficina quím. provincia* (Buenos Aires) 2, 1–22(1928).—Numerous equations are given for the reaction of Na phosphate with $Bi(NO_3)_3$: (*a*) dissolved in a little HNO_3, (*b*) in excess HNO_3, (*c*) in AcOH, (*d*) in a little HNO_3 with a little AcOH added, (*e*) in little or excess HNO_3 with the addn. of excess AcOH, and also for reactions of alk. solns. of Bi salts with Na phosphate and for Bi salts in neutral soln. with Na phosphate.
S. L. B. ETHERTON

Carbon suboxide. L. H. REYERSON AND KENNETH KOBE. *Chem. Reviews* 7, 479–92(1930).—A review of prepn. methods, properties and suggested structures of C_3O_2. C subsulfide, C_6S_2, is briefly reviewed. A full bibliography is included.
J. H. REEDY

——— compounds of the eighth group of the periodic system. II. Compounds of D. K. GORALEVICH. *J. Russ. Phys.-Chem. Soc.* 62, 897–913(1930);

cf. *C. A.* **22**, 1294.—Fusion of NiO with KNO_3 or $KClO_3$ in the presence of an excess of caustic alkali yields an unstable, water-sol. bright-green potassium nickelate, K_2NiO_4, which readily liberates O. It was analyzed by conversion into the Ba, Sr and Ca salts. The reactions of formation are: (1) $NiO + 2KNO_3 + 2KOH = K_2NiO_4 + 2KNO_2 + H_2O$; (2) $NiO + 2KClO_3 + 2KOH = K_2NiO_4 + KCl + KClO_4 + H_2O$. Fusion of NiO with $NaNO_3$ or $NaClO_3$ and NaOH yields bright-green, highly hygroscopic, readily sol. Na_2NiO_4, which, like K_2NiO_4, decomposes readily, liberating O_2. By the action of alkaline earth salts upon freshly prepd. aq. solns. of the alkali salts there are obtained insol. alk. earth nickelates, similar to the alk. earth ferrates, but more stable. In aq. soln., alkali ferrates decompose within 20–30 min.; the alkali nickelates, however, require several hrs. for complete decompn. The green soln. of the melt contg. K_2NiO_4 decomposed completely with liberation of gray NiO, only after 24 hrs. It follows, that with increase in at. wt. the stability of the higher oxides of the elements of the 8th group increases. D. K.

Reduction of the oxygen compounds of phosphorus by hydrogen. P. Villard. *Compt. rend.* **191**, 1035–8(1930).—P_2O_5, metaphosphoric acid, several alk. and alk. earth phosphates have been reduced in H. The reaction begins 800–900° and sufficient of the somber red variety appears so that it can be collected. All 3 forms appear between 900° and 950°; the 2 forms of red P are quite distinct and sep. Mary E. Lear

Influence of nitrogen peroxide on the glow of phosphorus. F. Schacherl. *Collection Czechoslov. Chem. Comm.* **2**, 665–80(1930); cf. *C. A.* **24**, 4476.—The pressure at which P would begin to glow in the presence of NO_2 in both O_2 and air was detd. This pressure p_x in mm. Hg. was found to be expressed by an equation $p_x = K/(a + x)$, where K and a are consts. (0.8 and 0.00135, resp., for O_2 at 20°), and x is the ratio $[NO_2]/[O_2]$. The effect is less in air than in O_2. The effect can be explained by reaction of NO_2 with O atoms, thus breaking reaction chains. T. H. Chilton

Preparation of pure rhenium compounds. F. Krauss and H. Steinfeld. *Z. anorg. allgem. Chem.* **193**, 385–90(1930).—Solns. of K perrhenates are not reduced by SO_2 or by a current of H_2 accompanied by ultra-violet radiation, but are reduced by Zn + HCl, Na amalgam and hydrazine hydrate. Treatment with Zn and HCl in cold soln. gave a step-by-step reduction, the soln. becoming first yellow, then yellowish green, bluish violet, brownish black and finally almost colorless. By stopping the reduction at the desired point, pure Re compds. in various states of oxidation can be obtained. H. Stoertz

Action of sodium thiosulfate on potassium iodate in weakly acid medium. E. Carrière and Juillard. *Compt. rend.* **191**, 1133–5(1930).—When a soln. of $Na_2S_2O_3$ is added to a soln. of KIO_3 which has been acidified with HCl so as to give an acidity of 0.1 mols. HCl per l., I_2 is formed. On further addn. of $Na_2S_2O_3$, the I_2 disappears. The changes which occur may be shown by the following reactions, the accuracy of which has been tested by a quant. study: $HIO_3 + 6Na_2S_2O_3 + 2H_2O \longrightarrow 5NaOH + NaI + 3Na_2S_4O_6$, and $4HIO_3 + 3Na_2S_2O_3 + 3H_2O \longrightarrow 4HI + 6NaHSO_4$. The factors influencing the reaction are T (temp.), C_{HCl} (concn. of HCl), C_{KIO_3} (concn. of KIO_3) and t (time of addn. of $Na_2S_2O_3$). T being const. and C_{HCl} and C_{KIO_3} being the same, the quantity of $Na_2S_2O_3$ necessary for the reaction decreases with increase in t. Slow addn. of $Na_2S_2O_3$ thus favors formation of $NaHSO_4$. T, C_{KIO_3} and t being const., the formation of sulfate is favored by an increase in C_{HCl}. C_{KIO_3} and C_{HCl} being the same and t being const., formation of sulfate is favored by an increase in T. T, t, C_{HCl} and C_{KIO_3} being const., the formation of $Na_2S_4O_6$ is favored by diln. Louise Kelley

Oxidation of ferrous iron by iodine in the presence of phosphate and the nonexistence of a ferriphosphate complex. Walter D. Bonner and Hendrick Romeyn, Jr. *Ind. Eng. Chem., Anal. Ed.* **3**, 85–7(1931).—Although, in the absence of H_3PO_4, Fe^{+++} is reduced to Fe^{++} by I^-, in the presence of H_3PO_4 and a moderate concn. of H^+ the reverse reaction can be made to take place completely. The reason for the completion of the reduction of Fe^{+++} to Fe^{++} is probably the decrease in the ratio Fe^{+++}/Fe^{++} caused by the presence of H_3PO_4. Probably no complex ion is formed but rather compounds such as $FePO_4$ and $Fe(H_2PO_4)_3$ which are but slightly ionized. W. T. H.

Iodine heptafluoride. Otto Ruff and Rudolf Keim. *Z. anorg. allgem. Chem.* **193**, 176–86(1930).—Heating IF_5 (made by treating I with F) with F up to 270° forms IF_7 with a 35% yield. Since the reaction is reversible, it is necessary to condense the IF_5 suitably to increase the yield. The IF_7 being more volatile passes off and is collected in a tube chilled with liquid air. It is then purified by distn. at a low temp. Pure IF_7 is a colorless gas at room temp., forming a cloud with moist air. On cooling,

it yields a mobile colorless liquid, a white powder or colorless crystals, m. 5° to 6°. The vapor presure, measured from 210° to 273° abs., is given by the expression $\log p = 8.6604 - 1602.6/T$. Liquid IF_7 has a d. of 2.8 at 6° and 2.7 at 10° and a mol. wt. of 260. Chem. properties include a lively reaction with H on heating, formation of BF_3 and IF_5 with B, etc.; it reacts rather easily with a large no. of substances and is much like ClF_3 (cf. *C. A.* **24**, 3722). L. P. HALL

Methods for determining the solubilities of some fluosilicates. KATHERINE K. WORTHINGTON AND MALCOLM M. HARING. *Ind. Eng. Chem., Anal. Ed.* **3**, 7–9(1931).—Methods for prepg. pure fluosilicates of Na, Mg, Zn, Pb and Cu are described and the methods of analyzing them are discussed briefly. W. T. H.

Action of fluorine on charcoal. Melting and boiling points of carbon tetrafluoride. P. LEBEAU AND A. DAMIENS. *Compt. rend.* **191**, 939–40(1930).—The mixt. of compds. resulting from the action of F on charcoal was purified by fractionation and C_2F_6 and C_3F_8 were isolated. A l. of very pure CF_4 was liquefied and the m. p. found to be —191°, and the b. p. —126° at 760 mm. Cf. *C. A.* **21**, 1603; **24**, 5741. J. H. M.

The decomposition of potassium ferrocyanide and of potassium ferricyanide by the autoclave treatment. T. KATSURA AND T. WATANABE. *Sci. Papers Inst. Phys Chem. Research* (Tokyo) **14**, 189–92(1930); cf. *C. A.* **24**, 5658.—In the previous paper a note was given as to decompn. products resulting from $K_4Fe(CN)_6$ and $K_3Fe(CN)_6$ when treated in an autoclave under pressure of 10 atm. (180°). This present study takes into account the changes of ferrocyanide on subjection to light, and of ferricyanide in presence of alkali. Variation in concn. seems to have no effect on the mode of decompn. $K_4Fe(CN)_6$ is hydrolyzed more rapidly by autoclave treatment than by action of light. Decompn. of $K_3Fe(CN)_6$ by autoclave treatment proceeds in the same way as that caused by alkali. The $Fe(OH)_3$ produced by the decompn. was dehydrated and tended to become Fe_2O_3. ALICE W. EPPERSON

The sulfides of gallium. ALFRED BRUKL AND GOTTFRIED ORTNER. *Monatsh* 56, 358–64(1930); cf. *C. A.* **24**, 4476.—Yellow, fairly hard crystals of Ga_2S_3, d_4^{20} 3.48 ± 0.02, m. 1255 ± 10° (precautions against decompn.), were prepd. by passing N loaded with S vapor over Ga heated to 1200°. Ga_2S_3 dissolves in acids and alkalies, and is attacked by moisture. Attempts to prep. Ga_2S_3 by reducing Ga_2O_3 with H_2S or S vapor failed to yield a homogeneous product. Ga_2S_3 is reduced by H, slightly at 400°, completely at 800°, yielding a luminous yellow sublimate of GaS, d. 3.75 ± 0.03, m. 965 ± 10°, stable toward water; warm 15% acetic acid causes evolution of H_2S. GaS is decompd. by heating in a high vacuum to form Ga_2S_3 and volatile Ga_2S. The latter was prepd. by heating the higher sulfides mixed with the calcd. amount of Ga metal, Ga_2S subliming in a high vacuum at 700–720°. The amorphous, grayish black product, d. 4.22 ± 0.03, is slowly attacked by air and moisture. Heating above 800° causes decompn. into Ga metal and higher sulfides. The existence of 3 different sulfides was confirmed by characteristic x-ray diagrams. L. ONSAGER

The displacement of metallic arsenic from an alkaline solution of arsenic acid by hydrogen pressure at high temperature. II. V. N. IPAT'EV, G. A. RAZUVAEV AND V. S. MALINOVSKII. *Ber.* **63B**, 2812–7(1930); cf. *C. A.* **24**, 2074—At 45 atm. pressure and 200°, in a 50 cc. mixt. of 0.025 mol. As and 0.065 mol. NaOH in a soln. of arsenic acid, only Na_2HAsO_3 will form in 24 hrs. At 250°, pptn. of metallic As begins and reaches a max. of 96% at 350°. From 200° to 350°, the reaction is almost complete; in 18 hrs. AsH_3 is not formed. The greater the concn. of NaOH between 0 and 0.3 mol. to 50 cc., the less the quantity of As but on increasing NaOH to 0.4 mol., the ppt. of As increases from 71 to 98%. One hundred % As has not been displaced or oxidized. MARY E. LEAR

Studies on phosphoric acid. III. The use of phosphoric acid in the preparation of ethylene. ARTHUR G. WEBER AND JAMES H. WALTON. *J. Phys. Chem.* **34**, 2693–700(1930); cf. *C. A.* **24**, 2076.—The prepn. of $CH_2:CH_2$ by the interaction of EtOH and H_3PO_4 between 210° and 260° was studied and the yields and purity of the gas were detd. Sirupy H_3PO_4 previously heated to 250° for 4.5 hrs. gave the highest yields (81–2%), and were at a max. when the reaction temp. was 250°. The addn. of HPO_3 decreased the yields approx. 15%, while the addn. of P_2O_5 or $H_4P_2O_7$ gave the usual yields. The addn. of 1.5–2% of CuO, $CuSO_4$, $Al_2(SO_4)_3$, Ag_2SO_4, Ag_2O, Fe_2O_3 and animal charcoal increased the yields as much as 10%, while $FeCl_3$, MoO_3, WO_3, NiO and silica gel increased the yields by smaller quantities. Na_3PO_4 tends to decrease the normal yield. In most cases the purity of the gas was over 99%. H. W. L.

Preparation of tetra- and trithionate from thiosulfate and sulfurous acid. A. KURTENACKER AND K. MATEJKA. *Z. anorg. allgem. Chem.* **193**, 367–84(1930).—To 400 cc. of satd. H_2SO_3 add 1 cc. of a satd. soln. of H_3AsO_3 and 200 g. of finely powdered

$Na_2S_2O_3$, and pass in a stream of SO_2 with simultaneous cooling and agitation. After 1 hr. the greater part of the $Na_2S_2O_3$ has gone into soln. and sepn. of tetrathionate commences; continue the passage of SO_2 for a half-hr. longer; then allow the flask to stand with occasional shaking and treatment with SO_2. The yellow color of the soln. gradually becomes lighter. After the last passage of SO_2, shake the flask well and quickly filter. Wash the residue with a little strong alc. and ether. Conduct SO_2 into the filtrate for a few min. and treat the yellow soln. with a soln. of 100 g. of $KC_2H_3O_2$ in 120 cc. of H_2O. Filter the ppt. of $K_2S_3O_6$ and wash with alc.-ether. By conducting SO_2 into the new filtrate for 5–10 min., more trithionate is obtained. Both the tetrathionate and trithionate are 95–98% pure, the first being faintly yellow on account of the presence of S. The trithionate is colorless. They can be purified by dissolving in a small quantity of luke-warm water, followed by pptn. with an equal vol. of alc. The yield was 62 g. of $Na_2S_4O_6$ and 96 g. of $K_2S_3O_6$. H. STOERTZ

Preparation of telluric acid. JULIUS MEYER AND WALTER FRANKE. *Z. anorg. allgem. Chem.* **193**, 191–2(1930); cf. *C. A.* **15**, 2397.—An easy and convenient method for making $Te(OH)_6$ consists in adding 12.75 g. finely powd. Te moistened with 5 cc. concd. HCl soln. to a previously prepd. soln. made from 24 g. $Ba(ClO_3)_2$ in 100 cc. H_2O and 7.2 cc. concd. H_2SO_4 in 40 cc. H_2O, decanted and filtered free from $BaSO_4$. The reaction raises the mixt. to the b. p., the Te dissolves and boiling is continued. On evapn. fine white crystals are obtained which are washed with alc. and ether and dried in a desiccator. The yield is 90–95%. L. P. HALL

Silicic acid hydrates. W. D. TREADWELL AND W. WIELAND. *Helv. Chim. Acta* **13**, 842–64(1930).—Recent literature on the prepn. and reactions of silicic acid hydrates is reviewed. A *M*/2 soln. of Na silicate was used as starting material from which various gels were prepd. From these gels solns. were prepd. with 1 mol. silicic acid hydrate in 2 mols NaOH, corresponding to Na metasilicate. The course of slow electrometric titrations with HCl is tabulated; data on titration of alc. solns. of the silicate are also given. Observations were made of the electrolysis of Na metasilicate solns. The course of the gelatinizing phenomena was investigated as to viscosity, temp. course, refraction, cond., Tyndall phenomenon, diln. of sols with H_2O, addn. of HCl to Na metasilicate, etc. M. MCMAHON

Valence chemistry of the metal alkyls of the third group: Secondary valence of aluminum aryls. ERICH KRAUSE AND PAUL DITTMAR. *Ber.* **63B**, 2401–7(1930).—$(MeC_6H_4)_3Al.Et_2O$ has been prepd. from the corresponding Hg compd. and Al in an app. previously described (*C. A.* **20**, 2668). It is stable and mono-mol. The Et_2O-free compd. prepd. in C_6H_6 is associated. $(MeC_6H_4)_3Al.NH_3$ and $(C_6H_5)_3Al.NH_3$, m. 112° with evolution of gas, are both prepd. by action of NH_3 on the Et_2O compds. All are decompd. by O_2 and water. V. F. HARRINGTON

Complex formation of mono- and di-carboxylic acids with ferric chloride. II. W. D. TREADWELL AND W. FISCH. *Helv. Chim. Acta* **13**, 1219–27(1930).—$FeCl_3$ titrated with formate and formate contg. formic acid gave the complex $[Fe_3(HCO_2)_6(OH)_2]^+$, $[Fe_3(OAc)_6(OH)_2]^+$ is formed with NaOAc and not with HOAc. $[Fe_3(C_2H_5CO_2)_6(OH)_2]^+$, $[Fe_3(C_3H_7CO_2)_6(OH)_2]^+$ and $[Fe_3(ClCH_2CO_2)_6(OH)_2]^+$ are formed from the Na salts of the corresponding acids. Titration with CH_2OHCO_2Na gave $H_3[Fe(OCH_2CO_2)_3]$; with $CH_2(CO_2CH_3)_2$ and NaOH, $[Fe(CH_2(CO_2)_2)_2]$; with $C_2O_4Na_2$, $[Fe(C_2O_4)_2]^-$ and $[Fe(C_2O_4)_3]^{---}$; with $CH_2(CO_2Na)_2$, $[Fe(CH_2(CO_2)_2)_2]^-$ and $[Fe(CH_2(CO_2)_2)_3]^{---}$; and with $C_2H_4(CO_2Na)_2$ and $C_2H_4(CO_2H)CO_2Na$, $[Fe(C_2H_4(CO_2)_2)_3]^-$. RACHEL BROWN

Complex formation of ferric ion with acetate ion in aqueous solution. W. D. TREADWELL AND W. FISCH. *Helv. Chim. Acta* **13**, 1209–18(1930).—$FeCl_3$ was titrated with NaOAc, Pt and HgCl electrodes being used. Eight mols. NaOAc required 3 mols. $FeCl_3$: $3\ Fe^{+++} + 2\ H_2O + 8\ HOAc \rightleftharpoons [Fe_3(OAc)_6(OH)_2]^+ + 2\ HOAc$. The presence of $FeCl_2$ or of HOAc did not alter the complex formation. The complex was also formed from $Fe(NO_3)_3$. HCl affected the titration until an equiv. amt. of NaOAc had been added after which the titration was normal. At the end of the titration the soln. contained 2 mols. free HOAc which easily explains the existence of $[Fe_3(AcO)_6(OH)_2]^+$. RACHEL BROWN

Phospho- and silico-tungstates of some quaternary bases. Analytical applications. L. LEMATTE, G. BOINOT, E. KAHANE AND MME. E. KAHANE. *Compt. rend.* **191**, 1130–2(1930).—The phospho- and silico-tungstates of choline (I), acetylcholine (II), α-methylcholine, α-methylacetylcholine, bromocholine, the Et ester of betaine and trimethylallylammonium hydroxide are const. in compn., whatever the conditions of pptn. This was tested thoroughly with I, which was used in neutral, weakly or strongly acid, dil. or concd., hot or cold solns., in an excess of one or the other of the reagents, and in

the presence of various inert substances. The pptd. salts of I correspond to the formulas $[N(CH_3)_3C_2H_4OH]_3PO_4.12WO_3$ and $[N(CH_3)_3C_2H_4OH]_4SiO_4.12WO_3$. Drummond's formula for the phospho-tungstate of I, namely, $[HON(CH_3)_3C_2H_4OH]_3H_3PO_4.12WO_3$, is not correct, since it would be more logical to write $[N(CH_3)_3C_2H_4OH]_3PO_4.12WO_3.3H_2O$. However, these salts are not hydrated. Dull red heat converts them into $HPO_3.12WO_3$ and $SiO_2.WO_3$. The pptn. of the phospho- and silico-tungstates of quaternary bases has been made use of for various exact analyses. The slight soly. of most of these salts, especially those of I and II, allows a gravimetric detn. with an accuracy of 2–3%, by weighing the dry salt or the residue from incineration. Other applications: an unknown base may be identified by detn. of its mol. wt.; if the base is known, its purity may be detd.; in a mixt. of bases of different mol. wts., the ratio in which they are present may be calcd.; with an unstable base, giving by decompn. a base of different mol. wt., the extent of its decompn. may be detd. *E. g.*, the authors made a study of the progress of the hydrolysis of the chloride of II to I in solvents contg. OH groups (EtOH, glycol, glycerol and their derivs.). LOUISE KELLEY

7—ANALYTICAL CHEMISTRY

W. T HALL

"Star trail" method for the spectrographic quantitative determination of the elements. A. C. SHEAD AND G. FREDERICK SMITH. *J. Am. Chem. Soc.* **52**, 5295(1930).—Preliminary statement of method. C. J. WEST

Perchloric acid as a new standard in acidimetry. G. FREDERICK SMITH AND W. W. KOCH. *Ind. Eng. Chem., Anal. Ed.* **3**, 52–5(1931).—A procedure is described whereby pure, 72% $HClO_4$ can be produced by a vacuum distn. This can be used in place of const.-boiling HCl as a standard in acidimetry. It is a more convenient standard. W. T. H.

Analysis of the aluminum group. SUNAO ATO. *Sci. Papers Inst. Phys. Chem. Research* **14**, 287–311(1930).—The procedure recommended by A. A. Noyes was tested and found faulty. To overcome the difficulties encountered the following procedure is recommended: (1) Dil. the soln. contg. cations of the Al-Fe groups to 50 cc., add pure 6 *N* NaOH soln. till neutral and 5 cc. in excess. Introduce 1–5 g. of Na_2O_2 in small portions with stirring, add 5 cc. of 3 *N* Na_2CO_3 and boil about 5 min. Dil. to 100 cc. and filter promptly. Exam. the ppt. for Fe, Mn, Ni and Co in the usual way. (2) Cool the filtrate under running water and make it about *N* in AcOH by adding 5–7 cc. of glacial AcOH. Boil 3–5 min. and filter. The ppt. contains Ti and the filtrate contains Al, Be, Zn, Cr, U and V. (3) Confirm the presence of Ti by dissolving the ppt. in HCl, evapg. to about 1 cc., dilg. to 5 cc. and adding H_2O_2. (4) Heat the filtrate from (2) to boiling, add 10–20 cc. of 3 *N* $Pb(OAc)_2$ soln., boil 1–2 min. and allow to stand for a short time. The ppt. contains V and Cr and the filtrate contains Al, Be, Zn and U. (5) To sep. Cr and V, treat the ppt. of Pb salt with 5–10 cc. of concd. HNO_3, heating on the steam bath. Dil. the soln. with 10 cc. of water and filter. Sat. the filtrate with SO_2, evap. to small vol. and heat until H_2SO_4 fumes appear. Add 7 *N* concd. H_2SO_4 if necessary, to make the vol. 3 cc., add water until the acidity is and filter off $PbSO_4$ after a short time. Make the filtrate slightly alk. with NaOH,

dil. to 100 cc. and filter off the $Cr(OH)_3$ ppt. after boiling for 5 min. (6) Dissolve the $Cr(OH)_3$ ppt. in HCl, convert the Cr^{+++} to CrO_4^{--} by the usual treatment with NaOH and Na_2O_2 and test for CrO_4^{--} with $Pb(OAc)_2$ in dil. AcOH soln. (7) Test for V by the H_2S test in ammoniacal soln. (8) To sep. Zn from Al, Be and U in the filtrate from (4), add an excess of NH_4OH to ppt. Al, Be and U, boil and filter. (9) Make the filtrate acid with AcOH and ppt. the Zn with H_2S, testing the ZnS ppt. by the Rinmann-green reaction. (10) Dissolve the ppt. produced in (8) in 4 cc. of 6 *N* HNO_3 and 80 cc. of water. Sat. with H_2S and filter off any PbS. Evap. the filtrate to dryness, add 15 cc. of 7.5 *N* HNO_3 and 30 cc. of ether. Sep. the layers which form after shaking, evap. the aq. layer to dryness and repeat the extn. with HNO_3 and ether to remove all U. (11) Evap. the ethereal soln. to dryness, to the residue add 3 cc. of 6 *N* HNO_3 and 30 cc. of ether and shake in a separatory funnel. Evap. this ether soln. almost to dryness, transfer the residue to a small test tube contg. 1 cc. of satd. NaCl soln., add 1–2 drops of 6 *N* HCl and some $K_4Fe(CN)_6$; a dark red ppt. is formed if U is present. (12) Evap. the HNO_3 soln. from (10) to dryness and remove the Al as $AlCl_3.6H_2O$ by adding 20 cc. of concd. HCl, 30 cc. of ether and HCl gas in excess. (13) To remove the last traces of Al, evap. the filtrate from (12) to dryness, dissolve the residue in 20 cc. of water and add 2 cc. of 6 *N* NaOH. Introduce Cl_2 until any color due to Cr disappears, make acid with HCl and boil off excess Cl_2. Dil. the soln. to 50 cc. and neutralize with $NaHCO_3$, adding 5 g. in excess and heating 20 min. in boiling water, using a stoppered pressure flask. (14) Confirm the presence of Al in the ppts. produced under (12) or (13) by the Thenard-blue test or by the test with aurintricarboxylic acid. (15) Make the filtrate from (13) slightly acid with HCl and boil off CO_2. Add NH_4OH in very slight excess, boil for a short time and filter. Dissolve a part of the ppt. in HCl, evap. to dryness and add 2 cc. of water and 1–3 drops of 1% alizarin red S, whereby a bluish purple color will be produced if Be is present. W. T. H.

Determination of aluminum in ferrochromium and in chromium metal. THOS. R. CUNNINGHAM. *Ind. Eng. Chem., Anal. Ed.* **3**, 103–4(1931).—The method depends upon the pptn. of Fe with cupferron, oxidation of Cr with $HClO_4$ and pptn. of Al with NH_4OH. The original $Al(OH)_3$ ppt. is dissolved in HCl, the diluted soln. satd. with H_2S and, after filtering, the treatment with $HClO_4$, etc., is repeated. The weighed ppt. is then examd. for Cr (colorimetrically) and for P. The original paper must be consulted for further details. W. T. H.

Gravimetric and direct volumetric determination of cadmium. R. C. WILEY. *Ind. Eng. Chem., Anal. Ed.* **3**, 14–5(1931).—A soln. of NH_4 molybdate (30 g. MoO_3 per l) which is neutral to phenolphthalein will ppt. Cd molybdate (contg. 41.22% Mo after drying at 120°) when added to a Cd^{++} soln. which is barely acid with AcOH. The Cd can thus be detd. gravimetrically or by measuring the vol. of the precipitant, with a satd. soln. of pyrogallol in $CHCl_3$ as indicator. In the latter case a soln. of 7.4 mg MoO_3 per l. is recommended. W. T. H.

Elimination of sulfur in carbon determinations by direct combustion. WM. H. BLATCHLEY. *Ind. Eng. Chem., Anal. Ed.* **3**, 13(1931).—If the combustion tube is loosely packed in its outlet end with ignited asbestos extending into the hot part of the tube and if Pb_3O_4 is used as a flux with pig Fe and other high-S alloys, the asbestos soon becomes impregnated with enough volatilized Pb_3O_4 to remove all SO_2 formed by the combustion. W. T. H.

Determination of chromium in special steels. EMIL SCHIFFER AND PAUL KLINGER. *Arch. Eisenhüttenw.* **4**, 7–15(1930).—Numerous methods proposed for the detn. of Cr in steel are discussed and 16 of them were tested in 6 different labs. The conclusion drawn from this coöperative work, of which the results are given in full, is that the $(NH_4)_2S_2O_8$–$AgNO_3$ method is to be recommended for Cr steels low in C. Steels high in Cr and in C are so brittle that they can be powdered easily and for their assay it is well to start by fusing the powder with Na_2O_2, after which an iodometric detn. of the Cr is most satisfactory. The effects of Ni, Co, V, Mo and W on the analysis are discussed W. T. H.

Determination of chromium and vanadium in ores and alloys after oxidation with perchloric acid. HOBART H. WILLARD AND R. C. GIBSON. *Ind. Eng. Chem., Anal. Ed.* **3**, 88–93(1931).—Boiling 70% $HClO_4$ is a good oxidizing agent and serves to oxidize Cr to $Cr_2O_7^{--}$ and V to H_3VO_4. The oxidized Cr and V can be detd. by any of the usual titration methods after dilg. the soln. Directions are given for applying this process to the analysis of Cr_2O_3, steel and Fe-Cr. If H_3PO_4 is added, Mn is oxidized more or less completely to Mn^{+++} but the oxidation of Cr^{+++} is then hindered. Small quantities of W do not interfere, but large quantities should be removed prior to the oxidation with $HClO_4$, although after the oxidation has been affected, addn. of Na tung-

state to the soln. causes no trouble. If both phosphotungstic and V are present, the results are low. CrO_4^{--} can be pptd. as $PbCrO_4$ from a soln. which is molar in $HClO_4$ and 0.04 molar in $Pb(ClO_4)_2$ and this sepd. from V, Mn and Fe. W. T. H.

Detection of cobalt as cesium cobaltinitrite. HERMAN YAGODA AND H. M. PARTRIDGE. *J. Am. Chem. Soc.* 52, 4857–8(1930).—The use of 2 cc. of 6 *M* $NaNO_2$ and 0.5 cc. of 0.5 *M* $CeNO_3$ is advantageous in the final test for Co as the ppt. forms more quickly and is less sol. than the corresponding K salt. The formula of the ppt. is $Cs_2NaCo(NO_2)_6$. W. T. H.

Iodide method for copper. BARTHOLOW PARK. *Ind. Eng. Chem., Anal. Ed.*, 3, 77–82(1931).—Arsenic acid is reduced by KI in the iodometric detn. of Cu under ordinary conditions. By means of K acid phthalate, however, it is easy to adjust the p_H so that all of the Cu will be reduced and none of the Cu. By adding NH_4HF_2, the interference of Fe is prevented. Taking these things into consideration, a very short and accurate method for detg. Cu is the following: Treat a suitable sample of the ore with HNO_3 until all Cu is dissolved, evap. to about 5 cc., add 30 cc. of water and boil until the nitrates are dissolved. Filter and wash the residue with hot, dil. HNO_3. Evap. to about 30 cc., cool, add NH_4OH until a faint odor persists, also 2 g. of NH_4HF_2, 1 g. of $KHC_8H_4O_2$ and 3 g. of KI. Titrate at once with $Na_2S_2O_3$. W. T. H.

Electrolytic determination of lead as lead dioxide. W. T. SCHRENK AND PHILIP H. DELANO. *Ind. Eng. Chem., Anal. Ed.* 3, 27–9(1931).—For detg. 5–150 mg. Pb it is recommended to use a sand-blasted anode, a current of 3 amp. for 1.5–2 hrs. and a soln. contg. 20–30% free HNO_3 and about 0.25 cc. of H_2SO_4. Ag, Bi, Mn, Sn, As, Sb, chromate and phosphate should be absent. The soln. should be at 90° at the start. W. T. H.

Determination of magnesium with 8-hydroxyquinoline—gravimetrically, volumetrically and colorimetrically. W. A. HOUGH AND J. B. FICKLEN. *J. Am. Chem. Soc.* 52, 4752–5(1930).—The oxine ppt., produced in NH_3 soln., can be weighed as MgO after strong ignition. It can be dissolved in hot, dil. H_2SO_4 and titrated with $KMnO_4$; if a persistent MnO_4^- color for 2 min. is taken as the end point, approx. correct results can be obtained on the assumption that 1 g. Mg = 41.7 g. of $KMnO_4$. Very small quantities of Mg can be detd. by using a carefully measured vol. of the reagent and detg. the excess by the color of the filtrate. W. T. H.

Modified Ford-Williams method. L. H. JAMES. *Ind. Eng. Chem., Anal. Ed.* 3, 31–2(1931).—To det. Mn in Cr-Ni alloys which are practically insol. in HNO_3 the following modification of the F.-W. method is recommended: Dissolve 2 g. of alloy in 15 cc. of concd. HCl, 5 cc. of concd. HNO_3 and 20 cc. of water. When dissolved, add 20 cc. of 60% $HClO_4$. Evap. till $HClO_4$ fumes are obtained and insol. salts begin to sep. Cool, add 30 cc. of concd. HNO_3 and heat just to boiling. Add a few crystals of $NaClO_3$ and then ppt. with 4 portions of 2 g. $NaClO_3$, adding each portion after effervescence has nearly ceased. This takes about 20 min. Remove from the hot plate before the effervescence from the last addn. has entirely ceased. Filter and exam. the ppt. in the usual manner. W. T. H.

Determination of mercury by the cyanide-silver method of Denigès. J. EURY. *Bull. sci. pharmacol.* 37, 599–603(1930).—The following modification of the method is suggested: Mix 20 cc. 0.05 *N* KCN soln., 10 cc. NH_3 soln., 1 cc. 10% KI and 70 cc. H_2O. Add the Hg salt to be tested. The ppt. formed must disappear after stirring or more KCN has to be added. Titrate with 0.05 *N* $AgNO_3$ soln. to a permanent turbidity. A second test is made by using only $20-n$ cc. KCN soln. when n cc. were titrated. For values of n between 0.1 and 0.6, 0.1 cc. KCN more is used and for n = 0.1 the original value + 0.1 cc. A. E. MEYER

Rapid colorimetric method for the determination of molybdenum in plain carbon and alloy steels. THOS. R. CUNNINGHAM AND H. L. HAMNER. *Ind. Eng. Chem., Anal. Ed.* 3, 106–7(1931).—Treat 0.5–1.0 g. of steel contg. not more than 1% Mo with 25 cc. of 7 *N* H_2SO_4 at about 60°. When the action is over, add 3 cc. of perhydrol and boil a few min. Filter, evap. to small vol., add 1 g. of citric or tartaric acid (to keep W in soln.), neutralize with NaOH and add 10 cc. of 18 *N* H_2SO_4. Transfer the cold soln. to a separatory funnel, dil. to 100 cc. and add 10 cc. of 5% KCNS soln. Shake vigorously, add 5–10 cc. of $SnCl_2$ soln., cool, discard the aq. soln. and det. the Mo colorimetrically, using as comparison a standard Mo soln. which has been mixed with Fe alum soln. and treated in the same way. W. T. H.

Rapid determination of nickel in electroplating baths. A. WOGRINZ. *Chem.-Ztg.* 54, 967(1930).—Transfer 25 cc. of the soln. by means of a pipet to a 250-cc. measuring flask, add about 25 cc. of water, a liberal quantity of NH_4Cl and enough NH_4OH to give a clear, dark blue soln. Then add a little "liquid petrolatum" and 25 cc. of a stand-

ard soln. of Na_2S (about 10% $Na_2S.9H_2O$). Carefully make up to the mark, stopper the flask, shake carefully and filter off about 100 cc. Transfer 25 cc. of the filtrate to a flask contg. 25 cc. of 0.1 *N* I_2 soln. and 5 cc. of HCl. Det. the excess I by titration with $Na_2S_2O_3$. W. T. H.

Determination of potassium by the sodium cobaltinitrite method. PIERRE J. VAN RYSSELBERGE. *Ind. Eng. Chem., Anal. Ed.* 3, 3–4(1931).—The time allowed for the settling of the ppt. has a marked effect on its degree of hydration. Satisfactory results can be obtained with the reagent of Adie and Wood if the ppt. is allowed to stand 24 hrs. before filtering, if the conditions of filtering, washing and drying the ppts. are always the same and if the results are computed with reference to the wt. of ppt. produced at the same time in a parallel test with a sample of known K content. W. T. H.

Rapid method for determining selenium. E. BENESCH AND E. ERDHEIM. *Chem.-Ztg.* 54, 954(1930).—To 400 cc. of soln. contg. 0.1–0.15 g. of Se, add 30 g. of $NH_2NH_2.2HCl$ and 5 cc. of concd. HCl. Boil until the red Se deposit becomes black, filter, wash free from chloride with hot water, dry at 110° and weigh. In the case of solid materials, heat a mixt. of the sample with 3 g. pure, powdered Fe_2O_3, 3 g. $KClO_3$ and 4 g. $NaHCO_3$ in a Ni crucible until the mass begins to sinter. Ext. with water and proceed as above. W. T. H.

Determination of sulfur by means of the turbidimeter. S. W. PARR AND W. D. STALEY. *Ind. Eng. Chem., Anal. Ed.* 3, 66–7(1931).—A turbidimeter is pictured and described which is suitable for the *control of sulfate in boiler waters*. Results obtained by different operators are given. W. T. H.

Rapid determination of zinc in brass. E. R. THEWS AND HARBISON. *Chem.-Ztg.* 54, 947–8(1930).—An approx. Zn estn. in brass can be made by comparing the color of shavings with that of brass of known Zn content. Directions are given for prepg. such standards and for making the comparison. More accurate results can be obtained by merely making an iodometric Cu detn. and estg. the Zn by difference. W. T. H.

Determination of zirconium in plain carbon and alloy steels. THOS. R. CUNNINGHAM AND R. J. PRICE. *Ind. Eng. Chem., Anal. Ed.* 3, 105–6(1931).—The detn. of Zr in Fe alloys contg. possibly Ti, Al, W, Mo, Cr, V, U, Co, Ni, Cu, Sn, As, Mn, Ta, Cb and Si is a somewhat difficult problem which appears to have been solved quite satisfactorily by the directions given in this paper. With an ordinary steel, the addn. of perhydrol to the HCl soln. serves to convert Ti to the sexivalent state and a fairly pure ppt. of $Zr(HPO_4)_2$ can be obtained by treatment with a considerable excess of $(NH_4)_2HPO_4$ in the diluted, acid soln. from which ZrP_2O_7 is formed by ignition. By treating the ignited ppt. with HF and H_2SO_4, SiO_2 is removed and by evapn. with H_2SO_4 the Zr is again brought into soln. from which it can be pptd. again as $Zr(HPO_4)_2$. Final allowance is made for a trace of Ti carried down in the last ppt. Sometimes, when W, Sn, Ta or Cb is present, it is necessary to fuse with Na_2CO_3 or even with NaOH. In this case an insol. Na zirconate is left behind after leaching the fused mass with water. This can be converted into sol. $Zr(SO_4)_2$ by fusion with $K_2S_2O_7$. In the absence of W, Sn, Ta or Cb, the detn. of Zr in steel can be finished within 2 hrs. W. T. H.

Detection by spectral analysis of foreign elements in a metal. LUCIEN AMY. *Compt. rend.* 191, 1049–50(1930).—Instead of merely photographing the spectrum of the pure metal and comparing it with the spectrum of another sample of metal which may be impure, it is better to make quite a no. of comparisons, each time photographing the spectrum during the first second and using fresh surfaces. Otherwise the spectrum may change and certain lines of more or less volatile metals be lost because of a change in surface of the metal as a result of the passage of the spark. By the new procedure it is possible to detect small quantities of Ca, Mg, etc., in metals which might otherwise be overlooked. This is shown by expts. with several metals. W. T. H.

Determination of gases in metals, specially of oxygen in iron and steel, by the hot extraction method. III. Oxygen in cast iron. H. DIERGARTEN AND E. PIWOWARSKY. *Arch. Eisenhüttenw.* 3, 627–35(1930); cf. *C. A.* 24, 4233.—The influence of the O content on the mech. properties of cast Fe was investigated. The cast Fe was found to contain 0.002–0.014% O, this being independent of the treatment of the melt. With increasing addn. of O to the melt the Si content decreased sharply, and the C and Mn contents slightly. These tests show the mech. properties of cast Fe are not influenced by its O content, or as to such a slight extent that they are covered by other influences (chem. compn. or the graphite formation). J. BALOZIAN

New method for detecting bromine and iodine. F. HARMS. *Z. physik. chem. Unterricht* 42, 266–7(1929).—NaClO is substituted for Cl_2 in the usual procedure. After the I_2 has been found by adding NaClO and shaking with CS_2 or $CHCl_3$, an excess

of NaClO is added to form HIO_3 from I_2 and then H_2SO_4. On slaking again $CHCl_3$ is colored brown if Br_2 is present. M. BEBER

Rapid colorimetric estimation of iodine in mineral waters and brines. L. C. CASE. *Chemist Analyst* **20**, No. 1, 9(1931).—To a sample contg. 0.10–0.65 mg. I_2 add 20 cc. of CS_2 or $CHCl_3$. Add 6 drops of H_2SO_4 which is satd. with N_2O_3 and compare the color that develops in the CS_2 or $CHCl_3$ on shaking with a set of standards. W. T. H.

Analysis of dilute iodine solutions. HERMAN A. LIEBHAFSKY. *J. Am. Chem. Soc.* **53**, 165–6(1930).—To a soln. contg. 0.4–2.0 $\times 10^{-6}$ equiv. of I_2 (less than 3 mg.) add CCl_4 and shake vigorously, using about 25 cc. to ext. all of the I_2. Transfer the CCl_4 soln. to a 500-cc. flask contg. 50 cc. of 1% KI and enough HCl to make the soln. about 0.001 *N* in H^+. Titrate with freshly prepd. 0.004 *N* $Na_2S_2O_3$ until the CCl_4 is practically colorless on shaking, add starch and enough more thiosulfate to make the aq. soln. colorless. W. T. H.

Colorimetric determination of silica. EARL J. KING. *Ind. Eng. Chem., Anal. Ed.* **3**, 117–8(1931). LEWIS A. THAYER. *Ibid* 118.—With reference to the paper of T. (*C. A.* **24**, 4239) K. points out that the procedure published by him (*C. A.* **23**, 403) serves to det. SiO_2 satisfactorily in the presence of Fe, to which T. replies that this is undoubtedly true when more PO_4^{---} than Fe is present but he questions whether this is true when a large excess of Fe is present. W. T. H.

Quantitative precipitation of sulfides in buffered solutions. I. Cobalt sulfide. MALCOLM M. HARING AND MARTIN LEATHERMAN. *J. Am. Chem. Soc.* **52**, 5135–41 (1930).—For the complete pptn. of 0.2 g. of Co as sulfide, add 25 cc. of 0.4 *N* NH_4OAc to the neutral $CoCl_2$, together with 4.5 cc. of 6.8 *N* AcOH and 70 cc. of water. Heat to boiling and sat. with H_2S in a 300-cc. Erlenmeyer flask until the soln. has reached room temp. (45 min.). Do not agitate during the first 5 min. but give the contents of the flask an occasional swirling motion thereafter. Wash the ppt. with the buffer soln., ignite in the air till the paper is burned and finally in H_2 for 15 min. at 1000°. Weigh as Co. **II. Nickel sulfide.** MALCOLM M. HARING AND BENTON B. WESTFALL. *Ibid* 5141–5.—The conditions for the complete pptn. of Ni as sulfide are very similar to those recommended for Co but the *p*H value must be slightly higher (4.4 instead of 3.93). Dissolve the neutral salt (about 0.2 g. of Ni) in 10–15 cc. of water, add 34 cc. of 0.4 *N* NH_4OAc, 2.8 cc. of 6.8 *N* AcOH and water to make about 90 cc. Heat to about 90° and sat. with H_2S. After about 5 min. shake the contents of the flask and heat in a water bath at 60°. Continue passing the H_2S into the soln. for nearly an hr. Filter with suction, keeping the crucible full and wash with the buffer soln. Place the crucible and ppt. in a cold furnace and gradually raise the temp. to 1000° and weigh as NiO. W. T. H.

Investigation of the ammonium acetate separation of sulfates of lead, barium and calcium. WILFRED W. SCOTT AND SAMUEL M. ALLDREDGE. *Ind. Eng. Chem., Anal. Ed.* **3**, 32–3(1931).—The expts. described indicate that the $PbSO_4$ can be extd. from a ppt. of $BaSO_4$ and $PbSO_4$ by treatment with hot, concd. NH_4OAc in spite of the statement of Majdel (*C. A.* **24**, 3194) to the contrary. When, however, the quantity of Ba present is large there is increased difficulty in dissolving out all of the $PbSO_4$. The soly. of $CaSO_4$ is too great to permit a quant. sepn. of $CaSO_4$ from $BaSO_4$. When considerable $BaSO_4$ is present, less $CaSO_4$ dissolves. W. T. H.

The analysis of chemically disintegrated phosphates. V. VINCENT. *Ann. fals.* **23**, 475–81(1930).—In the French official method for the detn. of citrate-sol. P_2O_5 (a soln. contg. 400 g. citric acid per l. being used), the direct pptn. of P_2O_5 with Joulie's MgO soln. in the citrate soln. of superphosphates gives accurate results in the absence of MgO in the sample analyzed; if MgO is present, the sample must first be washed with H_2O. With phosphates which have been treated by fusion with alkali silicates the results are low because of the incomplete pptn. of P_2O_5. With such products, the following method gives accurate results: dil. 10 cc. of the citrate soln. to 25 cc., add 50 cc. NH_4NO_3 soln. (160 g. NH_4NO_3 and 150 cc. concd. HNO_3 per l.), heat to boiling on a perforated metal plate to avoid overheating the sides of the beaker, remove from the flame, add 20 cc. NH_4 molybdate (dissolve 75 g. molybdic acid in hot H_2O contg. 57 cc. NH_4OH and dil. to 1 l.) with stirring, boil 2–3 min., let cool for 20 min., filter, wash free from acid (5–6 washings), place the filter and 50 cc. H_2O in a 250-cc. Erlenmeyer flask and disintegrate the filtrate, add 25 cc. NaOH (12.968 g. per l., 1 cc. = 1 mg. P_2O_5), shake till the yellow ppt. is dissolved, titrate the excess NaOH with H_2SO_4 (15.876 g. per l., 1 cc. = 1 mg. P_2O_5) with phenolphthalein as indicator. With phosphates which have been fused with alkali silicates, soln. of the citrate-sol. P_2O_5 by the Belgian method (use of a citrate soln. contg. 200 g. citric acid per l., and less alk. than the soln. of the French official method) and pptn. of the P_2O_5 by Joulie's MgO soln.

gives high results because of entrainment chiefly of SiO_2 but partly also of basic silicates; but the above-described method gives accurate results. With such products, and by use of the volumetric method above described for detn. of the dissolved P_2O_5, the French official method gives lower results than the Belgian official method, partly because of the differences in technic but chiefly because of differences in the compn. and proportion of reagents used. The French and Belgian methods can be conciliated by admitting that chemically disintegrated phosphates can be considered as almost identical with pptd. phosphates, and applying to the former the technic used for the latter, pptg. with NH_4 molybdate as above, and titrating the ppt.; *e. g.*, shaking 1 g. mechanically for 1 hr. with 100 cc. of Petermann's (Belgian) citrate soln., and dilg. to 250 cc. gave 21.31% P_2O_5; digesting 0.750 g. for 24 hrs. with 60 cc. of French citrate soln. with occasional shaking, and dilg. to 150 cc., gave 21.93% P_2O_5; a modification of the French method in which digestion for 1 hr. at 50° was used instead of digestion for 24 hrs. at room temp. gave 21.96% P_2O_5. Total P_2O_5 can be detd. as accurately and as rapidly by a slight modification of the reagents. The SiO_2 dissolved by the acid attack must be made insoluble by evapg. to dryness, dehydrating under well-regulated conditions (not specified), and taking up the residue in 50% HNO_3. The soln. is then dild. so that 25 cc. contains not over 25 mg. P_2O_5. The pptg. reagent is prepd. by mixing 1400 cc. of the NH_4NO_3-HNO_3 soln., 800 cc. of Petermann's NH_4 citrate soln and 1800 cc. H_2O. To 25 cc. of the soln. to be analyzed add 50 cc. of the above reagent, heat to boiling, add 20 cc. of NH_4 molybdate soln. and proceed as described above. This method gives results agreeing perfectly with those obtained by the Mg NH_4 phosphate method. A. PAPINEAU-COUTURE

Rapid determination of moisture. T. H. FAIRBROTHER AND R. J. WOOD. *Ind. Chemist* 6, 442–4(1930).—As a result of some expts. which are described, the conclusion is drawn that the diclectric const. method either of Burton and Pitt or of Berliner and Ruter can be used for the detn. of the natural H_2O content of *wheat* and *flour*. The detn. takes about 1 min. If water has been added to wheat, 2–4 days must be allowed for tempering the wheat and for the complete distribution of the moisture in the berry. Better results are obtained, in this case, with the app. described if the sample is ground. W. T. H.

Proposed modification of "oxygen consumed" method for determination of sea-water pollution. H. K. BENSON AND J. C. HICKS, JR. *Ind. Eng. Chem., Anal. Ed.*, 3, 30-1(1931).—Non-concordant results between the detn. of org. content by the biologic and $KMnO_4$ methods of detg. "oxygen consumed," led to a modification of the technic for carrying out the latter detn. The modification lies in the detn. of the unconsumed $KMnO_4$. Carry out the digestion exactly as in the standard method, then add 25 cc. of $MnSO_4$-H_2SO_4-H_3PO_4 soln. and 10 ml. of standard $FeSO_4$ soln. Bring to room temp. and titrate the excess Fe with standard $KMnO_4$ soln. The results thus obtained show much better correlation with the results of biological study. W. T. H.

Hydrogen-ion determinations with low-resistance glass electrodes. G. ROSS ROBERTSON. *Ind. Eng. Chem., Anal. Ed.* 3, 5–7(1931).—The detn. of p_H values becomes difficult or impossible when the soln. to be tested contains certain active oxidizers or reducers and in such cases the use of a glass electrode is to be recommended. The method of prepg. such an electrode and manner of using are described in detail. The use requires little more skill than is needed with an industrial quinhydrone app. W. T. H.

Determination of p_H at temperatures above 100°. SVERRE STENE. *Rec. trav. chim.* 49, 1133–45(1930).—It is shown that it is possible to det. the hydrion concn. of aq. solns. at temps. above 100° by the potentiometric method. Two forms of app. are described. One provides for the use of a standard Ag/AgCl cell kept at the same temp. as that of the soln. and the other for the use of a standard calomel cell at room temp. By use of the former type of app. a series of p_H detns. was made with various buffer solns. W. T. H.

Titration of phosphoric acid. P. VILLARD. *Compt. rend.* 191, 1101–4(1930).—In titrating H_3PO_4 with NaOH the end point is obtained when 1 H is neutralized with methyl orange as the indicator and when approx. 2 H are neutralized with phenolphthalein as indicator. With $Ba(OH)_2$ the results are different because both $BaHPO_4$ and $Ba_3(PO_4)_2$ are insol. If the titration takes place quickly in the cold, the end point is obtained somewhat after the second H of H_3PO_4 has been neutralized and the color fades slowly but if, when the second H is nearly neutralized, the soln. is heated to promote the formation of crystals of $Ba_3(PO_4)_2$, then by continuing the titration the end point corresponds to a nearly complete neutralization of the 3 H of H_3PO_4. W. T. H.

Direct and reverse titration of sulfuric acid with barium hydroxide. I. M. KOLT-

HOFF AND E. B. SANDELL. *Ind. Eng. Chem., Anal. Ed.* 3, 115–7(1931).—For the standardization of $Ba(OH)_2$ solns., K acid phthalate is distinctly better than pure $H_2C_2O_4 \cdot 2H_2O$ because of the adsorption error by the BaC_2O_4 ppt. Adsorption errors also interfere with the titration of H_2SO_4 with standard $Ba(OH)_2$, the results sometimes deviating as much as 0.85% from the true value. To overcome the error, it is best to titrate at room temp. to a phenolphthalein end point, then heat to boiling and add more base until the color persists for 15–30 sec. Then cool to room temp. and finish the titration at room temp. The error, then, is usually less than 0.2%. Similarly, the titration of $Ba(OH)_2$ with standard H_2SO_4 usually leads to imperfect results because of adsorption error. The best results are obtained by adding the $Ba(OH)_2$ to an excess of K_2SO_4 at room temp., titrating at room temp. to a preliminary end point, boiling 5 min. with a slight excess of H_2SO_4 present and finally titrating this excess at room temp. The error of the titration is then usually less than 0.2%. W. T. H.

The determination of silica in ferro-silicon. A. STADELER. *Arch. Eisenhüttenw.* 4, 1–6(1930).—A modified Cl_2-vaporization method is developed for detg. SiO_2 in ferro-Si (11, 45, 90% Si). Powd. ferro-Si (10 g.) contained in a boat is placed in a quartz reaction tube heated to 550° in 3 hrs., held at this temp. while a stream of Cl_2 (550°), which has previously been held (1/2-hr.) over charcoal at 800°, is passed at the rate of 10 l./hr. over the ferro-Si for not longer than 3 hrs. and cooled to 50° in a Cl_2 stream in 1–1 1/2 hrs. To det. SiO_2 in Si-low ferro-Si this chlorinated residue is kept overnight in a desiccator contg. $CaCl_2$, transferred to a Pt crucible, ignited at 800–900° in a muffle for 1 hr. and the SiO_2 detd. by known methods (*C. A.* 23, 4908). In Si-high ferro-Si the above chlorinated residue shows the presence of SiC. To det. the SiO_2 in these the ferro Si is chlorinated as above, the residue treated with concd. HCl to remove any traces of $SiCl_4$, filtered and the SiO_2 detd. in the residue by evapg. with H_2SO_4 and HF. Stronger heating must be avoided as much as possible in pulverizing the ferro-Si for analysis. The importance of adhering to the temps. and velocity of Cl_2 flow during chlorination is shown. J. BALOZIAN

Determination of picric acid in solution. MAURICE FRANÇOIS AND (MISS) LAURE SÉGUIN. *Ann. fals.* 23, 481–5(1930).—On treating picric acid in NH_3 soln., with ammoniacal $CuSO_4$ soln., there is formed a cryst. ppt. of $[C_6H_2(NO_2)_3OH]_2CuO.2NH$. The following technic is recommended. *In the absence of PhOH.*– Place in an Erlenmeyer flask a vol. of soln. contg. 0.05–0.1 g. picric acid, dil. to 50 cc., add an excess of Cu reagent (40 g. $CuSO_4.5H_2O$ and 200 cc. concd. NH_4OH per l.), 30 cc. being required to ppt. 0.1 g. picric acid, let stand 1 hr., filter through 2 balanced 9-cm. filters, transferring the last portions of ppt. by means of a policeman, wash with 10 cc. of NH_4OH by allowing it to flow, drop by drop, along the edge of the filter, let dry to const. wt. at atm. temp.; wt. of ppt. multiplied by 0.7563 = wt. of picric acid. If desired, the detn. can be checked as follows: heat the filter 1 hr. with 50 cc. H_2O on a boiling water bath, filter, evap. the filtrate to dryness and weigh; wt. of NH_4 picrate multiplied by 0.9308 = wt. of picric acid. If necessary, qual. tests for the identification of picric acid can be made on the residue. *In the presence of PhOH.*—The above technic can be followed if care is taken not to let the ppt. stand more than 1 hr. before filtering, which will give a slightly grayish ppt., probably due to the colored impurities present in the PhOH. The PhOH may be removed by adding 1 g. Na_2CO_3, extg. with 4 × 20 cc. $CHCl_3$; the soln. is heated to drive off dissolved $CHCl_3$, filtered and treated as above. *In presence of complex org. matter.*—Bring the soln. to a vol. of about 100 cc., add 5–6 g. of wool yarn, let stand 24 hrs., renew the wool, repeat the treatment till the soln. is decolorized (generally a total of about 20 g. of wool is required), rinse the wool in a large quantity of fresh water, press into a small cylinder, wash with ammoniacal alc. (22° Bé. NH_4OH 5 cc., 95% alc. 50 cc., H_2O 45 cc.) until the wool is decolorized, evap. the alc. and proceed as described above. Recoveries of 99.8 to 100.38% are reported. Also in *J. pharm. chem.* 12, 433–8(1930). A. PAPINEAU-COUTURE

Spectographic determination of aluminum in biological ashes. DEE TOURIELOTTE AND O. S. RASK. *Ind. Eng. Chem., Anal. Ed.* 3, 97–102(1931).—The spectrographic method of analysis is capable of detecting the presence of 5 parts per million of Al in all cases tested. It will det. within 0.25% concns. of Al ranging from 0.5 to 1000 parts per million in inorg. materials including biol. ashes. The arc and the condensed-spark methods of excitation appear to be equally satisfactory in samples of salts and salt mixts. and the same is true of tests with certain biol. ashes. In some cases, particularly in cases where the ash contains some unburned C, the arc method appears to be somewhat more sensitive. The principles underlying these spectrographic methods are explained and the technic is carefully described. Modifications in the procedure were developed. W. T. H.

Poisoning by seeds of Datura stramonium (thorn apple). A. SARTORI. *Chem.-Ztg.* **54**, 890(1930).—Poisoning being suspected, a body was analyzed for poison. Microscopic examn. of many seeds in the stomach and intestines indicated that these were identical with those of *Datura stramonium*. The presence of the alkaloid, atropine, was proved beyond a doubt both chemically and biologically. G. H. W. LUCAS

Proposed solubility scale for work in organic qualitative analysis. CHAO-LUN TSENG. *Natl. Central Univ. Sci. Repts. Ser. A, Phys. Sci.* **1**, 5–7(1930).—Instead of the present, indefinite references in tabulations, a *numerical soly. scale* of fixed meaning is proposed, such as: (1) sol. in less than 5 parts of the solvent; (2) sol. in 5–10 parts; (3) in 10–50 parts; (4) in 50–500 parts; (5) insol. in 500 parts. Tests are made with 0.05 g. samples, solvent being added from a graduated pipet in successive portions. K. H. ENGEL

Problems in the estimation of unsaturated hydrocarbons in gases. III. Some factors in bromination with potassium bromide-bromate mixture. H. S. DAVIS, G. S. CRANDALL AND W. E. HIGBEE, JR. *Ind. Eng. Chem., Anal. Ed.* **3**, 108–10(1931); cf. C. *A.* **24**, 1822.—The paper deals with the factors affecting the completeness of the titration of unsatd. hydrocarbons by Br, the KBr-$KBrO_3$ method of Francis being used. $AlCl_3$ and certain other metallic salts interfere and O_2 also causes trouble. The following procedure was developed for the detn. of C_2H_4, C_2H_2 and some of their homologs. Measure out into a bottle the necessary vol. of KBr-$KBrO_3$ soln., using about 2 cc. in excess of the theoretical quantity. Evacuate with a water pump until the liquid boils, using warm water to heat the soln. if necessary. Measure the gas sample into a buret, wash it twice with K pyrogallate in a Hempel pipet and then measure again in the buret. Fill the connecting tube of the evacuated bottle with water, connect with the buret and draw the gas sample into the bottle. Fill the connecting tube with water again, attach to a Mohr buret contg. 10% H_2SO_4 and add the acid in 1-cc. portions every 30 sec., shaking the contents of the bottle after each addn. Use acid equiv. to the vol. of the KBr-$KBrO_3$ soln. Finally shake the bottle in a machine for 60–90 min. Then add 3–5 cc. of satd. KI soln. and 20 cc. of water before breaking the vacuum. Finally open the bottle, dil. to 100–150 cc. and titrate with standard $Na_2S_2O_3$ soln. W. T. H.

Potassium persulfate as an oxidizing agent and the determination of carbon in organic compounds. P. RISCHBIETH. *Z. physik. chem. Unterricht* **43**, 132–4(1930).—Water-sol. org. compds. are oxidized in neutral soln. by $K_2S_2O_8$. The CO_2 evolved is dried and absorbed as in the usual combustion method and weighed. M. B.

Some errors in analytical bromination. Thermal cleavage of hydrogen bromide from brominated substances. A new procedure for determination of organic unsaturation. H. M. BUCKWALTER AND E. C. WAGNER. *J. Am. Chem. Soc.* **52**, 5241–54 (1930).—The errors in the bromination of org. compds. to det. unsatn. are discussed. Since some of these are due to contact of the halogenated sample with H_2O, KI and KIO_3, the *aeration method* was developed (app. described), in which the bromination is carried out in CCl_4 and the excess Br and HBr are removed by a N stream and caught in KI soln. About 40 compds., both satd. and unsatd., were studied at 75°, 20–5° and 0°. The results show that in all but a few cases the aeration method, under suitable temp. conditions, yields better results than did McIlhiney's method; by proper temp. control of the brominations neg. results were completely eliminated. With unsatd. hydrocarbons, a distinct temp. effect is shown by cyclohexene, phenanthrene, indene and expecially by retene. The resistance of crotonic acid to halogenation is shown by the ineffectiveness of bromination at room temp. The results with abietic acid indicate roughly 1 double bond, although 0° may be too high for normal bromination. The aeration procedure brings into prominence the spontaneous cleavage of HBr from certain compds. when exhaustively brominated at a too high temp. This was verified by exptl. elimination of HBr from several substances brominated at low temp. and then warmed to 75°. The practical application of these results requires the use of bromination temps. low enough to prevent excessive consumption of Br by reactions other than addn. and thereby to prevent or minimize spontaneous cleavage of HBr in excess of that actually due to substitution. Some substances brominate normally at 75°, others at room temp., while others yield entirely meaningless results unless brominated near 0°, which for some substances is perhaps still too high a temp. The new procedure permits the necessary temp. regulation and appears to be unique in that it permits bromination at elevated temp. and avoids complications due to contact of H_2O, KI and KIO_3 with the brominated sample. C. J. WEST

Application of a bromine method in the determination of phenol and cresols. R. D. SCOTT. *Ind. Eng. Chem., Anal. Ed.* **3**, 67–70(1931).—As a result of some exptl.

data described in this paper, the following method of analysis was devised and found reasonably accurate. After carrying the sample through a suitable preliminary purification, take an aliquot contg. about 0.02 g. of phenol or cresol in a 500-cc. glass-stoppered flask. Add water to make exactly 200 cc. and exactly 25 cc. of 25% KBr soln. Add 10 cc. of 6 *N* HCl and heat on a water bath kept at exactly 25° until the contents of the flask are at this temp., then add exactly 25 cc. of 0.3% $KBrO_3$ soln. Mix well and let stand at 25° for an hr., shaking occasionally. Then add 25 cc. of 20% KI soln., mix, allow to stand 30 min. at 25° with occasional shaking and titrate the liberated I_2 with standard $Na_2S_2O_3$. Run a blank detn. in the same manner. The difference between the 2 titrations multiplied by 0.00157 gives the wt. of phenol and cresol in terms of phenol. W. T. H.

Method for the accurate evaluation of acetic acid anhydride. ANDOR ROTH *Chem.-Ztg.* **54**, 954–5(1930).—The method, which is held to be more accurate than any other yet devised, depends upon boiling the anhydride with a definite vol. of water under a reflux condenser until the anhydride is fully hydrolyzed to AcOH and then detg. the solidification point of the soln. Full directions for carrying out the analysis are given as well as a table showing the water contents corresponding to different f. ps. W. T. H.

Quantitative determination of pyrethrin. I. RALPH C. VOLLMAR. *Ind. Eng. Chem., Anal. Ed.* **3**, 110-2(1931).—Two methods for detg. pyrethrin I and pyrethrin II (the toxic principles of pyrethrum flowers) were studied. One method is based on the ability of the pyrethrins to reduce alk. Cu soln., the amt. reduced being measured by comparison with a standard dextrose soln. (Method of Gnadinger and Corl). The other method (Staudinger and Harder method, modified by Tattersfield, Hobson and Gimingham) depends upon extn. with petr. ether, hydrolysis of the ext. with NaOH in alc., steam distn. and titration of the distillate with 0.02 NaOH, with phenolphthalein as indicator. These 2 methods were described for samples of flowers, stems, stalks etc. The present paper deals with the analysis of several samples of Dalmatian and California flowers by both methods and with the application of the second method to the analysis of kerosene exts. such as are often used in com. insect sprays. The method is applicable only to exts. which are known to contain no foreign material likely to interfere, such as an ester used as an odorant. A table is given showing the pyrethrin content of spent flowers and of the exts. from these flowers. W. T. H.

Helium ratios of the basic rocks of the Gwalior series. V. S. DUBEY. *Nature* **126**, 807(1930); cf. *C. A.* **23**, 4171.—The following ages were calcd. for the Morar group of the Gwalior series in the Purana group of India: Belaki-Bauri (fine-grained basalt) 466×10^6 yrs.; Santowa Temak (coarse-grained dolerite) 369×10^6 yrs.; Paniar (coarse-grained dolerite) 190×10^6 yrs. The method is suitable for fine-grained basaltic rocks, especially for distinguishing rocks of different igneous cycles. A. F.

The origin of meteorites. F. PANETH. *Z. Elektrochem.* **36**, 727–32(1930).—With newly improved technic 1×10^{-8} cc. He and 2×10^{-14} g. Ra can be detected (*C. A.* 22, 3110). In case of Fe meteorites (*C. A.* **23**, 3877), samples must be brought into soln., as heating expels less than 5% of the He even at 1000°. Metallic Fe, like Pd (*C. A.* **23**, 1026), is impermeable to He at red heat, as expts. with powd. meteorite samples show the He loss to be only superficial. Age calcns. based on the He:Ra ratio are considered significant to 10%. Specimens from a large no. of unaltered Fe meteorites show ages between 0.1×10^9 and 2.9×10^9 yrs., four being over 2.5×10^9 yrs. old. As these values are all less than the age now assigned to the solar system, 3×10^9 yrs., it is concluded that the meteorites were created with our solar system. Opposed astronomical arguments are also discussed. W. G. LEIGHTON

The orientation of rolled aluminum. J. THEWLIS. *Phil. Mag.* [7], **10**, 953–61 (1930).—Two series of photograms on flat-rolled Al with the x-ray beams at various angles to the normal direction showed that the rolling directions and the normal directions are not far from (353) and ($\bar{3}15$), resp., confirming Göler and Sachs (cf. *C. A.* **21**, 2640). Square-rolled Al, with no sign of selective orientation before rolling, showed that the direction coincides with the (111) direction. ARTHUR FLEISCHER

Carbon loss and diffusion in the malleableizing process. ENRIQUE TOUCEDA. *Metals and Alloys* **1**, 815(1930).—The C contents of the 8 samples varied from 1.99 to 2.66% before malleableizing. An av. loss of 0.35% C during malleableization was found; the range was 0.20 to 0.45%. In 6 of the samples the elimination was greatest between the surface and a depth of $^1/_{16}$ in. In the remaining 2 blocks the abrupt change took place at a depth of $^3/_{64}$ in. From the results it appears that a diffusion of the C toward the surface practically ceases at a depth of about $^7/_{16}$ in. A. J. MONACK

Extrusion of bismuth wire. J. G. THOMPSON. *Metals and Alloys* **1**, 826–7(1930).—Bi wire was produced in single pieces up to 20 ft. in length by means of an extrusion press which is described in detail. Three dies with orifices, resp., 0.012, 0.025 and 0.031 in. in diam., were used and successful operation was obtained at room temp. and at higher temps., up to 100°. The properties of the wire varied with the diam. and with the conditions of extrusion. A. J. MONACK

Behavior of thorium oxide in annealed tungsten wires. W. G. BURGERS AND J. A. M. VAN LIEMPT. *Z. anorg. allgem. Chem.* **193**, 144–60(1930).—X-ray investigation shows that in unannealed drawn W wire contg. ThO_2 and of polycryst. structure the oxide of Th is present as such. In single-crystal wire the ThO_2 crystallite shows no preferential orientation. By annealing the polycryst at high temps. (above 2500° abs.), part of the ThO_2 is reduced to metallic Th. At these temps. there is also the possibility of incomplete reduction of ThO_2, with the formation of oxides intermediate between the metal and ThO_2. The existence of a face-centered lattice with a parameter between those of ThO_2 and Th was observed, and it was also found that a lattice with varying values of parameter could be obtained by annealing superficially oxidized Th wire *in vacuo* for different time intervals. Accurate detns. of the lattice consts. of ThO_2 and Th were made, the following values being obtained for a: ThO_2, highly ignited and prepd. from the nitrate —5.585 ± 0.001 A. U.; Th prepd. by reduction of chloride with Na—5.074 ± 0.002 A. U.; Th metal prepd. by thermal decompn. of the iodide—5.081 ± 0.002 A. U. H. STOERTZ

Hardness of metallic alloys at various temperatures. V. P. SHISHOKIN AND V. AGEEVA. *Z. anorg. allgem. Chem.* **193**, 237–44(1930).—Hardness detns. were made on binary alloys in which the components do not form chem. compds.: Bi–Sn, Bi–Cd, Pb–Cd, Sn–Cd, Pb–Sn, Sn–Zn, Zn–Cd. In all cases except Pb–Sn, hardness-compn. curves show a similar course for all systems at all temps. Deviations in Pb–Sn alloys are perhaps explained by insufficient heat treatment. Breaks in the curves at 2.7% Bi in the system Cd–Bi, at 8.7 and 38% Cd in Cd–Pb, and at 1.7, 2.9 and 90.9% Pb in Pb–Sn are probably due to the passing of the 2 components into solid soln. In the systems Cd–Zn, Sn–Zn and Cd–Sn, these breaks are due to eutectoid transformations. The temp. coeff. of hardness of the alloys investigated is greater than the temp. coeff. of the pure metals, and is given by the expression: $\alpha = (\log H_2 - \log H_1)/(t_2 - t_1)$. The greatest increase in α is in the alloy Bi–Sn (0.0028–0.0117), the smallest in the alloys Pb–Cd (0.0039–0.0057) and Zn–Sn (0.0038–0.0056). Solid solns. of low concns. are found on both sides in the system Bi–Sn but only on the Pb side in the system Pb–Cd; no solid solns. are found in Zn–Sn. In all the systems except Sn–Cd the highest temp. coeff. of hardness is found in the region of the eutectic. The displacement of the max. in the Sn–Cd system is perhaps explained by the presence of a eutectoid point. The magnitude of the temp. coeff. of hardness is apparently not influenced by annealing conditions. H. STOERTZ

Heat treatment of aluminum and its light alloys. J. SUHR. *Rev. métal.* **27**, 563–9 (1930).—Numerous data are presented showing the advantage of heat-treating various Al alloys. The method used consisted in bringing the material to 525°, and keeping the temp. const. for 2 hrs. followed by a water-quench, after which treatment the samples

were kept for 15 hrs. at 150°. Hardness and tensile strength increased slightly but the resistance to repeated shocks increased to a remarkable extent, particularly for the specimens cast and treated in metal molds. Of the alloys tested there was only one, *viz.*, alpax, that could not be improved by heat treatment. Excellent results were obtained with the patented alloy with the av. compn.: Cu 1.5, Mn 0.8, Mg_2Si 1.58, Si 0.25, Ti 0.35%. In this case the heating period at 525° was 5 hrs., followed by a water quench and aging for 9 hrs. at 150° or 5 days at room temp. H. S. v. K.

Heat treatment of duralumin. MATTER. *Rev. métal.* **27**, 560–2(1930).—Specimens of duralumin varying in thickness from 1 to 20 mm. were heated in a salt bath to 500°, air-cooled and aged for 4 days. They were then broken in tension and the tensile strength was plotted as a function of the rate of cooling (at 400°) and also as a function of the thickness. For thicknesses of 1 and 2 mm. the tensile strength is practically the same as that of water-quenched specimens. For greater thicknesses the tensile strength decreases gradually to about ¾ of that for the thinnest samples. H. S. v. K.

Properties of lead-bismuth, lead-tin, type metal and fusible alloys. J. G. THOMPSON. *Bur. Standards J. Research* **5**, 1085–1107(1930).—Data are presented both in tabular form and in graphs, for tensile strength, hardness, elongation, resistance to compression and solidification characteristics of 4 classes of alloys: (1) binary alloys of Pb and Bi, (2) binary alloys of Pb and Sn, (3) type metals with and without addns. of small quantities of Bi and (4) fusible alloys of Bi, Pb, Sn and Cd. DOWNS SCHAAF

Grain growth in the chrome-irons. ARTHUR PHILLIPS AND RALPH W. BAKER. *Iron Age* **126**, 1588–9, 1665(1930).—A 5-lb. ingot was prepd. by melting Armco iron and low-C ferrochromium. The ingot contained Cr 28.72, C 0.26, Si 0.34 and Mn 0.39%. Specimens were cut from the center of the ingot, annealed at 1650°F. and then given a 20% reduction of thickness by cold working. One specimen was used for each temp. chosen for the annealing schedule. After annealing for 4 hrs. the sample was furnace-cooled and a grain count made. The same sample was annealed similarly for 4 more 4-hr. periods making the cumulative annealing period 20 hrs. This expt. leads to the conclusion that steel of this compn. is subject to relatively rapid grain growth at the lower temps. (1290 to 1830°F.) and to extremely rapid growth at higher temps. (1830 to 2550°F.). The grains approach max. size after comparatively short periods at elevated temps. Additional expts. were made on chrome-iron of similar analysis to det. if austenite occurs in quenched samples. Specimens were heated for 2 hrs. at temps. 2100 to 2640°F. and quenched in water. Austenite was found in all specimens. These results confirm belief that C is sol. to an appreciable extent in delta iron, the limit being approx. 0.10% C. A. W. HOLMES

Twenty alloys for gray iron. E. K. SMITH AND H. C. AUFDERHAAR. *Iron Age* 126, 1583–7, 1688–93(1930).—Al in gray iron has a softening effect up to 0.10% Al. Up to 0.5% Al continues to sep. out graphitic C. From 0.5% Al, graphitic C decreases, being only 0.20% of graphite with 11.8% C. White iron will usually turn to gray with 0.50 to 0.75% Al. Arsenic up to 0.1% has no deleterious effect in normal iron. B (0.4%) increases hardness and makes iron difficult to machine, while 0.8% B makes it decidedly brittle. Ca up to 0.2% has no effect on strength, fluidity or shrinkage. Cr increases chill, carbide, hardness and shrinkage. When Cr reaches 0.4 to 0.5% difficulty in machining is encountered due to carbides, but these may be broken up by addns. of Si or Ni. Co up to 2% gives no useful results. Cu up to 2% gives a slight increase in tensile strength, transverse strength and Brinell hardness. Max. soly. of Cu is placed by various investigators at from 3 to 4.9%. Cu appears to confer appreciable corrosion resistance to cast iron, reaching a max. at 1% Cu. Mo acts as strengthener and hardener of gray iron. Ni in cast iron permits production of plain castings either harder, stronger and of better structure with equal machinability or more readily machinable for the same hardness, strength and structure. Ni and Cr together produce increased tensile strength and are used for pieces that are subjected to unusual wear, high temp., repeated heatings, corroding influences, etc. Si is present in all cast irons, usually 1.5 to 2.5%. Five % Si makes iron very brittle; with 9 to 10% Si it corrodes more readily; with 11 to 14% Si it becomes corrosion-resistant; and with 14.5 to 17% it has max. resistance but is hard, brittle and unmachinable. One % V increases tensile strength 60% and Brinell hardness from 170 to 250. A. W. HOLMES

Hardening of gray iron castings. LEON GUILLET, JEAN GALIBOURG AND MARCEL BALLAY. *Compt. rend.* **191**, 538–41(1930).—Gray castings with Ni content of 0–5% were quenched at 700–950° in oil, in still air and in circulating air. The oil quench gave the highest Brinell no., the optimum temp. decreasing with increasing Ni content. The casting of 5% Ni, oil-quenched at 700°, was annealed at temps. ranging from 20°

to 825° and air-cooled. The Brinell no. decreased with rising temp. up to 750°, rising again at 825°. Heating to 900° and cooling in the furnace raised the critical points 45–100°. Annealing quenched castings at 300–350° has little effect on the hardness but increases shearing strength about 20% and compression strength about 25% without reducing resistance to bending. ANN NICHOLSON HIRD

Nitrogen in technical iron. I. The influence of nitrogen on the properties of technical iron, especially on its relation to magnetic aging. WERNER KÖSTER. *Arch. Eisenhüttenw.* **3**, 637–48(1930).—N is sol. in α-Fe (detd. as: 0.001% at 20°, 0.005% at 200°, 0.01% at 300°, 0.02% at 400°) being present in supersatd. solid soln. from which it does not sep. even on slow cooling; the sepn. is complete only after 14 days' annealing at 100°. The magnetic aging of tech. Fe is linearly proportional to its N content; by the sepn. of 0.01% N the coercive force increases 3.2 gausses. The sepn. of N from steels results in an increase in the constriction no. and chem. corrosion and a decrease in the sp. resistance, tensile strength and hardness, while the elastic limit and elongation are unchanged. The magnetic aging tendency of a steel increases with the possibility of its taking up N during production; thus Thomas steels and elec. steels age more strongly than the Siemens-Martin and weld steels. Microscopic studies show N to sep. out as small points at 100° and as small needles at higher temps.; the amt. which seps. increases with increase in temp. **II. The character of stress figures.** *Ibid* 649–58.—The relation between the N content of tech. Fe and the stress figures (I) (Kraftwirkungsfiguren) made visible by the Fry etch (*Kruppsche Monatsh.* **2**, 127–36(1921); cf. *C. A.* **16**, 226) is studied. It is shown that the N sepn. from steel is accelerated by cold forming and that the formation of I results from the difference in the sepn. velocity between the formed and unformed portions. The blackening in the etch is due to the sepn. of finely divided N. In the transition zone between the formed and unformed fields, micrographs show, after annealing the sample, the presence of grains having dark systems of lines, developed by the N sepn. I are visible only in magnetically aged steels and appear to be independent of mech. aging. Numerous photomicrographs showing the N sepn. and the I are given. J. BALOZIAN

Structures of mixed crystals of iron with beryllium and aluminum. F. WEVER AND A. MÜLLER. *Z. anorg. allgem. Chem.* **193**, 337–45(1930).—Thermal and microscopic study of Fe–Be and Fe–Al alloys led to a new detn. of the Fe side of the equil. diagram. Both systems have completely closed γ-fields. Mixed crystals of α-Fe with Be and Al are formed by at. substitution; the same structure is assumed for the mixed crystals of γ-Fe with both elements. The unusual behavior of C in alloy formation with Fe has no parallel in the elements Be and Al. H. STOERTZ

Occlusion of hydrogen and nitrogen by pure iron and some other metals. ERICH MARTIN. *Metals & Alloys* **1**, 831–5(1930).—The work of M. (cf. *C. A.* **24**, 2973) is correlated with the results obtained by other investigators. A *bibliography* is given. A. J. MONACK

The electrochemical behavior of metals. I. The passivity and corrosion of iron. JOSEPH F. CHITTUM. *J. Phys. Chem.* **34**, 2267–85(1930).—The acid, H_2O_2, colloidal, chem and electrochem. theories of corrosion are reviewed and discrimination is made between general surface, pitting and "water-line" types of corrosion. In passivity produced by anodic polarization at high c. ds. the time factor is important. C.'s theory explains production of H_2 in corrosion processes as well as the consumption of O_2 when Fe corrodes in a closed vessel. Other characteristics of passive iron, notably the absence of an oxide layer as shown by optical and x-ray evidence, substantiate the present view obtained by a study of electrode reactions in various acid media. In the present study sticks of Fe subjected to variable heat treatments and mech. roughening were used in the potential measurements. The effects of NO_3^-, Cl^-, SO_4^{--}, AcO^-, PO_4^{---} and S^{--} on the Fe neg. voltage were studied and conditions defined for the acquisition, by the Fe electrode, of the highest anode and cathode p. ds. H. R. MOORE

A study of the so-called "overreduced" condition in molten steel. J. V. MCCRAE, R. L. DOWDELL AND LOUIS JORDAN. *Bur. Standards J. Research* **5**, 1123–49(1930).—A study of 4 heats of acid elec. steel, 2 of which were "overreduced" and 2 were normal, failed to reveal any significant differences in temp., rate of cooling, tensile properties or microstructure. DOWNS SCHAAF

A magnetic method for determining carbon in steel and its application in deoxidation processes. C. J. GUNNAR MALMBERG. *Jernkontorets Ann.* **114**, 508–45(1930).—The method depends on submitting a test piece to a variable magnetic field, and measuring the induction. Thus a sample submitted to field strength H_1 and then to a lower field strength H_2 will after several repetitions show an induction B_1 and B_2 which differ by an amt. characteristic of the C content. A ballistic galvanometer is used for measur-

ing the induction, and the whole circuit is built into a compact app. known as a carbometer, on which the readings indicate the difference B_1–B_2. The test pieces, fitting into the magnetic circuit, are ingots of 12.90 ± 0.03 mm. radius poured from the steel bath. Since the diam. of the ingot is likely to vary with the compn. it is recommended that a series of ingots of known compn. be poured and used as standards. The texture of the ingots on breakage has no effect on the readings, and the C is uniformly distributed through the sample. The value of the carbometer reading is independent of the troostite, but ferrite and cementite, which form under 0.20% and above 1.20% C, resp., raise the carbometer value. The presence of Al has no influence on the reading for 0.60% C but lower it for lower C contents and raise it for higher C. Silica and Cr increase the readings; W and Mo lower them; while Mn and Ni behave somewhat as Al. O, H and N produce marked irregularities. H. C. Duus

The influence of nickel and manganese on the properties of high-speed steel. A contribution to the explanation of the tempering processes in high-speed steel as well as its peculiarity as heat-resisting steel. Viktor Ehmcke. *Arch. Eisenhüttenw.* **4**, 23–35 (1930).—The influence of Ni (2–12%) on the hardness and elongation of high-speed steel (I) quenched from temps. up to 1000°, and of Ni (11–15%) and Mn (7.8%) on the hardness and breaking strengths up to 800° is investigated. With increase in the Ni content of I the quench-hardness decreases, while the stability of the quench-austenite increases. On tempering from temps. up to 600° the quench-austenite of I contg. 5–12% Ni is stable. A crit. temp. field exists at 700–900° in which a breaking-up of the solid soln. occurs. Thus, on cooling from this field martensite is formed, resulting in an increase in the hardness I. However, the quench-austenite of tempered I alloyed with 3% Ni is unstable. At 600–700° the hardness and strength of I alloyed with Ni is less than for hardened I of normal compn., the difference increasing with the Ni added. At higher temps., however, I contg. Ni is distinctly superior to the ordinary I, the tensile properties increasing with the Ni added. The austenitic I alloyed with Mn has hot tensile properties similar to those alloyed with Ni. Photomicrographs (12) of specimens of I alloyed with various amts. of Ni and quenched in oil and H_2O are shown. J. Balozian

The ternary system: iron–nickel–sulfur. Rudolf Vogel and Willi Tonn. *Arch. Eisenhüttenw.* **3**, 769–80(1930).—The equilibria in the field Fe–FeS–Ni_3S_2–Ni of the system Fe–Ni–S are investigated, thermal, microscopic and magnetic methods being used. In this field 4 primary satn. surfaces are detd. on cooling the melt, the primary sepn. therefrom being: δ-Fe-Ni *mixed crystals* (**M**), γ-Fe-Ni **M**. FeS, and the S-rich **M**. The 3 curves formed by the intersection of 3 of these surfaces, in turn, intersect, the 4-phase reaction taking place here at 825° being: *FeS + melt (38% Fe, 27% S) = Fe(64%)-Ni* **M** *+ ternary* **M** *(39% Fe, 29% S)*. At 585° the sec. transition plane is caused by the decompn of the ternary **M**, the phases being: Fe (57%)-Ni **M**, FeS, $(FeS)_2Ni_3S_2$ and the ternary **M**, (26% Fe, 28% S). By cooling to 480° the ternary **M** contg. 13% Fe, 27% S, the ternary eutectic is formed having the phases: Fe (34%)-Ni **M**, Ni_3S_2 and $(FeS)_2Ni_3S_2$. Below 480° FeS, $(FeS)_2Ni_3S_2$, Ni_3S_2 and Fe-Ni **M** alone appear. The ternary condition diagram developed from cooling curves and microscopic investigations shows all the equilibria down to 480°. Magnetometric detns. of the magnetic transition temps. confirm the equil. relations detd. by thermal and microscopic methods. The condition diagram offers an explanation for the constitution of mat, but cannot explain the droplet form of troilite in meteors. Micrograms (9) of various Fe-Ni-S alloys are shown. J. Balozian

Influence of cadmium in a galvanizing bath. Heinz Bablik. *Metal Ind.* (London) **37**, 411–3(1930).—Cd exceeding 0.05% in a pure Zn bath increases the gain of wt., and decreases the bending qualities of the coating. O. M. Smith

Bend tests on hot-dipped zinc coatings measured with micrometer calipers. Wallace G. Imhoff. *Am. Metal Market* **37**, No. 247, 5, 9, 10(Dec. 24, 1930); cf. *C. A.* **25**, 272.—The complete results of all tests on galvanized iron pails are tabulated and lead to the conclusion that the lighter the Zn coating and the lower the temp. of the bath, the better the adherence to the base metal, the less peeling and flaking, and the more ductile the coating. For obtaining the best coating, a good grade of Zn must be used, and the proportion of alloys added to the bath is kept at a min. The time "through the flux" and the "submersion time" give a combined time of 24 secs. in the metal. Best results (pails from plant Z) were due to: (1) an open steel base, (2) proper pickling conditions, (3) good condition of the Zn in the pot, (4) proper fluxing conditions, (5) the right use of metal addns. to the bath, (6) the right bath temp., (7) the proper submersion time, (8) the proper withdrawal time, (9) the right production for the conditions set, and (10) the lightest wt. of metal deposited. A similar no. of reasons

for the poor deposits (pails from plant S) are given. Thirteen general conclusions are listed and a comparison of the deposits on pails from 4 sources is tabulated. W. H. B.

Corrosion phenomena. XVII. M. Straumanis' explanation of difference effect. A. Thiel. *Z. physik. Chem.*, Abt. A, **151**, 103–4(1930); cf. *C. A.* **24**, 5706; Straumanis, *C. A.* **24**, 4688.—Straumanis's theory of difference effect fails because it is based upon a phenomenon which cannot be explained with the help of existing theoretical considerations. T. believes that the earlier investigations of Centnerszwer and Straumanis have, therefore, no value in throwing light upon the difference. H. Stoertz

The corrosion of metals. H. Sutton. *Aircraft Eng.* **2**, 209–10(1930).—Intercryst. corrosion of duralumin is reduced to a min. when the alloy is heat-treated at a high temp., quenched in cold water and allowed to age at normal temp. Although rapid aging at elevated temps. is sometimes used for producing high-strength Al alloys, such practice has a harmful effect on corrosion resistance. Cold working increases slightly the corrosion tendency. The anodic oxidation process, in which an adherent film of oxide is produced by electrolytic oxidation of Al alloys in chromic acid soln., is valuable for protection of aircraft parts and also to show imperfections in the metal. Mg alloys, Cr Ni steels, and ordinary steels protected by oils, enamels, ZnO and Al paints are also used in the aircraft industry. H. F. Johnstone

Corrosion of light and extra light metals and alloys. I. R. Cazaud. *Rev. metal.* **27**, 285–9(1930).—A survey of the work done by different investigators. J. D. Gat

A simple method for the determination of atmospheric corrosion of protected metal tubes. W. Beck. *Korrosion Metallschutz* **6**, 201–4(1930).—The rate of decrease in the O_2 content of a closed cylinder was used as a measurement of the rate of corrosion of bare and of protected tubes in moist atms. H. F. Johnstone

The effect of cold working on the rates of corrosion of non-ferrous metals. Bernward Garre. *Korrosion Metallschutz* **6**, 200–1(1930).—The rate of attack of 10% HCl on pure Sn (99.99%) decreases with the extent of cold working. For Sn contg. small quantities of impurities (99.90%) cold working has the opposite effect. The rates of corrosion of Pb and Cu are also decreased by cold working. H. F. J.

Accurate corrosion test for chrome-iron alloys. Wm. R. Huey. *Iron Age* **126**, 1696–8(1930).—Pieces to be tested are fully immersed for five 48-hr. periods in HNO_3 (65% by wt.) contained in all-glass app. and maintained constantly at the b. p. A. W. Holmes

Effect of physical state of small quantities of copper upon rate of corrosion of lead by sulfuric acid. E. G. Mahin and E. J. Wilhelm. *Ind. Eng. Chem.* **22**, 1397–1404 (1930).—From the results of a metallographic study of the effect of small quantities of impurities upon the susceptibility of Pb to corrosion, it is shown that rapidly cooled Pb is improved in this respect by Cu in proportions up to 1%. If Pb is used under conditions where temps. of 100° are exceeded no more than 0.20% of Cu should be present as the destruction of the sheet is accelerated, since Cu falls out of solid soln. at this temp. Downs Schaaf

Testing ores. J. POHLIG A.-G. Ger. 509,850, Aug. 29, 1929. App. for removing a portion of each charge of ore excavated by a mech. scoop, for testing, is described.

Ore grading. RUDOLF WUNSCH and ERZ- UND KOHLE-FLOTATION G. M. B. H. Ger. 507,507, Mar. 23, 1927. Material fed into a hopper is carried upward by an inclined conveyor over an inclined sieve plate through which water under pressure is sprayed to carry away the lighter particles.

Treatment of complex ores by flotation and cyaniding. SHERWIN P. LOWE (to Roscoe H. Channing, Jr., Agent). Can. 305,961, Nov. 18, 1930. Complex ores are selectively floated in the absence of cyanide to give concentrates in which are contained most of the base metals that are cyanicides; the flotation tailings are treated with cyanide to recover the Au and Ag and the cyanide soln. is regenerated.

Flotation. G. O. ERCHIKOVSKII. Russ. 36,191, Nov. 30, 1928. Oxidized ores are first treated with colloidal Se or Te or their derivs. which produce a skin on the edges of oxidized metal crystals and this operation is followed by a treatment with dextrose or SO_2 as reducing agents.

Mineral froth flotation. WILHELM SCHÄFER. U. S. 1,788,331, Jan. 6. Finely divided sulfide ores such as those of Pb and Ag or Pb-Zn slimes are treated with a flotation soln. contg. Fe dithionate or Zn trithionate or other suitable stable metal salts of polythionic acids of the formula $H_2S_xO_6$. U. S. 1,788,332 describes a process of treating finely divided ZnS ore in the presence of other metalliferous ores, to effect sepn., by use of a flotation soln. contg. a metal salt (such as the Zn-Na or Na salt) of "hyposulfurous acid" ($H_2S_2O_4$), the ZnS to be sepd. being prevented from adhering to the froth.

Flotation and concentration of ores. SHERWIN P. LOWE (to Roscoe H. Channing, Jr., Agent). Can. 305,960, Nov. 18, 1930. Ores contg. Cu, Zn and Fe sulfides are sepd. by flotation into a Cu concentrate a Zn concentrate and a tailing carrying much Fe sulfide. The pulp during the Cu flotation is maintained at an alky. of from 0.01 to 0.15 lbs. CaO per ton of water, and during the Zn flotation at an alky. of from 0.4 to 0.7 CaO per ton of water, and during the retreatment of the Zn concentrates the pulp is maintained at an alky. of from 0.8 to 1.10 lbs. CaO per ton of water.

Flotation compound. WILLIAM A. DOUGLASS (to E. I. Du Pont de Nemours and Co.). Can. 305,435, Nov. 4, 1930. Flotation agents of the general formula ROC(:S)-SC(:O)OR′, in which R and R′ are alkyl, are specified.

Separating granular ores, etc., by an ascending water current. BAYERISCHE BERG-, HÜTTEN- UND SALZWERKE A.-G. Ger. 506,948, Dec. 16, 1925.

Pneumatic ore separator. OLIVER C. PATTON and JOHN G. RAWLINS. U. S. 1,787,75 , Jan. 6.

Washers for ores, etc. ANTOINE FRANCE. Ger. 509,245, Sept. 7, 1927. Automatic control means is described for app. of the kind in which the material is carried by a stream of water through a trough having an opening in the bottom for the discharge of the heavier particles.

Metals from their ores. CARL GOETZ. Fr. 686,782, Dec. 17, 1929. Metals are obtained from S-contg. ores by mixing the ores with finely ground coal or lignite or other substances which yield hydrocarbons on heating such as mineral oils, and finely ground $FeSO_4$ and, if necessary a little lime. The mixt. may be made into briquets and is heated to about 700°, when H_2S is evolved and the metal formed. The $FeSO_4$ acts as a catalyst. The hydrocarbons may also be introduced into the furnace in the gaseous form.

Reducing ores such as those of iron. JOHN W. HORNSBY (to Granular Iron Co.).

U. S. 1,786,999, Dec. 30. The ore is fed to a preheating cylinder while a slightly oxidizing atm. is maintained in its feed end and a non-oxidizing or reducing atm. at the discharge end, with introduction of a reducing agent such as granulated coal and of a stream of fuel such as pulverized coal and air, and the air is isolated from the charge being reduced by the fuel. App. is described.

Reducing carbon dioxide. Bo M. S. KALLING and CARL VON DELWIG. Ger. 508,010, Dec. 8, 1929. Gases contg. CO_2 are brought into contact with electrically heated C in a rotary oven fitted with electrodes. The whole or a part of the C may be finely subdivided. The method is applicable in regenerating gases for use in the *reduction of Fe ores.* App. is shown.

Iron ore treatment. EISEN- UND STAHLWERK HOESCH A.-G. Ger. 508,966, June 1, 1924. Fe ore is treated simultaneously with C and an O or O-enriched air blast in a converter.

Iron-ore agglomerates for blast furnaces. SOC. ANON. BELGE D'AGGLOMÉRATION DE MINERAIS. Belg. 367,556, March 31, 1930. Before calcining the powdered material contg. Fe, one or more substances contg. the P and Ca required for the production of open-hearth iron are added.

Treating titanium ores. I. G. FARBENIND. A.-G. (Heinrich Plaut, inventor). Ger. 508,110, May 7, 1927. The mixt. obtained by opening up Ti ores in the usual way with H_2SO_4 is treated with the sulfate or other salt of an alkali metal or NH_4 in order to convert the Ti into a titanium-alkali or -ammonium sulfate. The double sulfate is more stable to heat than $Ti(SO_4)_2$, and the mixt. may accordingly be warmed until all the Ti has dissolved and then filtered and cooled to cryst. the double sulfate. Addnl. details and an example are given. Cf. *C. A.* 25, 480.

Zirconium ores. KALI-CHEMIE A.-G. (Friedrich Rüsberg and Paul Schmid, inventors). Ger. 509,514, Dec. 14, 1926. Zr ores are disintegrated by heating to glowing with lime and earth-alkali oxide, carbonate or hydroxide to form a good flux. The process is preferably carried out in a rotary reverberatory furnace in the presence of steam. In the example, ore contg. 75% ZrO_2 and 15% SiO_2 is heated with fluorspar and $CaCO_3$ to 1200° in a tube furnace.

Metallurgy of sulfide ores. AARON B. BAGSAR. Can. 306,638, Dec. 16, 1930. Sulfide ores are chlorinated at a high temp. to volatilize the resulting chlorides and the volatilized chlorides are reduced with H.

Conversion of mineral carbon occurring in precious-metal ores from an active to a passive state. RALPH H. MCKEE. Can. 306,685, Dec. 16, 1930. Graphitic Au-bearing ore is ground in an aq. soln. of SO_2 to cyaniding fineness and exposed to the action of the SO_2 for 1/4 hr. to convert the graphite from an active to a passive state. The soln. is removed and the ore washed with water or an alk. soln. such as lime water, NaOH or Na_2CO_3 or corresponding K compds. before the ore is cyanided.

Semicircular trough and associated apparatus for amalgamating gold sands and ores. CHARLES S. WHITE (15% each to James E. Ogden and WM. J. Scheuss). U. S. 1,787,923, Jan. 6. Structural features.

Apparatus for dead-roasting finely granular or pulverulent ores, etc. BALZ-ERZRÖSTUNG G. M. B. H. Ger. 509,306, Dec. 4, 1926.

Water-removing centrifuge with a conical sieve drum for dressing ores, fuel, etc. HEINRICH KOPPERS A.-G. Ger. 507,892, Sept. 6, 1929.

Lignite coke. BUDERUS'SCHE EISENWERKE. Ger. 506,821, May 11, 1927. Lignite coke is rendered suitable as the reducing agent for blast furnaces by briquetting it with finely divided ores.

Slag. ADDISON H. BEALE, HERMAN A. BRASSERT and FRED WILLE (to A. M. Byers Co.). Can. 305,138, Oct. 28, 1930. A molten slag for manuf. of wrought Fe is prepd. by melting materials contg. Fe oxides and silicates in a hearth furnace in a non-reducing atm.

Apparatus for centrifugal casting of metal articles such as iron pipe. JOHN A. BYERS and MICHAEL C. SMOTZER (to Centrifugal Pipe Corp.). U. S. 1,787,567, Jan 6. Structural features.

Facing composition for foundry sand molds. BENJAMIN F. WALLACE. U. S. 1,787,964, Jan. 6. A facing compn. comprises a dry mixt. contg. a major proportion of a carbonaceous dust such as gas retort coke, the particles being coated with a deflocculating agent such as dextrin, gum arabic or gelatin and being intimately mixed with a highly colloidal clay such as bentonite.

Molds for metallic castings. I. G. FARBENIND. A.-G. Fr. 687,960, Nov. 2, 1929. The molds are made wholly or partially of porous metal by compression and heating

of metallic powder. The powder may be obtained by thermal decompn. of the carbonyl compd. of the metal.

Metal molding trough. Société électrométallurgique de Montricher. Ger. 506,523, Dec. 29, 1926.

Aluminum. Oscar M. Henriques and Thomas A. Thomsen. Fr. 688,563, Jan. 20, 1930. Al and Si are sepd. from Al silicates, with a view to getting metallic Al or Al compds., by treating the silicates with a gaseous chlorinating agent contg. H in the free or combined state at a temp. such that the silicate is partially or completely transformed to $AlCl_3$, which is volatilized, and SiO_2.

Alumina. Colloïd-Chemische Forschungs A.-G. (Eugen Herzfeld and Hans Walker, applicants in Switzerland). Fr. 687,725, Jan. 6, 1930. Bauxite or other ores contg. Al are heated with concd. H_2SO_4. The sulfate is dissolved in water and $Al_2(SO_4)_3$ is pptd. free from Fe by adding alc. The $Al_2(SO_4)_3$ is transformed to Al_2O_3 by roasting.

Refining lead. Henry Harris. Ger. 507,769, June 24, 1925. See *C. A.* **21**, 219 (Brit. 244,424).

Refining copper. Victor E. Legg (to The Western Electric Co., Inc.). Can. 306,406, Dec. 2, 1930. Non-embrittling Cu of a high degree of ductility is obtained by heating the Cu in a solid state for 1 hr. in the presence of charcoal to 1000°, cooling, cold-working, and again heating in the presence of fresh charcoal for an hr. at 1000°.

Copper and zinc. Metallgesellschaft A.-G. and Hochofenwerk Lübeck A.-G. (Otto Gerlich, inventor). Ger. 508,508, Apr. 26, 1927. Cu and Zn are obtained from the washings of chlorinated roasted ores by employing $Zn(OH)_2$ as the pptg. agent for the Cu. The Cu ppt. is redissolved by adding $FeCl_2$ soln., which causes the Fe to be pptd. as hydroxide. The Cu is pptd. from the filtered liquid by Fe, and the lye used as $FeCl_2$ lye for dissolving further Cu ppt. The Zn is pptd. from the decoppered lye by $Ca(OH)_2$ as $Zn(OH)_2$ and part may be used for pptg. the Cu as above.

Removal of magnesium and calcium from zinc-bearing material. Walter O. Borcherdt (to The New Jersey Zinc Co.). Can. 307,194, Dec. 30, 1930. Unroasted blende concentrate contg. substantial amts. of Mg and Ca as impurities is treated with H_2SO_4 in aq. soln. to cause complete conversion of the Mg and Ca into sulfates but insufficient to cause the conversion of appreciable amts. of the ZnS into $ZnSO_4$. The $MgSO_4$ and $CaSO_4$, which are present as minute suspended particles, are removed by washing.

Extracting zinc, etc. Duisberger Kupferhütte (Karl Mattenklodt and Hans Schramm, inventors). Ger. 508,071, Sept. 19, 1925. This relates to the treatment of impure Zn lyes obtained, *e. g.*, from cupriferous pyrites roasted under chloridizing conditions. The lyes are divided into 2 parts, one of which is treated in known manner to ppt. Ag, Cu, Fe, As, etc., as hydroxides or carbonates, and then further worked up, *e. g.*, to lithopone. The pptd. impurities from the first part are added to the second part, and the latter is then worked up to recover Ag, Cu, etc., in known manner.

Tin. Edgar A. Ashcroft. Ger. 508,342, May 17, 1928. See Brit. 295,805 (*C. A.* **23**, 2148).

Separating nickel and cobalt. Walter Savelsberg. Fr. 688,491, Jan. 20, 1930. See Ger. 504,437 (*C. A.* **24**, 5281).

Fused uranium. John W. Marden and Harvey C. Rentschler (to Canadian Westinghouse Co., Ltd.). Can. 305,418, Nov. 4, 1930. Anhydrous K U fluoride is reduced by Mg *in vacuo* at a temp. sufficient to remove the products of the reaction and fuse the U. The metallic U may be formed into suitable shapes for x-ray targets, wire, filaments and electrodes.

Blast furnaces. H. A. Brassert & Co. Fr. 688,204, Jan. 14, 1930.

Blast furnace with utilization of gaseous products of combustion. M. I. Fyuner Russ. 20,762, Nov. 9, 1927. Constructional details.

Open-hearth furnace. M. F. Morozov and D. I. Zelenskii. Russ. 59,796, Dec. 7, 1929. Structural details.

Open-hearth furnaces. Otto Reiner. Fr. 686,983, Dec. 20, 1929. Means for deflecting the hot and outlet gases is described.

Siemens-Martin furnaces. Ferdinando Fiorelli. Fr. 687,792, Jan. 7, 1930.

Rotating furnace for fusing metals. Carl Brackelsberg. Fr. 687,643, Jan. 3, 1930.

Rotating furnace for fusing metals. Compagnie du chemin de fer de Paris à Orléans and Louis J. Audo. Fr. 688,146, Jan. 13, 1930.

Reverberatory furnace for heating and reducing fused ores. Hans Christian. Ger. 507,963, Feb. 12, 1925. Details of arrangement.

Kiln suitable for roasting zinc blende, etc. GEORG BALZ (to Balz-Erzrostung G. m. b. H.). U. S. 1,787,504, Jan. 6.

Furnace for heating metal articles. WELLMAN SMITH OWEN ENGINEERING CORP., LTD., and E. W. PLUMLEY. Brit. 334,006, July 2, 1929.

Furnace suitable for annealing metal sheets. WM. F. DETWILER. U. S. 1,787,307, Dec. 30.

Muffle for annealing metal. Soc. ROBERT ZAPP. Fr. 687,670, Jan. 4, 1930.

Apparatus for annealing metal objects with recovery of heat. AKT. GES. BROWN BOVERI & CIE. Fr. 687,720, Jan. 6, 1930.

Furnace, quenching vat and associated apparatus for case-hardening metal articles. HEYMAN ROSENBERG. U. S. 1,786,508, Dec. 30. Structural features.

Case-hardening metals. PORTER W. SHIMER and EDWARD B. SHIMER. Can. 305,281, Nov. 4, 1930. A molten bath for case-hardening metals consists essentially of a mixt. of $CaCl_2$, NaCl and a minor proportion of $Ca(CN)_2$.

Apparatus (with troughs and stirrers) for heat treatment of metalliferous materials with a counter current of hot gases. RICHARD A. STOKES and EDWIN G. L. ROBERTS (to E. M. S. Industrial Processes, Ltd.). U. S. 1,788,351, Jan. 6. Various details of construction and procedure are described.

Heat treatment of rails. Soc. ANON. D'OUGRÉE-MARIHAYE. Belg. 368,181, March 31, 1930. The pearlite-ferrite structure is changed to a sorbitic structure, having a higher resistance to wear, by spraying water at a predetd. temp. on the working part of the rail as it leaves the rolling mill, the surface that is sprayed being limited by means of plates of a poorly conducting material which is resistant to high temps. and to water.

Hard metal compositions. EMERY G. GIBSON (to The Canadian General Electric Co., Ltd.). Can. 305,847, Nov. 18, 1930. Hard, strong metal compns. (suitable for cutting tools, wire drawing dies, etc.), consisting mainly of W, but contg. appreciable amts of C and Co, are made by mixing the W, C and Co in powd. form and uncombined with one another and consolidating the mixt. into a hard strong body by the application of heat and pressure.

Smelting vessel for making alloys or purifying metals by crystallizing. METALLHÜTTENWERKE SCHAEFER & SCHAEL A.-G. and OTTO NAESER. Ger. 509,307, Aug. 7, 1927. The vessel has a cylindrical lower part and an inverted frusto-conical upper part.

Working metals and alloys. SIEMENS & HALSKE A.-G. (Bruno Fetkenheuer, inventor). Ger. 508,436, Jan. 14, 1928. Metals and alloys that become more brittle with increase in temp. are strongly cooled before rolling, hammering, pressing, drawing or other mech. treatment, so that the temp. immediately after the treatment does not exceed about 10°. The metal may also be heated nearly to the m. p. between two mech. treatments. The treatment of Al-Ni alloys is referred to.

Refining alloys. ERWIN HOFMANN. Fr. 686,810, Dec. 18, 1929. An agent for refining metal alloys used for making printing characters is composed of a reducing mixt., *e. g.*, a mixt. of wood charcoal and borax and an alk. earth sulfide, including MgS. The constituent may be distributed in a molten mass of colophony, and $NaHCO_3$ may be added to make the mass spongy, after which it is ground.

Alloys. WILLOUGHBY S. SMITH, HENRY J. GARNETT and JOHN A. HOLDEN. Ger. 508,199, Jan. 5, 1927. See Brit. 278,454 (*C. A.* 22, 2546).

Alloy. HANS KANZ. Fr. 687,778, Jan. 7, 1930. An alloy suitable for acoustic instruments contains, *e. g.*, Cu 59.3, Sn 6, Zn 34, Ni 0.5 and Si 0.2 parts.

Alloys. THE INTERNATIONAL NICKEL CO., INC. Fr. 688,358, Jan. 16, 1930. Alloys of Fe, Ni and Cr which are resistant to corrosion and which may be worked in the cold contain Cr 4–30 and Fe over 62%, the limits of Cr and Ni being governed by the following: when the content of Cr rises to 10%, the percentage of Ni passes the no. obtained by subtracting the percentage of Cr from 19 and multiplying the result by 1.9; when the content of Cr is between 10 and 12%, the percentage of Ni is higher than the no. obtained by subtracting the content of Cr from 27, and, lastly, when the content of Cr is between 15 and 30%, the content of Ni is above the no. obtained by subtracting the content of Cr from 39 and multiplying the result by 0.5. Fr. 688,359 describes similar alloys in which the Cr content is 8–25 and the Ni 12–19%. The C content is below 0.3, and the max. amt. of other elements such as Si or Si and Mn is 5%.

Alloys. F. POMIANKOWSKI. Belg. 368,006, March 31, 1930. *Ni bronze* is obtained by melting 70–5% Cu in a crucible with 13–6% Ni and 0.04–0.08% Fe, then adding 6–9% Zn and 0.2–0.5% Al, removing from the fire, and adding 0.3–0.7% Pb and 0.02–0.06% P as Zn phosphide. It is suitable for taps, valves, equipment for the

chem. industries and parts for marine machinery, etc. Belg. 368,007 covers the prepn. of a *Zn-Al alloy* by melting 0.5–3.5% Cu and 0.1–1.5% Fe in a crucible, adding 2.7–3.8% Al followed by 88–95% Zn, and, after removing from the fire, adding 0.5–2.2% Sn and 0.5–2.8% Pb. Belg. 368,008 covers a *Pb-Al alloy* prepd. by melting in a crucible 0.04–0.08% Sb, adding 0.8–0.15% Al and then 0.5–0.12% Sn, removing from the fire and adding 95–9% Pb. It is suitable for the manuf. of pipes and roofs. Belg. 368,009 provides for the manuf. of *ferro-bronze* by melting 55–68% Cu with 0.5–3% Fe, adding 32–40% Zn, removing from the fire and adding 0.5–2% Sn. It is suitable for valves and machine parts as a substitute for bronze.

Alloy for bearings, packings, etc. KARL L. ACKERMANN. Ger. 508,154, Mar. 24, 1926. Pb 10–30, Sn 2–7, Ni and Co (together) 1–3, P up to 1, As up to 1%, the remainder being Cu. Part of the P may be replaced by Mn.

Inoxidizable alloy. WALTER HADDON and JACOB WINFIELD. Fr. 688,299, Jan. 15, 1930. An inoxidizable alloy contains, *e. g.*, Cu 89–90, Al 9–10, Ni about 1, and Mn 0.25–0.4%. Ni may be replaced partly or wholly by Fe.

Magnetic alloy. GUSTAF W. ELMAN (to The Western Electric Co., Inc.). Can. 306,812, Dec. 16, 1930. A magnetic alloy which comprises Ni 9–81, Co 4–80 and Fe 5–45% is characterized by a permeability that varies less than 5% over a range of flux densities from zero to 500 c. g. s. units.

Choke-coil frame of special alloy. ABRAHAM B. DIBNER. U. S. 1,786,604, Dec. 30. A choke coil suitable for use with high-tension transmission lines has a frame of low-cond. bronze which may contain Cu 90, P 0.1, Ni 8 and Si 1.9%.

Thermal treatment of aluminum or its alloys. ERFTWERK A.-G. Ger. 508,155, Apr. 8, 1924. Sheets of Al or alloys contg. above 80% of Al are heated to a temp. between 500° and 800° after rolling, etc. The time of heating varies with the thickness of the sheet, a sheet of 1 mm thickness being heated for 1 min. The treatment results in a finely granular recrystn. structure. Cf. *C. A.* **24**, 820.

Aluminum alloy. KARL SCHMIDT G. M. B. H. Fr. 688,076, Jan. 13, 1930. An alloy suitable for pistons contains Al about 70, Si 15–25 and 0.5–3% of each of the following metals: Mn, Cr, Co and Ni, and finally, 0.5–1% of Ti or Mo or 0.5–3% of Sb.

Aluminum-copper-nickel alloys. THE INTERNATIONAL NICKEL CO., INC. Ger. 508,198, June 4, 1926. See Brit. 253,879 (*C. A.* **21**, 2456).

Improving copper-aluminum alloys. BERG-HECKMANN-SELVE A.-G. ZWEIGNIEDERLASSUNG CARL BERG. Ger. 508,603, Oct. 21, 1928. The Cu-Al alloys are given an Fe, Co and (or) Ni content greater than the Al present, and heated to glowing, chilled and mechanically deformed by rolling, etc. Alloys mentioned in examples contain 89% Cu, 8% Ni and 3% Al or 92.5% Cu, 5% Ni and 2.5% Al.

Separating antimony from lead alloys. ALBERT HANAK. U. S. 1,786,908, Dec. 30. The alloy is treated with an alkali metal such as Na to form a less fusible alloy of Sb and alkali metal which is dissolved in caustic alkali in the molten state, the caustic melt is sepd. and treated with water to sep. metallic Sb.

Lead alloys. REGINALD S. DEAN (to the Western Electric Co., Inc.). Can. 306,610, Dec. 9, 1930. Pb alloys are produced by alloying 1% of Ca therewith and aging the alloy to cause dispersion of minute particles contg. the Ca uniformly throughout the Pb.

Refining lead-bismuth alloys. JOHN J. FINGLAND, ALEXANDER D. TURBULI and PETER F. MCINTYRE (to The Consolidated Mining and Smelting Co. of Canada). Can. 306,082, Nov. 25, 1930. Pb-Bi alloys contg. 20–40% Bi are refined by heating the crude charge to 1000°F., adding 1.5–3% Zn, agitating and allowing the molten charge to cool slowly by successive stages, removing the solidifying metals and crusts at each stage and transferring the crusts to hotter stages and finally to a stage heated to 1100° F., where after remelting they are removed and separately treated to recover the values. The liquid metal is transferred from the hottest stage to the initial stage for retreatment with a succeeding charge. The residual liquid metal of each stage is successively transferred to stages of lower temp. and the procedure continued until a low-freezing residual Pb-Bi alloy is obtained, substantially free from other metals.

Alloys of magnesium and aluminum. COMPAGNIE DE PRODUITS CHIM. ET ELECTROMÉTALLURGIQUES ALAIS, FROGES ET CAMARGUE. Fr. 686,855, Mar. 8, 1929. Alloys of Mg and Al, with or without other metals such as Zn or Cu, are improved by introducing into the alloys metals having a high affinity for N such as Ti, Zr and B, preferably in the proportion of 0.05–1%. These metals may be introduced in the form of a double fluoride of an alkali metal and the metal to be introduced.

Magnesium and its alloys. I. G. FARBENIND. A.-G. Fr. 687,274, Dec. 26, 1929. Particles of Fe or like impurities in suspension in Mg or its alloys are removed by treat-

ing the metal in fusion with purifying substances such as Si and Mn which sep. from the fusion bath by a primary crystn., after soln. by increasing the temp.

Protecting jets of magnesium or its alloys from oxidation while pouring in molten condition. ADOLF BECK, WALTER SCHMIDT and GUSTAV SCHREIBER (to I. G. Farbenind. A.-G.). U. S. 1,788,185, Jan. 6. Mech. details of pouring to minimize contact with the air.

Heat treatment of magnetic iron and nickel alloys. GUSTAF W. ELMEN (to Western Elec. Co.). U. S. 1,788,017, Jan. 6. For increasing the permeability, at magnetizing forces of less than 0.2 gauss, of a magnetic alloy formed mainly of Ni and Fe, the material is heated to at least 1100° but below the m. p. of the alloy and cooled at such a rate as to effect annealing.

Steel alloy resistant to hot gases and vapors. BENNO STRAUSS (to Fried. Krupp A.-G.). U. S. 1,787,403, Dec. 30. Vessels adapted to be used in the conversion of oil residues to gasoline are formed of an alloy which has been heated above the crit. point Ac3, quickly cooled, and reheated to about 600–650°, the alloy being a steel alloy contg. C 0.1–0.2, Cr 5–12 and V 0.2–0.5%.

"Stable-surface" alloy steel. RALPH P. DE VRIES (to Ludlum Steel Co.). U. S. 1,788,281, Jan. 6. An alloy steel which is resistant to scaling at high temps. contains Cr about 1%, Si about 2%, Cu about 1% and C less than 1%, the balance being mainly Fe. Cf. *C. A.* **24**, 4502.

The dephosphorization of cast iron in the converter. P. RIES and F. BICHEROUX. Belg 369,673, May 31, 1930. Before powdered CaO is added to the converter, a basic slag is formed in the converter, either by adding a limited amount of CaO in lumps before the introduction of the charge of Fe, or by retaining in the converter or putting back into it part of the slag from a preceding operation. Cf. *C. A.* **24**, 2104.

Cast iron. THE INTERNATIONAL NICKEL CO., INC. Fr. 687,677, Jan. 4, 1930. Gray cast Fe having a high resistance to traction is made by melting a charge composed, *e. g.*, of 60% of steel, 12% coke and the rest scrap Fe. The mass is cast in a casting ladle and graphite is sepd. by adding 2.5–7% of a mixt. of Si and Ni, the Ni being 1–5%. Cf. *C. A.* **24**, 3480.

Iron powder. HARTSTOFF-METALL-A. G. (HAMETAG). Fr. 686,689, Dec. 16, 1929. Fe powder is made by grinding the metal and heating it to redness in an atm. free from O, *e. g.*, an atm. of NH_3 and submitting it to a further mech. treatment.

Refining iron and steel. SIGURD WESTBERG. U. S. 1,786,806, Dec. 30. See Can. 301,389 (*C. A.* **24**, 3982).

Steel. WINFIELD C. HAMILTON and CLARENCE E. SIMS (to The American Steel Foundries). Can. 306,054, Nov. 25, 1930. A high-Mn pearlitic steel contains Si 0.20–1.50, C 0.20–0.60 and Cu 0.50–2.00%. Cf. *C. A.* **24**, 1612.

Steel. WINFIELD C. HAMILTON and CLARENCE E. SIMS (to The American Steel Foundries). Can. 306,055, Nov. 25, 1930. A high-Mn pearlitic steel contains Si 0.20–1.50, C 0.20–0.60 and Cr 0.50–2.00%. Cf. *C. A.* **24**, 1612.

Heat-treating steel. FRANK A. FAHRENWALD. U. S. 1,787,977, Jan. 6. Steel is heated quickly to a temp. above its crit. temp. in a "limitedly oxidizing" atm. contg. H_2O, CO, CO_2 and N but substantially devoid of free O, and is then cooled in such an atm. to a temp. which is both below the crit. temp. and below any temp. at which scale would form from reaction with free atm. O.

Operating apparatus for carburizing steel parts. RICHARD KAIER (to Singer Mfg. Co.). U. S. 1,786,951, Dec. 30. Various details of app. and mech. features of operation are described.

Apparatus for pickling steel sheets, etc. CHARLES T. HAINES. U. S. 1,787,820, Jan. 6. Structural features.

Protective treatment of aluminum or aluminum alloy. ARTHUR ARENT (to Arthur Arent Laboratories, Inc.). Can. 305,643, Nov. 11, 1930. Al surfaces are treated with a concd. NaCl soln. of $SbCl_3$.

Coating metals. OTTO HERTLING. Ger. 507,858, Sept. 29, 1928. Food containers, etc., of Fe or metal are given a galvanic coating of Sn on the inside, and a hard coating of Ni, Cr, etc., on the outside. An intermediate layer of Cu or brass may be present.

Coating with metals applied in the vapor phase. AMERICAN MACHINE & FOUNDRY CO. Ger. 508,375, April 1, 1926. See Brit. 276,390 (*C. A.* **22**, 2352).

Coating iron articles with tin or lead. MATUSCHEK METALLINDUSTRIE GUSTAV RADTKE. Ger. 508,043, Mar. 30, 1928. See Brit. 308,804 (*C. A.* **24**, 331).

Metal coatings. VEREINIGTE ALUMINIUM-WERKE A.-G. Ger. 508,554, Aug. 14, 1928. Light metals or alloys are given a corrosion-resistant coating by using metals or

alloys of m. p. below the critical or annealing temp. of the metal to be coated. Thus, a light-metal alloy may be coated galvanically with Cd, Sn or Cu.

Stainless metal coatings. N. V. MAATSCHAPPIJ TOT EXPLOITATIE VAN DER PARKER OCTROOIEN "PARKER RUST PROOF." Ger. 508,785, Apr. 14, 1927. A stainless Fe-Mn coating is given to Fe and steel objects by immersing the latter in a bath contg. MnO_2, H_3PO_4 and Mn phosphates, the proportion of phosphates being adjusted so that the $MnPO_4$ content of the final stainless coating is at least $^1/_3$ the $FePO_4$ content.

Metal-coating material. JAMES H. GRAVELL. Can. 306,870, Dec. 23, 1930. A material for coating metal consists of an admixt. of naphtha and kerosene, stearin pitch, H_3PO_4 and lampblack.

Metal-coating composition. ROBERT R. TANNER and VAN M. DARSEY (to The Parker Rust-Proof Co.). Can. 306,997, Dec. 23, 1930. Fe or Zn is treated with a hot, weak soln. of phosphates of Mn, Fe and Cu, the soln. being substantially free from acids stronger than phosphoric or salts thereof. After washing and drying, the surfaces may be coated with paint or enamel.

Apparatus for galvanizing or tinning articles such as pails or buckets, etc. JOHN CARROLL (to Reeves Mfg. Co.). U. S. 1,787,141, Dec. 30. Structural features.

Bearing metal. ROBERT J. SHOEMAKER (to The S. and T. Metal Co.). Can. 305,499, Nov. 4, 1930. A Pb alloy contains Li 0.01–0.05, Na 0.2–0.8, Ca 0.1–0.7, Al 0.02–0.1 and Pb to make up 100%. Cf. *C. A.* 24, 1612.

Magnetic material. GUSTAF W. ELMEN (to The Western Electric Co., Inc.). Can. 307,225, Dec. 30, 1930. A magnetic material comprises Ni 78.5, Fe 16–18.5 and Mo 3–4%. Cf *C. A.* 24, 4364.

Treatment of rare refractory metal powders. FRANK H. DRIGGS and WILLIAM C. LILLIENDAHL (to Canadian Westinghouse Co., Ltd.). Can. 305,425, Nov. 4, 1930. Ta oxide is mixed with powd. Ta metal in sufficient amt. to react with and reduce the C content of the metal to below 0.5%. The mixt. is compacted by heat-treating *in vacuo* to effect reaction and evacuate the C oxide product prior to sintering the powd. metal. The mixt. is then sintered *in vacuo* at a temp. below the actual fusion temp.

Joining aluminum to iron. HENRY DIETERLEN. Fr. 688,569, Jan. 20, 1930. Al is joined to Fe by first treating Fe to obtain a diffusion of Al into the Fe and then joining the Al by casting or soldering.

Apparatus and features of operation for electric arc welding. KARL STROBEL (to A. O. Smith Corp.). U. S. 1,787,600, Jan. 6.

Welding magnesium and its alloys. I. G. FARBENIND. A.-G. (Hubert Altwicker, inventor). Ger. 508,352, Apr. 27, 1929. A thin sheet or foil of a metal forming mixed crystals with Mg is laid between the parts to be joined, which are heated and then united under hydraulic pressure. Zn foil of 0.03 mm. thickness is suitable.

Welding flux for magnesium and its alloys. I. G. FARBENIND. A.-G. (Ernst de Ridder and Wilhelm Neuhaus, inventors). Ger. 509,024, June 13, 1928, and 509,025, June 8, 1929, addn. to 509,024. A salt mixt. is used comprising LiCl 0.8–14 and KF 1 part or alternatively LiBr 1–5 and KF 1 part. Small quantities of other alkali halides may be included.

Flux for welding copper to iron or steel. EMANUEL J. SCHAFFNER, NORA E. SCHAFFNER and KATIE E. FIELD. U. S. 1,787,553, Jan. 6. Cu 10, Zn 25 and Pb 1.25 parts are mixed while in a molten state, cooled and comminuted, and this product is further mixed with borax and $CuSO_4$.

Welding electrodes carrying flux, adhesive and insulating materials. MAURICE LEBRUN and JEAN BRILLIE (to La Soudure Autogene Française). U. S. 1,788,510, Jan. 6. Structural details.

Welding electrodes. R. D. THOMPSON and G. C. MILLS. Brit. 333,985, June 11, 1929. Electrodes or welding rods are coated with a compn. comprising Al or an Al alloy and AmOAc. Rods of high-speed tool alloy thus prepd. may be used for welding, tipping or depositing on C tool steel shanks, and rods of high-m. p. alloy of W, Cr or Mo may be deposited on other metals for elec. contact points. The electrode also may carry a flux such as may be formed from boric acid 15, fluorspar 15, Fe oxide 10, lime 50 and Mn oxide or carbonate 10 parts, finely ground and mixed with linseed oil and rosin.

Welding rod. FRANK A. FAHRENWALD (to The American Manganese Steel Co.). Can. 306,931, Dec. 23, 1930. A cast welding rod consists of Fe 75–95, Cr 1–15, Mo 1–8 and C 1–3%.

Welding rod. FRANK A. FAHRENWALD (to The American Manganese Steel Co.). Can. 307,129, Dec. 30, 1930. A welding rod contains Fe 80–80, Mn 10–15, Ni 1– and C 0.5–1.5%.

Soldering flux. JAMES H. GRAVELL. Can. 305,783, Nov. 18, 1930. A soldering flux comprises $ZnCl_2$, butyl alc., aniline-HCl and petrolatum.

10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

Syntheses with β,β′-dichlorodiethyl ether. I. Derivatives of tetrahydropyran. CHARLES S. GIBSON AND JOHN D. A. JOHNSON. *J. Chem. Soc.* 1930, 2525–30.—$(ClCH_2CH_2)_2O$ (I), m. −24.5°, b_{12} 66°, b_{18} 70°, b_{744} 176°, with a large excess of NaI in Me_2CO, gives the β,β′-diiododiethyl ether (II), b_{10} 123.5–4°. I, $CH_2(CO_2Et)_2$ and Na in EtOH, boiled 5 hrs., give Et tetrahydropyran-4,4-dicarboxylate, b_{12} 134–5°; hydrolysis with EtOH-KOH gives 81% of the acid, which loses CO_2 at 175–85°, giving 94.5% of tetrahydropyran-4-carboxylic acid (III), b_{18} 146–7°; *acid chloride*, b_{16} 85–6°; *Me ester*, b_{16} 80.5–1°; *Et ester*, b_{12} 82.5°; *amide*, m. 179°; *anilide*, m. 163°. I and $NCCHNaCO_2Et$ in EtOH, heated 3 hrs. and kept 12 hrs., give 33% of *Et 4-cyanotetrahydropyran-4-carboxylate*, b_{16} 125°; *free acid*, m. 160–2°; *amide*, m. 158°; heating at 180–200° for 1 hr. gives 66% of *4-cyanotetrahydropyran*, b_{10} 82–3°; this could not be reduced to the amine by Na in AmOH. I and $AcCHNaCO_2Et$ gave only a small amt. of high-boiling material. II gives a product b_8 122.5–3.5°, which, on hydrolysis, gives III, AcOH and a trace of a ketone. No results were obtained in the Friedel-Crafts reaction with I and C_6H_6 or between I and KCN. I, As_2O_3 and NaOH gave no condensation product.

C. J. WEST

Improved procedure for the preparation of nitromethane by Kolbe's synthesis. ABLL B. WANG AND CHAO-LUN TSENG. *Natl. Central Univ. Sci. Repts., Ser. A, Phys. Sci.* 1, 27–38(1930).—Addn. of H_3BO_3 in mol. quantities to the $NaNO_2$-$ClCH_2CO_2Na$ mixt. improves the yield of $MeNO_2$ to a max. of 58%. A mixt. of 50 g. $ClCH_2CO_2H$ with 100 g. ice was exactly neutralized with satd. NaOH; 36.5 g. $NaNO_2$ in 50 cc. water and 37.4 g. H_3BO_3 were added, the mixt. being shaken. With rising temp. distn. of $MeNO_2$ began at 80° and was completed by heating the mass to 110°. The crude product, 18.5 cc., yielded 18.7 g. of pure $MeNO_2$ on distn. Addn. of H_3BO_3 served to neutralize the generated $NaHCO_3$, which causes loss of $ClCH_2CO_2H$ through formation of glycolate.

K. H. ENGEL

Interaction between alkyl Grignard reagents and arsenic trichloride. WILFRED J. C. DYKE AND WM. J. JONES. *J. Chem. Soc.* 1930, 2426–30.—The app. and procedure used in the study of $SbCl_3$ (*C. A.* **24**, 2736) were used in this study. The chief product of RMgX and $AsCl_3$ is the AsR_3; some As is always liberated as a finely divided, brown powder. AsR_3 is less readily oxidized than the corresponding SbR_3; it combines immediately with Br and with I and its avidity for RX is much greater than that of the SbR_3. With Cl, $AsMe_3$ immediately bursts into flame. MeI (31 g.) and 13 g. $AsCl_3$ give 4.2 g. $AsMe_3$, b. 51–3°. EtBr (55 g.) and 13.8 g. $AsCl_3$ give 9 g. $AsEt_3$, b_{760} 8–9°. BuBr (69 g.) gives 10 g. $AsBu_3$ and 5 g. C_8H_{18}. Me_2CHCH_2Br (69 g.) gives 9 g. *triisobutylarsine*, b_{31} 119°, d_4^{25} 0.9590, n^{25} 1.4704, 1.4627, 1.4595 for F, D and C; 3 g. hydrocarbon was also obtained. Me_2CCl gave no arsine. AmBr (61 cc.) gives 12 g. $AsAm_3$, b_{10} 179–80° and 10 g. $C_{10}H_{22}$. *Tri-dl-β-methylbutylarsine* (*tri-dl-amylarsine*), b_{10} 160°, b_{20} 149°, d_4^{25} 0.9563, n^{25} 1.4772, 1.4696, 1.4665 for F, D and C, results in 7-g. yield from 76 g. of the alkyl bromide; there also results 10 g. of hydrocarbon. *Tri-γ-methylbutylarsine* (*triisoamylarsine*), b_{18} 167–8°, d_4^{25} 0.9504, n^{25} 1.4771, 1.4694, 1.4662 for F, D and C, results in 10-g. yield from 76 g. isoAmBr. *Tri-δ-methylamylarsine* (*triisohexylarsine*), b_5 158–60°, d_4^{25} 0.9309, n^{25} 1.4741, 1.4669, 1.4639 for F, D and C, results in 10-g. yield from 83 g. of alkyl bromide; 5 g. hydrocarbon was also formed. The av. at. refractivity for As, calcd. from the 4 new derivs. is: F, 12.21; D, 11.84; C, 11.69.

C. J. WEST

Action of magnesium on iodoform in ether solution. CHAO-LUN TSENG AND EDITH JU-HWA CHU. *Natl. Central Univ. Sci. Repts., Ser. A, Phys. Sci.* 1, 15–22(1930). —CHI_3 and Mg react readily in anhyd. Et_2O, giving C_2H_2 and $MgI_2{\cdot}2H_2O{\cdot}2Et_2O$. To a mixt. of 39.3 g. CHI_3 and 7.3 g. Mg turnings 200 cc. of dry Et_2O was gradually added at 0–30°, C_2H_2 being evolved during this stage. CH_2I_2, MeI, MeOH, CH_2O or HCO_2H could not be identified after addn. of H_2O. It is concluded that intermediate mono- or di-Mg compds. of CHI_3 were not formed, but only the tri-Mg compd., which reacted immediately with a second CHI_3. $CHCl_3$ and $CHBr_3$ did not react under the same conditions.

K. H. ENGEL

Suggested modifications of Mulliken's system for the identification of compounds of Order I. CHAO-LUN TSENG. *Natl. Central Univ. Sci. Repts., Ser. A, Phys. Sci.* 1, 1–3(1930).—It is proposed to rearrange the first 4 genera in the order aldehydes, acids, phenolic compds., carbohydrates. In applying the generic test for the latter group, M.'s 3 supplementary tests for the presence of phenols and acids may then be omitted. An addnl. preliminary test for water soly. (1 part in 50) and acidity is recommended. A soln. of 0.05 g. (or the decanted soln.) is tested for acidity with Congo red paper. If the substance is insol. it is placed in contact with the wetted indicator paper. Even acids as weak as stearic produce a color change. K. H. ENGEL

The condensation of acetone by sulfuric acid. D. TISHCHENKO. *Bull. soc. chim.* [4], 47, 1137–47(1930).—Much higher yields (up to 25% theory) of mesitylene than hitherto reported were obtained by mixing 1 vol. H_2SO_4 and 0.58 vol. H_2O, cooling, adding 1 vol. Me_2CO, standing at room temp. 24 hrs., then heating 2–3 hrs. on a water bath and steam distg. The high-boiling fraction of the mesitylene contains mesityl oxide, isophorone and a hydrocarbon thought to be $3,5\text{-}Me_2C_6H_3CH{:}CMe_2$. The residue in the original flask not volatile with steam is a liquid instead of a resin as when concd. H_2SO_4 is used. It contains some $2,4,5,7\text{-}C_{16}H_4Me_4$ and a little of a hydrocarbon, $C_{16}H_{20}$, partially identified as 2,4,5,5,7-pentamethyldihydronaphthalene by its yielding mellophanic acid by oxidation by dil. HNO_3 in a sealed tube. L. F. GILSON

The cracking of acetone under pressure and in the presence of zinc chloride. V. N. IPAT'EV, A. D. PETROV AND I. IVANOV. *Ber.* 63B, 2806–12(1930).—The condensate of acetone (300–325° under pressure, $ZnCl_2$ present) contains a number of hydrocarbons, mesitylene, mesityl oxide, isophorone and xyletone. The hydrocarbons are sepd. by acid treatment after distn. over Na. Unsatd. hydrocarbons are detd. from the I no. and by action of 80–100% H_2SO_4; the aromatic compds. by nitration and action of fuming H_2SO_4. The unsatd. hydrocarbons of the benzene fraction belong to the olefins; those of the kerosene fraction to the diethylene series. Efforts to sep. the unsatd. hydrocarbons by Hg were not entirely successful. The naphthene hydrocarbons are subordinate and cannot be detd. by the aniline point. MARY E. LEAR

Ammines. IV. Cuprammine salts of monobasic acids. HERBERT J. S. KING. *J. Chem. Soc.* 1930, 2307–19; cf. *C. A.* 24, 1380.—Although a no. of ammines of Cu contg. fewer than 4 mols. of the base in the coordination complex have been described no evidence has been adduced as to whether the acid radicals are ionized. A study has been made to ascertain whether acid radicals can replace mols. of NH_3 or C_5H_5N, with formation of acido-ammines sufficiently stable for their existence to be detected in aq. soln. $Cu(OAc)_2$ in NH_3-EtOH treated with NH_3 for 1 hr., gives $[Cu(NH_3)_4](AcO)_2$, blue plates, m. 194°; exposure to the air for 2 days gives the violet diammine, m. 180° (decompn.), decompd. by even a little H_2O and giving with KSCN 60% of the grayish blue diamminocupric thiocyanate. $Cu(HCO_2)_2.4H_2O$ and liquid NH_3 give *tetrammocupric formate* (I), deep blue, m. 157° (decompn.). I and excess HCO_2Na in H_2O liberated NH_3; the resulting soln. with NH_4 picrate gives *decamminotricupric picrate*, $Cu_3(NH_3)_{10}(C_6H_2O_7N_3)_6$, green needles, which does not lose NH_3 when heated 3 hrs. at 100°. I, standing over soda-lime for 3 days, gives *diamminocupric formate*, Co blue, m. 152° (decompn.), decompd. by H_2O. $Cu(HCO_2)_2$ in NH_4OH for 2 weeks gives the tetrammine. Heating $Cu(HCO_2)_2$ and C_5H_5N to boiling gives *di-pyridinocupric formate hydrate*, $[Cu(C_5H_5N)_2](HCO_2)_2.H_2O$, bright blue; if the heating is continued more than a few min., the product is decompd.; on heating at 85° for 4 hrs., all the H_2O and slightly more than 1 mol. of C_5H_5N are removed, leaving a green powder; Bz_2ONa in H_2O gives dipyridinocupric benzoate; $o\text{-}O_2NC_6H_4CO_2NH_4$ gives the *o-nitrobenzoate hydrate*, pale blue. $Cu(NH_3)_6I_2$ (II) in NH_3, satd. with NH_3, gives *pentamminocupric iodide hemihydrate* (III), blue; *in vacuo* over H_2SO_4 for 1 week, the H_2O and 1.66 mols. of NH_3 are lost, giving the black decamminotricupric iodide. III, shaken with 2 mols. NH_4I, gives *diamminocupric iodide*, chocolate-brown; the deep blue filtrate contains $Cu(NH_3)_4.H_2O$; this iodide was also obtained when the hexammine was kept *in vacuo* over H_2SO_4 for 1 month; it is insol. in and decompd. by H_2O; over H_2SO_4, continuous slow liberation of I occurs. II and C_5H_5N, boiled gently for 10 min., give *hexapyridinocupric iodide* (IV), black plates, giving a deep blue soln. in EtOH; hot EtOH liberates I and ppts. CuO. Exposure of IV to dry air for 4 days gives *tetrapyridinocupric iodide*, moss green; after 6 weeks over H_2SO_4 0.8 mol. of C_5H_5N and 1.5 g.-atoms of I remained in assocn. with each g.-atom of Cu, the residue being a brownish yellow powder. *Cupric o-nitrobenzoate*, bright green; liquid NH_3 gives *tetramminocupric o-nitrobenzoate*, purple, a Co-blue ammine, insol. in liquid NH_3, being an intermediate product; H_2O and EtOH give bright blue solns.; in dry air for 6 days, 1 mol. of NH_3 is lost, giving a grayish blue powder, decompd. by H_2O. *Tripyridinocupric o-nitrobenzoate*, blue, insol. in and not

decompd. by H_2O or EtOH. *Tetramminocupric m-nitrobenzoate*, lilac; in air for 7 days the NH_3 content decreased to 7.3% (diammine). *Tetramminocupric picrate*, from the sulfate and Na picrate, greenish yellow; no loss in wt. occurs on heating at 100°; liquid NH_3 gives a red soln.; on evapn. the tetrammine results, being the highest ammine stable at room temp. No evidence of the existence of pentamminocupric trichloroacetate was found. The *tetrammine* is bluish violet; exposure to the air for 5 days gives the triammine. *Diquinolinocupric trichloroacetate*, bluish violet. Mol.-wt. detns. are reported for these compds. by the b.-p. and f.-p. methods. While the osmotic factors recorded for the dipyridino compds. indicate the presence of a triionic salt, they diminish somewhat more rapidly with increasing concn. than would be expected and between concns. of 0.1 and 0.25 *M* the f.-p. depressions are lower than the corresponding values for $Cu(NO_3)_2$. The differences are greater than would be expected to result from hydration of the Cu ion and suggest that to a small extent coördination of acid radicals has occurred. This is the only evidence of coördination that has been obtained. Comparatively little increase in the osmotic factor takes place on passing from dipyridino- to tripyridinocupric nitrate and the difference diminishes with increasing concn. until at a concn of 0.25 *M* the 2 salts produce the same depression. No considerable modification is produced by ionic hydration and, at least up to a concn. of 0.1 *M*, the effect of any probable degree of hydration of the Cu ion is negligibly small. C. J. West

Conjugated double bonds. XIII. Synthesis of unsaturated colored fatty acids. Richard Kuhn and Max Hoffer. *Ber.* 63B, 2164–74(1930); cf. *C. A.* 24, 4302.—From the conclusion reached from the study of the polyene dyes that an aliphatic hydrocarbon must contain 5–6 double bonds in uninterrupted conjugation in order to be colored and that a free CO_2H group conjugated with double bonds corresponds approx. to 1.5 double bonds in color value, it was to be expected that among the unknown vinylene homologs of crotonic (I) and sorbic acid (II) the extension of the absorption bands into the visible part of the spectrum would occur between *2,4,6-octatrienic* (III) and *2,4,6,8-decatetraenic acid* (IV). This has been confirmed by the synthesis of III and IV. III is still white and has a faint lemon-yellow color only in thick layers, while IV is intensely yellow. Here, too, salt formation results in a marked lightening of the color. The Na, Ca, Pb and Ag salts of III and IV are pure white. The starting point of the synthesis was AcH which, by condensation with itself or, better, with MeCH:CHCHO, gives hexadienal (V) (the aldehyde of II). Under the exptl. conditions the V reacts with still another mol. of AcH to form *octatrienal* (VI) and with $CH_2(CO_2H)_2$ in C_5H_5N to give III; VI in the same way gives IV. Zeisel and v. Bittó, in prepg. MeCH:CHCHO from AcH, obtained, in addn., CH_2:CHC(:CHMe)CHO, and an isomer b_{24-6} 75–80°, that the latter was V has been confirmed by a repetition of their work. A method by which it is possible to obtain quickly large amts. of crude V (b_{12} 65–73°) and VI (b_{12} 97–115°) consists in treating AcH or mixts. of AcH and MeCH:CHCHO with secondary amines, which act as catalysts; 1% piperidine is sufficient. The V is formed by condensation of MeCH:CHCHO with AcH and the VI from V and AcH, as shown by a special expt.; pure MeCH:CHCHO does not react in the presence of piperidine, so VI is not formed from 2 mols. of this aldehyde. Characteristic derivs. of V and VI are the azines; the 2 azines give beautiful color reactions with concd. H_2SO_4, anhyd. HCO_2H, $AsCl_3$ and $SbCl_3$. The structure of III and IV was established by catalytic hydrogenation to caprylic and capric acids, resp. They decolorize cold $KMnO_4$ immediately, are oxidized by CrO_3 to AcOH and CO_2 and decolorize Br in AcOH but consume far less Br than corresponds to the no. of double bonds in them; the bromination products are colorless and sol. in Et_2O but are not homogeneous. The acids give color reactions with the same reagents as the azines of their aldehydes; these colors, obtained after short heating, often pass through various intermediate colors. *Azine* of V, S-yellow, m. 173.2–3.5° (cor., Berl block, partial decompn.), sol. in concd. H_2SO_4 and anhyd. HCO_2H with lemon yellow, in $AsCl_3$ with chrome-yellow color, increases in wt. in the air. *Semicarbazone*, m. 206° (cor.). III, m. 189–9.5° (cor., Berl block, partial decompn.), *Me ester*, prepd. through the chloride (which is obtained with $SOCl_2$), leaflets with a bare tinge of yellow, m. 75.2–5.6° (cor.), polymerizes on long standing to a viscous yellow gum like mass. *Amide*, m. 196.7–7.7° (cor., decompn.). *Azine* of VI, orange, decomps. 220.5° (cor.), undergoes autoxidation even more easily than the azine of V, dissolves in concd. H_2SO_4 with deep bluish red, in $AsCl_3$ with blood-red, in anhyd. HCO_2H with orange color. *Hydrazone*, lemon-yellow, sinters 153–4° (cor.), resinifies 180°, sol. in concd. H_2SO_4 with lemon-yellow color. *Semicarbazone*, S-yellow, decomps. around 250°, sol. in concd. H_2SO_4 with lemon-yellow color. *Oxime*, light yellow, m. 186–7° (cor., decompn.), sol. in H_2SO_4 with yellow color. IV, needles from AcOH at a high temp. (concd. soln.), leaflets at lower temps. (dil. soln.), sol. in H_2SO_4 with brownish orange

color, m. 210–1° (cor., Berl block), up to 220° on slower heating; if the heating is started from room temp., the acid may not melt at all but begin to carbonize at 200°. *Me ester*, m. 135–6° (cor.). *Amide*, decomps. around 200°. C. A. R.

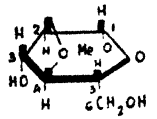
Conversion of erucic acid into brassidic acid by means of sulfur. G. RANKOFF *Ber.* **63B**, 2139–42(1930).—Saytzev and Saytzev found that erucic acid (I), heated 24 hrs. at 200° with satd. aq. SO_2, is converted into brassidic acid (II). However, they give 65–8° as the m. p. of II obtained both in this way and from I with HNO_2, while other workers give 59–61.5° for the II prepd. by the HNO_2 method. Recently (*C. A.* **24**, 1343) R. showed that oleic acid (III), heated 3 hrs. at 180° with an equal vol. of satd. aq. $NaHSO_3$, is changed into elaidic acid (IV) mixed with a S-contg. compd. of higher m. p., and that the isomerizing agent is not $NaHSO_3$ or H_2SO_3, as believed by S. and S., but the free S formed by decompn. of the $NaHSO_3$. As the result of these observations, R became convinced that the high m. p. of S. and S.'s II was due to an impurity, and this conclusion is further supported by the present investigation. I is converted into II by free S and H_2O on the one hand and by satd. $NaHSO_3$ on the other under the same conditions and in the same way as III is changed into IV; here, too, a small amt. of a S-contg. compd. of higher m. p. is formed. The II m. 61.5° (cor.), n_D^{100} 1.4347. C. A. R.

Ring contraction in the formation of internal ethers (oxides) from glycols (1,5-oxidododecane from 1,12-dodecanediol). ADOLF FRANKE AND ALFRED KROUPA. *Monatsh.* **56**, 331–46(1930).—Details are given for the prepn. of 1,12-dodecanediol (I) from 1,10-decanediol through the dibromide, dicyanide and di-Me ester of the resulting acid and from 1,10-dibromodecane by the Grignard reaction. With 50% H_2SO_4 35 g. I gives 13 g. pure *1,5-oxidododecane* (II), b. 235–7°, purified by repeated distn. at atm. pressure; it could not be freed of unsatd. impurities by shaking with $KMnO_4$. Its structure was established by oxidation to $C_7H_{15}CO_2H$ and $(CH_2CO_2H)_2$. Oxidation of I with $KMnO_4$ gave only CO_2. Heating 1,10-decanediol with 89% H_3PO_4 at 220° gives 1,5-oxidododecane, previously obtained by the action of H_2SO_4. The formation of II from I (and of other oxides from diols) is explained by the formation of a sulfate, which splits off H_2SO_4, forming an unsatd. hydrocarbon, which then adds H_2SO_4, the process being repeated until a sulfate results which is a deriv. of a 1,5-diol. C. J. WEST

Preparation of α-alkylpimelic acids from 1,5-oxidododecane and from 1,5-oxidododecane. ADOLF FRANKE AND ALFRED KROUPA. *Monatsh.* **56**, 347–57(1930).—1,5-Oxidododecane and HBr give 1,5-dibromodecane, b_9 146–7°; boiling with KCN in dil. EtOH gives about 52% of the *dinitrile*, b_9 185–9°; sapon. with KOH in dil. EtOH gives *α-amylpimelic acid* (I) and its *half amide* (II). II m. 149.5° and on hydrolysis with concd. KOH gives I, m. 68°; the I obtained in the hydrolysis of the nitrile did not crystallize but b_9 228–9°. Both the liquid and the solid acid give the same *amide*, m. 186°. 1,5-Oxidododecane yields a *dibromide*, b_9 171°, pale yellow oil; the *dinitrile*, b_9 203–4°, results in 55% yield; hydrolysis gives *α-heptylpimelic acid*, m. 75°, and the *half amide*, m. 150.3°; the acid obtained by direct hydrolysis could not be crystd. but gives an *amide*, m. 186°; alc. KOH saponifies the amide to the half amide. C. J. WEST

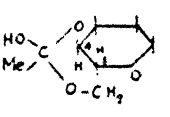
Unsaponifiable matter from the oils of elasmobranch fish. VII. The synthesis of α-glyceryl ethers and its bearing on the structure of batyl, selachyl and chimyl alcohols. GOMER G. DAVIES, ISIDOR M. HEILBRON AND WM. M. OWENS. *J. Chem. Soc.* 1930, 2542–6; cf. *C. A.* **23**, 3702.—Batyl (I), selachyl (II) and chimyl (III) alcs. were at first considered to be β-derivs., $ROCH(CH_2OH)_2$ but later were suggested to be α-derivs., $ROCH_2CH(OH)CH_2OH$. The lower alkyl α-monoglyceryl ethers may be readily prepd. by heating α-monochlorohydrin with RONa in ROH. The α-Et deriv., b_{21} 118–21°, gives a *diphenylurethan*, m. 103–4°. The *α-Pr deriv.* b_{18} 118–22°, d_4^{18} 1.074, n_D^{18} 1.4400; *diphenylurethan*, m. 116°. *α-Bu deriv.*, b_{22} 138–40°, d_4^{18} 1.002, n_D^{18} 1.4461; *diphenylurethan*, m. 94–5°. The *α-cetyl deriv.* (IV) could not be prepd. in this way by heating cetyl chloride (V) with Na glyceroxide. V and Na allyloxide, boiled 30 hrs., gives *cetyl allyl ether*, b_7 165–76°, m. 25°. Oxidation with H_2O_2 in AcOH gives IV, m. 64–5°; *diphenylurethan*, m. 93–4°. *Octadecyl allyl ether*, m. 27.5–8.5°; *α octadecyl glyceryl ether* (VI), m. 70–1°; *diphenylurethan*, m. 95–6°. III, which appeared at first to be identical with IV, was later shown to be a mixt. of I and an unidentified compd. I and VI give a small but definite depression of the m. p., which is emphasized in the case of the diphenylurethans. The results thus seem to indicate the β-structure III must by analogy be β-oleyl glyceryl ether. **VIII. Structure of the naphthalene hydrocarbon derived from squalene.** ISIDOR M. HEILBRON AND DONALD G. WILKINSON. *Ibid* 2546–54.—Tetrahydrosqualene and S give 1,2,5-trimethylnaphthalene (I), $C_{13}H_{14}$. Energetic oxidation with $K_3Fe(CN)_6$ gives a *naphthalenetricarboxylic acid*, m. 270–2°, whose *Me ester* m. 89°. Oxidation of I with CrO_3 in AcOH gives the following compds.: *1,2,5-*

trimethyl-β-naphthoquinone, red, decompg. 130–5°; 1,6-dimethyl-α-naphthoquinone, bright yellow, m. 94° (*phenylhydrazone*, bright red, m. 226°); *5,8-diacetoxy-1,6-dimethylnaphthalene*, m. 70–1°; *3-methylacetophenone-2-carboxylic acid*, m. 126° (*semicarbazone*, m. 177°; *Me ester*, m. 47–8.5°, and its *semicarbazone*, m. 215° (decompn.)); oxidation gives 3-methylphthalic acid; *4-methylacetophenone-2-carboxylic acid*, m. 125–6° (*Me ester*, m. 71–2°; *semicarbazone*, m. 182° (decompn.)); *3,4-dimethylacetophenone-2-carboxylic acid*, m. 105° (*Me ester*, m. 78–9°; *semicarbazone*, m. 217° (decompn.)). The structure of I was further confirmed by its synthesis by Ruzicka. C. J. West



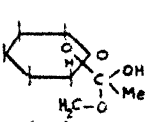
The action of alkali upon cystine and cysteine. H. T. Clarke and J. M. Inouye. *J. Biol. Chem.* 89, 399–419(1930).—The formation of $AcCO_2H$ as an intermediate product in the decompn. of cystine and cysteine by alk. plumbite has been confirmed by the isolation of its *p*-carboxyphenylhydrazone when the reaction is carried out in the presence of *p*-$H_2NNHC_6H_4CO_2H$. The characteristic orange color appearing when $AcCO_2H$ is condensed with *o*-$C_6H_4(OH)CHO$ in alk. soln. is also gradually developed when cystine or cysteine and the aldehyde are brought together in alk. soln. either alone or in the presence of plumbite. Cysteine may yield all its S as PbS when treated with plumbite but cystine normally yields but 75% with the remainder appearing largely as $Na_2S_2O_3$. NH_3 is formed in the alk. decompn. of cystine in amts. not more than the corresponding quantities of sulfide. The amt. of NH_3 is frequently less and recombination with decompn. products appears to occur, forming substances which are relatively slowly broken up by alkali. BzH, *o*-$C_6H_4(OH)CHO$ and $AcCO_2H$ accelerate the decompn. of cystine. Evidence has been obtained that when cystine reacts with NaOH alone, an unstable product is primarily formed before S ion makes its appearance. A. P. Lothrop

Metallic hydroxy acid complexes. V. Neutral α-cupritartrates. Elsie Evelyn Wark and Ian Wm. Wark. *J. Chem. Soc.* 1930, 2474–8; cf. *C. A.* 21, 3168.—This is largely polemic with Dumanskii and Chalisev (*C. A.* 23, 2088) who deny the existence of α-cupritartrates described by Packer and W. (*C. A.* 15, 3623). W. and W. are unable to notice any change in the compn. of Na α-cupritartrate when washed with 36% EtOH, as reported by D. and C. D. and C. also state that the point of soln. of Cu tartrate in NaOH does not always coincide with the ratio 5/4; repetition of their work gave the following values: for 0.1 *N* 1.17 for complete soln.; for 0.5 *N* 1.22 at room temp. and 1.15 at 35°; for 2 *N* 1.22 at room temp. At the point of complete soly. the soln. may remain acid to litmus but when the ratio Na/Cu reaches 5/4, alky. toward phenolphthalein develops. The variations observed by D. and C. are due to soly. and not to any variations in the primary chem. action. The conclusions are strengthened by the results of potentiometric titration. C. J. West



Pseudohalogens. X. Dichlorooxycyanide, *N*-mono- and *N*-dichloroallophanic ethyl ester and *N*-chloroallophanyl chloride. Lothar Birckenbach and Martin Linhard. *Ber.* 63B, 2528–44(1930); cf. *C. A.* 24, 4229.—$Cl_2NCONCO$ is prepd. in a similar manner as $(OCNBr)_3$. The dimer compds. with Cl and Br are formed already at −80°, but they are not considered pseudohalogens. With excess alc. Et allophanate and ClOEt are formed. The reaction is in 3 steps and the intermediate products, the Et esters of dichloro- and monochloroallophanic acid, have been isolated. **XI. Iodooxycyanide, diiododioxycyanide and triiodocyanuric acid.** *Ibid* 2544–58.—As solvent for the prepn. of OCNI, Et_2O is used. It is of practical importance as it combines easily with unsatd. products and may make possible the synthesis of a large no. of compds. OCNI polymerizes to the dimer compd. The end product of the polymerization is triiodocyanuric acid. The monomer form is more stable than that of the other halogens. The monomer form with alc. gives carbamic esters whereas with the dimer form the allophanic esters are formed. E. Schotte

A methyl glucoside of a new anhydrosugar; also, a contribution to acyl migration in partially acylated glucose. Burckhardt Helferich and Alexander Müller. *Ber.* 63B, 2142–9(1930).—H. and Klein recently described a tetraacetyl-β-*d*-glucose (I) obtained from 1,2,3,4-tetraacetyl-β-*d*-glucopyranose (II) by the action, *e. g.*, of dil. alkali. The process was explained as being an acyl migration and the structure of a 1,2,3,6-tetraacetyl-β-*d*-glucopyranose was suggested for I. The *p*-toluenesulfonate (III) of I with HBr-AcOH gives a well-crystd. *1-Br deriv.* (IV) which, like acetobromoglucose, yields with MeOH and Ag_2CO_3 a *p*-toluenesulfonyltriacetylmethylglucoside (V) identical with that previously obtained from 2,3,4-triacetyl-β-methyl-*d*-glucopyranoside (VI) by acyl migration and esterification of the resulting compd. with $MeC_6H_4SO_3H$. The V is rendered more readily available by this method of prepn. which strongly supports the structure which had been assigned to it. The *p*-toluenesulfonylglucose obtained by cautious sapon. of III was again prepd. and analyzed and the earlier findings



were confirmed, but cautious sapon. of V gave an unexpected result; the $MeC_6H_4SO_2$ group was split off as well as the Ac groups and there resulted a new *anhydromethylglucoside* (VIII?). Since it shows no double bond with Br, a new O ring must have been formed. It readily forms, in good yields, a cryst. diacetate and dibenzoate. H. and M. agree with Haworth, Hirst and Teece (*C. A.* 24, 4269) that the acyl migration in II can be explained as proceeding through $MeC(OH)_3$ derivs. but, contrary to the opinion of H., H. and T., such an explanation is also possible if it is assumed that it is the 4-Ac group in II which migrates; the hypothetical intermediate compd. (IX) thereby formed can be sterically constructed without strain by assuming the normal tetrahedral valence angle on the O and the C; there is fused on the glucopyranose ring already present a 2nd 6-membered ring which, in spite of the *trans*-position of the glucose-C valences involved (on C atoms 4 and 5), can be sterically developed without strain just as well as in *trans*-decalin and its derivs. That the I has a free HO group on a glucose-C atom rather than the structure IX seems to be indicated by the existence of VII, for the toluenesulfonate of a compd. IX could not, on alk. sapon., lose all 4 Ac groups and at the same time retain the $MeC_6H_4SO_2$ group. As regards the question raised by Haworth, whether it may not be the 1-Ac group in II which migrates, his exptl. observation that tetraacetyl-β-methylglucoside (X) can be isolated in the methylation of the different tetraacetylglucoses merely shows that rearrangements certainly play a role; even the formulation of the tetraacetate as XI permits of no direct methylation to X without the assumption

(VIII)

(IX)

(XI)

of further rearrangements. Evidence against the migration of the 1-Ac group, in addn. to that already given, is the above prepn. of V by a new method which shows that in the rearrangement of II and of VI the same acyl migrates and since there is no 1-acyl in VI it cannot be the 1-acyl in II which migrates. As between the 2- and 4-acyls, the following arguments can be advanced against the migration of the 2-acyl. I in C_5H_5N with Cl_3CCOCl gives a *tetraacetyltrichloroacetyl-β-d-glucose* (XII) different from Brigl's 2-Cl_3CCO compd. Furthermore, B.'s 3,5,6-triacetyl-β-methyl-*d*-glucopyranoside, whose structure has been established with certainty by Hickinbottom, is different from VII and therefore VII, formed by acyl migration, cannot have a free 2-HO group. The new VIII is formed with surprising smoothness. Its study has thus far given but few indications as to the position of the new O ring and the structure VIII is given only provisionally. Walden inversions may play a role and the substance may no longer be a glucose at all. *1,2,3,6-Tetraacetyl-4-trichloroacetyl-β-d-glucose* (XII) (yield, 35%), m. 153°, $[\alpha]_D^{20}$ —9.45° to —10.0° (ordinary $CHCl_3$), 10.23–11.30° ($PhNO_2$). *α-1-Bromo-2,3,6-triacetyl-4-toluenesulfonyl-d-glucopyranose* (IV) (80% yield), m. 171° (cor., decompn.), $[\alpha]_D^{20}$ 141° ($CHCl_3$). V, obtained in over 80% yield, m. 118° (cor.), $[\alpha]_D^{20}$ —29.8° to —32.0° (abs. C_5H_5N), —37.8° ($CHCl_3$). VIII (67% from V in $CHCl_3$ and Na in MeOH in ice-salt), m. 158°, reduces Fehling soln. only after hydrolysis with acids, $[\alpha]_D^{23}$ —118° (H_2O), shows no mutarotation (3 days), does not decolorize Br in AcOH. *Diacetate*, m. 118°, $[\alpha]_D^{20}$ —112.8° to —114.8° ($CHCl_3$), reduces Fehling soln. only after hydrolysis with acids. *Dibenzoate*, m. 133°, $[\alpha]_D^{20}$ —77.7° to —80.5° ($CHCl_3$).

C. A. R.

Structure of the acetylmethylmannosides. H. S. Isbell. *J. Am. Chem. Soc.* 52, 5298(1930).—Three new *heptaacetyl-4-glucosidomethylmannosides* are reported, m 185°, 161° and 167°, α_D^{20} 26.7° — 22.3° and —12.7° ($CHCl_3$); the 3rd compd. yields a *heptaacetyl-4-glucosidomannose*, α_D^{20} 21.7° ($CHCl_3$), which does not exhibit mutarotation. The absence of mutarotation indicates that the MeO group in the parent mannoside was not combined directly with the 1st or aldehyde C.

C. J. West

Reactivity of positivized hydrogen ions. V. Simple preparation method for tetraphenylcyclopentadienones. W. Dilthey and Ferd. Quint. *J. prakt. Chem.* 128, 139–49(1930); cf. *C. A.* 25, 294.—Bz_2 (2 g.) and 2 g. $(PhCH_2)_2CO$ in 40 cc. EtOH, treated with 0.25 cc. EtOH-KOH (1:4), give 3.1–3.2 g. 2,3,4,5-tetraphenyl-3-hydroxy-4-cyclopentenone (I), m. 210°, identical with the compd. of Löwenbein and Ulich (*C. A.* 20, 1407). Reduction of I with Zn and AcOH gives 2,3,4,5-tetraphenylcyclo-

pentenone (II), m. 162–3°. Catalytic reduction of I with Pt in AcOH gives 2 compds., 1 m. 163° but not identical with II and the second m. 220°; Pd gives a compd. m. 144°. If the above condensation reaction is heated 1–2 min., there results 3.4 g. 2,3,4,5-tetraphenylcyclopentadienone (III), red, m. 216–8°; the concd. H_2SO_4 soln. is blue-violet but becomes paler on standing, probably due to sulfonation. PbO_2 in AcOH oxidizes III to a colorless compd.; HNO_3 gives a pale yellow compd. Reduction of III with Pd-$BaSO_4$ gives II; reduction of III with Zn in AcOH gives *tetraphenylcyclopentadienol*, which apparently crystallizes with AcOH, m. 139–40°; H_2SO_4 solns. show a brick-red halochromy; the AcOH compd. is unstable in the air, giving III; Br in AcOH also gives III. The mother liquor from III contains II. III and Br in PhMe give the di-Br deriv., m. 169–70°; the Br is split off near the m. p. but more smoothly by heating in AcOH, Ac_2O, PhMe, C_5H_5N, etc. Condensation of Bz_2 and $(PhCH_2)_2CO$ with EtOH-KOH gives II. Dehydration of II by Br in AcOH gives III. C. J. West

Naphthol esters of chaulmoogric acid and chaulmoogrylnaphthylamines. Irene de Santos and Augustus P. West. *Philippine J. Sci.* **43**, 409–13(1930).—The following compds. were prepd. because of their possible therapeutic value. Chaulmoogryl chloride and α-$C_{10}H_7OH$ give about 10% of the *α-naphthyl ester* after heating 8 days at 100°, pale yellow, m. 53–4.5°; *β-naphthyl ester*, m. 49.5–51° (50% yield); time of heating, 6 days at 125°. The acid amide and α-$C_{10}H_7NH_2$, heated 5 days at 100°, give 30% of *chaulmoogryl-α-naphthylamide*, pale yellow, m. 93–5°; *β-naphthylamide*, pale yellow, m. 96–8° (40% yield). C. J. West

4-Alkyl derivatives of 1-phenylcyclohexane-3,5-dione. Ibrahim Hilmi El-Said Mattar, John J. H. Hastings and Thomas K. Walker. *J. Chem. Soc.* **1930**, 2455–8.—Styryl Et ketone and $CHNa(CO_2Et)_2$ in EtOH, boiled until neutral (4 hrs.), give 79% of *Et 1-phenyl-4-methylcyclohexane-3,5-dione-2-carboxylate*, m. 121–3°; heating with EtOH-KOH for 2 hrs. gives 40% of *1-phenyl-4-methylcyclohexane-3,5-dione*, m. 212–3°. In the same way styryl Pr ketone gives 41% of *1-phenyl-4-ethylcyclohexane-3,5-dione*, m. 200°, this absorbs O and becomes resinous in the air. The *4-Pr deriv.*, m. 185°, is formed in 35% yield from styryl Bu ketone; styryl hexyl ketone (22 g.) gives 17 g. of the *4-Am deriv.*, m. 191°. *Et 1-phenyl-4-benzylcyclohexane-3,5-dione-2-carboxylate*, m. 146° (60% yield); *1-phenyl-4-benzylcyclohexane-3,5-dione*, m. 169–70° (86% yield). $PhCH_2CO_2Et$ and styryl Et ketone give 21% of *1,2-diphenyl-4-methylcyclohexane-3,5-dione*, m. 167°. Styryl $PhCH_2CH_2$ ketone did not react. C. J. West

Aluminum chloride and the Friedel and Crafts reaction. P. H. Groggins. *Trans. Am. Inst. Chem. Eng.*, New Orleans Meeting, 1930, 44 pp.(Advance copy).—The utilization of anhyd. Al_2Cl_6 as a reagent for chem. reactions has increased tremendously during the last 10 years. Prices have declined and interest in further uses for the product have been stimulated. The F. and C. reaction employing Al_2Cl_6 is the basis of the vat dye industry. Production data on Al_2Cl_6 are given, showing that nearly 27 million lbs. was used in the petroleum industry in 1929. The prepn. of anhyd. material, the comparative properties of technical and C. P. grades, the function of anhyd. Al_2Cl_6 in org. reactions are discussed. Emphasis is placed on the material as a cracking agent in petroleum. A large share of the paper concerns itself with the mechanism of the F. and C. reaction and its numerous applications. From the engineering side, handling materials, design of app., the effect of various factors and control of the reaction are discussed. Also in *Ind. Eng. Chem.* **23**, 152–60(1931). C. L. Mantell

Identification of halides as 3,5-dinitrobenzoates. I. Chao-Lun Tseng and Edith Ju Hwa Chu. *Natl. Central Univ. Sci. Repts., Ser. A, Phys. Sci.* **1**, 9–14(1930).—In using Milliken's method, substitution of dry C_6H_6 for alc. is recommended. $ClCHPh_2$ in C_6H_6 gave the *diphenylcarbinol 3,5-dinitrobenzoate*, m. 142°. Me_3CCl reacted with $(O_2N)_2C_6H_3CO_2Ag$ but failed to yield the ester deriv. Halogenated benzenes did not react. K. H. Engel

Parachors of two isomeric chlorodinitrobenzenes. S. A. Mumford and J. W. C. Phillips. *J. Am. Chem. Soc.* **52**, 5295–7(1930).—Polemical with Sickman and Menzies (*C. A.* **24**, 4768). The parachor for $2,4$-$(O_2N)_2C_6H_3Cl$ rapidly attains and maintains a mean value of about 351.6, which is only 0.5% less than the calcd. value, 353.2. C. J. West

Parachors of isomeric chlorodinitrobenzenes. D. V. Sickman and Alan W. C. Menzies. *J. Am. Chem. Soc.* **52**, 5297(1930).—Reply to Mumford and Phillips (preceding abstr.). C. J. West

A new reaction of the aliphatic double bond. Zoltán Földi. *Ber.* **63B**, 2257–69(1930).—The addn. of halogenoamines and amides to unsatd. compds. has been studied with MeNHBr, AcNHBr, $(CONMeBr)_2$ (I), $MeNBrCO_2Et$ (II), $PhSO_2NMeBr$ (III) and $PhSO_2NNaCl$ (IV) as the one component and $PhCH{:}CHMe$ (V) as the other. Of the *N*-

Br derivs., III showed a striking reactivity with V, giving in very satisfactory yield *1-phenyl-1-bromo-2-(benzenesulfonylmethylamino)propane* (VI), $PhSO_2NMeCHMeCHPhBr$. In this addn. there can theoretically be formed 4 *dl*-isomers (2 stereoisomers of the structure VI and 2 of the structure $PhSO_2NMeCHPhCHMeBr$); there were actually formed at least 2 isomers but only the chief product, m. 105–6°, could be isolated in pure form, while the sepn. and isolation of the other product could be effected only in another way. Both products were diastereomers of the structure VI. The structure of VI was established by introducing an AcO group with NaOAc and as the resulting $PhSO_2NMeCHMeCHPhOAc$ (VII) showed no tendency to crystallize it was sapond. to the HO deriv. (VIII). The well-crystd. VIII has the same m. p. as the original I but is identical with the *N*-benzenesulfonylephedrine (IX) prepd. from *dl*-ephedrine. Furthermore, IX with PBr_5 is smoothly converted into VI. Although this establishes the structure of VI it shows nothing as to its configuration because of the possibility of a Walden inversion in the reactions VI ⟶ VIII and IX ⟶ VI and it became necessary to repeat the reactions with the optically active components. When the active ephedrines and *ψ*-ephedrines are converted into their $PhSO_2$ derivs. the rotation does not change in sign whereas when the active $PhSO_2$ derivs. are treated with PBr_5 the ephedrine derivs. suffer no optical inversion while the *l*-pseudoephedrine deriv. gives the *d*-*N*-benzenesulfonylbromoephedrine, and this with an equal part of the *l*-antipode obtained from the *l*-benzenesulfonylephedrine yields VI, which can be obtained directly with PBr_5 from the $PhSO_2$ deriv. of either *dl*-ephedrine or *dl*-*ψ*-ephedrine. The active or racemic benzenesulfonyl-*ψ*-ephedrines can therefore not be prepd. in this way, nor by changing the order of the reactions (treating the free *ψ*-ephedrine with PBr_5 and then the resulting Br compd. with $PhSO_2Cl$). The *dl*-benzenesulfonylbromo-*ψ*-ephedrine (X) was finally obtained in pure form as follows: *dl*-ephedrine-HCl was converted with PBr_5 into a mixt. of the HBr salts of the ephedrine and *ψ*-ephedrine Br derivs. which with $PhSO_2Cl$ gives an easily sepd. mixt. of VI and X. IV reacts with V like III but less homogeneously and barely 15% of *1-phenyl-1-chloro-2-(benzenesulfonylamino)propane* (XI) can be isolated. $PhCH{:}CHCH_2OH$ readily adds III but in a different way, apparently according to the scheme $2\ PhCH{:}CHCH_2OH + 2III \longrightarrow PhCHBrCHBrCH_2OH + PhCH(NMeSO_2Ph)CH(NMeSO_2Ph)OH$, the $PhCHBrCHBrCH_2OH$ being isolated (in the form of $PhCHBrCHBrCH_2Br$) in about 50% yield. The results with purely aliphatic olefins can be explained only by a similar addn.; thus $CH_2{:}CHCH_2Br$ with III gives 80% $CHBr(CH_2Br)_2$ and a product, presumably $BrCH_2CH(NMeSO_2Ph)CH_2NMeSO_2Ph$, which could not be isolated. From 2 g. each of I and V heated a few min. on the H_2O bath, dild. with alc., filtered from the $(CONHMe)_2$, concd. and boiled with 3 *N* HCl there is obtained 0.06–0.1 g. *dl*-*ψ*-ephedrine. II behaves in the same way. III is obtained in 85% yield of crude product (m. 102°, active Br 65.2%) from 30 cc. of 5 *N* NaOH dropped on a cold mixt. of 16.4 g. Br and 17 g. $PhSO_2NHMe$. IX m. 105°. *dl*-Benzenesulfonyl-*ψ*-ephedrine, from *dl*-*ψ*-ephedrine in $CHCl_3$ with $PhSO_2Cl$ and NaOH, m. 74–6°. *l*-*N*-Benzenesulfonylephedrine, m. 99°, $[\alpha]_D^{20}$ —44.59° (abs. alc.); *ψ*-isomer, m. 70°, $[\alpha]_D^{20.5}$ —27.86° (abs. alc.). *d*-*N*-Benzenesulfonylbromoephedrine, m. 88°, $[\alpha]_D^{22.5}$ 109.60° (abs. alc.); *l*-antipode, m. 88°, $[\alpha]_D^{21.5}$ —111.02° (abs. alc.). *dl*-Bromo-*ψ*-ephedrine-HBr, m. 155–7° (still contaminated with the diastereomeric ephedrine deriv.); *d*-isomer, from *l*-*ψ*-ephedrine with PBr_5 in $CHCl_3$, m. 174.5°. XI, m. 123°, insol. in concd. HCl and in NaOH, non-volatile with steam. With $CH_2{:}CHCH_2OH$, III gives $(CHBr{:}CHCH_2)_2O$ (contaminated with $CH_2BrCHBrCH_2OH$), b_{10} 118°, d^{22} 1.774.

C. A. R.

Ionization constants of some chloro- and nitroanilines by the partition method. Gwyn Williams and Frederick G. Soper. *J. Chem. Soc.* 1930, 2469–74.—The ionization consts. for *o*-, *m*- and *p*-$ClC_6H_4NH_2$ and for *o*-$O_2NC_6H_4NH_2$ have been detd., using a partition method, in which attention was directed to the effect of unhydrolyzed salt on the distribution equil. and to the choice of extg. solvent when dealing with certain very weak bases. The value of K_w employed in calcg. K_b is 1.005×10^{-14} at 25°. The following results for $K_b \times 10^{11}$ are given: *o*-Cl, *v* 39–89, 0.371; *m*-Cl, *v* 40–276, 2.88; *p*-Cl, *v* 43–170, 8.45; *o*-NO_2, *v* 32–33, 0.00353; these are at 25° ± 0.01°. The partition coeffs. at 25° ± 0.01° for C_6H_6-H_2O are (the concn. range of the aq. phase is given): *o*-Cl, 0.00115–0.00300 *M*, 119°; *m*-Cl, 0.000832–0.00327, 86.2; *p*-Cl, 0.00143–0.00348, 62.4; $PhCH_2NH_2$, 0.0162–0.0168, 4.03; heptane-H_2O: *p*-Cl, 0.0114–0.0142, 4.31; *o*-NO_2, 0.00764–0.0119, 1.790. For *p*-$ClC_6H_4NH_2$, where the unhydrolyzed salt concn. is greatest, the partition coeff. between heptane and H_2O is unchanged by salt concns. up to and including 0.1 *N*.

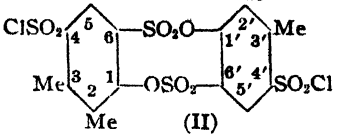
C. J. West

The quaternary ammonium iodides derived from iodoacetic ester. P. Freundler,

L. PIAUX AND MLLE. M. PILAUD. *Bull. soc. chim.* [4], 47, 1147–50(1930); cf. Piaux, *C. A.* 24, 4773.—In the splitting of compds. of the type $PhNMeRICH_2CO_2Et$ into betaines like $PhNMeR.CH_2.CO.O$ and EtOH by removing I with Ag_2O a large excess of the latter is required, suggesting the formation of a compd. such as AgI.AgOH. The betaine solns. are clear and colorless in the dark but in sunlight a purple to brown ppt. sometimes forms similar to that produced by very dil. $Sn(NO_3)_2$ and $AgNO_3$. Examd. spectroscopically this ppt. showed Sn present. All the reagents were free from Sn that could be detected by the ordinary qual. tests. It is assumed that Sn^{II} compds. were formed by photochem. reduction from traces of Sn^{IV} compds. present. L. E. G.

***p*-Aminophenylguanidine hydriodide.** CHARLES E. BRAUN. *J. Biol. Chem.* 89, 97–108(1930); cf. Frank, *C. A.* 21, 2320.—*p-Aminophenylguanidine-HI*, prepd. by a reaction between $MeSC(:NH)NH_2.HI$ and p-$C_6H_4(NH_2)_2$, m. 209–10°; attempts to isolate the free base have so far been unsuccessful. When injected subcutaneously it produced a hypoglucemia which reached a max. in 4–6 hrs. unaccompanied by convulsive symptoms or evidence of toxicity. A. P. LOTHROP

Action of ferric chloride upon acyl esters of phenol. HILDEGARD HUBER AND KARL BRUNNER. *Monatsh.* 56, 322–30(1930).—The action of $FeCl_3$ upon Ph esters does not give biphenyl derivs. but products of acyl wandering. Thus, AcO_2Ph and sublimed $FeCl_3$, warmed on the H_2O bath for 3 hrs., give 10% of p-HOC_6H_4OMe; if the reaction is carried out at 65° for 4–5 hrs., the yield is increased to 25%. Me_2CHCO_2Ph, b_{707} 210–12°, warmed with $FeCl_3$ 6 hrs. at 100°, gives *o-hydroxyisobutyrophenone*, b_{10} 110° (the *oxime* m. 129°; the *Br_2 deriv.* m. 97°), and 16% of the *p*-deriv., m. 56°. BzOPh gives a small amt. of the *o*- and 28% of the *p*-HOC_6H_4Bz; the latter was characterized by the *phenylhydrazone*, m. 144°, and the *semicarbazone*, m. 194°. C. J. WEST



Parachor and chemical constitution. XV. Constitution of sulfonium and ammonium mercuri-iodides (iodomercuriates). HAROLD J. CAVELL AND SAMUEL SUGDEN. *J. Chem. Soc.* 1930, 2572–9; cf. *C. A.* 24, 2651.—The sulfonium mercuri-iodides (R_3SHgI_3) are of interest in connection with the electronic theory of valency since they have been formulated with 6 groups attached to a central S atom. The following substances have been studied: $(PhCH_2)_2RSHgI_3$, where R is Me (I), Et (II), *Pr* (III) and *Bu* (IV), *$PhMe_2NHgI_3$* (V), $PhMe_2EtNHgI_3$ (VI), $PhMeEt_2NHgI_3$ (VII) and $PhEt_3NHg_2I_5$ (VIII). These are all readily sol. in Me_2CO and MeCN, sparingly sol. in EtOH and insol. in C_6H_6 and ligroin, suggesting that they are polar in character; measurement of the cond. in Me_2CO solns. showed that they are all strong binary electrolytes; results are given at 26° for various dilns. The S compds. give values of the same order of magnitude as the cond. of typical binary electrolytes in Me_2CO and the change of cond. with diln. is in good agreement with Onsager's equation. While the agreement of the N compds. with the equation is not so good, the deviation is in the opposite direction to that which would be expected from incomplete dissocn. Mol.-wt. detns. by the b.-p^t method in Me_2CO again indicate dissocn. into 2 ions. The N salts may be taken to have the structure $[R_4N]^+[HgI_3]^-$. The S salts may be $[R_3SHgI_2]^+[I]^-$ or $[R_3S]^+[HgI_3]^-$. AgI is readily sol. in any of the S iodides; hence not only is the concn. of the I^- negligibly small in these solns., but this ion is removed probably to form the more stable ion $[HgI_4]^{--}$. The cell Hg—1 *M*/100 $HgCl_2$ in Me_2CO—1 *M*/100 Me_3SHgI_3 in Me_2CO—1 Hg has an e. m. f. of 0.145 v., with the electrode in contact with $HgCl_2$ positive; the $[HgI_3]^-$ ion, seems, therefore, to be very stable. Two electronic formulas are possible: $I^6{=}Hg{<}^{I^7}_{I^7}$ (IX) and $I^6 = Hg{<}_{I^6}$ (X); the S compds. give parachors in good agreement with the singlet formula IX, while the N compds. are in better agreement with X; the correct interpretation cannot be given until more information has been obtained as to the types of salt which are likely to exhibit parachor anomalies. II, d^{120} 2.333, γ 45.33, parachor (mean) 915.2 (data also for 122° and 126°). III, m. 78°, $d_4^{88.5}$ 2.296, γ 45.96, parachor (mean) 952 (data also for 91.5° and 95.5°); $d_4^t = 2.446 - 0.00174t$. IV, m. 81°, d_4^t 2.335 − 0.00147*t*; $\gamma_{88.5}$ 45.62, parachor 1000 (data also for 93.5°, 100.5°, 111°). V, m. 137–8°, $d_4^t = 2.923 - 0.00145t$, $\gamma_{147.5}$ 54.61, parachor 719.1 (data also at 154°, 157°, 161.5°). VI, m. 97.5°, $d_4^t = 2.810 - 0.00155t$, $\gamma_{100.5}$ 55.24, parachor 754 (data also at 120°, 128.5°, 134.5°). VII, m. 98.5°, $d_4^t = 2.669 - 0.00114t$, $\gamma_{107.5}$ 52.41, parachor 789.5

(data also at 119°, 126.5°, 136°). VIII, m. 113°, $d_4^t = 3.300 - 0.00164t$, γ_{124} 53.38, parachor 1060 (data also at 129.5°, 134.5°, 140.5°). C. J. WEST

Constitution of double sulfonium mercuric iodides. Optically active mercuritri- and -tetraiodides and cadmitetra- and -pentaiodides derived from *l*-phenacylmethylethylsulfonium iodide. MICHAEL P. BALFE, JOSEPH KENYON AND HENRY PHILLIPS. *J. Chem. Soc.* **1930**, 2554–72.—A study of the chem. properties of the HgI_3 and HgI_4 and analogous compds. derived from Et_3SI and $PhEt_2SI$ has led to the conclusion that the racemization of the S compds. of Pope and Neville (*J. Chem. Soc.* **81**, 1552(1902)) was due to the chem. instability of sulfonium iodides and to the sensitiveness of sulfonium mercuritriiodides toward the reagents used in their prepn. Et_3SHgI_3 (I), m. 113–4°, is formed in 85.7% yield from Et_3SI and 1 mol. HgI_2; in 84.9% yield from $(Et_3S)_2HgI_4$ (II) and HgI_2 in Me_2CO and evapg. at room temp.; in 12.4 g. yield from 5 g. Et_3SI and HgI_2 in aq. KI; and in 60 g. yield from a soln. of 45.4 g. HgI_2 in 9 cc. Et_2S and 10 cc. Me_2CO and 9 cc. EtI. $Et_3SHg_2I_5$ (III), m. 121–2°, is formed in 8.8 g. yield from 9.1 g. HgI_2 and 2.5 g. Et_3SI in Me_2CO; in 93% yield from I and HgI_2 in Me_2CO; and in 99% yield from 7 g. Et_3SI in 40 cc. warm Me_2CO satd. with HgI_2. II, m. 150–1° (decompn.), results in 90% yield from 3.2 g. $KHgI_3$, 1.8 g. Et_2S and 3.3 g. EtI in H_2O-Me_2CO; in 93% yield from 1.13 g. HgI_2 and 1.46 g. Et_3SI in 25 cc. Me_2CO; in 99% yield from 1.66 g. KI and 7 g. I in 20 cc. Me_2CO; in 92% yield from 7 g. I and 2.5 g. Et_3SI in 50 cc. Me_2CO; in 94% yield from 1.91 g. III and 1.48 g. Et_3SI in 60 cc. Me_2CO; in 25% yield from 6.9 g. III and 1.5 g. KI in dil. Me_2CO; and in 89% yield by passing H_2S into a warm soln. of I in dil. Me_2CO. Heating 18.95 g. II at 145–65° for 2 hrs. gives 1 g. II and 13 g. I; the distillate (3.2 cc.) is a mixt. of EtI and Et_2S, solidifying to Et_3SI. PhSEt (27.6 g.), 91.4 g. HgI_2 and 32 g. EtI in 60 cc. Me_2CO, gently warmed and allowed to stand 5 months, give 95% of *phenyldiethylsulfoniummercuritriiodide*, $PhEt_2SHgI_3$ (IV), pale yellow, m. 56–7°; VI and HgI_2 in Me_2CO or an excess of aq. $KHgI_3$ also give IV. Heating IV at 120–70° gives nearly quant *phenyldiethylsulfonium trimercurioctaiodide*, $(PhEt_2S)_2Hg_3I_8$ (V), pale yellow, m. 65–6°, which also results by the action of HgI_2 upon IV in Me_2CO. The action of aq. HgI_2 upon IV or V in Me_2CO gives *phenyldiethylsulfonium mercuritetraiodide*, $(PhEt_2S)_2HgI_4$ (VI), m. 114–5°; VI also results from IV or V and H_2S in dil. Me_2CO. Heating VI at 110–30° gives PhSEt and IV. Resolution of phenacylmethylethylsulfonium *d*-bromocamphorsulfonate (VII) by fractional crystn. from 90% EtOH gives a *l*-VII with $[\alpha]_{6493}$ 46.03°, $[\alpha]_{5461}$ 59°; the corresponding picrate, m. 128°, $[\alpha]_{6493}$ —11.2°, $[\alpha]_{5461}$ —13.5° (Me_2CO, *c* 1.56). The *d*-VII could not be obtained in any quantity or even optically pure. An aq. soln. of *l*-VII had $[\alpha]_{5461}$ 58.1° when freshly prepd. and 59.1° after 237 and after 1392 hrs. Six months after prepn., a specimen of the *l*-picrate ($[\alpha]_{5461}$ —16.8° (Me_2CO, *c* 1.012)) had $[\alpha]_{5461}$ —17.8° (Me_2CO, *c* 1.570); this changed to —15° after 741 hrs. and to —13.4° after 1897 hrs. VII and $KHgI_3$ in dil. EtOH give the *dl-phenacylmethylethylsulfonium mercuritetraiodide* (VIII), m. 134°. On warming the paste of VIII in a little Me_2CO, there results the *mercuritriiodide* (IX), yellow, m. 82–3°. *l*-IX results from *l*-VII and $KHgI_3$ in H_2O or by adding Me_2CO to a mixt. of *l*-VIII and HgI_2 and warming. *l*-IX, m. 81–2°, $[\alpha]_{6780}$ —6.4°, $[\alpha]_{6493}$ —9.1°, $[\alpha]_{5461}$ —10.7° (Me_2CO, *c* 1.918), unchanged after 264 hrs. After 2865 hrs. this soln. had $[\alpha]_{5461}$ —5.5°. MeI (1.37 g., 15.8 mols.), added to 19 cc. of an Me_2CO soln. of *l*-IX, having $[\alpha]_{6780}$ —7.1°, $[\alpha]_{5461}$ —7.9° (*c* 2.53), gave a soln. having $[\alpha]_{5461}$ —8.1° (unchanged after 161 hrs.), —6.1° after 1032 hrs., —5.7° after 1358 hrs. and —4.3° after 2522 hrs. Adding 5 mols. KI to *l*-IX renders the soln. inactive in 15 hrs. Adding *l*-VIII to *l*-IX causes optical inactivity in 861 hrs. Heating *l*-IX at 100° for 2 hrs. also causes optical inactivity. *l*-VIII results from *l*-VII, KI and HgI_2 in EtOH or H_2O, from *l*-IX and KI in dil. Me_2CO or by the action of H_2S on *l*-IX; *l*-VIII, m. 122–3°, $[\alpha]_{6780}$ —8.2°, $[\alpha]_{5461}$ —9.3° (Me_2CO, *c* 2.425) when freshly prepd., changing to —2.9° and —3.1° after 72 hrs. and to —1.6° and —1.7° after 192 hrs. Another sample was optically inactive after 312 hrs. In the presence of 4.5 mols. MeI a sample was optically inactive after 42 hrs.; this also results after 2 hrs. heating of the solid salt. VII and $KHgCl_3$ in H_2O give *dl-phenacylmethylethylsulfonium dimercuriheptachloride* (X), m. 153° (decompn.). *l*-VII gives *l*-X, $[\alpha]_{6780}$ —10.7°, $[\alpha]_{5461}$ —11.3° (MeOH, *c* 1.17); after 1947 hrs. both values were —7.7°. $(BzCH_2)EtMeSBr$, KI and CdI_2 in H_2O give the *cadmitetraiodide* (XI), m. 126°; this results with either 1 or 2 mols. KI. *l*-XI, m. 132–3°, results from *l*-VII and K_2CdI_4 in dil. Me_2CO; $[\alpha]_{6780}$ —9.9°, $[\alpha]_{5461}$ —10.2° (Me_2CO, *c* 1.41); after 164 hrs. the soln. was optically inactive. XI and CdI_2, warmed with sufficient Me_2CO to give a paste, give the *cadmipentaiodide* (XII), m. 134–6°; *l*-XII, $[\alpha]_{6780}$ and $[\alpha]_{5461}$ —9.0° (Me_2CO, *c* 1.115); after 48 hrs. the soln. was inactive. C. J. WEST

Action of chlorosulfonic acid on phenols. VI. Xylenol-sulfonyl chlorides and -sulfonylides. ERNST KATSCHER, H. LEHR, A. HARNISCH AND L. STEINHARDT. *Mon-*

atsh. **56**, 381–90(1930); cf. *C. A.* **22**, 3652.—2,3-$Me_2C_6H_3OH$ (I) (2 g.) and 20 g. $ClSO_3H$ after 24 hrs. give 1.6 g. of a ppt., from which was isolated 0.8 g. *2,3,2',3'-tetramethyldiphenyl-1,6,1',6'-sulfonylide-4,4'-disulfonyl chloride* (II), decomps. 295°, crystd. from $PhNO_2$; on standing in an open dish for 7 hrs., the mother liquor deposits 1.15 g., from which was isolated 0.8 g. of *2,3-dimethylphenol-4,6-disulfonyl chloride*, m. 104–5°; the *disulfonanilide* m. 232°. II gives a *4,4'-disulfonanilide* (III), m. 273°. I with 10 parts by wt. of $ClSO_3H$ at —5° to 0° for 4 hrs. gives only H_2O- or HCl-sol. products. I (2 g.) and 20 g. $ClSO_3H$ at 110° for 2 hrs. give 2.5 g. II and 2.1 g. III. 3,4-$Me_2C_6H_3OH$ and 10 parts by wt. of $ClSO_3H$ give *3,4-dimethylphenol-2,5-sulfonyl chloride*, m. 72°; *disulfonanilide*, m. 160°; the free SO_3H acid couples with *p*-$O_2NC_6H_4N_2X$, giving a bright red soln., which dyes animal fibers. 2,5-$Me_2C_6H_3OH$ and $ClSO_3H$ (10 parts) give *2,5-dimethylphenol-3,6-disulfonyl chloride*, m. 58°; *disulfonanilide*, m. 173°; the free acid gives an orange-yellow dye with *p*-$O_2NC_6H_4N_2X$. 3,5-$Me_2C_6H_3OH$ and $ClSO_3H$ give a mixt., in varying proportions, depending upon the temp. of the reaction, of the 2 *disulfonyl chlorides*, m. 89–91° and 117–9°; the 2 *disulfonanilides* m. 160–61° and 205–207°. 2,4-$Me_2C_6H_3OH$ gives *2,4-dimethylphenol-6-sulfonyl chloride* (IV), m. 93–5°, and *1,3,1',3'-tetramethyldiphenyl-4,5,4',5'-sulfonylide*, decomps. above 300°. Since the compd. IV on standing in a corked bottle changes to a H_2O-sol. oil, which gives a typical blue color with $FeCl_3$, it is possible that it may be a chlorosulfonic ester.

C. J. West

Structure of isoanethole. Geo. D. Goodall and Robert D. Haworth. *J. Chem. Soc.* **1930**, 2482–7.—Anethole and 5 *N* MeOH-HCl, refluxed for 12 hrs., give isoanethole (I), pale yellow, $b_{0.7}$ 205–10°; of the possible formulas, $MeOC_6H_4CH{:}CMeCH{-}EtC_6H_4OMe$ (I), $MeOC_6H_4CH{:}CMeCHMeCH_2C_6H_4OMe$ (II) and $MeOC_6H_4CH_2{-}CMe{:}CEtC_6H_4OMe$ (III), III was excluded because oxidation of I gave anisic acid; the decision between I and II was made by comparing the ketone $C_{12}H_{16}O_2$ with the ketones $AcCHEtC_6H_4OMe$ (IV) and $AcCHMeCH_2C_6H_4OMe$ (V), which were synthesized. Oxidation of I gives *α-p-methoxyphenylpropyl Me ketone* (IV), $b_{0.7}$ 125–8°; *semicarbazone*, m. 189°; *oxime*, m. 84–5°. *p*-$MeOC_6H_4CH_2Br$ and $AcCHNaCO_2Et$ in C_6H_6 give *Et p-methoxybenzylacetoacetate* (VI), $b_{0.25}$ 172° and a higher, boiling fraction (VII). Hydrolysis of VI gives *p-methoxybenzylacetone*, b_{25} 177°; *semicarbazone*, m. 172–3°; *oxime*, m. 77°. Hydrolysis of VII gives *di-p-methoxybenzylacetone*, m. 96–7°. VI and MeI with MeONa give *Et p-methoxybenzylmethylacetoacetate*, $b_{0.5}$ 180°, which is hydrolyzed to *α-p-methoxybenzylethyl Me ketone* (V), b_{20} 175°; *semicarbazone*, m. 135°; oxime, oil. *p*-$MeOC_6H_4CH_2CN$ (VIII) with BzH and a few drops of MeOH-KOH gives the *benzylidine deriv.*, m. 96°. VIII and AcOEt with EtONa give *acetyl-p-methoxyphenylacetonitrile*, pale yellow, m. 80°; this could not be condensed with EtI by EtONa; hydrolysis with 50% H_2SO_4 gives *p-methoxybenzyl Me ketone*, b_{20} 150°; *semicarbazone*, m. 173°; this ketone with EtI and EtONa gives V. Oxidation of V with NaOBr gives *α-3-bromo-4-methoxyphenylbutyric acid*, m. 123–5°. These results show that isoanethole has the formula I.

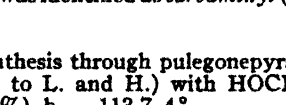
C. J. West

Reduction of substituted *p*-benzoquinones by sulfur dioxide alone and in the presence of alkali. John W. Dodgson. *J. Chem. Soc.* **1930**, 2498–2502; cf. *C. A.* **9**, 206.—SO_3H acids are regularly formed by the action of SO_2 on quinones. Direct reduction also takes place according to the equation: $C_6H_4O_2 + H_2SO_3 + H_2O \longrightarrow C_6X_4(OH)_2 + H_2SO_4$. While the quinone mol. contains 1 or more H atoms, the reaction may be expressed: $C_6HX_3O_2 + H_2SO_3 \longrightarrow C_6X_3(OH)_2.SO_3H$. In chloroquinones there is marked tendency to form di-SO_3H acids; *e. g.*, $C_6H_2Cl_2O_2 + 2H_2SO_3 \longrightarrow C_6HCl(OH)_2(SO_3H)_2 + HCl$. With tetrachloroquinone, which no longer contains a labile H, the sulfonation must be expressed by the equations: $C_6Cl_4O_2 + 2H_2SO_3 + H_2O \longrightarrow C_6Cl_3(OH)_2SO_3H + H_2SO_4 + HCl$; $C_6Cl_4O_2 + 3\ H_2SO_3 + H_2O \longrightarrow C_6Cl_2(OH)_2(SO_3H)_2 + H_2SO_4 + 2HCl$. The formation of SO_3H acids by neutral sulfites is largely in excess of reduction of the quinone. It must be the result of the presence of sulfonic ion. This demands previous hydrolysis of the sulfite. Additional alkali inhibits this hydrolysis and this is probably a contributing cause of the falling off of sulfonate as the proportion of alkali is increased. The action of excess of alkali apparently leads to destruction of the quinone through the formation of highly colored unstable compds. Results are given, in tabular form, for *o-* and *p*-xyloquinones, chlorobenzoquinone, 2,5- and 2,6-dichlorobenzoquinones and tetrachlorobenzoquinone. The following *Ba salts* are described: *toluquinolsulfonate*, $FeCl_3$ reaction blue; *p-xyloquinolsulfonate*, reaction, greenish blue; *chloroquinolsulfonate*, reaction, blue; *2,5-dichloro-*

quinolsulfonate, reaction, bluish violet; *2,3-dichloroquinolsulfonate*, reaction, bluish violet. C. J. WEST

1,3-Migration of amino groups. Mechanism. Application to other analogous reactions. JOSEPH ROBIN. *Compt. rend.* **191**, 1013–5(1930).—$Ph_2C(NHPh)C:CPh$ (I) to $Ph_2C:CHC(:NPh)Ph$ (II) is not a simple migration. $PhNH_2.HCl$ (III) is necessary for the reaction. If HCl from III adds at the triple bond and $PhNH_2$ and HCl split off, thus

II is formed. To test the theory, chlorides of the type $Ar_2CClC:CAr$ have been prepd. The HCl salt of diphenyl-β-naphthylethinylmethyl chloride, $C_{26}H_{17}Cl.HCl$, m. about 155°, and the HCl salt of diphenyl-*p*-bromophenylethinylmethyl chloride, $C_{21}H_{14}BrCl.HCl$, m. about 100°, were prepd. H_2O transformed these compds into $Ar_2C:CHCOAr$. The proposed interpretation can be applied to the transformation of acetylenecarbinols into their ether salts or oxides which is brought about in acid medium. RACHEL BROWN



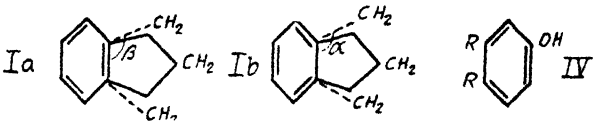
Dynamic isomerism involving mobile hydrocarbon radicals. II. Intramolecular character of the amidine rearrangement. ARTHUR WM. CHAPMAN. *J. Chem. Soc.* **1930**, 2458–62; cf. *C. A.* **24**, 94.—In part I it was shown that $PhN:CPhNPhC_7H_7$ (I) and $Ph_2NCPh:NC_7H_7$ (II), heated at a sufficiently high temp., underwent mutual interconversion by migration of a Ph group from 1 N atom to the other, similar equil. mixts. of the 2 isomers being obtained from both compds. Repeated recrystn. of II with change of solvent did not alter the rate of conversion into I nor was the velocity of change affected by the use of SiO_2 in place of a glass vessel. There was therefore no obvious indication that the progress of the reaction depended on the presence of a catalyst. *Triphenylbenzenylamidine* (III), yellow, m. 168.9°; hydrolysis gives Ph_2NH and $PhNH_2$. *Tri-p-tolylbenzenylamidine* (IV), lemon-yellow, m. 188.9°; hydrolysis gives *p*-$MeC_6H_4NH_2$ and $(p\text{-}MeC_6H_4)_2NH$. The m. p. curve of Ph_2NH and $(p\text{-}MeC_6H_4)_2NH$ is given. Heating III at 345° for 2 hrs. depresses the m. p. only 2°, while the m. p. of IV is depressed 2° after 1 hr. at 335°. To det. whether interchange of groups occurred during rearrangement, a mixt. of III and IV was made in such proportion as to yield on hydrolysis the eutectic mixt. of Ph_2NH and $(p\text{-}MeC_6H_4)_2NH$; this was analyzed before and after being heated at 330–1° for 0.5 and 1 hr. The m. p. of the mixt. of sec. amines obtained on hydrolysis differed by less than 1.5°, which is within the limit of exptl. error. *Tri-p-chlorophenylbenzenylamidine*, yellow, m. 147–8°; this was not sufficiently stable above 300° to be used. *N-p-Chlorophenylbenzimino p-chlorophenyl ether*, pale yellow, m. 68–9°. **III. Some effects of substitution on the velocity of interchange and position of equilibrium of isomeric triarylbenzenylamidines.** A. W. CHAPMAN AND CHARLES H. PERROTT. *Ibid* 2462–8.—*N,N'-Di-p-tolyl-N-phenylbenzenylamidine* (I), yellow, m. 133°; *N-di-p-tolyl-N'-phenylbenzenylamidine* (II), yellow, m. 149.5–50°; *N,N'-diphenyl-N-p-chlorophenylbenzenylamidine* (III), m. 150–2°; *N-diphenyl-N'-p-chlorophenylbenzenylamidine* (IV), yellow, m. 167.5–8.5°; *N,N'-di-p-chlorodiphenyl-N-phenylbenzenylamidine* (V), yellow, m. 132–3°; *N-di-p-chlorodiphenyl-N'-phenylbenzenylamidine* (VI), yellow, m. 101–3°. M.-p. curves are given for *p*-MeC_6H_4NHPh and $(p\text{-}MeC_6H_4)_2NH$, Ph_2NH and $(p\text{-}ClC_6H_4)NHPh$ and *p*-ClC_6H_4NHPh and $(p\text{-}ClC_6H_4)_2NH$. Details are given of the conversion of $PhN:CPhNPhC_7H_7$ (VII) and $Ph_2NCPh:NC_7H_7$ (VIII) and the above isomers at 330–1° are given. The results may be summarized as follows [$(k + k') \times 10^3$ and equil. % given]: VII–VIII, 6.2, 69% VII; I–II, 2.0, 53% I; III–IV, 4.5, 59% III; V–VI, 11.3, 71% V. The mobilities of the 3 groups concerned are in the order *p*-MeC_6H_4<Ph<*p*-ClC_6H_4. From the position of equil. of the 4 pairs of isomers investigated, it is evident that the mobile group tends, only slightly in VII–VIII, but quite definitely in the other 3 cases, to attach itself preferentially to the N atom which carries the group with the lesser attraction for electrons. The influence of substitution in the migrating group upon the position of equil. is small compared with that of substitution in the system. C. J. WEST

Menthone series. VII. Condensation of menthylamines with *d*- and *l*-oxymethylenecamphor. JOHN READ AND CATHERINE CASSELS STEELE. *J. Chem. Soc.* **1930**, 2430–4; cf. *C. A.* **23**, 2167.—The unusual difficulties experienced in attempting the resolution of menthylamines by means of the H *d*-tartrates led to the study of the possibility of utilizing optically active oxymethylenecamphor (I) as a resolving agent. *d-Neomenthylamino-d-I* (II), m. 105°, $[\alpha]_D$ 317.8° (abs. EtOH, *c* 0.6 g. in 100 cc.); no mutarotation was observed in 48 hrs. The *l-I deriv.* m. 94°, $[\alpha]_D$ —129.8° (abs. EtOH, *c* 0.6); no mutarotation. *dl*-Neomenthylamine (III) may be resolved by the use of *d*-I, the portion of the ppt. insol. in petrol. ether being II, while the mother liquor gives *l-neo-*

menthylamino-d-I, m. 92°, $[\alpha]_D$ 130° (abs. EtOH, *c* 0.6). II in EtOH, titrated with 1 mol. Br and the product shaken with H_2O and C_6H_6, gives *d-neomenthylamine-HBr*, does not m. 220°, $[\alpha]_D$ 18.6° (H_2O, *c* 0.6). The HBr salt of III is considerably less sol. than its optically active components. The unchanged base from the above resolution was optically inactive. *d-Isomenthylamino-d-I*, m. 110°, $[\alpha]_D$ 281.3° (EtOH, *c* 0.6), changing to 274.9° in 15 hrs. and to the const. value 257.5° in 48 hrs. The *l-I deriv.* m. 99–100°, $[\alpha]_D$ —212.9° (abs. EtOH, *c* 0.6), changing to —179.6° in 15 hrs. and to the const. value —160.8° in 48 hrs. The product from *dl*-isomenthylamine and *d*-I was a sirup, which could not be crystd.; it showed $[\alpha]_D$ 162.2° (EtOH, *c* 0.6), changing to 155.2° in 48 hrs. *l*-Menthylamino-*d*-I, m. 90°, $[\alpha]_D$ 96.7°, changing to 110.4° in 7 hrs. and to 125° in 16 hrs. The *l*-I deriv. is very sol. in all org. solvents and could not be recrystd.; $[\alpha]_D$ —170.2°, which remained unaltered after 24 hrs. *dl*-Menthylamine gave a product with *d*-I which could not be fractionally crystd. The recovered base was optically inactive. C. J. West

Hydration of nopinene. V. Hydration by (organic) acids in nascent state. G. Austerweil. *Bull. soc. chim.* [4], **47**, 1157–9(1930); cf. *C. A.* **21**, 3894.—*o*-$C_6H_4(CO)_2O$, 220 g., was dissolved in 600 g. xylene and kept at 135–8° while a mixt. of 100 g. nopinene and 66 g. abs. EtOH was added dropwise during 3 hrs. The mixt. was neutralized and steam-distd., leaving non-vol. bornyl Et phthalate in the flask. This, sapond. by aq. NaOH and steam-distd., yielded 48 g. (44% theory) of borneol contg. a little fenchol. With pinene instead of xylene, the yield was 64% of the theoretical. L. E. G.

Action of semicarbazide on pulegone. S. A. Busse and H. L. Gurevich. *Ber.* 63B, 2209–11(1930).—$H_2NCONHNH_2$ with unsatd. ketones under certain conditions gives, in addn. to the ordinary semicarbazones, semicarbazide semicarbazones, *i. e.*, products of the addn. of 1 mol. $H_2NCONHNH_2$ to the semicarbazone at the double bond. Attempts to obtain such products with compds. having conjugated double bonds, such as pulegone, have, however, been unsuccessful. Rupe with Lotz and with Schlochoff obtained only the ordinary semicarbazone, Masurewich only $(NHCONH_2)_2$. On the other hand, Rupe, Lotz and Schlochoff from mesityl oxide obtained the expected semicarbazide semicarbazone which with boiling H_2O yielded $(NHCONH_2)_2$ and a product identical with the pyrazoline obtained by Scholtz by distn. of mesityl oxide semicarbazone and subsequently synthesized by Locquin and Heilmann by condensing mesityl oxide with $N_2H_4.H_2O$ and introducing the $CONH_2$ group with HOCN. The question arose whether with pulegone a pyrazoline ring might not also be formed. As a matter of fact, $H_2NCONHNH_2$ and pulegone, under the conditions used by Beckmann and Fleissner with NH_2OH, gave in addn. to $(NHCONH_2)_2$ a product m. 156–7°, isomeric with the ordinary semicarbazone, m. 169°, but which did not regenerate pulegone with dil. acids and was identified as *carbaminyl* (*pulegonepyrazoline*) (I),



by its synthesis through pulegonepyrazoline (II) (prepd. from pulegone and $N_2H_4.H_2O$ according to L. and H.) with HOCN. I, m. 156–7°, mol. wt. in camphor 208. II (yield, 97%), b_{11-2} 113.7–4°. C. A. R.

Synthesis of alkylnaphthalenes. II. 1,3,5- and 1,3,8-trimethylnaphthalenes. Isidor M. Heilbron and Donald G. Wilkinson. *J. Chem. Soc.* 1930, 2537–42; cf. *C.* 1. 24, 2742.—2,4-$Me_2C_6H_3CHO$ (43 g.), AcOEt and Na give 40 g. *Et 2,4-dimethylcinnamate*, b_5 135–7°; reduction with Na and EtOH gives 19 g. *γ-(2,4-dimethylphenyl)-propyl alc.* (I), b_5 126° (*urethan*, m. 81°) and 13 g. 2,4-$Me_2C_6H_3CH_2CH_2CO_2H$. I (20 g.) with 30% HBr in AcOH gives 25 g. of the *bromide*, b_{18} 147°; with KCN, followed by hydrolysis, there results 18 g. *γ-(2,4-dimethylphenyl)butyric acid*, m. 78–9°; *chloride* (II), b_9 136–8°; *amide*, m. 128–9°. II (17 g.) with $AlCl_3$ gives 13 g. *5-keto-1,3-dimethyl-5,6,7,8-tetrahydronaphthalene* (III), b_{14} 160°; *semicarbazone*, m. 243–6° (decompn.). With MeMgI, 12.4 g. III gives 10 g. of an oil consisting mainly of the carbinol, converted into *1,3,5-trimethyl-7,8-dihydronaphthalene*, b_{18} 143–5°, by boiling 4 hrs. with Ac_2O (7 g. yield); dehydrogenation with Se gives *1,3,5-trimethylnaphthalene*, m. 47°; *picrate*, orange, m. 141–2°; *styphnate*, golden yellow, m. 138°. 2,4-$Me_2C_6H_3Ac$ and $BrCH_2CO_2Et$ with Zn give *Et β-hydroxy-β-(2,4-dimethylphenyl)butyrate* (IV), b_{10} 170–80°; the lower-boiling fraction, on hydrolysis, gives the free *acid*, m. 70–2°. IV and $POCl_3$, refluxed 30 min., give *Et β-(2,4-dimethylphenyl)crotonate*, b_{20} 160–70°; reduction of 58 g. of this ester with Na and EtOH gives 12 g. *γ-(2,4-dimethylphenyl)butyl alc.* (V), b_{16} 152–3°, and a large amt. of *β-(2,4-dimethylphenyl)butyric acid*, m. 69°; *Et ester*, b_{16} 168–70°; this ester may be reduced to V by Na and PrOH. The *bromide* from V, b_{17}

143°, is transformed into *γ-(2,4-dimethylphenyl)valeric acid*, b_8 175; *acid chloride*, b_{18} 157–60°; *amide*, m. 91–2°. *5-Keto-1,3,8-trimethyl-5,6,7,8-tetrahydronaphthalene*, b_{20} 174–6°; *semicarbazone*, m. 220–2°. *1,3,8-Trimethyl-5,6,7,8-tetrahydronaphthalene*, $b_{18.5}$ 133–6°; Se gives *1,3,8-trimethylnaphthalene*, m. 48 (liquefies when mixed with the 1,3,5-deriv., m. 47°); *picrate*, orange-red, m. 125°; *styphnate*, golden, m. 140.5°.

Stereochemical influences on aromatic substitution. Substitution derivatives of 5-hydroxyhydrindene. Wm. H. Mills and Ivor G. Nixon. *J. Chem. Soc.* **1930**, 2510–24.—From a discussion of the C valencies of the Kekulé formula for C_6H_6 it is concluded that there is reason to suppose that in the C_6H_6 nucleus constituted according to K.'s formula, the angle α, which each of the external valencies makes with the intranuclear single bond on the 1 side of it, is less than β, which it makes with the plane of the double bond on the other side. If this is correct, the stable form of a compd. in which the C_6H_6 ring is fused with a 5 atom ring must clearly be that in which the linking common to the 2 rings consists of a single bond. In hydrindene (I), *e. g.*, the form Ib should

be the more stable and I in the liquid or dissolved state should consist of an equil. mixt., in which this form predominates If this is so, then in 5-hydroxyhydrindene (II) substitution by diazo residues or by Br should take place at the 6-position, which actually occurs. The analog of II, in which the alicyclic 5-ring is replaced by a 6-ring, is *ar*-tetrahydro-β-naphthol, in which substitution takes place in the 1-position. It is suggested that the position assumed by the substituent group in the coupling and bromination of these hydrindene and tetralin derivs. is detd. by the disposition of the system of alternate single and double bonds in the benzenoid ring. 4,1,2-AcNHC$_6$H$_3$Me$_2$ (III) also gives a 5-Br deriv.; hence it may be inferred that in a 1,2,4-R$_2$C$_6$H$_3$OH, the more stable arrangement of the intranuclear bonds is that represented by IV. Details of the prepn. of II are given; with *p*-MeC$_6$H$_4$N$_2$X, 6.7 g. II gives 8.3 g. of the *6-p-toluenecazo deriv.* (V), m. 132.5° and 0.9 g. of a red compd., m. 99–101°, probably a mixt. of the 6- and 4-derivs. in the proportion approx. to the eutectic. *p*-ClC$_6$H$_4$N$_2$X gives about 90% of the *6-p-chlorobenzeneazo deriv.*, m. 155–6°, and some 4-deriv., not obtained pure. Reduction of V with SnCl$_2$, HCl and EtOH gives the 6-NH$_2$ deriv., m. 185–6°. Reduction of 5,6-dimethoxy-1-hydrindone gives *5,6-dimethoxyhydrindene*, m. 55°; heating with HI in CO$_2$ atm. gives the *5,6-di-HO deriv.*, m. 116°; this also results from the 6-NH$_2$ deriv. of II through the diazo reaction, some crystallographic data are given. II and Br in AcOH give the *6-Br deriv.*, m. 37.7°; this is also obtained from the 6-NH$_2$ deriv. through the Sandmeyer reaction. III yields a 5-Br deriv., m. 164°; hydrolysis gives *5-bromo-4-amino-o-xylene*, m. 84.5°. *4,5-Dibromo-o-xylene* m. 88°. C. J. West

2,3-Naphthalenedicarboxylic acid. Hans Waldmann. *J. prakt. Chem.* **128**, 150–2(1930).—2,3-H$_2$NC$_{10}$H$_6$CO$_2$H, through the Sandmeyer reaction, gives *2,3-cyanonaphthalenecarboxylic acid*, yellow, m. 273–4°; hydrolysis with concd. alkali or better with H$_2$SO$_4$ in dil. AcOH gives 2,3-C$_{10}$H$_6$(CO$_2$H)$_2$, m. 240°, raised by sublimation to 246°. This synthesis is simpler than that of Freund and Fleischer (*C. A.* **7**, 3737).

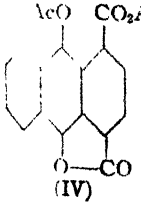
C. J. West

α,α-Dimethyl-β-phenylindene. J. C. Earl and C. A. Smythe. *J. Proc. Roy. Soc. N. S. Wales* **64**, 90–5(1930).— Through a misprint the title in the original reads α,α-dimenthyl-β-phenylindene. E. and S. describe the action of AlBr$_3$ upon BrCMe$_2$CHMeBr in benzene, which results in the formation of α,α-dimethyl-β-phenylindene, C$_{17}$H$_{16}$: Me$_2$CBrCHMeBr ⟶ Me$_2$CPhCHMePh(− H$_2$) ⟶ Me$_2$C.C$_6$H$_4$.CH$_2$.CHPh (−H$_2$) ⟶ Me$_2$C.C$_6$H$_4$.CH:CPh. On exhaustive oxidation phthalic acid is obtained as shown by its m. p., conversion into the anhydride and by the fluorescein reaction, while less drastic oxidation by CrO$_3$ in glacial AcOH leads to the formation of a very stable acid of the compn. C$_{17}$H$_{16}$O$_3$ and of the structural formula: *o*-HO$_2$CC$_6$H$_4$CMe$_2$COPh On treating this acid with Ac$_2$O, no dehydration is obtained but an acetylation occurs giving the Ac deriv. O.CO.C$_6$H$_4$.CMe$_2$.C(OAc)Ph. By heating the acid C$_{17}$H$_{16}$O$_3$ with baryta, cumene is produced which can be identified by its conversion into the *p*-sulphon-

amide (m. 106–7°) and by its oxidation with alk. $KMnO_4$ to phthalic acid. Aq. HNO_3 readily nitrates the hydrocarbon $C_{17}H_{16}$ to a nitro compd. (II): $C_6H_4.CMe_2.CPh{:}CNO_2$.

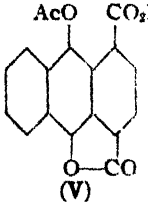
F. R. GREENBAUM

Berginization of anthracene. N. A. ORLOV AND N. D. LIKHACHEV. *Ber.* **63B**, 2179–85(1930); cf. *C. A.* **23**, 3926.—The study of the behavior of condensed ring systems toward H under pressure at high temps. has been extended to anthracene (I) which, from the results of its destructive distn. with $AlCl_3$ and the behavior of phenanthrene, would be expected to first form tetracene which at the high temp. would undergo rupture of the tetramethylene ring with formation of $C_{10}H_8$ and its homologs; these would again be hydrogenated to tetrahydrides and decompd., leading finally to the C_6H_6 hydrocarbons. These expectations were confirmed experimentally. In the mixt. of liquid hydrocarbons obtained by the berginization of I with Na as catalyst were identified with certainty C_6H_6 hydrocarbons (with insignificant amts. of satd. hydrocarbons, presumably naphthenes), tetralin, $C_{10}H_8$, β-$C_{10}H_7Me$, β-$C_{10}H_7Et$ and the tetrahydrides of the last 2 compds. The non-picrate forming part of the hydrocarbons (corresponding to the homologous tetralins) was investigated by the method of dehydrogenation with Se or S. The use of Se resulted in only moderate dehydrogenation, but with S the dehydrogenation apparently proceeded quite regularly, although only small amts. of the resulting alkylnaphthalenes could be isolated, the greater part of the hydrocarbons changing into an asphalt-like substance. No paraffins or olefins were present in the mixts. subjected to dehydrogenation and the anomalous results are ascribed to the presence of 5-membered ring hydrocarbons which might be formed by isomerization of the tetralins to hydrindenes. To test the possibility of the reaction tetralin ⟶ methylhydrindene, pure tetralin was heated under pressure; by careful fractionation of the product were obtained several tetralin-free fractions which were sepd. into C_6H_6 homologs and methylhydrindene. C. A. R.



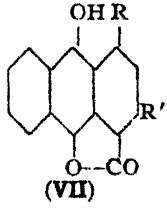
Anthraquinhydrone and anthraquinhydronecarboxylic acids. ROLAND SCHOLL AND OSKAR BÖTTGER. *Ber.* **63B**, 2120-6(1930).—1. *Anthraquinhydrone.*—Claus reported that when abs. alc. is poured upon anthraquinone (I) and Na-Hg there develops at the surface of contact of the amalgam with the alc. a dark green zone which on gentle shaking colors the whole soln. a beautiful green but disappears on shaking with air, with sepn. of I; if, however, the alc. contains even but a trace of H_2O there is formed, instead of the green soln., the air sensitive red soln. of the Na deriv. of anthrahydroquinone (II). The reaction, which was recommended by C. for the detection of traces either of I or of H_2O in alc., is still found in text- and handbooks. As a matter of fact, however, the colors formed are in no way dependent on the H_2O content of the alc., as believed by C.; the green color is an intermediate phase in the reduction to the red Na salt of II. When amorphous I is brought into contact, in the air, with Na-Hg and alc., whether or not the alc. contains a moderate amt. of H_2O, there is always produced in the immediate vicinity of the amalgam a red liquid in the form of red-brown streamers dispersing in the soln. with a green color which is destroyed, from the surface down, by atm. oxidation. In H, however, the green soln. changes, after some min. on standing quietly, very rapidly on shaking, through olive shades to the red of the II vat, and air or other oxidizing agents (AmONO) produce the same color changes, in the reverse order, in the red alc. alk. II soln. after filtration in H from the excess of Na-Hg. The red filtered soln. can also be converted back into the green soln. (quinhydrone formation) in H by adding amorphous I suspended in alc. Addn. to the green filtered alc. soln. of a moderate vol. of air free H_2O (up to 1 vol., at the proper concn.) produces no or hardly any change, but if the amt. of H_2O is increased to about 2 vols. the soln. becomes brown-red and deposits a colorless ppt. (dissocn. of the green quinhydrone salt into I and the red Na salt of II). The brown-red aq. alc. soln. is completely decolorized by the air, with pptn. of I without passing through the green stage because the quinhydrone is not capable of existence in the presence of a sufficient amt. of H_2O. The quinhydrone formation does not depend on the presence of alc.; when amorphous I is rubbed with Na-Hg and a drop of H_2O, or with $Na_2S_2O_4$ and very concd. KOH, there is formed a green mass (quinhydrone) which only on treatment with H_2O dissolves with red color (Na salt of II) and sepn. of I. When the red vat obtained from I with $Na_2S_2O_4$ and dil. NaOH in excess is concd. by boiling and the flame is removed, the green quinhydrone begins to sep. from the upper rim of the soln., as the steam condenses and the air enters, because the $Na_2S_2O_4$ is insol. a very difficultly sol. in concd. NaOH and its protective action on the Na salt of II against the atm. O is greatly weakened. The green quinhydrone salt, which is at once dissocd. by H_2O and is extraordinarily sensitive to air, was prepd., not without difficulty, by bringing together I and 2.5% Na-Hg in a little 99% alc. at room temp., filtering,

oxidizing the red vat filtrate with a little AmONO, filtering the resulting difficultly sol. quinhydrone salt, washing with petroleum ether and drying with hot H. All operations were carried out in an app. (sketch given) filled with H. The compn. of the salt was established as follows: (1) Dissocn. with H_2O or dil. alk. into the insol. I and the sol. salt of II and detn. of the I; (2) dissocn. in an open dish, passing in air or adding a little hypochlorite, and detn. of the total I formed; (3) titration of the II remaining in soln. in (1) to decolorization with $K_3Fe(CN)_6$; (4) detn. of the Na. These detns., made on samples prepd. by different methods, showed that alc. and NaOEt also play a part in the formation of the salt, whose compn. corresponds to the formula ($2C_{14}H_8O_2 + C_{14}H_8O_2Na_2 + EtOH + EtONa$). *2. Anthraquinhydronecarboxylic acids.*—It was reported some time ago (*C. A.* **23**, 3700) that the violet color of the vat acids pptd. from cold alk. hyposulfite vats of anthraquinonecarboxylic acids is not produced by radical or quinhydrone admixts. but is a property of the pure anthrahydroquinonecarboxylic acids. Nevertheless, there are indications that the reduction of the quinone acids by alk. $Na_2S_2O_4$ or Na-Hg in alc. (in the absence of air) to the hydroquinone acids and the reconversion of the latter into the quinone acids by atm. O pass through an intermediate phase, manifested by the appearance of a peculiar olive-green color. These olive-green solns. can also be obtained by bringing together the almost colorless alk. soln. of the quinone acid and the red alk. soln. of the hydroquinone acid. The color is observed only in caustic alkali solns.; the Na_2CO_3 and NH_4OH solns. are red. From all these solns. HCl ppts. the free quinhydrone acid, on strong diln., in cryst., deeply colored form, quite stable toward the air These ppts. again form with NaOH olive-green and with Na_2CO_3 or NH_4OH red solns. sensitive to the air. In the olive-green solns. the *ms*-HO groups are probably neutralized in addn. to the CO_2H groups. Unlike the noncarboxylated Na quinhydrone, the quinhydronecarboxylates, as well as the free acids, are capable of existence in much water, the 2 components in each being equally easily or difficultly sol. in H_2O, as the case may be. Neither the salts nor the free acids were isolated in pure form. C. A. R.

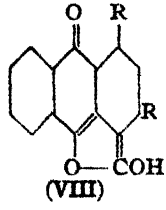


Anthraquinone azine and anthraquinone azhydrin. Roland Scholl and Herbert Lamprecht. *Ber.* **63B**, 2126-8(1930).—It has been reported (*Ber.* **40**, 321(1907)) that indanthrene (I) in concd. H_2SO_4 gives with CrO_3 2 products: a greenish yellow anthraquinone azine (II) and a green substance (III) assumed to be an intermediate product in the oxidation of I to II and designated as anthraquinone azhydrin. The similarity of II and III and the way in which it was thought that the azhydrin structure of II was proved made it doubtful whether III was really a homogeneous substance and not a mixt. of II with varying amts. of unchanged I. A no. of expts. have accordingly been made to settle this point. When pure II, pptd. in amorphous form from concd. H_2SO_4 with H_2O, is boiled with freshly distd. BzCl, the originally green liquid passes in about 45 min. through blue-green and dirty violet to a red-brown which undergoes no further change. After 1 hr., however, the product consists of chiefly the original I (which has become cryst.) and red needles of dibenzoylindanthrene; after 4 hrs. boiling the latter is the chief product. Contrary to earlier statements, III is sol. in pure, HCl-free BzCl with red color, changed to blue by small amts. of strong mineral acids and, therefore, on standing in moist air. At the time S. and Berblinger assigned to III the azhydrin structure they were not aware that II is quantitatively converted by hot concd. HCl into chloroindanthrene only under definite conditions (long heating of the amorphous II in sealed tubes at 150°). They boiled their green III 1 hr. with concd. HCl and found in the blue product a Cl content (4.4%) which by chance corresponded approx. to that (3.86%) of a mol. mixt. of I and chloroindanthrene. Moreover, the nature of the product obtained by turbining I in concd. H_2SO_4 with $K_2Cr_2O_7$ varies with the length of the turbining. The product prepd. under the conditions given by S. and B. (0.5 hr. turbining) and then heated 3 hrs. at 150° with concd. HCl gave a mixt. of I and chloroindanthrene with 4.87% Cl; with 1.5 hrs. turbining, the Cl content of the final product was 5.73%. There is, therefore, at present no definite proof of the existence of an anthraquinone azhydrin. C. A. R.

Carboxylated blue anthrahydroquinone-α-carboxylic acid lactones. I. Roland Scholl and Oskar Böttger. *Ber.* **63B**, 2128-38(1930); cf. *C. A.* **23**, 4944.—This is a contribution to the chemistry of the free radicals of the anthracene series (the so-called aroyloxanthronyls, arylpyrrolinoanthranolazyls), insofar as it deals with anthracene derivs. which, from their blue color, sensitivity to air and other properties, at first glance convey the impression of being free radicals but on closer investigation prove to be as far removed from these radicals as are the violet anthrahydroquinone-α-carboxylic acids or the blue true salts of the red anthrahydroquinone-α-carboxylic acid lactones already described. When the cold alk. hyposulfite vat of 1,4-$C_6H_4(CO)_2C_6H_2(CO_2H)_2$



is acidified with HCl, the hydroquinone acid (I) seps. as a red to brown-red ppt. which, when boiled for a few min. in the strongly acid soln., becomes dark violet or blue and now shows great similarity to the violet anthrahydroquinone-1,5-dicarboxylic acid (II) but is fundamentally different from the latter. When purified through its *pyridinium salt*, which is stable *in vacuo* at 100° and crystallizes from Me_2CO in the form of a loose 1:1 mol. compd., it contains 1 mol. H_2O less than I, *i. e.*, it has the compn. of an *anthrahydroquinone-1,4-dicarboxylic acid monolactone* (III). It dissolves easily in dil. Na_2CO_3 and NH_4OH or very dil. NaOH with blue color, but with the NaOH it rapidly (immediately on heating) regenerates the red air-sensitive soln. of I. Ac_2O dissolves it on moderate heating with violet, on short boiling with red color and formation of a red di-Ac deriv., one of whose Ac groups is held loosely and is readily removed by boiling AcOH with formation of a red mono-Ac deriv. Both Ac derivs. are converted by cold concd. HCl into the blue III, by hot NaOH into I, and they therefore have the structures IV and V, resp. The lactonization of I also occurs in boiling AcOH and hot Ac_2O, and III can be obtained by boiling $1,4\text{-}C_6H_4(CO)_2C_6H_2(CO_2H)_2$ a short time with Na_2SO_4 and AcOH. No dilactone could be obtained from I as from II, however. Since these reactions are not quant. and elementary analysis does not show with certainty differences of one H atom in substances of such high mol. wt., titration was made use of to det. whether the dark blue III is really a lactonecarboxylic acid rather than, possibly, a free org. radical. III is readily oxidized; titrated in AcOH-Me_2CO with $KMnO_4$ to a yellow end point, it consumes 1 equiv. of O. The prepn. of the titration product by the method used with anthrahydroquinone-1-carboxylic acid lactone (VI) (with $PhNO_2$ at 70°) proved difficult, however; the mixt. had to be heated to its b. p. and under these conditions the chief product was $1,4\text{-}C_6H_4(CO)_2C_6H_2(CO_2H)_2$, the lactone ring being opened by the H_2O formed in the oxidation. If the III is sapond. to I (red soln.) with NaOH under H and titrated with NaOCl to a yellow end point, 2 equivs. of O are used up. Hence III is beyond doubt not a free org. radical; a $4\text{-}CO_2H$ group favors the lactonization of $1\text{-}C_6H_4(CO)_2C_6H_3CO_2H$ like a 2-Me group, while a $5\text{-}CO_2H$ group has no such influence. On the other hand, I, unlike II, does not give a dilactone with dehydrating agents. The most remarkable property of III is its dark blue color and the violet-blue color of its solns. in org. solvents. The other known anthrahydroquinonecarboxylic acid mono- and dilactones and -monolactonecarboxylic acids are red, both in the free state and in org. solvents, including anhyd. C_5H_5N, but with aq. C_5H_5N and with Na_2CO_3, NH_4OH and NaOH they form blue solns. of true salts. This change from red to blue was explained as a case of halochromism—the change of a vividly colored (red) phenol into its true heteropolar salt—but it was also suggested that the free red lactones and their red C_5H_5N derivs. might have the true anthrahydroquinone structure VII and the blue heteropolar salts be derivs. of a hypothetical *o*-quinoid hydroxyfuran (VIII). The discovery of III, which is blue in the free state and in indifferent org. solvents, makes it possible to decide between the 2 views. Kehrmann has shown that the tendency of quinones to pass into hydroquinones is the greater the more negatively they are substituted; introduction of CO_2H in position 4 of $1\text{-}C_6H_4(CO)_2C_6H_3CO_2H$ should, therefore, make the hydroquinone form the more stable and exclude structure VIII for III. Nor would there be any apparent reason why the blue salts of the non-carboxylated red

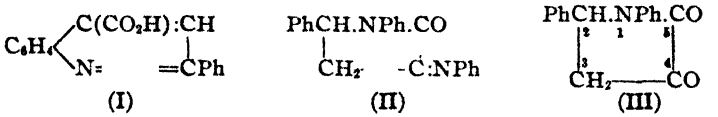


(IV)

(V)

(VII)

(VIII)



lactones should correspond to structure VIII. There is no real basis for the assumption that the red non-carboxylated lactones have the quinoid structure VIII and their blue salts and the blue III, on the other hand, the hydroquinoid structure VII, and decisive proof of the similarity in structure of the 2 groups of substances is found in the absorption spectra of VI and III in AcOEt. The 2 curves are entirely analogous: VI, max. 2580, 2720, 3510; min. 2490, 2645, 2890, >4000. III, max. 2510, 2630, 3350; min. 2380, 2550, 2750, 3900. The red VI and the blue III, therefore, undoubtedly have the same structure and the introduction of a $4\text{-}CO_2H$ group into VI has a strong bathochromic effect. Although the absorption curve for the blue Na_2CO_3 soln. of VI could not be detd. because of the instability of the soln., there can hardly be any doubt that the change

from the red VI to its blue salt is due to the bathochromic effect of salt formation. *1-Cyanoanthraquinone-4-carboxylic acid* (13 g. from 15.1 g. of the 1-NH_2 deriv. through the diazo compd.), yellowish prisms forming, through an intermediate olive-green quinhydrone, a dark red alk. $Na_2S_2O_4$ vat at room temp. and on heating (also with Zn dust and NH_4OH at room temp.) a free org. radical (azyl). The CN compd. (12.5 g.) with H_2SO_4-H_2O at 150-60° gives 9.5 g. of the light yellow 1,4-$C_6H_4(CO)_2C_6H_2(CO_2H)_2$. This acid was also prepd. (WITH ALFRED KELLER AND H. KURT MEYER) by condensing *o*-(2,5-$Me_2C_6H_3CO)C_6H_4CO_2H$ (obtained in 91% yield from *o*-$C_6H_4(CO)_2O$, *p*-xylene and $AlCl_3$ in $(CHCl_2)_2$) to 1,4-$C_6H_4(CO)_2C_6H_2Me_2$ and oxidizing the latter with MnO_2-H_2SO_4 at 110° or HNO_3 (d. 1.1) at 180-90° (yield, 90 and 95%, resp.). *Acetic (acetylanthrahydroquinone-1,4-dicarboxylic monolactone) anhydride* (IV), cinnabar-red, begins to m. 193°. *ms-Acetylanthrahydroquinone-1,4-dicarboxylic acid monolactone* (V), red, m. 239–40°. C. A. R.

Pyrrolenitriles and some of their transformations. H. FISCHER AND PAUL ROTHEMUND. *Ber.* **63B**, 2249–57(1930).—2,4-Dimethyl-3-cyano-5-carbethoxypyrrole, MeC:C(CN).CMe:CR.NH (I, R = CO_2Et) is sapond. to the *5-CO_2H acid* (II) (I, R = CO_2H) without the CN group being hydrolyzed, and distn. *in vacuo* gives *2,4-dimethyl-3-cyanopyrrole* (III). The CN group is materially stabilized by its position on the nucleus, whereas when it is on a side chain, as in 2,4-dimethyl-3-ω-cyano-ω'-carbethoxyvinyl-5-carbethoxypyrrole, it can be hydrolyzed with extraordinary ease, the β-position being attacked first and then the α-position. III can be obtained still more easily by the Knorr pyrrole synthesis from $AcCH_2CO_2Et$ and $AcCH_2CONH_2$, and $AcCH_2NH_2.HCl$ instead of $AcCH_2CO_2Et$-$NaNO_2$ gives an even better yield. With HCHO and a little HCl III readily yields *3,3',5,5'-tetramethyl-4,4'-dicyanopyrromethane* (IV) which, surprisingly enough, cannot be converted with either $FeCl_3$ or Br into the corresponding *methene* (V) although the V.*HBr* is obtained in good yield, with elimination of CO_2, from II with HCO_2H and 48% HBr on the H_2O bath. NH_4OH readily gives the free V in red needles which form metal complexes. III and HCN readily give an aldehyde (VI) (I, R = CHO), whose oxime yields with Ac_2O *2,4-dimethyl-3,5-dicyanopyrrole* (VII). With boiling HCl VI yields V.*HCl*. The CHO group in VI is reduced to Me by the Wolff-Kishner method, giving 2,4,5-trimethyl-3-cyanopyrrole, together with some 2,4,5-trimethylpyrrole. From VI and 2,3,4-trimethylpyrrole, cryptopyrrole and cryptopyrrolecarboxylic acid were obtained *3,3',4,5,5'-pentamethyl-* (VII), *3,3',5,5'-tetramethyl-4-ethyl-* (VIII) and *3,3',5,5'-tetramethyl-4-propionic acid-4'-cyanopyrromethene-HBr* (IX), resp.; VIII was also obtained from cryptopyrrolealdehyde with III. These cyanomethenes were synthesized with the object of prepg. porphyrins with CN groups on the nucleus but numerous attempts to do this failed. Porphyrin formation took place but only etioporphyrin II could be isolated. This negative result is perhaps due to the unreactiveness of the α-Me groups. Bromination of the 3 methenes could not be effected either and I (R = CO_2Et) is likewise unreactive toward Br, although with Br and $NaBrO_3$ 3 Br atoms can be introduced into the α-Me group, with simultaneous oxidation of the β-Me group, the product being *2-tribromomethyl-3-cyano-4-hydroxymethyl-5-carbethoxypyrrole* (X). III can also be brominated on the nucleus in the β position. With SO_2Cl_2 I gave a yellow oil yielding with H_2O *2-hydroxymethyl-3-cyano-4-methyl-5-carbethoxypyrrole* (XI). With higher concns., 6 atoms Cl are introduced the product is probably *2,4-bistrichloromethyl-3-cyano-5-carbethoxypyrrole* (XII). II (about 40 g. from 60 g. I with boiling aq. NaOH), m. 250°; 8 g. *in vacuo* at 150° gives 4 g. III, m. 107°. *2,4-Dimethyl-3-carboxamide-5-carbethoxypyrrole* (1.8 g. from 12 g. $AcCH_2CO_2Et$, $NaNO_2$, $AcCH_2CONH_2$ and Zn dust), m. 173°; 0.5 g. gives with boiling NaOAc Ac_2O 0.3 g. I, which is obtained in 1 g. yield from 1.5 g. $AcCH_2NH_2.HCl$ and $AcCH_2CONH_2$ in NaOH. V.HBr (13-5 g. from 20 g. II), golden yellow, m. 242° (decompn.); V.HCl (1 g. from 2 g. II), m. 225° (decompn.). Free V, ruby-red, m. 280° (decompn.). *Cu complex*, $C_{30}H_{26}N_8Cu$, crystals with metallic green surface luster, sol. in most solvents with red color; *Co complex*, green; *Zn complex*, $2C_{30}H_{26}N_8Zn.Zn(OAc)_2$, pink, contains 2 active H atoms (Chugaev-Zerevitinov). XI, reddens and sinters 145°, m. around 195-6°. XII (2.8 g. from 5 g. I, 20 g. SO_2Cl_2 and 20 cc. Et_2O), m. around 98°. X (about 20%), m. 183°, easily sol. in dil. alkalies, the yellow soln. becoming dark brown and finally black (in 20% NaOH it at once darkens and decomps.), regenerates I on long boiling with Zn dust in AcOH. *2,4-Dimethyl-3-cyano-5-formylpyrrole* (VI) (9–10 g. from 15 g. III in $CHCl_3$-Et_2O with anhyd. HCN), m. 223°; *oxime*, m. 206°; *semicarbazone*, turns yellow 250° and gradually darkens and sinters; *phenylhydrazone*, m. 175°. VII, m. 209°. *2,4-Dimethyl-3-cyano-5-bromopyrrole* (0.5 g. from 0.4 g. III with Br AcOH), darkens 130° and sinters without melting. VII (1.3 g. from 0.75 g. VI), yellow,

decomps. 230°. VIII (80%), orange-red, darkens 190°, m. 241°. IX, golden yellow, m. 240° (decompn.). C. A. R.

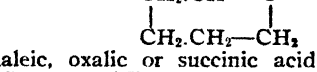
Action of aniline and its derivatives on benzaldehyde and pyruvic acid. HANS TH. BUCHERER AND RASCHDEN RUSSISCHWILI. *J. prakt. Chem.* **128**, 89–138(1930).—The course of the reaction between $PhNH_2$, BzH and $AcCO_2H$ is dependent upon external conditions (medium, temp., etc.), upon the nature of the combination of the components (PhCH:NPh and $AcCO_2H$, $PhNH_2$ and PhCH:$CHCOCO_2H$) and upon the substituents in the C_6H_6 nucleus of the $PhNH_2$ (NO_2, NH_2, NHAc, $NHSO_2C_6H_4Me$). In the action of $PhNH_2$ upon BzH and $AcCO_2H$ the reaction may take 3 directions instead of 2 as has been previously supposed; the formation of the by-product III has been demonstrated in the Döbner atophan synthesis as well as in the anil-anilide formation. By variation in the temp. and by the use of different solvents, the course of the reaction can be changed to secure various end products. In EtOH and at higher temps. the main product is I, with some II and III. In Et_2O and at lower temps., the products are II and III, while in AcOH or in the presence of AcOH and with low temps., the main product is III. PhCH:NPh acts upon $AcCO_2H$ as a mixt. of its components and the reaction proceeds, under the different conditions, in exactly the same way as that of $PhNH_2$, BzH and $AcCO_2H$, with the 1 difference that here the formation of the quinoline deriv. is suppressed and the formation of III is favored. The following conditions give a 80–85% yield of III: PhCH:NPh (0.05 mol.) in about 100 cc. AcOH at 8° is added to 0.05 mol. $AcCO_2H$ in 10–12 cc. abs. Et_2O and stirred for about 15 min. and then dild. with 1.5 parts H_2O. If one first condenses the BzH and $AcCO_2H$, forming the solid PhCH:$CHCOCO_2H$ and then treats this with $PhNH_2$, there results the $PhNH_2$ salt of the acid, which rearranges quant. into III, in either Et_2O or EtOH. This reaction supports the idea that the solid PhCH:$CHCOCO_2H$ is the *trans*-form. It was not possible to condense the $O_2NC_6H_4NH_2$ or $O_2NC_6H_3(NH_2)Me$ with BzH and $AcCO_2H$ to cinchonic acids, *o*-$H_2NC_6H_4NO_2$ with BzH and $AcCO_2H$ gives 34% of *1-o-nitrophenyl-2-phenyl-4,5-diketopyrrolidine*, orange-yellow, m. 154°; 4,2-$H_2N(O_2N)C_6H_3Me$ gives 71% of *1-nitrotolyl-2-phenyl-4,5-diketopyrrolidine*, yellow, m. 213–4°. III cannot be rearranged to atophan; with 80% H_2SO_4 there results *γ-anilino-γ-phenyl-α-ketobutyric acid*, decomps. 75–85°; the NH_4 salt decomps. 175°; the Ag salt decomps. 190°; the Ca and Mg salts are very stable; it was not possible to transform the acid back to III. III and EtOH KOH give a soln. from which H_2O ppts. a resin-like mass. The 4-CO group of III shows a peculiar behavior in that it is not possible to condense it with $PhNH_2$ or $PhNHNH_2$; with 1 equiv. of $PhNHNH_2$, the PhNH residue is replaced by the PhNHNH residue, giving *1-anilino-2-phenyl-4,5-diketopyrrolidine* (IV), m. 153.5°, sol. in 1% NaOH and in dil NH_4OH; the yellow Mg salt decomps. 265°; the compd. reduces $AgNO_3$ soln. and couples with *p*-$O_2NC_6H_4N_2Cl$, giving the red-brown *dye*, $C_{22}H_{17}O_4N_5$, decomps. 115°. With a 10% excess of $PhNHNH_2$, III gives IV and a small amt. of a second compd., $C_{16}H_{14}ON_2$ (?), bright yellow, m. 124–5°, which is insol. in alkali; the same compd. is obtained from Döbner's anil-anilide and $PhNHNH_2$: $FeCl_3$ gives an intense blue-violet color. 4-$MeC_6H_4SO_2Cl$ and 2,4-$H_2N(O_2N)C_6H_3Me$ with about 10% excess $CaCO_3$, heated 2 hrs. at 160–70°, give 40–45% of *4-nitro-2-toluenesulfonylaminotoluene*, m. 157°. Reduction with Fe and dil. AcOH in EtOH gives quant. *toluenesulfonyl-N³-m-toluylenediamine* (V), m. 176°. The *Ac deriv.*, m. 182–3°, results in 75% yield by the condensation of *p*-$MeC_6H_4SO_2Cl$ and 2,4-$H_2N(AcNH)C_6H_3Me$ with Na_2CO_3 in aq. suspension. *p*-$MeC_6H_4SO_2Cl$ and 4,2-$H_2N(O_2N)C_6H_3Me$ with Na_2CO_3 heated 2 hrs. at 160°, give 83% of *toluenesulfonyl-N⁴-amino-2-nitrotoluene*, yellow, m. 162–3°; reduction gives *toluenesulfonyl-N⁴-m-toluylenediamine* (VI), m. 164–5°. 2,4-$(H_2N)_2C_6H_3Me$ (2.65 g.) in 50 cc. abs. EtOH, added to a boiling soln. of 2.65 g. BzH and 2.2 g. $AcCO_2H$ in 25 cc. abs. EtOH, gives 85% of *6-methyl-7-aminoatophan*, brown powder, decomps. 250–70°; the AcOH salt, orange-yellow, decomps. above 300°; *HCl salt*, red rods; *Ac deriv.*, yellow, decomps. 300–2°; this also results by using 4,2-$H_2N(AcHN)C_6H_3Me$ in the above condensation. While ditoluenesulfonyl-*m*-toluylenediamine does not react with BzH and $AcCO_2H$, the 2 mono-$MeC_6H_4SO_2$ derivs. give the corresponding atophan derivs. V, BzH and $AcCO_2H$ in AcOH, boiled 3 hrs., give 51% of *6-methyl-7-toluenesulfonylaminoatophan*, light yellow, m. 273–4° (decompn.); *Me ester*, m. 224°; *Et ester*, m. 186–7°. VI gives a small yield of the *8-methyl-5-toluenesulfonyl deriv.*, which was not

(I) (II) (III)

obtained cryst. Isatin and resacetophenone, heated 8 hrs. with 33% NaOH, give quant. *2',4'-dihydroxy-2-phenylquinoline-4-carboxylic acid*, yellow, decomps. 305°; *Me ester*, m. 211–2°; *Et ester*, m. 195–6°. C. J. West

Synthetic experiments in the indole group. VII. Nitration and bromination of β-indolecarboxylic ester and a new synthesis of the dye of the purple of antiquity. Riko Majima and Munio Kotake. *Ber.* **63B**, 2237–45(1930); cf. *C. A.* **20**, 758.—A repetition of the work of Oddo and Sessa (*C. A.* **5**, 2638) not only confirmed the earlier observation that, contrary to the statements of O. and S., Et β-indolecarboxylate (I) is formed by the action of $ClCO_2Et$ on indolylmagnesium iodide but also showed that *di-Et N,β-indoledicarboxylate* (II) is formed at the same time; to obtain II in good yield it is well to use 2 mols. $ClCO_2Et$ per mol. of indole. Addn. of concd. HNO_3 to I in cold AcOH gives chiefly *Et 6-nitroindole-3-carboxylate* (III), sapond. by KOH to the free *acid* (IV) which with hot quinoline gives *6-nitroindole* (V). The position of the NO_2 group was established by oxidation of the salt of IV with aq. $KMnO_4$ to 2,4-$H_2N(O_2N)C_6H_3$-CO_2H. With HCl and $SnCl_2$ in AcOH III readily yields the *3-amino ester* (VI). V similarly gives the amorphous and very unstable *6-aminoindole* (VII). I is readily brominated in AcOH, giving chiefly either *Et 6-bromoindole-3-carboxylate* (VIII) or the *5,6-di-Br ester* (IX), depending on the conditions. The free *di-Br acid* (X) can be further converted into *5,6-dibromoindole* (XI). X with CrO_3 in AcOH gives a red *5,6-dibromoisatin* (XII), m. above 290°, which on distn. with KOH yields a $Br_2C_6H_3NH_2$, m. 79–80° (of the known $Br_2C_6H_3NH_2$, the 3,4-compd., m. 80.4°, comes closest in its properties to the one obtained from XII). XII on further oxidation with CrO_3 in AcOH gives a *dibromoisatoic acid* (XIII) which with concd. HCl yields 4,5,2-$Br_2(H_2N)C_6H_2CO_2H$, m. 227–8°. In the same way VIII gave *6-bromoisatin* (XIV), different from Borsche and Jacobs' synthetic 5-Br compd With O_2 in alk. soln., VIII readily gives 6,6'-dibromoindigo (XV), thus further confirming the structure of VIII. II (1.1 g. from 3 g. indole through the Mg compd. with 2 mols. $ClCO_2Et$), less sol. in alc. than I, m. 102–3°. The yield of I has been increased to over 78% by slowly adding 11 g. $ClCO_2Et$ to the Mg deriv. from 11 g. indole in cold Et_2O. III, light yellowish needles, m. 198–9°. IV, yellow, becomes opaque at 227°, decomps. around 275–8°; its alkali salts dissolve in H_2O with orange-red color. V, yellow, m. 139–40.5°. VI, m. 149–50°; *HCl salt, chloroplatinate*. β-Indolealdehyde in AcOH with HNO_3 (d. 1.4) gives an addn. *product*, $C_9H_7ON.HNO_3$, decomps 94°; with excess of HNO_3 on the H_2O bath is obtained a *nitro-β-indolealdehyde*, light yellow, m. around 290° (decompn.), turns brownish in the air. VIII, m. 134–7°; free *acid*, m. 212°. IX (85% from 2 g. I and 4 g. Br), m. 223–5°. X, m. 255–7°; if, in the sapon. of IX, the boiling with excess of alc. KOH is continued 10 hrs. the product is XI, m. 154°. XII, m. 290°, shows the indophenin reaction, gives with dil. NaOH a dark violet ppt. which redissolves with yellow color on heating and acids reppt. the original XII. XIV, orange-red, m. 256–8°. *5,5',6,6'-Tetrabromoindigo*, is obtained from IX with O_2; it dyes silk in somewhat less reddish shades than XV, the chief constituent of the purple of the ancients. **VIII. Synthesis of harman and harmine.** Shiro Akabori and Kojiro Saito. *Ibid* 2245–8.—The paper of Späth and Lederer (*C. A.* 24, 2464) appeared during the course of the present work, the starting point of which was also β-(β-indolyl)ethylamine (I) and *β-(6-methoxy-β-indolyl)ethylamine* (II). Tetrahydroharman, m. 175–7°, was obtained in 86% yield from I in dil. H_2SO_4 with AcH at 110°, and when boiled in H_2O with maleic acid and Pd black gave its own wt. of harman, m. 235–6°. *(β-6-Methoxyindolyl)acetonitrile* (52% from MeMgI, 6-methoxyindole and $ClCH_2CN$), m. 113–4°, gives in boiling alc. with Na 50% of II, m. 142.5–3.5° (S. and L. give 112–30°), distils without decompn. *in vacuo*. II with AcH in H_2SO_4 at 110° gives 85% *tetrahydroharmine*, m. 196–6.5°, dehydrogenated by maleic acid and Pd black to harmine, m. 259–9.5° (70% yield). C. A. R.

Researches directed toward the preparation of hydroxyindoles and some iodoindoles. Q. Mingoia. *Gazz. chim. ital.* **60**, 509–15(1930).—A survey of the literature shows that the various hydroxyindoles which have been prepd. have been synthesized by more or less indirect methods, and so expts. were directed toward developing a method of prepn. of hydroxyindoles by first prepg. the corresponding iodoindoles from the Hg derivs. and treating the iodoindoles with moist Ag_2O or with alkali hydroxides. In the present paper there are also described some previously unknown aceto- and chloromercuric derivs. of indole (I). It was not possible to obtain the OH derivs. from the iodoindoles, for the latter are highly resistant to hydrolyzing agents. I (5 g.) and aq. $Hg(OAc)_2$ (27.22 g. in 100 cc.), agitated for 2 hrs., filtered, washed with water, the residue dried, extd. with Et_2O, and recrystd. from glacial AcOH, yield *dimercuriindole diacetate*, $C_6H_4.C(HgOAc):C(HgOAc).NH$ (II), turns brown when heated and burns without



fusion. II (10 g.) and satd. aq. NaCl (300 cc.), heated for 3 hrs., cooled, filtered, washed (until the filtrate gives no ppt. with $AgNO_3$), and the residue recrystd. from hot AcOEt, yield *dimercuriindole dichloride*, $C_6H_4.C(HgCl):C(HgCl).NH$ (III), burns without fusion, gives an intense red with concd. H_2SO_4. III (5 g.), I (5 g.), KI (10 g.) and water (100 cc.), agitated for 1 hr., filtered, the residue washed free of I, dried and recrystd. from petr. ether (contg. a little Et_2O), yield *α,β-diiodoindole* $C_6H_4.CI:CI.NH$ (IV), lustrous brown, m. around 220° (decompn.). IV in dil. EtOH (and in a 2nd expt. in abs. EtOH) and Ag_2O, heated for several hrs. at 100°, gave completely negative results, and all the ingredients were recovered unaltered. Neither was there any reaction when the Ag_2O was replaced by KOH in water, in dil. EtOH and in abs. EtOH, and 10.2 to 50% concn. Skatole (5 g.) and aq. $Hg(OAc)_2$ (12.15 g. in 50 cc.), agitated for 2 hrs., filtered, the residue washed with water, dried and washed with EtOH, yield *mercurisaktole acetate*, $C_6H_4.CMe:C(HgOAc).NH$ (V), burns without fusion, has no odor; its soln. in concd. H_2SO_4 has a lemon-yellow color which changes rapidly to a violet-red; it is sol. in hot AcOH. V (5 g.) and satd. aq. NaCl (100 cc.), heated for 3 hrs., cooled, filtered, the residue washed and dried, yield *mercuriskatole chloride* (VI), decomps. when heated, burns without fusion. VI (4 g.), I (8 g.) and KI (16 g.) in water, agitated for 1 hr., filtered, the residue washed free of I, dried and recrystd. from benzine (contg. a little AcOEt), yield *α-iodo-β-methylindole*, $C_6H_4.CMe:CI.NH$ (VII), gray, m. 197–8°; in dil. EtOH with NH_3-$AgNO_3$ it forms a *Ag deriv.*, brown, sol. in excess NH_4OH. VII does not react with moist Ag_2O or with alk. hydroxides under the conditions described for IV.

Following the procedure for prepg. V, $C_6H_4.CH:CMe.NH$ (5 g.) and aq. $Hg(OAc)_2$ (12.15 g. in 50 cc.) yield, after recrystn. from AcOH, *mercurimethylketole acetate*, $C_6H_4.C(HgOAc):CMe.NH$ (VIII) pearly luster, hard but friable, does not fuse. VIII (5 g.) and satd. aq. NaCl (100 cc.), refluxed for 1 hr., cooled, filtered, the residue washed free of NaCl, and dried *in vacuo*, yields *mercurimethylketole chloride*, $C_6H_4.C(HgCl):CMe.NH$ (IX), does not fuse, gives the reaction of the Cl ion. Following the procedure used in the prepn. of VII, IX (5 g.), I (10 g.) and KI (20 g.) in water yield, after recrystn. of the product from EtOAc, $C_6H_4.CI:CMe.NH$, m. 82°, has all the properties described in the literature, does not react with moist Ag_2O or with alk. hydroxides.

C. C. DAVIS

Color of complex diazoles. III. Reduced pyrroleimidazole compounds. MANGESH V. BETRABET AND GOPAL C. CHAKRAVARTI. *J. Indian Chem. Soc.* 7, 191–7(1930). In the abstract in *C. A.* 24, 4516, the compds. prepd. were not described. This is a supplementary abstract. B. and C. describe the prepn. of reduced pyrroleimidazole derivs. similar to those studied in Part II (*C. A.* 19, 2493). The simplest was prepd. by condensing succinic anhydride with *o*-$C_6H_4(NH_2)_2$ by the method of Anderlini (*Gazz. chim. ital.*, 24, 140(1894)) to form *o*-$NH_2C_6H_4NHCOCH_2CH_2CO_2H$, m. 148–50°, which was converted by boiling with abs. alc. into *benzimidazole-2-propionic acid*, m. 225–6°, and not into an 8-membered ring compd. This acid was then converted into *α,β-dihydroacrylene-1,3-benzimidazole*, m. 172–5°. Hexahydrophthalic acid, prepd. by the reduction of phthalic acid in the presence of Pt oxide, condensed with *o*-$C_6H_4(NH_2)_2$ to give a mixt. of *benzimidazole-2-hexahydro-o-benzoic acid*, m. 245–7°, and *o-aminohexahydrophthalanil*, m. 195–6° (*Ac deriv.*, m. 261–3°). When boiled with Ac_2O, the former gave *1,2-hexahydrobenzoylene-1,3-benzimidazole*, m. 175–6°, which was converted into *Et benzimidazole-2-hexahydro-o-benzoate*, m. 163–4°, on boiling with NaOEt. *o*-Tolylenediamine was condensed with hexahydrophthalic anhydride to give a little *o-aminotolylhexahydrophthalic acid*, m. 264–6°, and *o-aminotolylamidohexahydrophthalimide*, m. 274–6°. (*Ac compd.*, m. 289–91°.) The latter, when heated at 280° until vapors ceased to evolve, gave *1,2-hexahydrobenzoylene-1,3-ethylbenzimidazole*, m. 186–7°. Similarly, 1,2-$C_{10}H_6(NH_2)_2$ and hexahydrophthalic anhydride condensed to give *naphthimidazole-2-hexahydro-o-benzoic acid*, m. 263–5°, and *aminonaphthylhexahydrophthalimide*, m. 241–3° (*Ac deriv.*, m. 217–8°). By ring closure of the former, *1,2-hexahydrobenzoylene-1,3-naphthimidazole* was obtained, m. 223–4°. **IV. Constitution of Thiele's supposed *o*-benzylene-1,3-benzimidazole.** *Ibid* 495–502.—B. and C. synthesized *o*-benzylenebenzimidazole, showing thereby that the constitution assigned by Thiele and Falk (cf.

Ann. **347**, 112(1906) to *o*-benzylene-1,3-benzimidazole is erroneous and should be represented by $C_6H_4.CH{:}N.C_6H_4.N{:}CH$ (I) instead of $C_6H_4.CH_2.N.C_6H_4.N{:}C$ (II). It was expected that phthalide and o-$C_6H_4(NH_2)_2$ would condense as follows: $C_6H_4.CH_2.O.CO$ + $C_6H_4(NH_2)_2$ ⟶ $CH_2(OH)C_6H_4C{:}N.C_6H_4.NH$ (IV) ⟶ II. When this condensation is effected by fusion, benzimidazole-2-benzyl-*o*-phenylenediamine, $NH_2C_6H_4NHCH_2C_6H_4C{:}N.C_6H_4.NH$ (V), m. above 300°, is obtained instead of II. On boiling together the phthalide and diamine in abs. alc., *o*-aminophenylaminomethyl-*o'*-aminobenzanilide, m. 162°, was obtained and converted into V on fusion. On refluxing *o*-$HOCH_2C_6H_4CO_2H$ with the diamine in the presence of 4 *N* HCl, V and IV were obtained, but the yield of the latter was very poor. On condensing the $HOCH_2C_6H_4CO_2H$ with the diamine in cold abs. alc., there was obtained *o'*-aminophenylammonium *o*-hydroxymethylbenzoate, m. 103–4°, which lost a mol. of water to form *o*-hydroxymethyl-*o'*-aminobenzanilide, $CH_2(OH)C_6H_4CONHC_6H_4NH_2$ (VIII), m. 152°, when boiled with abs. alc. VIII was also obtained in good yield by condensing the phthalide and diamine in cold abs. alc. Dehydration of VIII with Ac_2O or by fusion gave II, m. 185°. Thiele and Falk's compd. m. 210° (213.5° as found by B. and C.) must be represented by I. Both I and II gave *o*-benzoylenebenzimidazole (III) on oxidation with $KMnO_4$ and H_2SO_4. B. and C. also condensed phthalide with $(CH_2NH_2)_2$ in cold abs. alc. obtaining *o*-hydroxymethylaminoethylbenzamide, m. 179–80°. On boiling with abs. alc. for 3 hrs., dihydroimidazole-2-hydroxymethylbenzene, m. 210–1°, was obtained. This was converted into *o*-benzylenedihydroimidazole, m. 152–3°, by heating with excess Ac_2O and this in turn was oxidized by means of $KMnO_4$ and H_2SO_4 to *o*-benzoylenedihydroimidazole, m. 229–30°. A. WIEBEN

Anhydro-1-(1'-hydrazino-1'-cyclohexyl)-2-cyclohexanone. R. STOLLÉ AND FR. HANUSCH. *Ber.* **63B**, 2211–5(1930).—Kishner and Bielov assign to the compd. obtained by reduction of cyclohexanone azine with Na in alc. the structure of an asym. dicyclohexylhydrazine, $(C_6H_{11})_2NNH_2$. Expts. made in connection with 2-homopiperidone azine (*C. A.* **24**, 4034), however, indicated the possibility that the cyclohexanone azine in the Kishner reduction might rearrange under the influence of the heat or the NaOEt into a pyrazoline,  (I). Such a rearrangement was actually effected with maleic, oxalic or succinic acid. Investigation of the *semicarbazide*, $C_6H_{11}NHNC_6H_{11}CONHPh$ (II), and *thiosemicarbazide* (III) of the sym. $(NHC_6H_{11})_2$ (IV), prepd. according to Lochte, showed that IV is present in the K. reduction product. The *phenylurea* (V) and *phenylthiourea deriv.* (VI) (I, R = CONHPh and CSNHPh, resp.) of *anhydro-1-(1'-hydrazino-1'-cyclohexyl)-2-cyclohexanone* (VII) (I, R = H) are entirely different from II and III. VII, from I and about an equimol. amt. of anhyd. $(CO_2H)_2$ at 70°, b_{17} 165°, m. about 64°, liquefies in the air, turning brown and evolving gas, gives no ppt. with alc. NH_3-$AgNO_3$ even on heating, while reduction at once occurs on addn. of alkali; alc. $HgCl_2$ gives a curdy ppt. With excess of MeI in sealed tubes VII gives in poor yield a *methiodide*, m. 186°, which in H_2O or alc. gives AgI with $AgNO_3$. V, obtained in poor yield from VII and PhNCO, m. 124°, insol. in acids and alkalies, gives no ppt. with alc. NH_3-$AgNO_3$, and on heating reduction occurs only when alkali is added. VI (yield, about 50%), m. 168°, gives with alc. $AgNO_3$ a turbidity rapidly becoming yellow and on heating an immediate black ppt.; alc. $HgCl_2$ gives a white ppt. which does not change on heating. *Urea deriv.* (I, R = $CONH_2$) of VII, from VII and KOCN in AcOH, m. 161°, does not reduce aq. NH_3-$AgNO_3$ even on heating after adding alkali. II, m. 124°, insol. in acids and alkalies, gives no ppt. with alc. NH_3-$AgNO_3$ and on heating reduction takes place only after adding alkali. III, m. 129°, gives with alc. NH_3-$AgNO_3$ a ppt. which blackens on heating, and with alc. $HgCl_2$ a white ppt. C. A. R.

Trypanocidal activity and chemical constitution. II. New sulfur derivatives of aromatic organic arsenicals (continued). Derivatives of 2-thiolbenzimidazole-5-arsonic acid. JOHN G. EVERETT. *J. Chem. Soc.* **1930**, 2402–8; cf. *C. A.* **23**, 3448.—The outstanding trypanocidal value of 2-thiolbenzimidazole-5-arsonic acid (I) and its

arseno compd. made it seem possible that the free SH group had some significance in the cure of trypanosomiasis. Various derivs. of this acid have now been prepd., in which the H of the SH group has been replaced by other groups. Oxidation of 5.48 g. I in 300 cc. H_2O with 20 cc. *N* I soln. gives 45% of *benzimidazole-5-arsonic acid 2-disulfide* (II), as the *HI salt*, deep orange; the orange mother liquor, on standing, deposits 2 g. I. II is obtained as an orange, amorphous powder by acidifying an aq. soln. of the Na salt, obtained from the HI salt. Reduction of II gives 5,5′-arseno(2-thiolbenzimidazole); hydrolysis of II with dil. acid or alkali gives I. I, boiled with $HSCH_2CONH_2$ gives the *thiolacetamide deriv.*, m. 245° (decompn.). I (27.4 g.) and 9.4 g. $ClCH_2CO_2H$ in 200 cc. H_2O, mixed after being separately neutralized with NaOH, give 25 g. *2-carboxymethylthiolbenzimidazole-5-arsonic acid* (III); Ca salt, microcryst. rosets; Ba salt, amorphous. With $ClCH_2CONH_2$ there results 90% of the *2-carbamyl deriv.* (IV), needles, whose Mg salt is amorphous and Ba salt crystallizes in needles. I (5.6 g.) in 25 cc. H_2O and 12 cc. 50% KOH, heated to boiling and treated with 6.4 g. $KMnO_4$, gives 4 g. of *2-sulfobenzimidazole-5-arsonic acid* (V), needles, very resistant to hydrolysis; Ba salt, fine needles. Reduction of III with $Na_2S_2O_4$ gives 70% of *5,5′-arseno(2-carboxymethylthiolbenzimidazole)*, bright yellow, amorphous powder, which forms an insol. HCl salt; the corresponding *2-carbamyl deriv.*, bright yellow, amorphous, results in 72% yield from IV. V gives 60% of *5,5′-arseno(benzimidazole-2-sulfonic acid)*, yellow, amorphous. 2-Thiolbenzimidazole (VI) and *N* I give *benzimidazole 2-disulfide* (VII), orange, m. 198°; *HCl salt*, yellow, decomps. 210°; the HI salt could not be obtained, reduction taking place. VII is hydrolyzed by HCl or NaOH to VI. *Benzimidazole-2-sulfonic acid*, m. 365°, results in 90% yield; it crystallizes with 0.5 mol. H_2O; hydrolysis with HCl at 170° gives benzimidazole; NaOH does not cause hydrolysis. A comparison of the arsonic acids with I shows that only II approaches it in therapeutic activity; it is probably present in the blood stream and tissues as the free thiol type RSH. In other cases replacement of the H of the SH group causes adverse modification of therapeutic activity in both arsonic acid and arseno compd. Details are given of the therapeutic results. C. J. West

The production and analyses of some 1,2,4-triazoles. I. K. Matzurevich. *Bull. soc. chim.* [4], **47**, 1160–83(1930); cf. *C. A.* **21**, 2901, 3894.—The reaction between hydrazodithiocarboxamide and its mono-Ph deriv. (I) and the various common aromatic amines was studied. In all cases only a 1,2,4-triazole (urazole) was formed; thus 1,3,4-xylidine and I form 3-xylyliminothiourazole, $NH.CS.NH.NH.C{:}NC_6H_3Me_2$, tautomeric with $NH.C(SH){:}N.NH.C{:}NC_6H_3Me_2$. All formed mono-Ag salts because of the acidic H of the SH group and all formed mono-Ac and mono-Bz derivs. through the basic imino H. All the compds. in alk. soln. with a satd. soln. of $K_3Fe(CN)_6$ give a red-yellow changing to red on standing (Arndt azo-reaction). It is evident that the hydrazo group which does not exist at first is formed by the action of the alkali on the tautomer. The hydrazo group is then oxidized by the $K_3Fe(CN)_6$ to the azo compd. which gives the red color reaction. L. E. Gilson

The possible yellow content of red acid solutions of methyl yellow. A. Thiel. *Ber.* 63B, 2453–5(1930).—T. disagrees with Hantzsch and Burawoy (*C. A.* **24**, 5733) in their interpretation of his data (*C. A.* **18**, 3569) to mean that acid solns. of methyl yellow contain 30–40% of the salt form. Further spectrographic and photoelec. data are presented to prove the point. V. F. Harrington

General method for the preparation of thiocyanine dyes. Some simple thiocarbocyanines. Nellie Ivy Fisher and Frances Mary Hamer. *J. Chem. Soc.* **1930**, 2–10.—A new method for the prepn. of thiocyanine dyes consists in the action of $AmNO_2$ in the presence of Ac_2O on a benzothiazolinium salt contg. a reactive Me group. The reaction is tentatively formulated by the change of the Me group to a CH_2NO group, which then loses H_2O, giving a CCN group, which in turn reacts with a mol. of the original salt to give the thiocyanine dye, with the evolution of HCN. Neg. results were obtained with 2-methyl-β-naphthathiazole EtCl or MeCl salts and with 2,4-dimethylthiazole. The yields given below are for the recrystd. dye. 1-Methylbenzothiazole-EtCl (2 mols., 5 g.) in 75 cc. Ac_2O, treated with 2.4 cc. (1.5 mols.) $AmNO_2$ and heated under the reflux for 15 min., gives 29% of *2,2′-diethylthiocyanine chloride*, m. 255° (decompn.); NaBr in dil. EtOH gives 56% of the *bromide*, m. 298° (decompn.); KI in dil. EtOH gives the iodide, identical with a specimen prepd. by Mills' method. 1-Methylbenzothiazole-MeCl gives 33% of 2,2′-dimethylthiocyanine chloride, m. 261° (decompn.); the *bromide* m. 287° (decompn.) (72% yield); the iodide m. 290–2° (decompn.) (Mills gives 279–80°). 1-Methyl-α-naphthathiazole-EtCl gives 20% of

2,2'-diethyl-5,6,5',6'-dibenzothiocyanine chloride, m. 264° (decompn.); an EtOH soln. shows an absorption band with its max. at 4450 A. U.; with chloride plates the well-marked band of extra-sensitivity extends to 5300 A. U. and has a max. at 4800 A. U.; *bromide*, m. 286° (decompn.) (51% yield); *iodide*, m. 297° (decompn.) (70% yield). *2,2'-Dimethyl-5,6,5',6'-dibenzothiocyanine chloride*, m. 275° (decompn.) (18% yield); *bromide*, m. 309° (decompn.) (yield, 43%); the absorption max. of its EtOH soln. lies at 4500 A. U.; the band of extra-sensitivity reaches its max. at 4750 A. U. and extends to 5200 A. U. for moderate exposures; *iodide*, m. 314° (decompn.) (44% yield). 2,4-Dimethylthiazole methiodide, m. 260° (decompn.), results in 81% yield by heating the thiazole and MeI 2 days at 100°; the *ethiodide* results in 90% yield and is much more sol. in EtOH than is the MeI deriv. The MeI deriv., $HC(OEt)_3$ and C_5H_5N, boiled 4 hrs., give 14% of the *thiocarbocyanine*, $C_{13}H_{17}N_2IS_2$, m. 255° (decompn.); the EtOH soln. shows a rather broad absorption band with its max. at 5500 A. U. and an indication of another band at 5100 A. U.; a gelatino-bromide plate, bathed in it, shows practically uniform sensitivity, extending to 6800 A. U. for moderate exposure; the max. is at 5900 A. U. The EtI deriv. gives 27% of a *thiocarbocyanine*, $C_{15}H_{21}N_2IS_2$, m. 271° to 294°, depending on the rate of heating; the band of extra-sensitivity is not quite as uniform as for the preceding deriv., showing 1 max. at 5900 A. U. and a weaker 1 at 5350 A. U.; it extends to 6500 A. U. C. J. West

Certain quinoline and benzacridine derivatives yielding colored adsorption compounds with iodine. William O. Kermack, Robert H. Slater and Walter T. Spragg. *Proc. Roy. Soc. Edinburgh* **50**, Pt. 3, 243–61(1930).—Certain derivs. of benzacridine and 4-aminoquinoline give a blue or red color with I in aq. KI. The sensitivity of some of these compds. to I is equal to or greater than that of starch. To 10 cc. of a 0.05% soln. of *3,4,5,6-dibenzacridine* (I) in abs. alc. was added 90 cc. of distd. H_2O with vigorous stirring, forming a sol with particles possessing a positive charge. A series of dilns. was made from this sol and another series from a 0.05 *N* soln. of I in aq. KI. The effect of variation of concn. of the compd., I, and H ion was investigated, a whole range of colors being obtained according to the conditions of the reaction. In the case of anilino-quinoline compds. the color developed in solns. contg. I at 0.0001 *N* concns., while the benzacridines showed color at 0.00001 *N* or less. The action of the presence of KCl, K_2SO_4, KH_2PO_4, $CaCl_2$, $LaCl_3$ was tested but at low concns they are without much effect. The closely related compds., *1,2,7,8-dibenzacridine*, *1,2,5,6-dibenzacridine*, *9-phenyl-3,4,5,6-dibenzacridine* and *9-(3',4'-methylenedioxyphenyl)-3,4,5,6-dibenzacridine* (II), were prepd. and their solns. in abs. alc. were tested with I in KI solns. ranging from 0.01 *N* to 0.0001 *N*, but in no instance was any coloration observed. *9,10-Dihydro-9-(3',4'-methylenedioxyphenyl)-3,4,5,6-dibenzacridine* was prepd. by heating 7.5 g. CH_2O_2, C_6H_5CHO and 7.2 g. β-$C_{10}H_7NH_2$ to 100–10° until no further steam was evolved, adding 7.2 g. β-$C_{10}H_7OH$, heating to 200–30° and pouring the hot melt into alc. Crystd. from PhMe it m. 305°. On heating with an equimol. amt. of Br in AcOH, the HBr compd. of II was formed, decompd. by warming with dil. alkali, recrystd. from $PhNH_2$, m. 282°. *9-Methyl-3,4-benzacridine* (III) gave rise to a red color with I in dil. neutral soln., the color being detected at an I concn. of 0.000002 *N*, but small amts. of acid decreased the sensitivity. I might react with I and II through the residual valency of the feebly basic N atom, but since their methosulfates also develop colors it is suggested that the latter form micellar colloidal solns., and that the chromogenic property depends on the structure of the mol. as a whole. Certain derivs. of 2-methyl-4-anilino-6-methoxyquinoline, RPh, where R is $C_{11}H_{11}ON_2$ (cf. *C. A.* **24**, 4039), were tested by adding 90 cc. of H_2O rapidly to 10 cc. of their 0.05% solns. in abs. alc., and mixing with equal vols. of solns of I in KI. $RC_6H_4NH_2(3)$ and $RC_6H_4NH_2(4)$ gave brown colors with min. concns. of I of 0.00025 *N* and 0.0005 *N*, resp.; $RC_6H_4NHAc(4)$ a blue color at 0.000125 *N* and RC_6H_4-$C_6H_4NHAc(4')$ blue to red at 0.000004 *N*. Four quinoline compds. contg. As were investigated by dissolving 0.05 g. of each in H_2O with addn. of a min. amt. of Na_2CO_3, neutralizing with 0.1 *N* H_2SO_4 and dilg. to 100 cc. The milky suspensions were mixed with equal vols. of solns. of I in KI. $RC_6H_4AsO(OH)_2(2)$ gave a blue color with a min. concn. of I of 0.0005 *N* in presence of at least 0.625 *N* HCl; $RC_6H_4AsO(OH)_2(3)$, no color; $RC_6H_4AsO(OH)_2(4)$, purple at 0.000125 *N*; $RC_6H_4C_6H_4AsO(OH)_2(4')$, purple to 0.000125 *N*, red to 0.000008 *N*, brown to 0.000004 *N*. The compds. investigated differ from most of those previously known to give color with I, in that they are basic and form colloidal solns. in which the particles are positively charged. C. R. Addinall

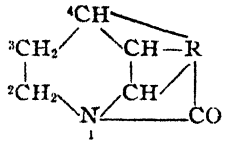
Stereoisomerism in substituted 1,2,3,4-tetrahydroquinolines. II. Sydney G. P. Plant and Reginald J. Rosser. *J. Chem. Soc.* **1930**, 2444–55; cf. *C. A.* **24**, 117.—3,4-Dimethylquinoline (I) is best prepd. by treating 2-keto-3,4-dimethyl-1,2-dihydroquinoline (II) with $POCl_3$ and reducing the 2-chloro-3,4-dimethylquinoline (III) with HI

and red P; I m. 73–4°; the picrate m. 215–7°; the HCl salt m. 290° (decompn.). Reduction of I with Sn and HCl, Na and EtOH, Zn and EtOH-HCl or electrolytically gives only 1 form of *3,4-dimethyl-1,2,3,4-tetrahydroquinoline* (IV), whose *1-phenylcarbamyl deriv.* m. 107–8°; the *picrate*, orange, m. 143–5°; the *HCl salt* m. 156–8°; the free base is an oil. The reduction of I is a slow process and some unchanged I is always found. Reduction of II with Na-Hg in EtOH gives a mixt. of the *A* and *B* forms (in the ratio of about 6:1) of *2-keto-3,4-dimethyl-1,2,3,4-tetrahydroquinoline* (V), m. 127–8° and 117°, resp. The *A* form, with $POCl_3$, gives III. Reduction of the mixt. of the 2 forms with Na and EtOH gives I and IV. Further action of Na and EtOH on IV gave no trace of I. It would thus appear that the I is an intermediate product of the reduction of V, the keto group probably being reduced to an alc. group, which is then further reduced to I and then to IV; this accounts for the formation of only 1 form of IV in the reduction of the 2 forms of V. Reduction of 2,4-dimethylquinoline (VI) with Na and EtOH gives 2 forms of *2,4-dimethyl-1,2,3,4-tetrahydroquinoline A* (VI) and *B* (VII). VI was isolated from the reduction product as the *HCl salt*, m. 228°; *1-Ac deriv.*, m. 50–1°; *picrate*, yellow, m. 139–41°; *1-phenylcarbamyl deriv.*, m. 121–2°; *1-Bz deriv.*, m. 115°. VII was isolated from the mother liquor of VI as the *1-Ac deriv.*, m. 97–8°; *HCl salt*, m. 178–9°; *picrate*, yellow, m. 188–90°; *1-phenylcarbamyl deriv.*, m. 112–3°. The ratio of VI to VII is approx 2:3. With Sn and HCl the amt. of VII is less than 10% of the total yield; on electrolytic reduction the yield of reduction product is poor, but both VI and VII were present. With Zn and EtOH-HCl the ratio of VI to VII was approx. 5:1.

C. J. West

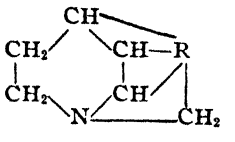
γ-Triazines. Synthesis of ethyl- and propyl-aminothioltriazine with some new data on methylaminothioltriazine. A. Ostrogovich and V. Galea. *Atti accad. Lincei* **11**, 1012–9(1930).—In a previous paper (*C. A.* **6**, 1137) O. described the prepn. of methylaminothioltriazine, HSC:N.CMe:N.C(NH_2).N, by the condensation of cyanoguanidine with thiolacetic acid. In a similar manner the *Et* and *Pr compds.* have been prepd. using 2 moles of cyanoguanidine and the K salt of the corresponding thiol acid, and then acidifying with H_2SO_4 (1:1). The *Et deriv.* (I) is obtained as needles, m. 257–8° (decompn.), very sol. in water, EtOH and MeOH, insol. in Et_2O and $CHCl_3$. It forms a picrate, m. 188–9° (decompn.). The Ag salt, formed by adding the calcd. amt. of $AgNO_3$, is not sensitive to light. The *Pr deriv.* (II) is obtained as needles, m. 262–3° (decompn.). Its soly. is a little less than that of I, which is much more sol. than the *Me deriv.* The picrate, m. 153° (decompn.), and the Ag salt is again insensitive to light. A *picrate* of the Me deriv. was also prepd. as yellow needles, m. 196–7° (decompn.).

A. W. Contieri



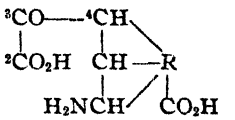
Alkaloid from Anona Reticulata Linnaeus. Alfredo C. Santos. *Philippine J. Sci.* **43**, 561–4(1930).—*Anona reticulata Linnaeus*, commonly called "anonas" is extensively cultivated in the Philippines; the leaves and fruit are officially in the first to the fourth editions of the Mexican Pharm.; the green fruit contains a large quantity of tannin and is used to check diarrhea and dysentery; the juice of the trunk is irritant. Air-dried bark (1.8 kg.) was refluxed for 3 hrs. with 3 vols. of 95% alc., filtered, the alc. evapd. from the filtrate, the sirupy residue acidified with dil. AcOH, the aq. soln. sepd. from the insol. resins, made alk. with NH_4OH, extd. with Et_2O, the Et_2O shaken with 5% NaOH to remove phenols and then treated with HCl; the HCl salt of the alkaloid which crystd. from the Et_2O was filtered, recrystd., dissolved in H_2O, extd. with Et_2O, the ext. shaken with NH_4OH and on evapg. the Et_2O gave 0.25 g. of long needles, m. 122–3°, $[\alpha]_D^{16.6°}$ −83.01° (in $CHCl_3$). The resinous material sepd. as above was dissolved in dil. NaOH, extd. with Et_2O, the Et_2O treated with dil. HCl and the HCl salt which sepd. was purified as above, yielding 0.33 g. of alkaloid. It is proposed to name this alkaloid "*anonaine*"; the chlorpolatinate is a yellow amorphous product; the alkaloid does not contain a MeO group but does have a dioxymethylene group.

N. A. Lange



Strychnos alkaloids. LVI. Transformations of 2,3-dioxonucidine, of 2,3-dioxonucinic acid hydrate and of carboxyaponucine. Hermann Leuchs and Werner Weglner. *Ber.* **63B**, 2215–26(1930); cf. *C. A.* **24**, 4044.—It seems well to introduce special names for the degradation alkaloids and acids common to strychnine and brucine. The parent substances are 2 compds. related to each other as strychnine to strychnidine and therefore called *nucine* (I) and *nucidine* (II) (from *Strychnos nux vomica*). I, $C_{17}H_{22}O_2N_2$, is obtained with Zn-Hg from $C_{17}H_{20}O_3N_2Br_2$ (which is to be regarded as *2-hydroxy-3,4-dibromonucine*), and its 1st reduction product, *2-hydroxynucine*, $C_{17}H_{22}O_3N_2$. The product $C_{17}H_{22}O_4N_2$ obtained by oxidation of 2-hydroxynucine is *2-oxonucine hydrate*, and the Wieland acid $C_{17}H_{22}O_6N_2$ is *2,3- dioxonucine dihydrate* (III). Hanssen's acid $C_{18}H_{20}O_6N_2$ is then *3-carboxymethylene-2-oxonucine hydrate* (IV) and its reduction product

is *2-oxonucinyl-3-acetic acid* (V). Further examples are *2,3,4-trihydroxynucine* and its *diacetate anhydride*, probably *2,3-diacetoxy-Δ^3-nucenine* (VI). The other parent substance, $C_{17}H_{24}ON_2$ (II), has not yet been prepd. but *2,3-dioxonucidine*, $C_{17}H_{20}O_3N_2$, is obtained by oxidation of strychnidine, $C_{21}H_{24}ON_2$, with CrO_3. There has now been obtained about 1% of a 2nd product, a well-crystd., difficultly sol. *amino acid*, $C_{21}H_{22}O_4N_2$ (VII), whose compn. has not yet been established with certainty and whose structure is not known. Among derivs. of 2,3-dioxonucidine already described are the methiodide hydrate, the methoperchlorate, the semicarbazone and the Br oxidation product $C_{17}H_{20}O_5N_2$. Its reduction has now been effected. By Clemmensen's method it gives, not 2-oxonucidine but, in very good yield, *2-oxo-3-hydroxynucidine* (VIII), also obtained with Na-Hg. The product seems to be homogeneous, although, as the result of the appearance of a new asym. C atom, 2 stereoisomers are possible. The presence of the new HO group is shown by the formation of an *acetoxy acetate* (IX), $C_{19}H_{24}O_4N_2.AcOH.H_2O$; the well-crystd. *hydroperchlorate* and the free *base* (X) were also prepd. Dioxonucidine, similarly treated, gave only the *AcOH salt*. The *methiodide* of VIII has a normal compn.; with Ag_2CO_3 it yields a strongly basic cryst. substance which is so hygroscopic that it cannot be analyzed. The oxidation of VIII with Br is much easier than that of the dioxonucidine, the product, $C_{17}H_{22}O_5N_2$ (XI) being isolated as the *HBr salt* and the *hydroperchlorate*. The presence of the new C:O group can be shown by the formation of a *semicarbazone perchlorate* and an *oxime-HBr*. It is probably in an aldehyde group, for the HBr very rapidly reduces yellow HgO; 2 mols. HgBr are formed but the *product*, $C_{17}H_{22}O_6N_2$ (XII), was isolated in only moderate yield as the well-crystd. *perchlorate* which in H_2O gave, by dissocn., 60% of the free XII in tables with $3H_2O$. A further transformation of the dioxonucidine is the degradation to an *amino acid*, $C_{16}H_{22}O_3N_2$ (XIII), according to the scheme $=CH.CO.CO.N.CH_2- \longrightarrow :CH.CO_2H(CO_2)NH.CH_2-$ with H_2O_2 in $Ba(OH)_2$; there was obtained 75% of a *salt* XIII.$2HClO_4.2H_2O$, $[\alpha]_D^{20}$ --59.7°; as by-product was isolated up to 5% of difficultly sol. lancets, $[\alpha]$ 36.4°, whose compn., $C_{17}H_{20}O_4N_2.HClO_4.H_2O$, corresponds to an *amine oxide* of dioxonucidine XIII is called *carboxyaponucidine* and is assumed to be derived from *aponucidine* (XIV), $C_{15}H_{22}ON_2$, in which all 6 C atoms of the strychnidine C_6H_6 nucleus have been removed. Likewise, Hanssen's acid $C_{16}H_{20}O_4N_2$ is *carboxyaponucine* and its oxidation products are *carboxyaponucinic acid* and *aldehyde*. XIII is oxidized by Br to the *aldehyde*, $C_{16}H_{22}O_6N_2$ (XV), which, when, boiled with HgO, gives in good yield *carboxyaponucidinic acid* (XVI). It is a striking fact that in this whole series of compds. the original CO_2H group apparently does not react with the basic NH group, which would lead to the formation of a 5-membered ring. It is also worthy of note that the two Br oxidations yield only 1 detectable C:O group and this again disappears on boiling with HgO. This is contrary to the views of the English chemists who represent the reaction by the scheme $CH{\cdot}C{\cdot}C_2 \longrightarrow CHO—CO{:}C_2 \longrightarrow CO_2H{:}OC{:}C_2$. They also assume that strychnine contains an ether group $C.O.CH_2.CH{:}C{:}C_2$ which on oxidation naturally changes to $C.O.CH_2{-}CO_2H$, but XVI and oxohydroxynucidinic acid are not broken down by boiling 2 hrs. with much 8.8 *N* HBr; neither $BrCH_2CO_2H$ nor $HOCH_2CO_2H$ can be detected and more than 80% of the acids are recovered unchanged. The hydrates of dioxo- and oxohydroxynucinic acids are likewise not hydrolyzed; the latter yields 35% of a compd. $C_{17}H_{20}O_7N_2$ (XVII); evidently the 3-HO group has been split off along with the 4 H atom and XVII is *2-oxo-Δ^3-nuceninic acid hydrate*. 2-Oxo-3-hydroxynucine hydrate, VIII and 2-oxo-3-hydroxynucidinic acid are likewise not hydrolyzed. Carboxyaponucine, distd. *in vacuo* with Zn dust, gives at 330–50° a $CHCl_3$-sol. basic resin from which can be obtained around 6% of a *perchlorate*, $[\alpha]$ 209°, whose compn. indicates that it contains 2 mols. $HClO_4$ and that CO_2 and 1 mol. H_2O or 1 atom O have been split off in its formation. The salt is not obtained without Zn and therefore is probably a reduction product, $C_{15}H_{20}ON_2.2HClO_4$. Strychnidine and tetrahydrostrychnine were obtained in 70 and 20% yield, resp., by reducing strychnine electrolytically in H_2SO_4, pptg. the strychnidine with NH_4OH and extg. the filtrate with $CHCl_3$. VII, brownish needles and leaflets with $3H_2O$, does not m. 320°, easily sol. in NH_4OH, HCl and AcOH; *sulfate, AcOH salt* of *2,3-dioxonucidine*, obtained with Ac_2O at 100°, neutral to faintly acid, sinters 230°, m. 269–74° (decompn.) like the free base. VIII, sinters 240°, m. 252–4°, $[\alpha]_D^{20}$ easily sol. in H_2O with alk. reaction; *perchlorate*, prisms and lancets with $1H_2O$, 33°/d. IX, reacts faintly acid, sinters 117°, m. 121–2°, evolves vapors at 140°, loses its H_2O at 40° and 15 mm. over P_2O_5, leaving a neutral residue which m. 100° with loss of AcOH and formation of a strongly basic residue; *perchlorate*, needles with $1H_2O$; free *base*, obtained with $NaHCO_3$-$CHCl_3$, m. 143–4°, foams, resolidifies and again m. around



180°. *Methiodide* of **VIII**, does not m. 290°, dissolves in 55 parts H_2O. *3-Oxo-2-hydroxynucidinic aldehyde* (**XI**): *perchlorate*, m. 158–60°; *HBr salt*, prisms with $1H_2O$, $[\alpha]_D^{20}$ 106.0°/d. *3-Oxo-2-hydroxynucidinic acid* (**XII**), turns brown around 300°, reacts practically neutral. **XV.***2HBr.2H₂O*, $[\alpha]_D^{20}$ 11.1°/d.; **XV.***3HClO₄.4H₂O*; *semicarbazone-2HBr*, leaflets losing 10.1% in wt. at 100° and 15 mm., $[\alpha]_D^{20}$ −16°/d.; *oxime-2HBr*, $[\alpha]_D^{20}$ −8.5°/d. **XVI.***HBr*, tables with $2H_2O$, $[\alpha]_D^{20}$ −3.6°/d., sol. in less than 4 parts H_2O at 100°, does not dissoc., does not ppt. the free **XVI** with 1 mol. alkali; **XVI.***2HCl.HOH*, m. 266° (foaming). **XVII**, prisms with $2H_2O$, sinters 255°, m. around 270°, rapidly reacts with $KMnO_4$ in $NaHCO_3$ at 0°.

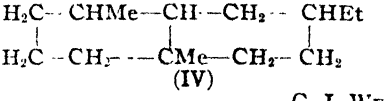
C. A. R.



Natural glucosides. II. Constitution of esculin. FRANK S. H. HEAD AND ALEXANDER ROBERTSON. *J. Chem. Soc.* **1930**, 2434–44; cf. *C. A.* **24**, 1865.—Glaser and Kraus (*C. A.* **18**, 76) have suggested that esculin (I) was 7-glucosidoxy-6-hydroxycoumarin; the following work proves that this suggestion is incorrect. I, MeI, K_2CO_3 and Me_2CO, warmed under the reflux for 85 hrs., give *7-O-methylesculin*, crystg. with 2 mols. H_2O, m. 230° (decompn.); aq. and EtOH solns. are non-fluorescent; hydrolysis with 5% H_2SO_4 gives 7-*O*-methylesculetin (II), m. 185°, and glucose. II, EtI, K_2CO_3 and Me_2CO give nearly quant. *7-methoxy-6-ethoxycoumarin* (III), m. 120°; the EtOH soln. has a blue fluorescence. *3-Methoxy-4-ethoxyphenol*, m. 58°, was obtained from the anilide sulfate; $FeCl_3$ gives a brownish violet color; concd. H_2SO_4 gives a brownish purple soln., changing to an intense magenta and then a bright blue on addn. of H_2O; with HCN, HCl and $Zn(CN)_2$ there results *2-hydroxy-4-methoxy-5-ethoxybenzaldehyde*, m. 112.3°; the $FeCl_3$ reaction is dark green; the *2,4-di-MeO deriv.* (IV) m. 110° and does not give a $FeCl_3$ reaction. Oxidation with $KMnO_4$ in Me_2CO gives *2,4-dimethoxy-5-ethoxybenzoic acid*, m. 137°. III and 20% aq. NaOH, heated until soln. results and then treated with Me_2SO_4, gives the *Me ester*, pale yellow, m. 80°, of *2,4-dimethoxy-5-ethoxycinnamic acid* (V), colorless needles from C_6H_6, transformed at 117–8° into a bright yellow solid, m. 128°, which then crystallizes from C_6H_6 in bright yellow needles; on standing in contact with the solvent the colorless form is obtained. Oxidation with $KMnO_4$ gives **IV**. IV, $CH_2(CO_2H)_2$, C_5H_5N and piperidine, heated on the H_2O bath for 4 hrs. and then boiled for 5 min., give V as pale yellow needles, crystg. from C_6H_6 with solvent of crystn., m. 132–3°; oxidation also gives IV. Exptl. conditions necessary for the mutual reconversion of the 2 forms could not be detd. *3,4-Dimethoxyphenol*, pale yellow oil, b. 168–70°, gives a *hydrate* from H_2O, m. 46°; the $FeCl_3$ reaction in EtOH is pale green, in H_2O, bluish green, instantly changing to reddish brown; with HCl, HCN and $Zn(CN)_2$ give *2-hydroxy-4,5-dimethoxybenzaldehyde*, m. 105°; the $FeCl_3$ reaction is dark green, changing to brownish purple on diln. with H_2O. MeI and K_2CO_3 give asarylaldehyde (VI), m. 114°. 2,5-$(HO)_2C_6H_2OMe$ gives *2,5-dihydroxy-4-methoxybenzaldehyde* (VII), m. 209° (slight decompn.); $FeCl_3$ gives a bluish green color, fading on addn. of H_2O. Methylation gives **VI**. VII, Ac_2O and AcONa, heated for 3 hrs. on a steam bath, 2 hrs. at 120° and 8 hrs. at 180°, and the soln. in NaOH acidified after 2 hrs., give II. 4,3-MeO(EtO)$C_6H_3NH_2$, through the diazo reaction, gives *4-methoxy-3-ethoxyphenol*, b. 175°, crystn. from H_2O gives a *hydrate*, m. 92–3°; $FeCl_3$ gives an unstable greenish blue color; the HCN reaction gives *2-hydroxy-5-methoxy-4-ethoxybenzaldehyde*, m. 91°; $FeCl_3$ gives a bluish green color; *phenylhydrazone*, pale yellow, m. 157–8°. *2,5-Di-*

methoxy-4-ethoxybenzaldehyde, m. 110°; oxidation gives *2,5-dimethoxy-6-ethoxybenzoic acid*, m. 130°. *2,5-Dimethoxy-4-ethoxycinnamic acid*, pale yellow, m. 178–9°.
C. J. WEST

Constitution of santonin. III. Proof of the position of the methyl groups. GEO. R. CLEMO AND ROBERT D. HAWORTH. *J. Chem. Soc.* **1930**, 2579–82; cf. *C. A.* **24**, 4046.—In the structure proposed for santonin (I), there still remains the proof of the 5-position of the 2nd Me group. In order to prevent the production of phenolic derivs. from I due to the migration of a Me group from position 5 to 6, I was reduced to the tetrahydro deriv. (II), m. 156–7°; reduction of II with Zn-Hg and concd. HCl gives *deoxytetrahydrosantonin* (III), m. 141–2°; with HI and red P, distn. with soda-lime, followed by reduction of the I-contg. residue with Na and EtOH, gives *1,4(a)-dimethyl-7-ethyldecalin* (IV), b_{20} 120–5°; attempts to dehydrogenate this with Se or S gave unsatisfactory results and a pure cryst. picrate could not be obtained. III and Se give 1-methyl-7-ethylnaphthalene, b_1 95–9° (picrate, m. 96–7°). The loss of the Me group during the Se treatment establishes the 5-position of the 2nd Me group in I.

(I)

Digitalis glucosides. II. Digoxigenin, the aglucone of digoxin. SYDNEY SMITH. *J. Chem. Soc.* **1930**, 2478–82; cf. *C. A.* **24**, 2753.—Digoxigenin (I) reduces alk. AgNO, and gives a red color with Na nitroprusside; H_2SO_4-$Fe_2(SO_4)_3$ gives a yellow soln. becoming red on standing. Titration indicates 1 lactone group; the *di-Ac deriv.* m. 221° (all m. p. cor.), $[\alpha]^{20}_{5461}$ 61.3° (MeOH, *c* 1.56). Refluxing I in 50% EtOH contg. H_2SO_4 gives *anhydrodigoxigenin*, m. 182°, $[\alpha]^{20}_{5461}$ 16.3° (MeOH, *c* 1.6); from dil. EtOH it crystallizes with 1 mol. H_2O; *di-Ac deriv.*, m. 199°, $[\alpha]^{20}_{5461}$ 38.6° (MeOH, *c* 0.5). Catalytic reduction (Pd black) of I gives the *dihydro deriv.*, m. 215°, $[\alpha]^{20}_{5461}$ 20.5° (MeOH, *c* 0.5); it does not give the Legal test; *di-Ac deriv.*, m. 222°, $[\alpha]^{20}_{5461}$ 29.8° (MeOH, *c* 0.9). I in MeOH-KOH gives *isodigoxigenin* (II), m. 260° (decompn.), $[\alpha]^{20}_{5461}$ 13.6° (MeOH, *c* 1); II retains the bitter taste of I but does not give the Legal test; II crystallizes from C_5H_5N with 1 mol. C_5H_5N, m. 280°; *di-Ac deriv.*, m. 280°. Heating II with MeOH-KOH for 15 min. gives *isodigoxigeninic acid*, m. 228°; the acid is very readily relactonized. I is therefore a tri-HO Δ^{β}-unsatd. lactone.

Heat treatment of hydrocarbons. SOC. D'ÉTUDES SCIENTIFIQUES ET D'ENTREPRISES INDUSTRIELLES. Fr. 687,904, Jan. 9, 1930. **A gaseous mixt. contg.** C_2H_2, CO **and H is made by passing, at a high speed, satd. hydrocarbons or gaseous mixts. rich**

in satd. hydrocarbons mixed with steam and O through a chamber heated exteriorly to at least 1300°. Olefins may also be added to the mixt. Examples are given.

Dehydrogenating organic compounds. I. G. FARBENIND. A.-G. Fr. 688,369, Jan. 17, 1930. Co or Fe or metals of the 5th to the 7th group or their oxides, after a treatment at about 200° with gases formed of or contg. compds. of solid metalloids of groups 5 to 7, are used as *catalysts* in the dehydrogenation of org. compds. Thus, a mixt. of NH_4 tungstate, $Co(NO_3)_2$ and antimonic acid are applied to active C and the mass treated at 350° for 4 hrs. with H_2S. This catalyst is used for the *dehydrogenation of petroleum fractions* rich in naphthenes. Other examples are given.

Catalysts for dehydrogenation of organic compounds. I. G. FARBENIND. A.-G. Brit. 333,975, June 5, 1929. Catalysts comprise metals such as Co, Fe, metals of groups 5 to 7 of the periodic system such as V, Mo, W, Cb, Ta, Cr and Mn, and compds. of these metals such as their oxides, in admixt. with each other or with other materials such as Pb, Sn, Zn, Cd or their compds. or solid oxides of non-metals such as those of P, As or Sb or corresponding acids or salts, which are used after a pretreatment at above 200° with gases or vapors such as H_2S, H selenide, H phosphide, CS_2 or HI. Several examples with details are given, and the catalysts may be used in the treatment of materials such as mineral oils, naphthenes and products of the destructive hydrogenation of coal, tar, etc.

Halogenation of organic compounds. I. G. FARBENIND. A.-G. Fr. 688,046, Jan. 11, 1930. Aliphatic and isocyclic compds. are treated in the presence of strong mineral acids contg. O. and catalysts, with less than one mol. of halogen for each atom of halogen to be introduced whereby loss due to the formation of the H halide is avoided. A very large no. of examples is given.

Halogenated hydrocarbons. ALEXANDER WACKER GES. FÜR ELEKTROCHEMISCHE IND G. M. B. H. Fr. 687,855, Jan. 8, 1930. Alkyl halides are prepd. by passing a mixt. of alcs. and halogen acids over or through phosphoric acids at a temp. of about 200°. Thus EtCl is formed by passing EtOH and HCl through liquid phosphoric acid. Other examples are given.

Apparatus for drying and distilling organic materials. VEREIN FÜR CHEMISCHE INDUSTRIE A.-G. Ger. 508,668, Mar. 1, 1928. Details are given of construction of an arrangement for circulating steam through the retort.

Purifying synthetic organic products of carbon monoxide. I. G. FARBENIND. A.-G (Otto Mohr, inventor). Ger. 508,953, Aug. 5, 1924. Synthetic org. products of CO and H (*e. g.*, CH_3OH, isobutyl alc., etc.) are purified by treating them with an oxidizing agent such as $KMnO_4$, H_2O_2, HClO, HBrO, etc., and free alkali. Examples are given.

Liquid **mixtures of saturated aliphatic oxygenated compounds.** MARIA CASALE-SACCHI, LUCIA CASALE and RENATO CASALE. Swiss 139,179 and 139,180, May 12, 1926. The mixt. of compds. is produced by the catalytic treatment of gaseous hydrocarbons with oxides of C under pressure (139,179). H may also be added (139,180). The app. is described.

Liquid **mixtures of saturated aliphatic oxygenated compounds.** MARIA CASALE-SACCHI, LUCIA CASALE and RENATO CASALE. Swiss 139,798 and 139,799, Sept. 22, 1925. The mixt. is prepd. by the catalytic treatment of a mixt. of gaseous hydrocarbons and oxides of C (139,798); H may also be added to the mixt. (139,799). The layout is described.

Aliphatic nitriles. IMPERIAL CHEMICAL INDUSTRIES, LTD., and T. S. WHEELER. Brit. 333,989, June 14, 1929. A metal cyanide such as NaCN, and an aliphatic halide such as ethylene chloride are heated together (suitably under a reflux condenser) in the presence of a nitrile which may be the nitrile to be produced such as ethylene cyanide.

Aromatic hydrocarbons. I. G. FARBENIND. A.-G. (Alwin Mittasch, Wilhelm Pungs and Franz Krägeloh, inventors). Ger. 509,406, Sept. 2, 1924. Aromatic hydrocarbons are prepd. from aliphatic hydrocarbons that are gaseous at atm. temp. by leading them at a temp. above 400° over catalysts comprising carbonates or other oxygenated salts of alk. earth metals, including Mg and Be. Other gases, including H, may be mixed with the hydrocarbon. Examples are given. Cf. *C. A.* **24**, 860.

Purification of crude aromatic compounds. ALPHONS O. JAEGER and LLOYD C. DANIELS (to The Selden Co.). Can. 306,381, Dec. 2, 1930. Crude anthracene is fractionally sublimed in a carrier gas stream contg. vapors of *o*-$C_6H_4Cl_2$ or other chlorinated aromatic hydrocarbon.

Purification of crude aromatic compounds. ALPHONS O. JAEGER and LLOYD C. DANIELS (to The Selden Co.). Can. 306,382, Dec. 2, 1930. Crude anthracene or other

aromatic hydrocarbon is purified by fractional sublimation in a carrier gas stream contg. vapors of furfural.

Purification of crude aromatic compounds. ALPHONS O. JAEGER and LLOYD C. DANIELS (to The Selden Co.). Can. 306,383, Dec. 2, 1930. Crude aromatic hydrocarbons are fractionally sublimed in a carrier gas stream contg. vapors of unchlorinated aromatic hydrocarbons of the benzene series or their unchlorinated derivs.

Aromatic aldehydes. I. G. FARBENIND. A.-G. Brit. 334,009, July 4, 1929. In the manuf. of aldehydes (such as benzaldehyde, *p*-tolualdehyde or *p*-chlorobenzaldehyde) aromatic compds. such as C_6H_6, toluene or PhCl are treated with CO under pressure (suitably at a temp. of about 35°) in the presence of an anhyd. $AlCl_3$ catalyst activated with a small quantity of Ti chloride or a mixt. of the latter with other metal halides such as the chlorides of Fe and other metals present in Al ores. A small quantity of acid such as HCl or H_2SO_4 also may be added to facilitate initiation of the reaction. Various examples and details of procedure are given.

Aromatic hydroxyl compounds. I. G. FARBENIND. A.-G. Fr. 686,650, Dec. 14, 1929. Aromatic hydroxyl compds. and their halogen substitution products are made by treating C_6H_6 or its halogen substitution products in the vapor state with O or gases contg. or liberating O in the presence of O-contg. compds. of metals which are found at the minima of the large periods of the curve of at. vols. Examples are given of the prepn. of PhOH and chlorophenol. Examples of catalysts are oxides of Cr, Mo, U, V, Ta, Ti and Cb.

Olefins. ALEXANDER WACKER GES. FÜR ELEKTROCHEMISCHE IND. G. M. B. H. Fr. 687,311, Dec. 27, 1929. Olefins are prepd. from alcs., such as C_2H_4 from EtOH or butylene isomers from BuOH, by means of phosphoric acid or compds. capable of being transformed into phosphoric acids placed on supports of wood charcoal or bone charcoal material of like absorption capacity at a temp. below 300°.

Olefins from alkyl esters of sulfuric acid. I. G. FARBENIND A.-G. (Rudolf Engelhardt and Wilhelm Lommel, inventors). Ger. 507,961, Mar. 19, 1924. Alkyl esters of H_2SO_4 are heated to above 170° with salts of di- or polybasic acids, or such monobasic acids as do not combine with the liberated olefin, the salts being present in such amts. that no free H_2SO_4 is formed. Thus, Et_2SO_4 is heated to 300° with Na_2SO_4 to give C_2H_4. Other examples are given.

Polymerizing diolefins. I. G. FARBENIND. A.-G. Fr. 688,592, Jan. 21, 1930. Valuable products are made by polymerizing diolefins in the presence of alkali or alk. earth metals, the mass being stirred or the vessel rotated during the reaction. Fr. 688,593 describes a similar polymerization in the presence of solvents, the polymerization product being continuously eliminated in soln. Examples are given of the use of ether and of hexamethylene in a Soxhlet app.

Polymerizing diolefins to obtain rubber-like products. I. G. FARBENIND. A. G. Brit. 333,872, March 15, 1929. Readily sol. polymerization products are obtained by effecting the polymerization of diolefins such as butadiene in the presence of Na or other alkali or alk. earth metals previously dispersed in solvents or dispersion media such as decahydronaphthalene, dry xylene, toluene, tetrahydronaphthalene, benzene, hexahydrobenzene, gasoline or liquid polymerization products of the process. Various details of procedure are given.

Esters of resin acids. CHEM. FAB. KURT ALBERT G. M. B. H. Ger. 509,368, Aug. 29, 1928. Natural or artificial resin acids are heated with monoesters or monoethers of glycol, or with alc. compds. derived from glycol by internal etherification. The esters so obtained are sol. and resistant resins stable to light. Suitable resin acids are those from Manila or Congo copal, or acid synthetic resins prepd. from PhOH, CH_2O and colophony, or from glycerol and phthalic anhydride. Examples are given.

Vinyl esters of organic acids. HARRY B. DYKSTRA and CARYL SLY (to E. I. du Pont de Nemours & Co.). U. S. 1,786,647, Dec. 30. See Brit. 319,589 (*C. A.* **24**, 2470).

Halogen hydracid esters of 5-methyl-2-hexen-4-ol. I. G. FARBENIND. A.-G. (Karl Böttcher, inventor). Ger. 508,891, Apr. 17, 1925. These are produced directly by the action of the halogen hydracid at ordinary temps. Thus, 4-chloro-5-methyl-2-hexene (b. 38–40°) is produced by shaking 5-methyl-2-hexen-4-ol with concd. HCl. A 90% yield is obtained.

Dihaloethyl esters. SOC. DES USINES CHIM. RHÔNE-POULENC. Fr. 687,621, Jan. 3, 1930. See Brit. 325,115 (*C. A.* **24**, 3800).

Esters of borneol and isoborneol. SCHERING-KAHLBAUM A.-G. (Karl Stephan and Fritz Ulffers, inventors). Ger. 508,093, Apr. 12, 1925. Camphene and a fatty acid are mixed at atm. temp., the mixt. is cooled to about 0° and a strong mineral acid, which acts as a catalyst, is then added. The mixt. is allowed to stand until the reac-

tion is completed, rise of temp. being avoided, and the catalyst is then eliminated. The fatty acid may be in excess. Examples are given. Cf. *C. A.* **24**, 2756.

Imido ethers. KNOLL & Co., KARL F. SCHMIDT and PHILIPP ZUTAVERN. Fr. 688,062, Jan. 11, 1930. The same products as are described in Fr. 673,628 (*C. A.* **24**, 2469) are prepd. from oximes or esters of oximes by submitting them to the Beckmann transposition in the presence of alcs. Thus, the *p*-toluenesulfonic acid ester of the oxime of cyclohexanone is heated in abs. alc., and the imido ether is liberated by the addn. of KOH which is the same product as that described in example I of the prior case.

Aliphatic amines. ALEXANDER WACKER GES. FÜR ELEKTROCHEMISCHE IND. G. M. B. H. Fr. 687,398, Dec. 30, 1929. Alcs. and NH_3 are passed over heated heavy metals, such as Ni, Cu or mixts. thereof which may be deposited in pumice powder or clay.

Separating amines. I. G. FARBENIND. A.-G. Fr. 687,826, Jan. 8, 1930. Secondary and tertiary amines are sepd. by adding to the mixt. at ordinary or moderately raised temp., an amt. of phthalic anhydride corresponding approx. to the content of ondary amine, and sepg. the phthalamic acid formed from the tertiary amine, which d s not react, by extn. with NaOH lye. Examples are given.

Halogenated acetylenes and diacetylenes. I. G. FARBENIND. A.-G. Brit. 333,946, May 25, 1929. Chloro- and bromo-acetylenes and their derivs. are formed by direct replacement of H combined with triply linked C atoms by Cl or Br, by subjecting an acetylene compd. to the action of an aq. soln. of a hypochlorite or hypobromite (preferably with addn. of an excess of free alkali). The prepn. of dichloroacetylene, dibromoacetylene, bromo- and chloro-propiolic acid, 1-bromoacetinyl-1-cyclohexanol and diethylbromoacetinylcarbinol is described, and reference is also made to the prepn. of tetrabromoethylene from dibromoacetylene and a soln. of Br in $CHCl_3$.

Organic acid halides. SOC. DES USINES CHIM. RHÔNE-POULENC. Fr. 687,689, Jan. 4, 1930. α-Haloethyl esters are heated in the liquid state in the presence of acid catalysts. Examples are given of the prepn. of AcCl from α-chloroethyl acetate with $ZnCl_2$, H_2SO_4 or phosphoric acid as catalyst, chloroacetyl chloride from α-chloroethyl monochloroacetate, butyryl chloride from α-chloroethyl butyrate and others.

Acid halides. SOC. DES USINES CHIM. RHÔNE-POULENC. Fr. 687,731, Jan. 6, 1930. Halides of org. acids are made by splitting α-halo- or α,β-dihalo-ethyl esters by heating, preferably in the presence of pumice, kieselguhr, active charcoal, etc. Thus, AcCl and AcH are produced by passing chloroethylacetate over pumice heated to 250–300°.

Alkyl chlorides. I. G. FARBENIND. A.-G. Ger. 509,263, May 15, 1927. Alkyl chlorides are prepd. from alcs. boiling below 114° by adding aq. HCl to the boiling alc at such a rate that the concn. of HCl in the reaction mixt. never exceeds 20%. From ¼ to ¼ of the HCl used may be added to the alc. at the beginning, and part of the acid may be supplied as gas or in alc. soln. The method enables one to dispense with water binding agents.

Methylation. I. G. FARBENIND. A.-G. (Eduard Tschunkur and Fritz Eichler, inventors). Ger. 509,149, Jan. 15, 1927. Aromatic compds. are methylated in the nucleus by treating in the presence of hydrogen halide with CH_2O, or reagents giving rise thereto, and reducing the halomethyl deriv. so obtained. The reaction may be effected while heating, and a condensing agent, *e. g.*, $ZnCl_2$ or $AlCl_3$, may be present. Thus, $C_{10}H_8$, treated in HCl suspension at 80° with paraformaldehyde, yields α-chloromethylnaphthalene, m. 31°, which can be reduced in alc. soln. with Zn and NH_4Cl to give α-methylnaphthalene, b_{12} 110°. Other examples are given. Cf. *C. A.* **23**, 5196.

Separation of phenols. KLÄR-U. ENTPHENOLUNGS G. M. B. H. Fr. 687,319, Dec. 27, 1929. Benzene dissolved in water during the sepn. of phenols by benzene is recovered by adding a solvent for benzene insol. in water such as tar oil, or by treating the water with heated air or steam, or by submitting the water to a distn., cooling the distillate under reflux and sepg. the benzene from the distd. water.

Sulfoxylates. I. G. FARBENIND. A.-G. (Eduard Münch and Otto Schlichting, inventors). Ger. 509,516, Apr. 8, 1928. Addn. to 501,085 (*C. A.* **24**, 4521). Sulfoxylates are prepd. by reducing ketone bisulfites with H in the presence of a catalyst, *e. g.*, Ni, and in the presence or absence of indifferent gases. The reaction should be effected at about 0°, and the reaction mixt. should be approx. neutral. Pressure may be applied. Examples are given.

S-Alkylisothiourea salts. SCHERING-KAHLBAUM A.-G. (Herbert Schotte, inventor). Ger. 506,962, Sept. 10, 1927. These salts are prepd. by the action of mercaptans on cyanamide, preferably CaNCN, in the presence of acid. Thus, MeSH and $(Me)_2NCN$ are allowed to react in the presence of H_2SO_4 to give dimethylisothiourea. Other examples are given.

Acyl derivatives of k-strophanthidin. SCHERING-KAHLBAUM A.-G. (Wilhelm Neumann, inventor). Ger. 508,096, Jan. 1, 1929. See Brit. 323,973 (*C. A.* **24**, 3249).

Amino derivatives of cyclohexylbenzene. I. G. FARBENIND. A.-G. (Ernst Korten, inventor). Ger. 509,045, Mar. 29, 1928. These are prepd. by treating amino derivs. of tetrahydrobiphenyl in the liquid phase with H under pressure in the presence of a catalyst. Thus, 4-aminotetrahydrobiphenyl yields *p*-cyclohexylaniline. Other examples are given describing the prepn. of 4-amino-3-methylhexahydrobiphenyl, b_{11} 175–7°, and 4-amino-3-methoxyhexahydrobiphenyl, m. 107°. The diazo compds. of the products can be coupled to yield yellowish dyes. Acylamino derivs. of tetrahydrobiphenyl may be hydrogenated, and afterward sapond. Cf. *C. A.* **24**, 4792.

Anthraquinone derivatives. SOC. POUR L'IND. CHIM. À BÂLE. Fr. 687,039, Dec. 20, 1929. Condensation products of the anthraquinone series are made by causing the leuco-α-hydroxyanthraquinones and the leuco-α-hydroxyaminoanthraquinones and their derivs. to react in aq. medium with primary aromatic bases in the presence of boric acid. The hydroxy or hydroxyamino compds. themselves may be used if the reaction is carried out in the presence of a reducing agent. The OH groups are replaced by NH-aryl groups. The products may be used as *acid dyes* for animal or artificial fiber, or the unsulfonated compds. may be used for *coloring resins, lacquers*, etc. Several examples are given.

Benzanthrone derivatives. I. G. FARBENIND. A.-G. (Hugo Wolff, inventor). Ger. 508,322, Dec. 14, 1928. Benzanthrone derivs, substituted in the *Bz*-2-position with halogen or the NO_2 or OH group are prepd. by treating ethers of *Bz*-1-hydroxybenzanthrone with halogenating, nitrating, or oxidizing agents. Examples are given describing the prepn. of (*inter alia*), *Bz-2-nitro-Bz-1-methoxybenzanthrone*, m. 237°; *Bz-2-bromo-Bz-1-methoxybenzanthrone*, m. 186–188°; *Bz-2-chloro-Bz-1-methoxybenzanthrone*, m. 183–185°; *Bz-1-Bz-2-dihydroxybenzanthrone*, m. 355°; and *Bz-1-Bz-2-dimethoxybenzanthrone*, m. 156–158°.

Guanidine derivatives. SCHERING-KAHLBAUM A.-G. (Herbert Schotte, inventor). Ger. 509,264, Sept. 13, 1927. Polyaryl guanidines are prepd. by treating aryl-substituted isothiourea ethers with NH_3 or amines in the presence of a heavy metal salt capable of reacting with mercaptans, the reaction being effected in a mixt. of an alc. and water in such proportions that the mercaptide is pptd. while the guanidine deriv. remains dissolved. Thus, *N,N'*-di-*o*-methoxyphenyl-*S*-ethylisothiourea-HBr, treated in aq. MeOH soln. with NH_3 and then with $HgCl_2$, yields *N,N'*-di-*o*-methoxyphenylguanidine, m. 116–117°. Other examples are given also.

Propenyl derivatives of aromatic hydrocarbons such as isoeugenol. JACOB EHRLICH (to Verona Chemical Co.). U. S. 1,787,036, Dec. 30. In forming propenyl derivs. such as isoeugenol, an allyl deriv. of an aromatic hydrocarbon such as eugenol is heated with an alkali such as KOH in the presence of an org. phenolic compd. such as PhOH which causes a soln. of the allyl compd. and its corresponding propenyl deriv. during the isomerization process with practically no chem. change in the phenolic compd itself.

Quinone derivatives. I. G. FARBENIND. A.-G. (Fritz Günther, inventor). Ger. 508,395, Oct. 23, 1924. Nuclearly substituted quinones are prepd. by treating quinones with aromatic diazo compds. Thus, benzoquinone, treated in alc. soln. with the diazo compd. from aniline, yields phenylquinone, N being evolved. Other examples are given also.

Basic derivatives of substituted quinolinecarboxylic acid. SOC. ANON. POUR L'IND. CHIM. À BÂLE. Swiss 137,940, July 15, 1927. Addn. to 131,926 (*C. A.* **24**, 2473) The deriv. 2-chloro-4-quinolinecarboxylic acid-diethylaminoethanol is obtained by the action of an ester of diethylaminoethanol on a salt of 2-chloro-4-quinolinecarboxylic acid. An example mentions chloroethyldiethylamine and the Na salt of the acid.

Basic derivative of a substituted quinolinecarboxylic acid. SOC. ANON. POUR L'IND. CHIM. À BÂLE. Swiss 137,964, July 15, 1927. Addn. to 135,076 (*C. A.* 24, 3023). The deriv. 2-diethylaminoethoxy-4-quinolinecarboxylic acid ethyl ester is obtained by reacting on the diethylaminoethanol ester of 2-chloro-4-quinolinecarboxylic acid with a metal compd. of EtOH. An example is given.

Higher fatty acid derivatives. I. G. FARBENIND. A.-G. Fr. 687,752, Jan. 6, 1930. New derivs. are made by the reaction of alkali solns. on the halogen acids or their derivs. such as esters or amides with the addn., or not, of catalysts and heat under pressure. If caustic alkalies are used, products are obtained which are sol. in alkalies and are intermediate products for further derivs. If weak alkalies are used the products are insol. in alkalies and have plastic properties. Examples are given of the treatment of pentachlororicinoleic acid, hexachlororicinoleic acid, hexachlorostearic acid and others.

Derivatives of 2-hydroxynaphthalene-3-carboxylic acid amide. I. G. FARBENIND. A.-G. (Max Raeck, inventor). Ger. 506,837, April 23, 1927. See U. S. 1,733,468 (*C. A.* **24**, 380).

Aldehyde-amine condensation products having antioxidant properties. I. G. FARBENIND. A.-G. Brit. 333,941, May 24, 1929. α-Naphthylamine or a substitution product is condensed with an aliphatic aldehyde such as acetaldehyde, aldol or crotonaldehyde, in the presence of an acid such as formic acid or HOAc and a water-sol. alc. such as EtOH, and the insol. product obtained is decompd. with water. Examples with details of procedure are given.

Condensation products of aromatic sulfonic acids suitable for use as wetting agents, etc. FRIEDRICH POSPIECH (to Chemische Fabrik Pott & Co.). U. S. 1,787,408, Dec. 30. Compds. suitable for use as wetting agents or the like are obtained by reaction (suitably in the presence of H_2SO_4 at temps. of 85-90° but not higher) between naphthalenesulfonic acids or those of anthracene, phenanthrene, acenaphthene or the like, and olefins having 3 or more C atoms in their chain, and there may also be employed as starting materials halonaphthalenes, nitronaphthalenes, aminonaphthalenes, naphthalenecarboxylic acids, naphthols and so-called "functional derivs." of these compds. such as their esters, ethers, amides, chlorides, etc., and cyclic hydrocarbons with olefinic characteristics such as dihydrobenzene, tetrahydrobenzene or substitution products such as styrene. Various details and examples are given.

Metallic organic compounds. I. G. FARBENIND. A.-G. (Max Hardtmann and Peter Backes, inventors). Ger. 508,667, Oct. 28, 1926. Halides of P, As, Sb, Bi, Sn, Hg, Pb and Si and alkyl, aralkyl or arylchloro compds. are treated with finely divided high-boiling hydrocarbons in the presence of the calcd. amt. of alkali metals to produce metallic org. compds. Thus, the calcd. amt. of Na fused under toluene is added to $SbCl_5$, PhCl and toluene to give diphenyl- and monophenylstibine derivs. Several other examples are given.

Alkali salts of organic compounds. I. G. FARBENIND. A.-G. (Karl Dobmaier, inventor.) Ger. 508,097, Jan. 19, 1927. Solid alkali salts of org. compds. that are unstable or sensitive to alkali are prepd. by intimately mixing the compd. with the alkali salt of an aromatic hydroxyl compd. in the presence of a small quantity of water. Thus, chlorobenzoic acid, PhONa, and a little water may be ground together and then extd. with Et_2O, leaving Na chlorobenzoate. Alkali salts of organo-metallic compds. may be prepd. similarly.

Organic cupric cyanide compounds. I. G. FARBENIND. A.-G. (Friedrich W. Stauf and Hermann Hagenest, inventors). Ger. 507,791, Nov. 1, 1928. Addn. to 505,631 (*C. A.* **25**, 563). The method of 505,631 for producing $Cu(CN)_2$, *i. e.*, by the interaction of 1 mol. of a cupric salt, 1 mol. NH_3 and 2 mol. CN as a HCN salt in aq. soln., is modified by using a basic N-compd. (*e. g.*, urea or pyridine) instead of the NH_3.

Mercury compound of *p*-nitroaniline. MORRIS S. KHARASCH (to E. I. du Pont de Nemours & Co.). U. S. 1,787,630, Jan. 6. *p*-Nitroaniline is dissolved in HOAc and water and this soln. is warmed with an admixt. of $Hg(OAc)_2$ and the resulting Hg compd. may be pptd. as chloride by adding NaCl. A similar procedure also may be followed in the mercurizing of other substituted anilines such as *m*- and *o*-nitroaniline, the corresponding chloroanilines, bromoanilines, sulfoanilines, etc. The pptd. mercurized compd., after drying in any suitable manner, may be employed, either in water suspension or dry, as a *germicide, fungicide*, etc., and by reason of its relatively low toxicity, it is suitable for use in the treatment of diseases of small grains such as smut, wheat rust, etc.

Carbamates. I. G. FARBENIND. A.-G. Fr. 686,649, Dec. 14, 1929. NH_3 and CO_2 are introduced into solns. of salts in agents in which the carbamates are insol. or almost insol. Examples are given of the prepn. of the carbamates of Ca, Na, Pb and Ba, which may be converted to cyanamides, carbonates or cyanides as desired. Cf. C. A. **24**, 5947.

Metallic carbamates. I. G. FARBENIND. A.-G. Fr. 687,091, Dec. 21, 1929. Metallic carbamates and their transformation products are made by causing $NH_2COO-NH_4$ to react with inorg. metallic compds. in solvents for NH_2COONH_4. Thus, NaCl is dissolved in aq. NH_3 and a soln. of NH_2COONH_4 in aq. NH_3 is added, NH_2COONa being pptd. Examples are also given of the prepn. of the Ca, K, Ba and Zn salts, with MeOH or EtOH as solvent. Cf. *C. A.* **25**, 303.

Volatile aliphatic acids. HOLZVERKOHLUNGS-INDUSTRIE A.-G. Ger. 509,936, Feb. 17, 1928. Concd. volatile aliphatic acids are obtained from their solns. by adding a salt mixt. with which the acid combines, and recovering the acid by heating. Thus, a 50% soln. of glacial AcOH is treated with anhyd. AcONa and AcOK. The mixt.

is heated in a distg. current. The water distils over at temps. up to 170°, with a small quantity of acid. At 300° acid of 95% purity distils over.

Acetic acid. HOLZVERKOHLUNGS-IND. A.-G. Fr. 687,789, Jan. 7, 1930. AcOH is made by the continuous oxidation of AcH by means of O or a gas contg. O, the temp. being preferably 60–75°. The O is kept considerably in excess of the amt. theoretically necessary. The crude reaction product, *i. e.*, the product freed from AcH but not rectified, is used for extg. the unaltered AcH from the gases.

Acetic acid. WILHELM STRECKER. Fr. 688,417, Jan. 17, 1930. In the manuf. of AcOH by oxidizing AcH with O, the concn. of peracid which forms is kept below about 0.2% by a continuous circulation of crude AcOH. The peracid in this form is placed into contact with AcH on a large surface to be transformed.

Concentrating dilute acetic acid. HERMANN SUIDA. Austrian 119,478, May 15, 1930. Addn. to 116,727. The method of Austrian 116,727 (*C. A.* **24**, 2758) is modified by using 20–50% of a water-insol. wood-tar oil, or wood-spirit oil, b. 60–80°, instead of 10–30% of the fraction b. 80–120°.

Concentrating dilute acetic acid. HERMANN SUIDA. Austrian 119,481, May 15, 1930. Addn. to 117,858. The method of Austrian 117,858 (*C. A.* **24**, 4306) is modified by using an ester of a cyclic carboxylic acid as the extg. agent. Suitable esters are dibutyl or dihexyl phthalate, neutral esters from phthalic acid and glycol or glycerol, and esters of naphthenic acid.

Acetic acid; acetaldehyde. I. G. FARBENIND. A.-G. (Hermann Jochheim, inventor). Ger. 509,020, Dec. 14, 1926. AcOH and AcH are prepd. by passing C_2H_2, H, and O at a raised temp. over a contact mass, *e. g.*, a compd. of Sn, Ag or Hg. Other gases may be present in the mixt., and other compds. in the contact mass. Examples are given. Cf. *C. A.* **24**, 5768.

Acetic acid and its homologs. HOLZVERKOHLUNGS-INDUSTRIE A.-G. (Adolf Gorhan, inventor). Ger. 508,256, June 17, 1927. AcOH and its vaporizable homologs are concd. by treating the vapors of the dil. acids with fused $NaHSO_4$, which may be used alone or mixed with $KHSO_4$ or with addns. that lower the m. p., such as a small quantity of H_2SO_4 or H_2O. The treatment may be effected in a countercurrent manner. Addnl. details are given, and app. is shown.

Recovering acetic acid solvents. DESTILACIJA DRVA D. D. Ger. 508,092, June 18, 1926. See Suida, Austrian 116,377 (*C. A.* **24**, 2473–4).

4-Halo-*p*-phenyl-*o*-benzoylbenzoic acid, etc. PHILIP H. GROGGINS. U. S. 1,786,526, Dec. 30. 4-Halo derivs. of *p*-phenyl-*o*-benzoylbenzoic acid are prepd. by condensing 4-halobiphenyl with phthalic anhydride. U. S. 1,786,527 relates to the production of the similar 2-halo derivs. by condensing 2-halobiphenyl with phthalic anhydride. U. S. 1,786,528 relates to the production of 4-amino-*p*-phenyl-*o*-benzoyl benzoic acid by heating 4-halo-*p*-phenyl-*o*-benzoylbenzoic acid with aq. NH_3 under pressure in the presence of a Cu catalyst. U. S. 1,786,529 relates to similar production of the corresponding 2-amino compd. from the corresponding 2-halo compd. U. S. 1,786,530 relates to production of 4-amino-β-phenylanthraquinone by heating 4 halo β-phenylanthraquinone with aq. NH_3 under pressure, and U. S. 1,786,531 relates to similar production of the corresponding 2-amino compd. from the corresponding 2-halo compd. U. S. 1,786,532 relates to prepn. of the Al base of *p*-phenoxy-*o*-benzoylbenzoic acid by condensing diphenyl oxide with phthalic anhydride in the presence of $AlCl_3$.

6-Hydroxybenzylamine-3-arsonic acid. I. G. FARBENIND. A.-G. (Werner Schmidt, inventor). Ger. 507,638, June 1, 1927. 6-Hydroxybenzylamine-3-arsonic acid and its acyl derivs. are obtained by diazotizing 3-amino-6-hydroxyacylbenzylamine bases, treating with Na_3AsO_3 in alk. soln. and then, optionally treating the 6-hydroxyacylbenzylamine-3-arsonic acid formed with sapong. agents. Thus, 1-hydroxy-2-methyl 4-nitrobenzene, m. 95°, is diazotized and treated with Na_3AsO_3 to give 6-hydroxy 5-methylbenzylphthalimide-3-arsonic acid, m. 273°. Sapon. yields 6-hydroxy-5-methyl benzylamine-3-arsonic acid, m. 290°. Other examples describe the prepn. of 6-hydroxy benzoylbenzylamine-3-arsonic acid (m. 220 221°), 6-hydroxybenzylamine-3-arsonic acid (m. over 290°), and 6-hydroxy-*N*-phthaloxylbenzylamine-3-arsonic acid (m. 276°).

***N*-Substituted benzimidazolonearsonic acid.** I. G. FARBENIND. A.-G. (Karl Streitwolf, Alfred Fehrle and Walter Herrmann, inventors). Ger. 507,525, Feb. 12, 1929. Addn. to 446,545. Amino-*o*-alkylamino- or amino-*o*-alkenylaminobenzene-arsonic acid is treated with an ester of ClCOOH and then with acid. Thus, 3-amino 4-methylaminobenzene-1-arsonic acid is dissolved in dil. NaOH cooled to 0–5° and treated with HCl when 2,3-dihydro-1-methyl-2-ketobenzimidazole-5-arsonic acid sepd. out. Cf. *C. A.* **24**, 4057.

Phenylglycidic acid. ADOLF KAUFMANN. Ger. 509,938, July 28, 1927. Phenylglycidic acid is prepd. by treating cinnamaldehyde with H_2O_2 and alkali, optionally in the presence of a solvent.

Sulfinic acids. I. G. FARBENIND. A.-G. (Heinrich Hapff, inventor). Ger. 506,964, Sept. 18, 1928. See Brit. 321,843 (*C. A.* **24**, 2759).

4-Chloro-1-aminoanthraquinone-2-sulfonic acid. I. G. FARBENIND. A.-G. (Georg Kränzlein, Fritz Roemer and Erich Kronholz, inventors). Ger. 507,798, Dec. 9, 1927. See Brit. 302,171 (*C. A.* **23**, 4350).

Acetic anhydride. E. B. BADGER & SONS CO. Brit. 333,991, June 17, 1929. Anhyd. NaOAc, S chloride or sulfuryl chloride and Cl are fed to a batch reaction chamber surrounded by a cooling jacket and the temp. is preferably maintained slightly below 10°. Various details of app. and procedure are described.

Trichloroethane. I. G. FARBENIND. A.-G. Fr. 687,307, Dec. 27, 1929. 1,1,2-Trichloroethane is prepd. by heating a mixt. contg. C_2H_2, Cl and gaseous HCl, with or without catalysts, in reaction chambers filled with fine-grained material to prevent all danger of explosions or in the presence of an amt. of C_2H_2 (or HCl or inert gases) above the limits of explosibility of the mixt. of gases. In examples the gas mixt. is passed over coke heated to 220° and active charcoal impregnated with $MgCl_2$ and heated to 80–150°. Cf. *C. A.* **23**, 2724.

Acetylene. ROBERT G. WULFF. Can. 306,263, Dec. 2, 1930. C_2H_2 is made by rapidly passing one or more non-acetylene hydrocarbons mixed with a dilg. agent, both in vapor form, over a refractory contact mass maintained at 1500° F., the period of contact being relatively short, and then cooling the reaction products.

Methanol. GIULIO NATTA. Swiss 140,093, Mar. 9, 1929. See Fr. 670,763 (*C. A.* 24, 1869).

Methanol synthesis, etc. MATHIAS PIER and GUSTAV WIETZEL (to I. G. Farbenind. A.-G.). U. S. 1,788,170, Jan. 6. For production of org. compds. such as MeOH, there is passed over a suitable catalyst such as Fe oxide, in a circulating system, a gas mixt. contg. a large proportion of inert gas, such as a "power-gas" which has been scrubbed to remove CO_2 and then contains CO about 15.3, H about 30.6, CH_4 about 2.8 and N about 51.3%, and part of the residual gas mixt. is removed and continuously replaced by fresh gas so as constantly to maintain a proportion of about 12% CO and 24% H in the circulating gas. Temps. of 200–500° and pressures above 50 atm. are suitable for the process. It is stated that as good yields may be obtained as when employing gases richer in reacting constituents.

Formaldehyde. HOLZVERKOHLUNGS-IND. A.-G. Fr. 688,436, Jan. 18, 1930. To reduce the acidity of CH_2O prepd. by the catalytic oxidation of MeOH, the gaseous reaction mixt. is caused to pass at a temp. between 100° and the decompn. temp. of CH_2O, over one or more catalysts which are good conductors of heat such as Ag or Cu or their easily reducible compds.

Acetaldehyde. I. G. FARBENIND. A.-G. Fr. 688,047, Jan. 11, 1930. AcH is made by catalytic hydration of C_2H_2 using as catalyst Al_2O_3 activated by addnl. substances having a dehydrogenating action, or compds. of W, particularly the oxides and complex acids of W, if desired with the addn. of compds. of the heavy metals except Fe_2O_3. Thus, a mixt. of C_2H_2 and steam is passed over a mixt. of Al_2O_3 and pumice contg. a small quantity of ZnO or $ZnSO_4$ heated to 400°. Cf. *C. A.* **25**, 304.

Acetone. I. G. FARBENIND A.-G. Fr. 688,074, Jan. 13, 1930. Acetone is prepd. by passing C_2H_2 and steam over catalysts and directing the by-products formed, such as AcH and AcOH, and the unchanged C_2H_2 over catalysts which favor the production of acetone from the compds. An example is given in which ZnO is used in both reactions.

Formamide. BURRITT S. LACY (to Roessler & Hasslacher Chemical Co.). U. S. 1,787,183, Jan. 6. Combination of CO and NH_3 is effected in the presence of an alc. such as MeOH and an alcoholate such as NaOMe at about 70° under 17 atm. pressure.

Methyl chloride. MAITLAND C. BOSWELL and ROLAND R. MCLAUGHLIN. Can. 306,629, Dec. 9, 1930. MeCl is prepd. by passing a mixt. of CH_4 and Cl at a high temp. over a catalyst comprising a complex of Cu and Cl contg. less Cu than does Cu_2Cl_2 and more than does $CuCl_2$.

Hexamethylenetetramine. GUTEHOFFNUNGSHUTTE OBERHAUSEN A.-G. Fr. 687,735, Jan. 6, 1930. $(CH_2)_6N_4$ is made by passing a mixt. of CH_4 and air through an elec. field of high tension and high frequency. HCHO is also formed. Examples are given.

Urea. I. G. FARBENIND. A.-G. Fr. 687,188, Dec. 24, 1929. Carbamates are heated in the presence of an excess of NH_3 under a partial pressure of NH_3 higher than

its crit. pressure. Catalysts such as finely divided charcoal, or salts or oxides of light metals such as $MgCl_2$ or $AlCl_3$ or acids may be added. A small quantity of water also is advantageous. The carbamates may be formed intermediately by starting with NH_4HCO_3 or $(NH_4)_2CO_3$ or mixts. of these salts with metal bicarbonates.

4,6-Dichloro- and 3,4,6-trichloro-2-nitro-1-methylbenzene. I. G. FARBENIND. A.-G. (Karl Moldaenke and Ernst Runne, inventors). Ger. 507,792, Nov. 8, 1925. The above compds. are produced by treating 4-chloro-2-nitro-1-methylbenzene with Cl. Examples are given. The chlorination is arrested at the dichloro or trichloro compd. as desired.

1'-Chloro-1-methylnaphthalene. I. G. FARBENIND. A.-G. (Gustav Reddelien and Hans Lange, inventors). Ger. 508,890, Jan. 13, 1929. 1'-Chloro-1-methylnaphthalene is produced by the action of monomol. CH_2O on an aq. suspension of cryst. naphthalene in the presence of concd. HCl. The HCl may be led in as gas and the mixt. may be heated. An example is given.

Benzaldehyde. P. P. SHORUIGIN. Russ. 33,783, Oct. 11, 1928. A mixt. of $PhCHCl_2$ vapor and steam with an excess of air is passed at high temp. over a catalyst contg. oxides or salts of V.

Mesityl oxide. SOC. ANON. DES DISTILLERIES DES DEUX-SÈVRES. Fr. 687,176, Dec. 23, 1929. Mesityl oxide is prepd. in a continuous manner by the decompn. of diacetone alc. heated to boiling in a considerable excess of water contg. a small quantity of a catalyst such as phosphoric acid. The oxide and water form a mixt. with a min. b. p. of 91.5°, and this is rapidly eliminated from the reaction medium. An app. is described.

Anthraquinone from anthracene and similar catalytic oxidations of organic compounds. ALFRED WOHL (to I. G. Farbenind. A.-G.). U. S. 1,787,416, Dec. 30. Anthracene vapor with an oxidizing gas such as air is passed over a catalyst such as Ag vanadate at a temp. of about 400°, and similarly, other carbonyl compds. are formed from hydrocarbons by passing their vapors with a gas contg. O over catalysts of like character, among which are generally mentioned compds. such as vanadates, chromates, uranates, stannates and arsenates of metals such as Cu, Ag, Pb, Tl, Pt, Ce, Ni and Co. Various details are given for prepg. the catalyst, etc. U. S. 1,787,417 relates to effecting similar production of anthraquinone with an oxide of V as catalyst. These two patents are based upon corresponding patent applications filed in Germany June 22, 1916.

Anthraquinone from anthracene by catalytic oxidation. ALPHONS O. JAEGER (to Selden Co.). U. S. 1,786,950, Dec. 30. Anthracene in vapor phase is caused to react with an oxidizing gas such as air in the presence of a contact mass contg. at least one non-siliceous base-exchange material such as one contg. V. Numerous details and examples are given.

***p*-Nitroaniline.** HAMILTON MERRILL (to Tower Mfg. Co.). U. S. 1,786,766, Dec. 30. *p*-Nitrochlorobenzene is heated with NH_3, treated with an alkali such as $Ca(OH)_2$ or NaOH and the charge is filtered while hot enough to keep the nitroaniline in soln. and the purified product in the filtrate is recovered.

1,5-Naphthyridine. SCHERING-KAHLBAUM A.-G. (Curt Räth, inventor). Ger. 507,637, Sept. 10, 1926. 1,5-Naphthyridine and its substitution products are prepd. by subjecting 3-aminopyridine to the usual quinoline synthesis. Thus, 3-aminopyridine is heated with glycerol, H_3AsO_4, concd. to produce 1,5-naphthyridine, b$_{12}$ 112°. Other examples describe the production of 6-hydroxy-1,5-naphthyridine, m. 258°, 2-phenyl-6-chloro-1,5-naphthyridine-4-carboxylic acid, decomposes 186° and 6-hydroxy-2-methyl-1,5-naphthyridine, m. 260°.

Porphyrin. HANS FISCHER and JOSEF KLARER. Ger. 509,939, Mar. 11, 1926. Porphyrin is prepd. by the action of concd. H_2SO_4 on halogenated dipyrrylmethene. Thus, cryptopyrrol in glacial AcOH is shaken with Br to give brominated dipyrrylmethene. This is treated with concd. H_2SO_4 to give etioporphyrin.

1-Aminocarbazole. I. G. FARBENIND. A.-G. (Friedrich Muth and Albert Schmelzer, inventors). Ger. 507,797, Mar. 14, 1927. 1-Aminocarbazole and derivs. are prepd. by first introducing the SO_3H group into the carbazole mol., then introducing the NO_2 group into the 1-position, reducing it to the NH_2 group, and finally removing the SO_3H group if desired. Examples describe the prepn. of 1-nitrocarbazole-3,6,8-sulfonic acid, 1-aminocarbazole-3,6,8-sulfonic acid, 1-aminocarbazole and 1-phenylaminocarbazole.

***Bz*-1,*Bz*-1'-Dibenzanthronyl.** SOC. ANON. POUR L'IND. CHIM. À BÂLE. Swiss 138,589. July 13, 1928. See Brit. 315,433 (*C. A.* **24**, 1652).

Menthol. RHEINISCHE KAMPFER-FABRIK G. M. B. H. Fr. 687,279, Dec. 26, 1929. Pure inactive menthol is prepd. from the hydrogenation products of thymol men

thones and inactive menthenones and from the isomerization products of inactive isomeric menthols by submitting these products to a partial esterification, purifying the esters formed by crystn. and sapong. the pure esters.

Menthol. SCHERING-KAHLBAUM A.-G. (Walter Schoeller, Hans Jordan and Reinhard Clerc, inventors). Ger. 508,095, Nov. 25, 1927. Addn. to 498,281. A mixt. of stereoisomeric menthols is prepd. by hydrogenating hydroxythymol, as described in Ger. 498,281 (*C. A.* **24**, 3802), until 8 atoms of H have been taken up.

Menthol. SCHERING-KAHLBAUM A.-G. (Walter Schoeller and Hans Jordan, inventors). Ger. 508,892, July 15, 1927. See U. S. 1,765,620 (*C. A.* **24**, 4054).

Menthol, menthone and their homologs. SCHERING-KAHLBAUM A.-G. (Walter Schoeller, Hans Jordan, and Reinhard Clerc, inventors). Ger. 508,893, Aug. 30, 1927. Addn. to 506,044 (*C. A.* **25**, 382). Menthol and its isomers and homologs, as well as the corresponding ketones, are prepd. by treating the condensation products from *m*- or *p*-cresol and ketones (cf. Brit. 273,684, *C. A.* **22**, 1982), with H in the presence of hydrogenation catalyst until 16 or 14 atoms of H have been taken up, the reaction being effected at a temp. above 200°. Under these conditions, the use of a metal henolate auxiliary catalyst, as described in Brit. 276,010 (*C. A.* **22**, 2379), can be dispensed with. Examples are given.

Thymol. WALTER SCHOELLER and HANS JORDAN (to Chemische Fabrik auf Actien vorm. E. Schering). U. S. 1,786,922, Dec. 30. In producing alkylisopropylphenols, an alkylisopropylenephenol (such as 3-methyl-6-isopropylenephenol in making thymol) is treated with H at a temp. of about 160° in the presence of a hydrogenating catalyst such as one contg. Ni until 2 H atoms have entered into the mol. combination. Cf. *C. A.* **25**, 305.

Thymol, etc. SCHERING-KAHLBAUM A.-G. Fr. 687,101, Dec. 21, 1929. Thymol, its isomers and homologs are prepd. by submitting the condensation products of ketones and cresols obtained by the processes of Fr. 636,119 and 645,271 (*C. A.* **23**, 1911) to decompn. in a current of H according to Fr. 638,483 (*C. A.* **23**, 154) and 636,228 (*C. A.* **23**, 1761) and causing the vapors of the decompn. products mixed with H to pass over a hydrogenation catalyst at 200°. Thus, the condensation product of *m*-cresol and acetone (Fr. 636,119, *C. A.* **23**, 247) is heated to about 300° with passage of a current of H and the resulting vapors are caused to circulate over Ni pptd. on pumice stone. Thymol is sepd. by fractionation from the product. Other examples are given. Cf. *C. A.* **24**, 1394.

Vanillin. J. D. RIEDEL-E. DE HAËN A.-G. Ger. 509,152, Jan. 21, 1926. Addn. to 507,404 and 507,796. In prepg. vanillin as described in Ger. 505,404 (*C. A.* **24**, 5770) and 507,796 (*C. A.* **25**, 525), the removal of the alkoxymethyl residue from acylated monoalkoxymethyl ethers of propenylpyrocatechol is effected by warming the ethers with dil. AcOH to which a little HCl has been added. An example is given.

Bivinyl. I. G. FARBENIND. A.-G. (Richard Leopold and Alfred Michael, inventors). Ger. 507,995, June 8, 1927. Bivinyl and its homologs are prepd. by leading 1,4-butylene glycol or homologs in vapor form, diluted with gas or vapor such as steam, over anhyd. alum at high temps. Examples are given.

2-Ethoxy-6,9-diaminoacridine cholate (desoxycholate, or apocholate), and 3,6-diamino-10-methylacridinium desoxycholate. CHEM. FAB. VORM. SANDOZ. Swiss 139,409 to 139,407. Addns. to 126,678 (*C. A.* **23**, 612). The above compds. are prepd. directly by the action of 2-ethoxy-6,9-diaminoacridine on cholic, desoxycholic or apocholic acids, or of 3,6-diamino-10-methylacridinium chloride on desoxycholic acid. Cf. *C. A.* **24**, 919–20.

3,6-Tetramethyldiaminophenothiazinium desoxycholate (dehydrocholate or apocholate). CHEM. FAB. VORM. SANDOZ. Swiss 139,408 to 139,410. Addns. to 128,326 (*C. A.* **23**, 2192). The above compds. are obtained directly by the action of the appropriate cholic acid on the base.

FRANK P. UNDERHILL

The destruction of one enzyme without the suppression of the activity of two others in the seed of Soja hispida. R. FOSSE, A. BRUNEL, P. DE GRAEVE, P. E. THOMAS AND J. SARAZIN. *Compt. rend.* **191**, 1025–8(1930).—**The activity of uricase in the soy bean**

has been destroyed without affecting the activity of allantoinase and urease by 2 methods: (1) The ground bean was macerated with H_2O, held overnight on ice, heated 30 min. at 78°, and the mixt. centrifugalized. (2) The beans were held over $CaCl_2$ for 48 hrs., then ground and placed in sealed tubes and held at 82° for 50 hrs. RACHEL BROWN

Asymmetric hydrolysis of esters by enzymes. IV. The influence of optically active foreign substances on the configuration specificity of liver esterase of varying degrees of purity. EUGEN BAMANN AND PAUL LAEVERENZ. *Z. physiol. Chem.* **193**, 201–14(1930); cf. *C. A.* **24**, 2153; **25**, 527.—If the influence of optically active substances, such as alkaloids, on the optical selectivity of esterase toward esters of *dl*-acids is due to concomitant substances present in the enzyme prepn., there should be a marked difference in selectivity response between purified and unpurified enzyme. Comparisons were made between the crude esterase from human liver and prepns. that had been purified 10-fold by the adsorption method of Kraut and Rubenbauer (*C. A.* **22**, 1167), with *dl*-$PhCHOHCO_2Et$ as substrate. The effect of adding strychnine was in most cases a slight increase in the extent of ester hydrolysis but more especially a considerable difference in optical rotation of the acid liberated. The adsorption treatment, however, whereby much of the accompanying substances was removed, had no appreciable effect on optical selectivity. The effect of purification was rather to render the enzyme somewhat less sensitive to the activating influence of strychnine. Evidently an enzyme-strychnine complex is formed independently of the presence of concomitant substances. This process is reversible since the properties of the original enzyme may be restored by dialysis. The influence of strychnine changes as the enzyme undergoes aging or autolysis. This is due to alteration in the enzyme complex, probably by combination with sp. cleavage products of the non-sp. concomitant substances. In sufficient concn. these products may even change the optical selectivity of the enzyme.
A. W. DOX

The cephalin from human brain. HERMANN RUDY AND IRVINE H. PAGE. *Z. physiol. Chem.* **193**, 251–68(1930).—Most cephalin prepns. thus far described have contained 59–60% C instead of the theoretical value of 66–7%. By working up the lecithin fraction remaining after pptn. of the cephalin by EtOH, prepns. of cephalin with the theoretical C content have now been obtained. The neutralization no., which agrees approx. with the Van Slyke amino-N after hydrolysis, is useful for detg. the cephalin content of lipoid mixts. and estg. the progress of purification. The amino N of the unhydrolyzed prepns. in H_2O runs 10–12% too high. A Ba salt of cephalin was prepd. by adding $Ba(OH)_2$ in MeOH to a C_6H_6-EtOH soln. of the phosphatide and pptg. with EtOH-MeOH. The salt contains 2 equivs. of Ba and is decompd. by H_2O and CO_2. Repeated pptn. of the Ba salt is a means of sepg. cephalin from lecithin. The salt-forming properties of cephalin may possibly be of physiol. importance in regulating an exchange of bases.
A. W. DOX

Estimation of diastatic enzyme preparations: taka-diastase, malt diastase and pancreatic diastase. TAICHI HARADA. *Ind. Eng. Chem., Anal. Ed.* **3**, 1–3(1931).—An improved modification of Lintner's method for the assay of diastatic enzymes is presented. The p_H is carefully controlled by a phthalate buffer giving more accurate results. A new standard unit is offered and calcd. in terms of Lintner's value. Tables to aid calcn. are given.
L. E. GILSON

X-ray interpretation of the structure and elastic properties of hair keratin. W. T. ASTBURY AND H. J. WOODS. *Nature* **126**, 913–4(1930).—Expts. carried out on human hair and various types of sheep wool show that animal hairs give rise to two x-ray fiber photographs according as the hairs are unstretched or stretched, and that the change from one photograph to the other corresponds to a reversible transformation between two forms of the keratin complex. α-Keratin (unstretched) is characterized by a marked periodicity of 5.15 A. U. along the fiber axis, and two chief side spacings of 9.8 A. U. and 27 (mean value) A. U., resp., while β-keratin shows a strong periodicity of 3.4 A. U. along the fiber axis with side spacings of 9.8 A. U. and 4.65 A. U., of which the latter is at least second order. On the basis of phys. and chem. properties and x-ray data a skeleton of the keratin complex is offered which gives a quant. interpretation of the fundamentals, and may lead to a correct solution of the details. It is a peptide chain folded into a series of hexagons, with the precise nature of the side links yet undetd.
C. E. P. JEFFREYS

The oxidizing action of cryptomeria wood. MASAKAZU YAMADA. *J. Agr. Chem. Soc. Japan* **6**, 168–77(1930); *Bull. Agr. Chem. Soc. Japan* **6**, 9–11.—Cryptomeria wood, like some other woods, has the power of oxidizing ale. In cryptomeria the zone between heart and sap wood is generally most powerful. The oxidizing power is not due to the action of substances like aldehyde or ketone, because for those the sunlight

is indispensable, while with the wood oxidation takes place smoothly in the cold and dark. Moreover the action is not due to terpene, oxidase or peroxidase, for the resin of pine tree or cryptomeria, terpene oil, potato and wheat bran have almost no effect upon alc. "Dehydrase," or in a wider sense some oxidizing catalyst, may be considered as the main cause of the oxidation. Y. KIHARA

Glutathione. V. The spontaneous cleavage of glutathione in aqueous solution. HAROLD L. MASON. *J. Biol. Chem.* **90**, 25–32(1931); cf. *C. A.* **24**, 5760.—When glutathione is kept in aq. soln. at 37–62° it undergoes cleavage into pyrrolidonecarboxylic acid and cysteinylglycine. The acid is the primary product of this cleavage and its formation may well be the first step in the synthesis of proline. Cysteinylglycine rather than cysteine is probably the catalyst which is active in the autoxidation of glutathione. Glutathione is not attacked directly by erepsin but after the glutamyl radical is broken off hydrolysis of the cysteinylglycine occurs. The glutathione mol. is in this way broken up with the liberation of only 1 CO_2H group. A. P. LOTHROP

Polar conductivity of living and dead membranes. PAUL METZNER. *Ber. deut. botan. Ges.* **48**, 207–11(1930).— A great no. of plant parts show a greater cond. in one direction than in the other. This difference is greatest when d. c. is used and decreases as a. c. of increasing frequency is used until, with extremely high frequencies, there is in general no polar effect. The current intensity also influences the magnitude of the effect. In certain tissues the results are little different if the tissue is previously killed by boiling, but with parenchymatous tissue the difference almost disappears.
LAWRENCE P. MILLER

Agglutination of cell suspensions. (Blood, milk, latex, bacteria, etc.) N. BEUMER-NIEUWLAND. *Chem. Weekblad* **27**, 658–63(1930).—An address. Sixty references are cited. W. GORDON ROSE

The mechanism of enzyme reactions. I. The influence of the hydrogen-ion concentration on the action of liver esterase upon the mono-ethyl esters of a homologous series of dibasic aliphatic acids. H. G. K. WESTENBRINK AND H. M. RONIJN. *Arch. néerland. physiol.* **15**, 529–37(1930).— W. and R. detd. the amt. of acid formed by action of the enzyme on the esters for a definite time, temp. and p_H. The latter was maintained by the continuous addn. of standard alkali, the amt. needed being indicated by a Michaelis' "Glockenelectrode." This reaction velocity is deemed an index of the optimum p_H. It increases with the C content of the series:

Acid	glutaric	adipic	pimelic	suberic	azelaic	sebacic
Optimum p_H	5.6	5.8	6.0	6.3	6.9	7.3

II. **The hydrolysis of a mixture of two esters by liver esterase.** H. G. K. WESTENBRINK. *Ibid* 538–44.—W. detd. the time required for addn. of a definite amt. of 0.1 *N* NaOH to maintain the p_H const. during the hydrolysis of the mono-ethyl esters of sebacic and azelaic acids and a mixt. of the 2. The reaction velocity for each ester alone is a max. in a 2% soln. Results with the mixt. lie between those obtained with the individuals. This would be expected on the basis of the intermediate compd. or adsorption theories. M. H. SOULE

The imitation of chromosomes with sodium silicate and alcohol. A. L. HERRERA. *Protoplasma* **11**, 168–74(1930).—A summary of H's. expts. M. H. SOULE

Refutation of the Schutz law and its analogous equations in the kinetics of enzymes. KENZO NAKAJIMA. *J. Faculty Agr. Hokkaido Imp. Univ.* **28**, 329–56(1930).—By a study of published data N. concludes that the Schutz equation holds only for dil. pepsin soln. He gives the theoretical arguments against its general applicability.
J. J. WILLAMAN

The conditions of activation of washed zymin. II. A. A. STHEEMAN. *Proc. Acad. Sci. Amsterdam* **33**, 889–97(1930); cf. *C. A.* **23**, 4238, 5201.—Zymin inactivated by washing may be reactivated by the addn. of a H acceptor, such as methylene blue, a hexosediphosphate, and von Euler's "principle." These 3 are fully as potent as the boiled washings in acting as cozymase. If von Euler's principle is present in sufficient amt. it may replace the hexosediphosphate, because it contains org. phosphate. The principle loses its potency if its phosphate is removed by hydrolysis, or if its adenine group is desaminated. Probably the principle functions by virtue of these 2 groups.

B—METHODS AND APPARATUS

STANLEY R. BENEDICT

The determination of the surface area of the white rat. SAMUEL L. DIACK. *J. Nutrition* **3**, 289–96(1930); cf. *C. A.* **23**, 3939.—The rats were carefully tied to a board, chloroformed, dehaired with a BaS-NaOH mixt. and covered evenly with a soln. consisting of dried guncotton 4 g., castor oil 1.5 cc., turpentine 2.0 cc., EtOH (95%) 20 cc. and Et_2O 80 cc. The shrinkage of this covering was detd. experimentally as 3.7%. After drying, the film was cut in pieces and the area taken with a planimeter. Seventy rats were measured. The best results were obtained by using the formula $S = 7.47\ W^{2/3}$ for normal animals, and $S = 7.64\ W^{2/3}$ for starved and emaciated animals. C. R. F.

The urocarmine reaction. WM. R. FEARON AND ARTHUR G. THOMPSON. *Biochem. J.* **24**, 1371–8(1930).—The name "urocarmine" is given to a group of pigments obtained from the condensation of indoxyl with various phenols unsubstituted in the *p*-position. The urocarmine reaction accounts for many of the pigments obtained from urine which are insol. in $CHCl_3$. To carry out the reaction, treat 2 cc. urine with 2 drops of 0.1% $KClO_3$ soln. or of 3% H_2O_2, and then 10 cc. of colorless concd. HCl. Shake the mixt., let stand for a few min. and ext. first with $CHCl_3$ and then with AmOH. Most normal urines give a variable indigo-blue reaction, the pigment dissolving in the $CHCl_3$, but from time to time specimens will be found which display a reddish color not removed by $CHCl_3$, but sol. in AmOH. BENJAMIN HARROW

A study of the bile pigments in relation to the van den Bergh reaction. WILLIAM JAMES GRIFFITHS AND GEOFFREY KAYE. *Biochem. J.* **24**, 1400–7(1930).—Pure bilirubin when suspended in blood serum does not give a prompt direct van den Bergh reaction (v. d. B.). Serum contg. bilirubin does give the indirect reaction. Fresh bile contains a pigment which, when taken up in serum, yields a prompt direct reaction ("direct-reaction pigment" (d.-r. p.)) The d.-r. p. is not bilirubin. The d.-r. p. of bile is present in those icteric sera which give a direct v. d. B. BENJAMIN HARROW

Improved method for the determination of iodine in blood. HARRY A. A. AIKEN. *Biochem. J.* **24**, 1456–9(1930).—A modification of the method of Leitch and Henderson (*C. A.* **21**, 2339). BENJAMIN HARROW

Apparatus for measuring catalase activity in plant and animal tissues. H. H. BUNZELL. *Science* **72**, 505–6(1930).—The app. described is similar to an enlarged Warburg respirometer, but useful only for megascopic measurements. From the rate of evolution of O, the activity of the enzyme is established, the unit of catalase being the amt. which will liberate 10^{-6} g. O per g. of tissue in 5 min. W. D. LANGLEY

A technic to facilitate reading of Kahn results in hemolyzed, highly tinted and cloudy sera, and in sera of doubtful reaction. B. S. LEVINE. *J. Lab. Clin. Med.* **16**, 310–11 (1930); cf. *C. A.* **24**, 5777. B. S. LEVINE

C—BACTERIOLOGY

CHARLES B. MORREY

Prodigiosin, the red dye of Serratia marcescens (B. prodigiosus). FRITZ WREDE. *Z. Hyg. Infektionskrankh.* **111**, 531–5(1930); cf. *C. A.* **24**, 4318.—*S. marcescens* organisms from 4–5 day cultures were shaken with 10% NaOH, and then with alc. and petr. ether. The ether layer was washed with alc. and H_2O and finally filtered and evapd. to a small vol. The cryst. HCl salt was prepd. by passing in dry HCl. The cryst. perchlorate, $C_{20}H_{26}N_3O \cdot HClO_4$, sintering 226°, m. 228°, was prepd. from the HCl salt with 5% $HClO_4$. The perchlorate (1 g.) treated with 10% NaOH until a golden-brown color was converted into free prodigiosin which was extd. with $CHCl_3$. It was a brittle solid without definite m. p., sintering 70–80°, picrate m. 176°, salicylate m. 178°, and benzoate m. 170°. RACHEL BROWN

The mechanism of the bactericidal action of ultra-violet rays. OTFRID EHRISMANN. *Z. Hyg. Infektionskrankh.* **111**, 618–43(1930).—The exposure to ultra-violet light of physiol. saline suspensions of bacteria causes a clearing. This clearing is conditioned by the passing into soln. of the cell substance, recognized by the decrease in vol. of the suspended particles, and by the appearance of N-contg. compds. in the surrounding fluid. The different bacteria tested can be arranged in a series according to their sensitiveness. An accelerated chem. decompn. of the bacterial proteins into amino acids under the influence of ultra-violet rays cannot be recognized. Increase in temp., displacement of p_H to the acid point, addn. of HCHO or $HgCl_2$ inhibit the clearing. The following cations inhibit the action in the order indicated: $La^{++} > Ca^{++} > Ba^{++} > Sr^{++} > Mg^{++} > Na^+, Li^+, K^+$. RACHEL BROWN

Bacteriophage, a central biological problem. C. J. SCHUURMANN. *Kolloid-Z.* **53**, 231–9(1930).—The physicochem. and biological data on bacteriophage are reviewed. ARTHUR FLEISCHER

Oxidation-reduction studies in relation to bacterial growth. III. The positive limit of oxidation-reduction potential required for the germination of Cl. tetani spores in vitro. BERT C. J. G. KNIGHT AND PAUL FILDES. *Biochem. J.* **24**, 1496–1502(1930); cf. *C. A.* **25**, 128.—The spores were subjected to different potential levels. Germination was completely inhibited at potentials more pos. than E_h + 0.11 v. (p_H 7.0–7.65). BENJAMIN HARROW

Pyruvic acid in bacterial metabolism, with an account of the methods used for the detection and determination of pyruvic acid. ROBERT P. COOK. *Biochem. J.* **24**, 1526–37(1930).—The method of detn. depends on the bisulfite-binding capacity of pyruvic acid. The acid is produced by the aerobic oxidation of *E. coli*. It is not decarboxylated by *E. coli*, but is broken down into a mixt. of formic and acetic acids. B. H.

Comparison of the dehydrogenations produced by E. coli in the presence of oxygen and methylene blue. ROBERT PERCIVAL COOK. *Biochem. J.* **24**, 1538–50(1930).—For formate and lactate the velocities of oxidation by methylene blue and O for the lower

temps. were nearly equal. In the dehydrogenation of succinate there is considerable difference between the velocities of oxidation by O and by methylene blue. B. H.

Oxidation-reduction potentials of pneumococcus cultures. I. LESLIE F. HEWITT. *Biochem. J.* **24**, 1551–6(1930).—The oxidation-reduction potential-time curves obtained with pneumococci are generally similar to those obtained with hemolytic streptococci, but differ from those obtained with diphtheria bacilli and staphylococci.
BENJAMIN HARROW

The oxidation of oxalates by bacteria. RUDOLF SCHOLDER AND CARL F. LINSTRÖM. *Ber.* **63B**, 2730–7(1930).—Alk. oxalates (0.01 *N*) change to bicarbonates by action with the O of the air, if bacteria are present. The reaction is more rapid in air than in O. Acids prevent the action. Suspensions of some heavy metals and alk. earth oxalates show a similar change in a longer time. $MeC_2O_4 + O = MeCO_3 + CO_2$. Cu, Hg, Ag and Ni oxalates are bactericidal and form no CO_2. MARY E. LEAR

Studies of pneumococci. III. The effect of chemicals on pneumococci. 1. Experiments in vivo. Y. MAEJI. *Acta Schol. Med. Univ. Imp. Kioto* **12**, 405–13(1930).—The chemotherapeutic effects of the following drugs were tested: (I) Quinine derivs.; (1) optochine-HCl; (2) remijine-HCl; (3) quinine-HCl; (4) eucupine-di-HCl; (5) vuzine-di-HCl. (II) Acridine derivs; (1) trypaflavine. (III) Hexamethylenetetramine. Twenty-three series of expts. were carried out on mice. The animals were given intraperitoneal injections of pneumococci type I, II, and III, which were followed in 3 hrs. by subcutaneous injection of 0.1 cc. of 2% soln. of each of the drugs. Results were judged by survival of the animals. Optochine-HCl proved impotent in both protective and therapeutic respects. Remijine-HCl possessed some effect as compared with optochine-HCl. Quinine-HCl was impotent in both respects. Eucupine-HCl showed only a slight therapeutic or protective effect. Vuzine-di-HCl possessed a slight chemotherapeutic but no protective effect. Trypaflavine was devoid of any beneficial effect. Hexamethylenetetramine possessed a noteworthy beneficial effect only when injected immediately after, or prior to, the inoculation. **2. Experiments in vitro.** *Ibid* 415–23.—The same chemicals were studied as in the *in vivo* expts. A drop of a serum-bouillon culture of virulent pneumococci was introduced into 2 cc. of serum-bouillon (of p_H 7.3 to 7.4) contg. different concns. of the chemicals. The tubes contg. the culture and chemicals were shaken and incubated at 37° for 24 hrs. Observation was then made macroscopically for turbidity and after plating a fraction upon blood agar. Bacteriolytic action was shown by optochine-HCl in dilns. of 1:8000 to 1:10000, by remijine-HCl in 1:8000 to 1:10000; by quinine-HCl in 1:2000 to 1:4000; by eucupine-HCl 1:20000 to 1:40000; by vuzine-di-HCl in 1:30000 to 1:60000; by trypaflavine in 1:100000; by hexamethylenetetramine in 1:1000 to 1:2000. A more prolonged action of optochine and remijine upon the pneumococcus culture increases the resistance of the latter to the chemicals and renders it insol. in bile and less virulent to mice. As a result of the action of optochine and remijine, pneumococci of types I and II develop a staphylococcus-like growth upon blood agar, which is not observed with type III. Pneumococci grown for 30 culture generations on media contg. optochine and remijine suffer a reduction in their agglutinability by corresponding immune serums. However, the culture generation thus obtained is still able to produce agglutinating serums which possess the same specificity as serums obtained with normal cultures. The agglutinating effect of such serums upon normal cultures is more pronounced than upon those grown in the presence of the chemicals. B. S. LEVINE

The question of the aerobic digestive processes of Shiga-Kruse-Ruhr bacilli. HERMANN HORSTER. *Zentr. Bakt. Parasitenk.*, 1 Abt., **118**, 283–97(1930).—N-, C-, S- and P-contg. salts are absolutely necessary for the multiplication of the NH_3-assimilating Shiga-Kruse-Ruhr bacillus. Mg salts while not essential are conducive to growth. Salts of asparaginic and glutaminic acids are not superior to NH_4Cl as sources of N. They will not serve as a source of both C and N, but only for N in the presence of a suitable source of C. Na lactate is a better source of C than is glucose under aerobic conditions. The acid produced from the latter quickly kills the cultures. Sulfate is necessary for the Shiga-Kruse-Ruhr bacillus but not for paratyphoid B and coli. The Shiga bacillus will grow in a variety of synthetic media if the p_H is between 5.7 and 7.7. The organism can adapt itself to unfavorable conditions as to acid or alkali if not excessive. The C metabolism of the Shiga bacillus has narrower limits than has paratyphoid B or coli, in that there are fewer suitable sources of C. A medium contg. a mixt. of amino acids (Na asparaginate, Na glutaminate, glycylglycine, proline and cystine) as sources of N, and Na lactate or glucose as a source of C is especially useful for the Shiga bacillus. JOHN T. MYERS

The Gram selective action of dye-containing culture media. Changes with the

addition of serum. W. HAUPTMAN. *Zentr. Bakt. Parasitenk.*, 1 Abt., **118**, 373–88 (1930).—Crystal violet inhibits Gram pos. organisms 2500 times more actively than it does Gram neg. ones; fuchsin and Nile blue sulfate were 200–500 times as active. The addn. of ox serum decreased the activity of fuchsin, Nile blue sulfate and crystal violet about one fifth. This may be due to a decrease in diffusion of the dye caused by a decrease in the degree of dispersion. JOHN T. MYERS

Bacillus jordaniformis and its hemotoxin. ALFRED WALD. *Zentr. Bakt. Parasitenk.*, 1 Abt., **118**, 406–10(1930).—*B. jordaniformis* produced a hemolysin which is a true toxin for which an antilysin can be prepd. JOHN T. MYERS

The influence of various salts on the activity, filterability and adsorbability of bacteriophage suspensions. E. KLEINEBERGER. *Zentr. Bakt. Parasitenk.*, 1 Abt., **118**, 411–22(1930).—Bimolar solns. of a variety of salts had no effect on the activity of lysates, while *M*/16 to *M*/32 solns. markedly decreased it. Strong solns. apparently exert a protective action. The weakening effect of the dil. solns. can be counteracted by protective colloids. Salts decrease filterability as do weak acids while weak alkalies do not. Kaolin and other materials will adsorb phage in dil. salt solns. but not in distd. water. JOHN T. MYERS

Remarks on the article of Krichevskii on the mechanism of the action of bismuth compounds on spirochetes. A. P. UHLENHUTH AND W. SEIFFERT. *Zentr. Bakt. Parasitenk.*, 1 Abt., **118**, 422–5(1930).—There is evidence that Bi salts have a direct action on spirochetes rather than an indirect action through the reticulo-endothelial system. Cf. *C. A.* **24**, 5872. JOHN T. MYERS

Reactions relating to carbohydrates and polysaccharides. XXXIII. Synthesis of polysaccharides by bacteria and enzymes. F. C. HARRISON, H. L. A. TARR AND HAROLD HIBBERT. *Can. J. Research* **3**, 449–63(1930); cf. *C. A.* **25**, 498.—*B. mesentericus* and *B. subtilis* were found to produce levan only from sucrose and raffinose and not from melezitose, lactose, maltose, xylose, glucose or fructose. The chem. structure of levan was found to be a polymer of 2,6-anhydrofructo-furanose and both sucrose and raffinose contain the fructo-furanose residue in their mols. as a terminal group. An enzyme prepn. from *B. mesentericus* was found to produce a similar synthesis of levan from sugars contg. a terminal fructo-furanose group. It was not found possible, however, to obtain a product which in small quantities would bring about the synthesis of relatively large quantities of levan from sucrose solns. J. W. SHIPLEY

D—BOTANY

THOMAS G. PHILLIPS

The **origin of chlorophyll and its relation to the blood pigment. II.** KURT NOACK AND WILHELM KIESSLING. *Z. physiol. Chem.* **193**, 97–137(1930); cf. *C. A.* **23**, 3249.—Crude protochlorophyll was obtained by extg. the hulls of germinated pumpkin seeds with H_2O, extg the Et_2O soln. with 18% HCl, neutralizing with Na_2CO_3 and extg. this soln with Et_2O. The product is obviously a mixt. due to a partial splitting off of phytol by the HCl, but the MeO group is still present. It resembles the phytol-free substance obtained by reduction of chlorophyll a. Protochlorophyll is, however, a phytol ester, since it is converted into chlorophyll by the living cells under the influence of light. Treatment with MeOH contg. 30% HCl converts the crude product into a blued. violet trimethyl ester, m. 233°. The same ester is obtained by reduction and esterification of methylpheophorbide a, and is designated *protophytochlorin trimethyl ester*. Protochlorophyll is therefore a deriv. of a tricarboxylic acid. Sapon. of the tri ester with dil. alkali gives a mono ester sol. in Na_2HPO_4, but unstable because of a strong tendency to form an anhydride. The resistant MeO corresponds to that of chlorophyll which is not split off by chlorophyllase. The mono ester is therefore a protopheophorbide. Direct sapon. of crude pheophytin yields an anhydro product from which the protopheophorbide is obtained by treatment with very dil. alkali. Reduction of methylpheophorbide a with Fe and 80% CH_2O_2 gives *methylprotopheophorbide* by removal of 1 O. Under the same treatment the b isomer is much less stable and yields only brown substances. In the reduction of chlorophyll a, or a + b, by Fe and CH_2O_2, the phytol is completely split off even at 0–5°. An alkali-insol. substance is formed which gives the protopheophytin spectrum. Chlorophyll b does not undergo reduction in the cold but its basicity changes. The transformation of chlorophyll into

porphyrin consists essentially in the removal of 1 O; whether or not H substitution occurs is not known. Phylloerythrin, the porphyrin derived from chlorophyll and present in beef bile, is an acid anhydride which is very sensitive to alkalies but stable to acids. Alkali treatment converts it into a free acid with a spectrum quite different from that of phylloerythrin. It is probably a tricarboxylic acid in which $1CO_2H$ is present in lactone or lactam linkage. It forms a trimethyl ester, m. 230–2°, which resembles the phytochlorin trimethyl ester in several points but shows a displacement of all 4 absorption bands. Treatment of phylloerythrin with MeOH-HCl apparently esterifies 2 CO_2H, one of which is then split off with its ester group. The product is a mono ester or a mixt. of mono and di ester according to the concn. of HCl used. Dil. alkali converts the mono ester into an alkali-sol. substance without loss of MeO. At the same time the acid no. increases to 6, hence a new CO_2H has been formed in addn. to the opening of the lactone ring. Treatment of this acid with CH_2N_2 yields a trimethyl ester, m. 205°. The intramolecular anhydride grouping of phylloerythrin corresponds to the 2 esterified carboxyls of chlorophyll, and the assumed lactam or lactone group is common to both phylloerythrin and chlorophyll. The spectral displacement between phylloerythrin and the protopheophytin series is of fundamental character, yet the transition may be effected by HI reduction. The 2 spectral types probably represent 2 isomeric groups of pigments. A. W. Dox

Chemistry of the products of Cocos nucifera. I. Juan P. C. Chandrasena. *Biochem. J.* **24**, 1493–5(1930).—The percentage of water in the kernel of the coconut palm diminishes with age. The oil content at the latest stage may be less than or equal to that at the preceding stage. The quantity of "residue" (mainly cellulose) varies slightly during all the stages of development. The quantity of pentosans is usually the same and is low. Benjamin Harrow

E—NUTRITION

PHILIP B. HAWK

The conception of nutrition values and their determination. Holger Möllgaard. *Tierernähr.* **1**, No. 1, 44–64(1929).—In all cases in which an animal's work parallels in some degree its protein synthesis, and especially when such a synthesis is a necessary hypothesis for the phenomenon of the total work, a clear definition for nutrition value for a single food is impossible. Such a definition could apply only for a mixed food which has fixed nutritive proportions between the different amino acids and the N-contg. and N-free nutrients. If slight errors are disregarded, the nutrition value can best be defined when based on fat production. Another means of defining the nutrition value of fodder would be by utilizing its power of milk formation and growth production. Russell C. Erb

Influence of various concentrates on egg production. H. L. Kempster. Missouri Agr. Expt. Sta., *Bull.* **288**, 3–20(1930); cf. *C. A.* **24**, 2777.—White Leghorn pullets and hens were used in feeding expts. over a period of about 5 yrs. Dried milk, meat scrap, tankage and fish meal rank in the order named with reference to influencing egg production. Cottonseed meal, when supplemented with bone meal or rock phosphate and salt, produced satisfactory egg yields though the eggs did not possess as good keeping qualities as did the eggs from hens fed other rations. Soybean meal when properly supplemented with minerals proved an excellent protein supplement. The extra eggs laid by the hens fed dried buttermilk did not pay for the cost of the ration as compared to the lot fed meat scrap. C. R. Fellers

Recent advances in the study of basal metabolism. Eugene F. Du Bois. *J. Nutrition* **3**, 217–28, 331–43(1930).—A very extensive and crit. editorial review with bibliography. C. R. Fellers

Iron requirement in early childhood. Mary Swartz Rose, Ella McC. Vahlteich, Elda Robb and Emily M. Bloomfield. *J. Nutrition* **3**, 229–35(1930).—A girl aged 31 months was used as a subject in an 11-day test. The diet consisted of milk, cereal, orange powder, toast and pea, potato or prune pulp, all specially prepd. so as to avoid Fe contamination. The av. daily intake of Fe was 4.64 mg.; the av. daily output was 5.74, thus giving a neg. balance of 1.10. Sherman's tables give 30% higher Fe content in the foods consumed than were found by lab. analysis. Conclu-

sion: Though the subject was fed an av. normal diet, the intake of Fe was insufficient for all the body needs. The hemoglobin balance was above the av. for supposedly normal children of this age. The intake of Cu was about 1/5 that of the Fe, an amt. considered sufficient for normal needs. C. R. FELLERS

Basal metabolism of Filipinos. MARIANO OCAMPO, NARCISO CORDERO AND ISABELO CONCEPCION. *J. Nutrition* 3, 237–44(1930); cf. *C. A.* 24, 1891.—Observations were made on 104 healthy subjects between 20 and 30 yrs. of age during the cool season. A Benedict-Roth respiration metabolimeter was used for taking all of the measurements. The tests were performed in the morning about 12 hrs. after the last meal and following 1 hr. of complete relaxation. The metabolism of 2 subjects was taken in the U. S. during the winter for the sake of comparison. The 88 men showed metabolism measurements —7.8% lower than the Aub-DuBois standards; for 16 women, the metabolism value was —9.3%. The 2 expts. conducted in the U. S. on Filipinos gave very similar values, indicating that climate exerted very little difference in metabolism expts. The bearing of the results on the question of racial and climatic factors is discussed. C. R. FELLERS

Chemical and immunological study of egg protein obtained under restricted diets. J. GERBER AND R. H. CARR. *J. Nutrition* 3, 245–56(1930).—Pigeons were kept under controlled conditions with rations limited to a single grain, supplemented with grit, oyster shell, charcoal, salt and tap water for 150 days. Representative eggs were subjected to a modified Van Slyke procedure for the detn. of N distribution and showed differences in the make-up of the proteins. Ammonia N showed the largest deviations represented by 4.75% of the total N for "rye" eggs and 8.40 for % for "barley" egg protein. The total N content of the egg substance was fairly const. showing only slight abs. differences. Monoamino N was higher in the eggs obtained from the feeding of hemp, soy beans and wheat while "kafir" eggs showed a higher diamino N content. Corn and kafir yielded eggs with the highest non-amino N in the basic fraction. Anaphylactic shock was produced in albino rats and guinea pigs through which means quant. differences were indicated in immunological relationships between the egg proteins from various sources suggesting dissimilar chem. combination. The importance of the protein present in the egg in the development of the embryo was shown by incubation expts. Initial progress, shown by a series of photomicrographs, implies a beneficence of the proteins supplied to the egg by hemp, soy beans and wheat, whereas corn and oat embryos developed much more slowly, indicating a poorer-quality protein. C. R. FELLERS

Vitamin B and G contents of certain yeast samples. E. J. QUINN, F. B. WHALEN AND J. G. HARTLEY. *J. Nutrition* 3, 257–63(1930).—With albino rats at the weaning age, quant. tests for vitamins B and G in 5 samples of American or Canadian yeast showed the concn. of vitamin B varied considerably, at least 10-fold, in the different samples, while the vitamin G content was very uniform. Of the 2 vitamins, the antineuritic vitamin was the limiting factor in the 2 samples of brewer's yeast examd. C. R. FELLERS

Study of the absorption and retention of vitamin A in young children. JENNIE I. ROTHSTREE. *J. Nutrition* 3, 265–87(1930).—Four normal and 4 diabetic children and infants, 2–8 months old, were used in this expt. Normal diets of milk, orange juice and cod liver oil were used for the infants while the children received daily 1 g. of protein per lb. of body wt., 150 g. of vegetables and 60 g. of fat (except the diabetics who received 116–150 g. of fat). The feces and urine were collected, extd. with EtOH and petr. ether, and fed to rats suffering from xerophthalmia. Preliminary trials with the *$SbCl_3$ colorimetric test for vitamin A* showed the tests to be non-specific, and the biol. method of assay was resorted to. Even when fed generous amts., vitamin A was not excreted in the urine, and if there is a limit to the capacity to store vitamin A, it is not indicated by alimentary vitaminuria. Marked fecal loss of vitamin A always occurred, the loss varying from 2 to 12% of the intake. The largest losses corresponded to the largest intakes; similarly, the greatest retention occurred with the greatest intakes. The vitamin A of cod-liver oil and egg yolk were equally well utilized by the children. Results were inconclusive with vitamin A from carrots. C. R. FELLERS

Glycogen formation in rats. II. Diets containing approximately eighty-seven per cent of the total caloric value in the form of sucrose, lard and casein, respectively. ESTHER M. GREISHEIMER AND OLGA H. JOHNSON. *J. Nutrition* 3, 297–302(1930); cf. *C. A.* 24, 5803; 25, 132.—When 87% of the cals. was fed in the form of sucrose, lard or casein, abs. liver wts. did not vary appreciably. Liver glycogen was significantly higher on the high sucrose and lower on the lard and casein diets than on the control diet. Glycogen was not readily formed on the high lard diet. A close relationship

was noted between the last 12-hr. food intake in g. and the liver glycogen content on the stock diet (McCollom's No. 1). If it is assumed that the stock diet possesses an efficiency of 1, the values for sucrose, casein and fat are, resp., 1.85, 0.61 and 0.44.
C. R. FELLERS

Meat in nutrition. I. Preliminary report on beef muscle. P. MABEL NELSON, MARGARET H. IRWIN AND LOUISE J. PEET. *J. Nutrition* 3, 303–11(1930); cf. *C. A.* 24, 5056, 5340.—Excellent growth and reproduction were secured in rats consuming a meat ration supposedly well fortified with the necessary vitamins and mineral matter and having lean muscle beef as the main protein constituent. Lactation difficulties, cannibalism and hair-ball formation were numerous, however, and the meat ration failed to meet the needs of the mother rats during the critical period of lactation. Early senility was also evident. The addn. of yeast, salt mixt. or increased protein failed to improve the results. **II. Some dietary factors influencing lactation.** LOUISE JENISON PEET, P. MABEL NELSON AND ERMA A. SMITH. *Ibid* 313–23.—If a well-balanced, modified, synthetic ration, contg. pressure-cooked lean beef round as the chief source of protein is used as a diet, reproduction and lactation responses in rats were observed through 3 generations. Dietary modifications were added to the basal diet during pregnancy and throughout lactation. All the diets, except the basal, enabled the mothers to bear litters at the normal age of 3 months. There was a tendency of the high meat diets to delay the onset of pregnancy. The diets modified by the addns. of tikitiki and wheat germ oil and the control basal diet were least efficient in maintaining the wt. of the mothers during lactation. Mothers on the increased meat diet plus 15% autoclaved yeast weaned the largest % of the young born in the 3 generations. **III. Hemoglobin formation.** *Ibid* 325–30.—Detns. were made of the hemoglobin concn. of the blood of 82 young rats from the second and third generations of rats fed a modified synthetic diet in which lean beef muscle was the chief source of protein. To this diet during the suckling period were added certain modifications recommended as valuable for promoting successful lactation. The diets which contained, during the suckling period, an increased % of autoclaved yeast, yeast, tikitiki, lemon juice or wheat germ oil, led to significantly greater hemoglobin formation in the young than diets contg. increased protein.
C. R. FELLERS

The preparation of an activated substance from crude coffee. L. v. NOEL AND F DANNMEYER. *Strahlentherapie* 38, 583-90(1930); cf. *C. A.* 24, 4808.—The present study shows that a purified substance was obtained from crude coffee which, although biologically active, is not activated ergosterol. Various brands of coffee were not active rachitically and the authors agree that the findings published in their preliminary report have not been confirmed. They still maintain, however, that freshly obtained coffee contains vitamin D. Further work in this respect is being carried on. F. R. G

Avitaminosis B in relation to tumor growth. ESMÉ GILROY. *Biochem. J.* 24, 1384–9(1930).—The general debility induced by a vitamin-B-deficient diet is accompanied by a reduction in the rate of tumor growth. Growth is unaffected if the health of the host is not impaired. It is suggested that the high arginine content of foods rich in vitamin B accounts for the fact that diets rich in vitamin B stimulate tumor growth.
BENJAMIN HARROW

Studies on the metabolism of animals on a carbohydrate-free diet. I. The distribution of glycogen and fat in the liver of animals fed on a carbohydrate-free diet. ALEXANDER HYND AND DOROTHY LILLIE ROTTER. *Biochem. J.* 24, 1390–9(1930). In rats on a carbohydrate-free diet, the blood sugar tends to be high, there is no change in the muscle glycogen but a large increase in the liver-fat content, and the liver glycogen is reduced to half that on a carbohydrate diet. With mice similar results are obtained, but with kittens only slight differences are detected. The fasting of rats for a period of 12–24 hrs. causes a very rapid disappearance of the excess of fat from the liver, a slow fall in both muscle and liver glycogen, and a fall in blood sugar to the normal fasting level of 0.11 to 0.12%.
BENJAMIN HARROW

Vitamin B_2 content of cereals and the supposed connection between human pellagra and deficiency of this vitamin. WALLACE R. AYKROYD. *Biochem. J.* 24, 1479–88 (1930).—Since neither rice nor millet shows any superiority over maize as a source of vitamin B_2 (for method of estg. this vitamin, see Chick and Roscoe, *C. A.* 22, 4588), and since pellagra is almost invariably assocd. with the consumption of maize, "it is difficult to accept vitamin-B_2 deficiency as the sole cause of human pellagra." B. H

Question of the identity of a bacterial growth-promoting factor with vitamin B. JOHN G. DAVIS AND JOHN GOLDING. *Biochem. J.* 24, 1503–6(1930).—The bacterial test organism used was a lacto-bacillus requiring not only the intermediate products of protein degradation for good growth, but some factor present in all tissues contg.

vitamin B_1. The bacterial growth-stimulating substance and vitamin B are not identical. BENJAMIN HARROW

Irradiated ergosterol and calcium-free diet; effect of calcium and phosphorus metabolism. ELSIE WATCHORN. *Biochem. J.* **24**, 1560–3(1930).—The difference between the rats which received Ca and those which did not was the absence of any effect of large doses of irradiated ergosterol upon the P metabolism of the latter. B. H.

Manganese in relation to nutrition. MARION B. RICHARDS. *Biochem. J.* **24**, 1572–89(1930).—In lupine seeds there is a marked increase in total Mn as the seeds grow to maturity. Soil conditions have little to do with the Mn content of foodstuffs. There is a steady increase of Mn in the developing egg. The element is invariably present in the reproductive organs. "Mn may have an intimate relationship to the vital processes." BENJAMIN HARROW

The precise evaluation of light therapy in experimental rickets. JOHN W. M. BUNKER AND ROBERT S. HARRIS. *Am. J. Pub. Health* **20**, 1287–92(1930).—In precise evaluation of light therapy in exptl. rickets it is necessary to exercise meticulous care in standardizing all procedures in respect to breeding and care of animals. In the matter of diet, one factor which may be variable to a bothersome degree is the amt. of antirachitic factor in freshly ground yellow corn, which variable can be reduced by definite aging of the corn meal before use. In comparison of different light zones, the characteristics and limitations of selectively absorbing filters must be understood, and compensations therefor be introduced into the set-up. Numerous repetitions of each set of expts. with controls common to all compared conditions must be carried out. In the light of results obtained, it is felt that the rather general belief that the antirachitic effect of light in rickets prevention in white rats is confined to the zone of ultraviolet in the neighborhood of 3000 A. U. and that other parts of the spectrum from the Hg arc lamp are without contributory effect, is a belief that is not adequately supported by exptl. evidence. It is still a possibility that the future will show that radiations longer or shorter in wave length than those of the alleged "vital band" of ultraviolet may assist in the biochem. processes of rickets therapy. J. A. KENNEDY

Relationship in the hen between the development of ova, blood calcium, and the antirachitic factor. W. C. RUSSELL, C. H. HOWARD AND A. F. HESS. *Science* **72**, 506–7(1930).—Pullets which were maintained deficient in regard to vitamin D and sunlight were found to have undeveloped ova (less than 1 cm. diam.) and low blood Ca (less than 13.7 mg. per 100 cc.). Ingestion of irradiated ergosterol before and during the period of molting did not forestall the waning egg production. W. D. L.

Considerations leading to the view that pellagra is an iron-deficiency disease. SIDNEY BLISS. *Science* **72**, 577–8(1930).—Much evidence is reported from the literature on pellagra that the P-P factor or vitamin G is Fe. An attempt to prove this is being made. W. D. LANGLEY

Hemoglobin maintenance and production upon synthetic diets, including modifications in the ethyl xanthate and Biazzo methods for copper analysis. I. DAVID L. DRABKIN AND C. STANLEY WAGGONER. *J. Biol. Chem.* **89**, 51–75(1930).—"Rats which have become severely anemic upon a diet of whole milk showed a prompt and striking recovery of hemoglobin when changed to synthetic rations lower in Cu (on the basis of the quantity fed per day) than the milk. One of these hemoglobin regenerative diets was a basic incomplete ration in that no vitamins had been added to it and the salt ration used contained only NaCl and an Fe salt. The latter furnished the min. level of 0.2 mg. of Fe per rat per day. The same Fe salt added in the same quantity of milk did not stop the progressive anemia. Without the addn. of the Fe, however, the synthetic ration was inadequate for hemoglobin production under the conditions of the expts. Evidence was also obtained which indicates that rats which have had Cu in their ration are more resistant to the onset of milk anemia than rats which have been on a low Cu diet. This may have some bearing on the possibility that the effects of Cu described by Hart *et al.*, are not due to systemic action of the metal. On the basis of the above expts. the specificity of Cu in hemoglobin formation becomes questionable. In the controversy as to the unique importance of Cu in hemoglobin synthesis, min. quantities of Cu are of such moment that the method of detn. becomes of utmost importance. For this reason both the Biazzo and K Et xanthate methods for the detn. of Cu have been modified as both were found to be inaccurate in certain respects. Synthetic diets of the Karr-Cowgill type were found to be adequate in respect to hemoglobin maintenance when fed to dogs over periods ranging from 6 months to 4 yrs. Bibliography of 41 references. A. P. LOTHROP

Evidence for the presence of a third factor in the vitamin B complex of yeast. GEO Z. WILLIAMS AND ROBERT C. LEWIS. *J. Biol. Chem.* **89**, 275–88(1930).—Rats

were fed a basal diet deficient in all of the factors of vitamin B contained in yeast and to this diet were added whole yeast and various fractions of yeast for different groups of rats. In this way the growth curves produced by various fractions fed separately and various combinations of the fractions fed together were compared with those produced by feeding whole yeast. The prepns. employed were: an ext. contg. the thermolabile, antineuritic factor B_1, an ext. contg. the thermostable factor B_2 and the residue left after these 2 factors had been extd. from yeast. The residue was found to contain a growth-promoting principle necessary for the maintenance of normal growth of rats and qualitatively distinct from either factors B_1 or B_2 of the vitamin B complex. It is insol. in H_2O and alc. and is *thermostable*. This principle seems to be similar to the factor of Hunt (*C. A.* **23**, 417) and differs from all of the other third factors described in the literature [Williams and Waterman (*C. A.* **22**, 3907), Reader (*C. A.* **24**, 5801), Eddy, *et al.* (*C. A.* **24**, 4536), Coward, *et al.* (*C. A.* **24**, 4021)]. A. P. LOTHROP

The toxic effect of fish liver oils and the action of vitamin B. EARL R. NORRIS AND ANNA E. CHURCH. *J. Biol. Chem.* **89**, 437–49(1930).—Some cod-liver oils contain a toxic substance which produces symptoms similar to vitamin-B deficiency in rats even when the animals are receiving as high as 10% of yeast in their diets. This effect is not due to the excess of vitamins A and D in the oil and it can be counteracted by feeding 18% of yeast. Continued small doses of isoamylamine and of choline produce like symptoms which can be prevented or cured by added yeast. Both of these substances have been identified among the several nitrogenous bases which make up an av. of 0.2% of the oil. "The quant. detn. of vitamin A in cod-liver oil is influenced by the amt. of yeast in the basal diet, even when there is sufficient yeast to satisfy the vitamin-B requirement under some conditions. Detns. of vitamin B by methods of increase in rat wt., where a cod-liver oil of unknown toxicity is incorporated in the diet, cannot be compared." A. P. LOTHROP

Influence of the chemical composition of protein upon the elimination of unaccounted for forms of nitrogen. UGO LOMBROSO AND SALVATOR DI FRISCO. *Arch. Intern. Physiol.* **33**, 109–36(1930).—The N of the urine, feces and body deposits does not account for the intake. A series of diets with adequate protein, calories, inorg. elements and vitamin supplements was fed to rats Various proteins were employed including casein, egg albumin and gluten. The urine and feces were sepd. and their N contents detd. separately by the Kjeldahl method. They were preserved in acid. The excreted and stored N failed to account for that ingested by amts. varying 0–16% in gluten-starch diets and from values of 2–23% for casein diets. The greatest discrepancy of nearly $^1/_3$ the ingested N was found for a gluten diet. C. M. MCCAY

The vitamins and the refining of olive oil. L. MARGAILLAN. *Compt. rend.* **191**, 725–7(1930).—A comparison of the growth-promoting properties of virgin and refined olive oil shows that the refining processes destroy most of the vitamins of the raw product. Vitamin A suffers the most injury from refining and more than $^4/_5$ of it is destroyed. C. M. MCCAY

Is it possible to produce experimental rickets in the guinea pig? MME. L. RANDOIN AND R. LECOQ. *Compt. rend.* **191**, 732–4(1930).—A basal diet of meat peptone 17, dry yeast 3, butter fat 5.5, corn starch 64, NaCl 1.5, filter paper 2 was fed to 4 groups of guinea pigs. Attempts were made to produce rickets in the various groups by supplementing the basal diet with Ca lactate, leaving the P low or with phosphates with little Ca. Scurvy was prevented by feeding each animal 2 cc. of lemon juice daily. The typical lesions of rickets were not produced. The animals were very sensitive to the unequal intakes of Ca and P and usually died suddenly. Vitamin D was of no value in preventing these developments that produced death. C. M. MCCAY

Effect of a diet of sweet clover on the calcium in the blood serum. C. Y. CANNON AND DELBERT GREENWOOD. *J. Dairy Sci.* **13**, 424–31(1930).—Certain physiol. differences obtained by feeding young rabbits the diets indicated are summarized as follows: (1) There was a decrease in serum Ca of young rabbits fed on an exclusive diet of sweet clover meal with distd. H_2O, while it remained fairly const. with rabbits fed alfalfa meal with distd. H_2O or a mixed diet of alfalfa meal, oats, cabbage or lettuce. When the alfalfa diet was resumed the serum Ca returned to normal. (2) Expts. indicate that the decline in serum Ca is linked with failure of blood to clot. (3) It is suggested that loss of serum Ca may raise the surface tension of the blood such that the blood platelets would fail to rupture, thus interfering with the formation of thrombin. (4) All 3 diets support regular growth. N. M. NAYLOR

Calcium and phosphorus metabolism of heavily milking cows. C. F. HUFFMAN, C. S. ROBINSON AND O. B. WINTER. *J. Dairy Sci.* **13**, 432–48(1930).—The expts. reported are part of an extensive study of the effects of different Ca and P levels and

different mineral supplements on the growth, health, reproduction and milk production of young dairy cattle. It was shown that pos. Ca and P balances of heavily milking cows could be maintained on a diet of alfalfa, silage and grain or of timothy hay, silage and grain supplemented by bone flour. There was a tendency to utilize Ca and P more efficiently during high production of milk than during low production or when dry. The total intake of Ca or P has greater significance in utilization than has the Ca/P ratio in the food. N. M. NAYLOR

Fat-soluble vitamins. XXXI. Butter fat: its antirachitic properties and its artificial activation. H. STEENBOCK, ALICE M. WIRICK AND BLANCHE M. RIISING. *J. Dairy Sci.* **13**, 497–521(1930); cf. *C. A.* **24**, 5807.—A complete series of studies with exptl. rats is described in which comparisons are made of methods of testing the antirachitic potency of butter fat and in which the effect of irradiation of butter fat is detd. The following conclusions are made: (1) It was found that a quant. prophylactic method based on the percentage of bone ash was more accurate in the detn. of antirachitic potency than the curative method. (2) June butter fat was found to be low in vitamin D but contained constituents readily activatable by ultra-violet radiations. (3) The optimum irradiation was obtained in 10 min. exposure at a depth of 0.16 cm. of fat. Exposure for 16 hrs. destroyed the activation originally induced. (4) Irradiation is stable to storage. (5) Introduction of irradiated ergosterol in butter fat is practicable. N. M. NAYLOR

Observation on the vitamin activity and the amylolytic activity of cereal grains and various products derived therefrom. M. JAVILLIER, D. DJELATIDÈS AND (MISS) AL. CRÉMIEU. *Bull. soc. hyg. aliment.* **18**, 344-6(1930).—Examn. of 5 com. products, 3 of which were claimed to be rich in vitamins while the 2 others could be reasonably expected from their compn. to contain vitamins (at least B), showed that none of them contained any vitamin A or B in appreciable quantities. Four of the products (the 5th was not tested) were found to have a high amylolytic activity. On the other hand, the germs of wheat and other cereals, with or without removal of the oil, were found to have a good vitamin activity, but a relatively small amylolytic activity. A. P.-C.

Sulfur metabolism. L. LEMATTE. *Bull mém. soc. méd. Paris* **1930**, 105; *Bull. soc. hyg. aliment.* **18**, 354(1930).—S does not seem to possess any functional specificity and is found in the following proportions in the organs of man (the 1st figure is the total wt. and the 2nd the wt. of S in g.): skeleton 16,341, 14.580; muscles 24,872, 44.769; cerebellum 1232, 1.293, brain 163, 0.110; liver 1500, 2.313; spleen 194, 0.264; thyroid 25, 0.052, kidneys 355, 0.489; lungs 1200, 1.980; heart 314, 0.299; blood 5110, 6.392, undetd. 5805, 10.449. The S:N ratio in the active living matter is about 1:18, varying from 1:20 in the heart to 1:12 in the liver. Food normally supplies 1.235 g. of S, of which 1.16 is found in the urine and 0.075 in the feces. A. PAPINEAU-COUTURE

Does exclusive consumption of milk always produce anemia in rats? (MRS.) L. RANDOIN AND R. LECOQ. *Bull. soc. thérap* [11], **35**, 46(1930); *Bull. soc. hyg. aliment.* **18**, 355 (C. -Nutritional anemia, caused by the use of milk, either alone or in conjunction with amylaceous foods, has been reproduced experimentally on a large no. of animals, more particularly the rat. Recent investigations have shown that deficiency of Cu was responsible even more than deficiency of Fe. As com. dried and condensed milks are enriched in Cu in the course of the mfg. processes to which they are subjected, it was to be expected that they would not produce anemia. This was confirmed by expts. lasting 5 months, based on the development of the rats and the detn. of hemoglobin in the blood. A. PAPINEAU-COUTURE

Biological analysis of city milk and sweetened condensed milk from the standpoint of their antiscorbutic values. (MRS.) L. RANDOIN AND R. LECOQ. *Bull. soc. thérap.* [11], **35**, 49(1930); *Bull. soc. hyg. aliment.* **18**, 356(1930).—It is generally believed that city milk and sweetened condensed milk still possess their natural antiscorbutic values. Expts. by R. and L. have shown that this is not so, and that consequently it is advisable always to add a little fresh fruit juice to the food of city children which are brought up exclusively on such milks. A. PAPINEAU-COUTURE

Biological properties of the theosterols of the cacao bean. HENRI LABBÉ, F. HEIM DE BALSAC AND R. LERAT. *Bull. soc. thérap.* [11], **35**, 71(1930); *Bull. soc. hyg. aliment.* **18**, [illegible]; cf. *C. A.* **24**, 982.—Cacao bean butter contains 0.6–0.8% unsaponifiable matter and cac[illegible] were named α- and β-theosterols, one m. 115° and the other 134°, and having different phys. and chem. properties. β-Theosterol can fix ultra-violet rays, thus acquiring antirachitic properties like ergosterol. The calcifying action of this compd. was detd. on young rats who had been rendered rachitic by the Randoin-Lecoq diet. The active dose used was 1 mg. per day, but this does not seem to be min. dose. In the animals

which have been cured with β-theosterol the P_2O_5 content of the bones increases considerably. A. PAPINEAU-COUTURE

Vitamins in relation to pharmacy. F. WOKES. *Pharm. J.* 125, 478–80(1930).—account of recent work on vitamins A and D; cf. *C. A.* 23, 4727; with 12 references. [illegible] discussed are: casein in the basal diet (*C. A.* 24, 402, 1141); curve 850(1930)), color tests for vitamin A (*C. A.* 22, 4086; 23, 2270; 24, 3536), carotene and vitamin A (*C. A.* 23, 3013; 24, 3536), and a standard for vitamin D (*C. A.* 22, 4154; 24, 5808). S. WALDBOTT

F—PHYSIOLOGY

E. K MARSHALL, JR.

The arteriovenous difference in blood-sugar content. B. Y. GLASSBERG. *Arch Internal Med.* 46, 605–9(1930).—After ingestion of 100 g. of glucose the arteriovenous difference in blood sugar showed such wide variations (2–60 mg. per 100 cc.) that no normal standard could be predicted. Study of a no. of pathol. cases, including diabetes, gave results which do not seem to warrant attaching diagnostic significance to this type of detn. J. B. BROWN

The oxygen and carbon dioxide content of blood from the internal jugular and other veins. WM. G. LENNOX AND ERNA LEONHARDT. *Arch. Internal Med.* 46, 630–6 (1930).—The O_2 and CO_2 contents of the blood from an artery and various veins were measured in a large series of patients. The gaseous content from the femoral vein was found to be the same as that from a cubital vein. However, the blood from the internal jugular was more reduced and that from the external jugular less reduced than that from a cubital vein. The results showed wide variations. The av. respiratory quotient from a cubital vein was found to be 0.84 and from the internal jugular 0.9. More sugar disappeared while the blood was passing through the brain than through a muscle, suggesting that carbohydrates are unusually important in brain metabolism. J. B. BROWN

The alkaline tide as a method of studying gastric acidity. ROGER S. HUBBARD. *Arch. Internal Med.* 46, 994–1001(1930).—In 80% of the cases studied which did not show a definite alk. tide in the urine HCl was either absent from or present in very low concn. in the gastric juice. HCl can nearly always be demonstrated in the stomach when an alk. tide appears after a meal. Normal and hypersecretion cannot be distinguished by this method. The test is useless in cystitis and nephritis. J. B. B

A comparison of the urea nitrogen content of cutaneous and venous blood by microgasometric analysis. CHRISTOPHER JOHNSTON. *J. Clin. Investigation* 9, 209–13 (1930).—In tests on 6 normal and 6 nephritic subjects no difference was found in the concn. of urea N in venous and cutaneous blood. J. B. BROWN

The occurrence of the Abderhalden reaction after parenteral administration of the hypophysis preparation prehormone and of the ovarian hormone folliculin (menformone). EMIL ABDERHALDEN AND SEVERIAN BUADZE. *Fermentforschung* 12, 262–72 (1930).—Subcutaneous injection of prehormone and menformone in castrated or non-castrated dogs of either sex results in a pos. Abderhalden reaction of the urine toward ovarian, testicular and anterior hypophysis substrates. The hormone prepns. themselves contained no specific enzymes and no appreciable quantities of protein. It is suggested that a part of the hormones occurs as a structural unit of proteins and becomes available when occasion arises. Possibly the hypophysis and the sex glands contain proteins which have structural features in common. In the absence of sex glands the specific unit would then be supplied by the hypophysis. As a practical application of these observations the fact is pointed out that glandular therapy of the patient must be taken into account when interpreting a pos. diagnosis by the Abderhalden reaction. A. W. DOX

Experimental investigations on the effect of yeast on the chemical composition of muscle and liver during chronic training and during a single performance. C. Pi-Suñer Bayo and G. Liss. *Z. physiol. Chem.* **193**, 193–7(1930).—A comparison was made of the effect of adding yeast to the diet of dogs performing regular work and those doing a single performance in a treadmill. The yeast had no effect on the glycogen content of the liver of the animals in regular training as compared to the controls without yeast. The glycogen content varied between 3 and 4%. However, the liver was larger in those animals receiving yeast. Variations were noted in the muscle glycogen but no significance is attached to them. A large increase was found in the fat content of the liver and especially of the muscle. Probably the increased glycogen is transformed into fat and stored as such. The lactic acid content of both liver and muscle was somewhat greater than in the control. On the other hand the animals subjected to a single period of work showed an increase in glycogen several times greater with yeast than without. The max. of liver glycogen was reached in about 3 hrs. No definite conclusions could be drawn from the lactic acid values. A. W. Dox

Quantitative studies in ion antagonism. I. Experiments on the striated muscle of the frog. E. Gellhorn. *Biol. Bull.* **59**, 339–52(1930).—The irritability of the sartorius muscle of *Rana esculenta* has been studied in different mixts. of NaCl, KCl and $CaCl_2$. Within certain limits, 0.014 *M* NaCl has the same antagonistic value against KCl as 0.00081 *M* $CaCl_2$. It is possible, therefore, to predict the behavior of the muscle in any other soln. if the antagonism has been investigated for 1 single mixt. of these 3 salts. Frederick G. Germuth

Fatty acids in the liver of sheep. Kenneth Turner. *Biochem. J.* **24**, 1327–36 (1930). Oxidation of the Et esters prepd. from the fatty acids (see Armstrong and Hilditch *C. A.* **19**, 1851) gives a mixt. of pelargonic and caproic acids. Oxidation of the liquid fatty acids with H_2O_2 gives dihydroxystearic acid. The oleic acid present in sheep liver fat is the $\Delta^{9,10}$-modification. Linoleic and arachidonic acids are also present. Benjamin Harrow

Effect of freezing in a concentrated solution of sodium chloride on the color of red muscle. John Brooks. *Biochem. J.* **24**, 1379–83(1930).—Differences between the results of air freezing and brine freezing are due to the penetration of NaCl into the tissue. This penetration influences the oxidation of hemoglobin into methemoglobin by increasing the rate of oxidation, and by increasing the depth of the superficial layer of tissue in which oxidation is possible. Benjamin Harrow

Glycogen of mammalian muscle and its behavior after death. Ian A. Anderson and John J. R. Macleod. *Biochem. J.* **24**, 1408–20(1930).—The glycogen of intact mammalian muscle does not appreciably diminish when the muscle is kept for 1 hr. at room temp. after death. Lactic acid accumulates; and it is believed that an intermediate substance exists in mammalian muscle from which the lactic acid can be derived. Benjamin Harrow

Alleged presence of bile salts in normal blood. Ernest Walker. *Biochem. J.* **24**, 1892(1930). The pos. Pettenkofer test obtained with alc. exts. of blood is due to choleic acid. There are no bile salts in normal blood (ox and sheep). B. H.

Preparation and properties of the gonad-stimulating hormone from the urine of pregnancy. Frank Dickens. *Biochem. J.* **24**, 1507–25(1930).—The hormone is prepd. from the urine of pregnant women by satn. with NH_4 sulfate. Injection of the hormone into immature animals leads to precocious sexual maturity. Aq. solns. contg. up to 1000 mouse-units per cc. have been obtained. The hormone dialyzes slowly; it is inactivated by boiling and by acids and alkalies; and it is slowly inactivated by trypsin or pepsin. Benjamin Harrow

Production of ammonia by surviving kidney tissue. II. Studies of the possible precursors of **urinary ammonia.** Barbara Elizabeth Holmes and Antoinette Pantin. *Biochem. J.* **24**, 1564–71(1930); cf. *C. A.* **24**, 408.—The precursor of the NH_3 produced is unknown. The possibility that it may be adenylic acid or urea is discussed. Benjamin Harrow

The lactic acid metabolism in pregnancy and its relation to carbohydrate metabolism, to the **function of the liver and thyroid gland and to the circulation. I. What is** the source of the **lactic acid increase in the blood of pregnant women?** K. J. Anselming and F. Hoffmann. *Arch. Gynäkol.* **142**, 289–309(1930).—The increase of **lactic** acid noted in the blood of **pregnant women** towards the end of pregnancy might be due to a failure of the liver to **remove the lactic acid** from the blood or to an increased formation of lactic acid in the **placenta or the muscles.** Injections of lactic acid showed that the liver of pregnant **women is quite as able** to dispose of lactic acid as the liver of non-pregnant women. **It has been shown that the placenta is not the source of any consider-**

able amt. of lactic acid. Pregnant women doing light work were found to have more lactic acid in the blood than non-pregnant women doing similar work. It is probable, therefore, that the muscles are the source of the increase of lactic acid towards the end of pregnancy. Soon after delivery the lactic acid formation from the muscles returns to normal. **II. The cause of the increased formation of lactic acid in the muscles of pregnant women.** *Ibid* 310–23.—The increased production of lactic acid in the muscles of the pregnant woman as compared to the non-pregnant woman might be due to a deficient supply of O or to a change in the regulation of carbohydrate metabolism. No relation was found between the O content and the lactic acid content while the percentage use of O directly after work was greater in the pregnant than in the non-pregnant woman. Physiol. and clinical studies indicate that in pregnancy there is a hormonal change in regulation of carbohydrate metabolism which through an increased function of the thyroid gland leads to an increased production of lactic acid in the muscles both when at rest or at work. HARRIET F. HOLMES

Iodine content of lamb thyroids. B. W. SIMPSON. *New Zealand J. Agr* **41**, 302–6 (1930); cf. *C. A.* **24**, 5409; **25**, 749.—Thyroid glands from lambs grown in various New Zealand districts contained 0.1 mg. to 10 mg., or 0.0009 to 0.21% I. The I content of the thyroids of lambs born and bred on definite areas seemed to give a fair indication of the amt. of I available in those areas. K. D. JACOB

Oxidative nature of the nerve impulse. FRANCIS O. SCHMITT. *Science* **72**, 583–4 (1930); cf. *C. A.* **23**, 4254.—Nerve respiration is inhibited by 0.1 *N* NaCN, and by CO in the dark. Illumination of the nerve causes a marked diminution of the inhibition by CO. The effect is not one of temp. or photoöxidation. It seems that the action potential is produced by the oxygenation of some substance in the nerve, and that activation of the O by a respiratory enzyme similar to that discovered by Warburg is essential. W. D. LANGLEY

A comparison of the highly unsaturated acids of beef, hog and sheep brains. J. B BROWN AND W. C. AULT. *J. Biol. Chem* **89**, 167–71(1930); cf. *C. A.* **23**, 5495.—Tetracosapentenoic acid, having 5 double bonds, probably occurs in both beef and sheep brains but is not present in more than traces in hog brains. The content of highly unsatd. acids is essentially the same in all 3 types. The Me esters of the acids from beef and sheep brains are very similar and are more unsatd. and of higher mol. wt than the esters prepd. from hog brain acids. The latter esters analyze very closely to the theoretical for Me arachidonate except for the m. p. of the bromide and the possibility of the presence of an isomeric arachidonic acid is suggested to explain this anomaly. The acids were isolated by direct alk. hydrolysis of the fresh tissue and extn. of the soaps by BuOH. A. P. LOTHROP

Further studies of blood creatinine. OLIVER HENRY GAEBLER. *J. Biol. Chem.* **89**, 451–66(1930); cf. *C. A.* **22**, 1168.—Blood of normal dogs contains a substance, not creatine, which yields creatinine in isolation expts. A similar substance is also present in human blood. The amts. present in corpuscles and plasma are approx. the same. The creatinine-yielding substance is not creatinine itself and whether it is the precursor of the urinary creatinine cannot be stated although its accumulation in early retention suggests, but by no means establishes, this. Impairment of renal function, whatever the cause, results in the accumulation of one or more substances (other than creatine) yielding creatinine and the accumulation in the exptl. types of retention was found to be progressive from the beginning to the end of the expt. The findings are in agreement with the view of Behre and Benedict that creatinine is not present in blood in detectable quantities. A. P. LOTHROP

Kallikrein, a hormone of the pancreas. HEINRICH KRAUT. *Chem.-Ztg.* **54**, 849–51 (1930).—When urine is injected intravenously into an animal, the amplitude of the pulse is increased, but the mean blood pressure falls. This response is due to a substance provisionally named *kallikrein*, which is found only in the pancreas. It is present in the blood, but only in an inactive state, rendered thus by a proteolytic enzyme. This enzyme is also present in tissue fluid, but in a greater degree of purity. Inactivation is dependent on the p_H of the media. Kallikrein dilates peripheral blood vessels and is assayed biologically only. It is absorbed on argillaceous earth, and forms a cryst. product with uranyl acetate. It has a high mol. wt., and does not dialyze through parchment. After final purification, it forms a weakly yellow, odorless soln. contg. P and protein; 0.1 mg. of the dry substance constitutes a standard unit. After hydrolysis in strong acid, it reduces Fehling's soln. G. H. W. LUCAS

Investigations on the metabolism of the heart. III. The phosphoric acid metabolism of the surviving beating cold-blooded heart deprived of oxygen. KAORU MONONOBE. *Folia Pharmacol. Japon.* **11**, No. 1, Opera orig. 1–39(1930) (in German); cf.

C. A. **25**, 328.—Expts. have been continued by M. to det. the P metabolism in the isolated toad heart prefused according to the Straub method with Ringer soln. to which other reagents were added. Inorg. P phosphagen and total P were measured by the method of Lohmann. Lactacidogen estns. were made according to Embden. In summer months at high temp. perfused hearts show that inorg. P suffered no change, while the phosphagen and total P and that from a 2-hr. autolysis with 2% bicarbonate soln. at 45° showed a decrease. The most rapid change occurred in the first 1½ hrs., but continued gradually for 4 hrs. Frequent changing of the perfusion fluid made an important difference. Addn. of O to the perfusion fluid made little or no difference in the various P contents, if it was given shortly before activity ceased. The P contents of hearts perfused with Ringer soln. and O were practically the same as those in hearts of freshly killed toads. The decrease in phosphagen and P from bicarbonate autolysis was much greater in summer than in spring, in hearts perfused with Ringer soln. without O. Solns. contg. *M*/5000 KCN temporarily strengthened systole and diastole. The heart ceased in diastole. Solns. *M*/2000 quickly killed the heart in diastole. Hearts poisoned with KCN showed practically the same P contents as hearts perfused with Ringer soln. for the same period, except that the P from bicarbonate autolysis was lower. Turtle hearts perfused with 0.1% dihydroxyacetone Ringer soln. were damaged considerably in both diastole and systole. Beating ceased in diastole or half diastole. P changes were very small. Dihydroxyacetone temporarily improved a turtle heart poisoned with KCN. When N was added to the perfusion fluid in place of O, the heart was somewhat damaged, and beating ceased in diastole or half diastole. Inorg. and total P remained unchanged, but phosphagen and autolysis P were considerably greater. The action of KCN and N was due to the lack of O for large quantities of lactic acid were formed. G. H. W. LUCAS

The action of the anterior pituitary hormone on the testicle, with special reference to the interstitial cells. CAMILLO COLOMBI. *Boll. soc. ital. biol. sper.* **5**, 726–8(1930).—The anterior pituitary hormone, when injected into mice in the form found in the urine of pregnant women, is active in causing a marked increase of interstitial substance. The increase is attributed to the hypertrophy of the prostate and of the seminal vesicles. PETER MASUCCI

Experimental studies on the fixation of eosin in living tissues. VIRGILIO DALL' ACQUA. *Boll. soc. ital. biol. sper.* **5**, 724–6(1930).—By means of a local anesthetic it is possible to fix eosin in living tissue. It behaves differently from other electronegative colloids because it does not form granular ppts. either outside or inside the cells. Only the pseudoeosinophiles are stained. The eosin stain remains longer in the superficial strata of the derma and epiderma; it first disappears from the deep connective tissue strata. After 24 hrs. microscopic examn. shows that the dye has almost completely disappeared because of elimination. PETER MASUCCI

New biochemical properties of biliary pigments. III. The agglutinating power of bile on the stroma of hemolyzed erythrocytes. A. CLEMENTI AND F. CONDORELLI. *Boll. soc. ital. biol. sper.* **5**, 748–50(1930); cf. *C. A.* **24**, 5826.—The bile of certain vertebrates (frogs and hogs) in proper dilns. hemolyze instantly the erythrocytes (of animals of the same species or different species) suspended in physiol. NaCl soln. or in Ringer soln. After 2–4 hrs. the hemolyzed tubes get cloudy and finally show a flocculent ppt. The ppt. consists of the stroma of deformed erythrocytes. The bile, therefore, has an agglutinating power on the stroma. PETER MASUCCI

The relation of the mitochondria-Golgi complex to secretion. V. Further identification of neutral red stained material. WEN-CHAO MA. *Chinese J. Physiol.* **4**, 381–6 (1930); cf. *C. A.* **23**, 406.—The neutral red stained material is lipoid in nature. It is physicochemically similar to the osmophilic substance, the Golgi material. L. A. M.

The effect of thyroparathyroidectomy and parahormone administration on gastric motility in dogs. CHIAO TSAI. *Chinese J. Physiol.* **4**, 415–22(1930).—After parathyroidectomy in dogs the stomach no longer exhibits hunger contractions, despite several days deprivation of food, and gastric tone is permanently lowered. Administration of parahormone to normal dogs has no effect on gastric motility except a partial and temporary inhibition. With parathyroidectomized dogs it restores the gastric tone but not the appetite. L. A. MAYNARD

The calcium content of the skeletal muscles after thyroparathyroidectomy and parahormone injection. FONG-YEN HSU AND CHIAO TSAI. *Chinese J. Physiol.* **4**, 423–9(1930).—Thyroparathyroidectomy resulted in a drop in the Ca content of the muscles of dogs. This drop was less abrupt and less extensive than the fall of serum Ca. This suggested that the diminution in the muscle was the result of the drop in the blood. The effect of parahormone administration was variable, but in no case did

a depression of muscle Ca result. In general the muscle Ca followed the serum Ca. L. A. MAYNARD

Experimental hyperfeminization. DEMETRIUS GOSTIMIROVIC. *Biol. Zentr.* **50**, 599–608(1930).—The female sex hormone, when injected into female mice shortly after they had been mated, caused sterility, but a non-specific protein caused also a considerable reduction of fertility. Pregnancy, once developed, was not interrupted by the hormone. Treatment before mating increased the fertility. No influence on the offspring was observed. A. E. MEYER

The destruction of vegetable tissues and especially of the cellulose in nature and in the intestine of man and animal. PIERRE LAVIALLE. *Bull. sci. pharmacol.* **37**, 613–39(1930).—A review of the work of Khouvine and René Sartory. A. E. M.

The active principles of the posterior hypophysis. I. SPAGNOL AND D. BOCCIA. *Rev. sudamericana endocrinol. inmunol. quimioterap.* **13**, 699–716(1930).—After a general introduction the prepn. of *Metrergin* and *Vasopressin* is described. The method of Kamm was used. Tests on animals and clinical results are reported. A. E. M.

The heart hormones. GAETANO VIALE. *Rev. sudamericana endocrinol. inmunol. quimioterap.* **13**, 801–8(1930).(Italian).—A general review is given. A. E. M.

The catalytic action of methylene blue in living cells. OTTO WARBURG, FRITZ KUBOWITZ AND WALTER CHRISTIAN. *Biochem. Z.* **227**, 245–71(1930).—If methylene blue is added to red blood cells the following reaction takes place: Methylene blue + *n* hemoglobin + *n* H_2O ⇌ leucomethylene blue + *n* methemoglobin (1), *n* probably being 2. If the cells are free from glucose the methemoglobin accumulates in the cells, otherwise the first reaction is followed by a second: *n* methemoglobin + glucose = *n* hemoglobin + glucose oxidation products + *n* H_2O (2). It is not yet decided whether it is hexose, hexosephosphoric esters or hexose cleavage products which react with the methemoglobin. This is then followed by a third reaction: leucomethylene blue + $^1/_2$ O_2 = methylene blue + H_2O (3). Each of these 3 phases of the methylene blue catalysis can be studied separately: the first phase, by means of glucose-free red cells; the second phase, by producing methemoglobin in the cells with Am nitrite. The second phase is also a surface reaction where the methylene blue is adsorbed and produces a small concn. of methemoglobin which suffices to effect extensive oxidation. Much more methemoglobin is required to produce a corresponding oxidation rate, if the methemoglobin is produced by Am nitrite, because in this case the methemoglobin is formed in the cell fluid and must diffuse to the surface to become effective. CO inhibits the methemoglobin formation because it diminishes the concn. of free hemoglobin and thus hinders the methylene blue catalysis. Although the catalysis is independent of the methylene blue concn. when this concn. is sufficiently high, it is inhibited relatively little when the methemoglobin formation is slowed up by CO in the presence of a great excess of methylene blue. On the contrary, when the methylene blue concn. is reduced to a point where the catalysis does vary considerably with the variation in its concn. the catalysis is strongly suppressed by CO when the methemoglobin production is hindered by it. The reaction of the third phase is only a balancing reaction but there is evidence that H_2O_2 is produced. It is concluded that one must clearly differentiate in the study of living processes between the balance of reactions and the actual mechanism of these chem. reactions. As a balance of reactions, the effect of methylene blue on red blood cells seems to parallel the normal catalytic processes of the living substance, whereas as a matter of fact one deals with an instance of heavy metal catalysis instead. S. MORGULIS

The effect of blood pigments in augmenting oxidation. K. BINGOLD. *Biochem. Z.* **227**, 457–61(1930).—H_2O_2 decolorizes blood rather rapidly, the temp. at which this occurs being practically specific. Thus 3% H_2O_2 decolorizes blood from pigeons, ducks or geese at room temp., dog blood at 50°, guinea pig blood at 60°, goat blood at 68° and human blood at 73–74°. Probably an iron-contg. product of partial oxidation of the blood pigment catalyzes further oxidation. When the compd. is freed from the Fe it no longer exerts the catalytic action. S. MORGULIS

Studies on the carbon dioxide production of Finnish school girls. ARMAS RUOTSALAINEN. *Skand. Arch. Physiol.* **60**, 225–43(1930).—The total CO_2 production of girls between 9 and 18 years increases with age. The av. CO_2 production of a 9-year-old girl is 10.7 g. for 2 hrs. and of an 18-year-old girl 15.1 g. The av. CO_2 production per kg. and 2 hrs. diminishes with increasing age from 9 to 18 years from 0.36 g. at the former to 0.26 g. at the latter age. The av. CO_2 production per sq. m. of body surface likewise diminishes from 9.76 g. at 9 years to 7.71 g. at 18 years of age. S. M.

Metabolism of billiard playing. H. BORGSTRÖM, E. ELFVENGREN, C. O. LÖVEGREN AND C. SUNDSTRÖM. *Akand. Arch. Physiol.* **60**, 244–6(1930).—The metabolism of

billiard playing is about 2.9 cal. per hr. per kg. It is thus somewhat higher than in walking at a pace of 70 steps per min., but considerably lower than in walking 120 steps per min., or in playing ping-pong. S. MORGULIS

Metabolism of parallel-bar gymnastics. O. SILANDER AND H. VIRI. *Skand. Arch. Physiol.* **60**, 247–50(1930).—The metabolism of exercise on the parallel bars, which is about 8.7 cal. per hr. per kg., is of the same magnitude as that of some of the most strenuous sports, like fencing, and corresponds to the metabolism of some of the heaviest muscle work. S. MORGULIS

A contribution to the knowledge of calcium metabolism. III. The relative fecal outgo of calcium in dairy cows. A. WESTERLUND. *Skand. Arch. Physiol.* **60**, 251–63 (1930); cf. *C. A.* **25**, 316.—A statistical study of the co-variations of the factors affecting the relative Ca elimination points to the conclusion that the difficulty of keeping lactating cows in Ca equil. on the usual feeds is chiefly due to the unsuitability of such controlling factors as the scanty supply of some dietary constituents necessary to guarantee the animals max. utilization of the Ca, *i. e.*, Ca itself, as well as P, fat, Na and silage, while such constituents as Mg or Si are supplied too abundantly in proportion to the Ca consumed. Besides, the milk secretion is also of importance, the more copious its flow the smaller the relative fecal outgo of Ca. **IV. The relative fecal outgo of calcium in children.** *Ibid* 264–72.—Analysis of exptl. data leads to the conclusion that the relative fecal outgo of Ca is reduced by a restriction of the K, Mg or fat consumption, or by a more liberal supply of P than is usually given. S. M.

Elimination of alcohol in the expired air. G. LILJESTRAND AND P. LINDE. *Skand. Arch. Physiol.* **60**, 273–98(1930).—The alc. content of arterial venous and capillary blood following alc. consumption is the same. The distribution coeff. of alc. between air and blood at 37° is 0.00063–0.00073, and at equil. at 31° one cc. blood contains as much alc. as 2 l. air. Alveolar air in the first hrs. after taking alc. contains considerable amts. of alc. The air of the dead space as well as the expired air is practically satd. with alc. With the alc. consumption is rather large and the ventilation of the lungs vigorous; considerable quantities of alc. may be eliminated in this way. S. M.

The relation between sleep and the liver function. ERIK FORSGREN. *Skand. Arch. Physiol.* **60**, 299–310(1930).—The human liver has a rhythmic function with an assimilatory and secretory phase of its activity. The bile secretion in man reaches a max. in the daytime and a min. at night, so that the anabolic function of the liver is greatest at night. In the rabbit the situation is reversed because, during the day when the liver is generally in the secretory phase of its activity, the animal is in a somnolent state. It is suggested that possibly the drowsy condition of the rabbit as well as man at midday is due to the production of hypnotic substances in the liver during its secretory phase S. MORGULIS

Alveolar gas exchanges and atelectasis. The mechanism of gas absorption in bronchial obstruction. POL N. CORYLLOS AND GEORGE L. BIRNBAUM. *Arch. Surg.* **21**, 1211–81(1931).—The gases of the alveolar air tend to, but never quite reach, an equil. with the gases of the venous blood. The entrapped alveolar gases pass through the respiratory membrane into the blood in the perialveolar capillaries, until complete airlessness of the involved area is produced. The mechanism of the production of atelectasis in the compressed lung is the same as in bronchial obstruction. If, instead of air, other gases are introduced into the atelectatic lung, the absorption time is different for each gas, depending on the respective coeffs. of soly. and diffusion and the chem affinity for the blood. N in the respiratory air plays the part of a buffer, retarding the absorption of more diffusible and more sol. gases. JOHN T. MYERS

Normal synovial fluid of cattle. I. Cellular constituents and nitrogen content. WALTER BAUER, G. A. BENNETT, ALEXANDER MARBLE AND DOROTHY CLAFLIN. *J. Exptl. Med.* **52**, 835–48(1930).—The astragalotibial (hock) joints of normal young beef cattle contain large and uniform quantities of synovial fluid, the total N content of which is 169 mg. per 100 cc. The approx. total protein content was calcd. to be 680 mg. of 0.68% per 100 cc. No correlation between the total protein level and the total cell counts of isolated specimens of synovial fluid is possible from the data reported. C. J. WEST

Relative reaction within living mammalian tissues. XIII. The reaction prevailing during the autolysis in vivo of small tissue masses. H. P. GILDING. *J. Exptl. Med.* **52**, 953–61(1930); cf. *C. A.* **22**, 2609.—The findings support the view that within the body the autolysis of individual cells and of small tissue masses may take place under the circumstances of a slight alky. C. J. WEST

G—PATHOLOGY

H. GIDEON WELLS

Diabetes mellitus. Sugar consumption in its etiology. C. A. MILLS. *Arch. Internal Med.* **46,** 582–4(1930).—Examn. of the death rate from diabetes in relation to the sugar consumption shows that there is no uniform correlation between the two in the many countries studied. J. B. BROWN

The specific effect of bile salts on pneumococci and on pneumococcus pneumonia. EDWIN E. ZIEGLER. *Arch. Internal Med.* **46,** 644–56(1930).—Solns. as dil. as 1:25000 of bile salts produce lysis of pneumococci *in vitro*. The presence of serum inhibits the action. The lytic action is 5 times as great on pneumococci as on red blood cells. Bile salts do not interfere with antibody action of specific serums. No toxic symptoms follow injections of these salts. Intravenous injections tend to damage the veins in proportion to the concn. Bile salts seem to have a specific effect in terminating pneumococcus pneumonia. J. B. BROWN

Diabetes mellitus. The colliodal osmotic pressure of the blood. I. M. RABINOWITCH AND MARY BEARD. *Arch. Internal Med.* **46,** 752–67(1930).—No explanation was found for certain high cholesterol values occasionally occurring in diabetic blood. It is probable that in diabetes with lipemia there is constantly exerted in the capillaries a colloidal pressure higher than normal. To overcome this for renal secretion a higher hydrostatic pressure is required. This may be the cause of the marked incidence of cardiovascular disease in diabetes. J. B. BROWN

The Boltz test in urinalysis. ARTHUR T. BRICE, JR. *Arch. Internal Med.* **46,** 778–81 (1930).—The Boltz test (treatment of specimen with Ac_2O and H_2SO_4) was applied to 167 normal and 525 pathol. urines. It is of value in demonstrating the elimination of an amino acid and may be of more value than the test for albumin for discovering an early or latent condition of the kidney. The test is of particular significance in nervous and mental cases and in shock. J. B. BROWN

The diagnostic value of the sugar tolerance curve in endocrinopathies. B. Y. GLASSBERG. *Arch. Internal Med.* **46,** 984–7(1930).—The sugar tolerance test yields no information of diagnostic value in the differentiation of normal and endocrinopathic conditions. J. B. BROWN

The origin of urobilinogen. A clinical experiment. I. M. RABINOWITCH. *Arch Internal Med.* **46,** 1014–7(1930).—A case is reported of the presence of increased amts of urobilinogen in the urine, apparently caused by reduction of extravasated blood in a large ovarian cyst with torsion of the pedicle. This pigment can be formed elsewhere in the body than in the intestine. J. B. BROWN

Studies in congestive heart failure. V. The potassium content of skeletal muscle obtained by biopsy. COBB PILCHER, J. ALFRED CALHOUN, GLENN E. CULLEN AND T. R. HARRISON. *J. Clin. Investigation* **9,** 191–6(1930).—Pieces of muscle removed by biopsy from patients with cardiac edema showed an increased % of H_2O with a corresponding decrease of total solids. The K content of wet muscle was always abnormally low. With dry muscle, however, the K was usually but not always diminished. The K content of muscle was raised by administration of K_2HPO_4. J. B. B

The serum calcium in polycythemia vera. ETHEL M. BENEDICT AND KENNETH B. TURNER. *J. Clin. Investigation* **9,** 263–4(1930).—There is no significant variation in serum Ca in polycythemia vera. J. B. BROWN

Serum electrolyte studies in normal and pathological conditions: pneumonia, renal edema, cardiac edema, uremic and diabetic acidosis. DANA W. ATCHLEY AND ETHEL M. BENEDICT. *J. Clin. Investigation* **9,** 265–94(1930).—Serum electrolyte partitions were made on normal and pathol. individuals. If HCO_3^-, Cl^-, protein, phosphate, sulfate and ketones were measured, the so-called "undetermined acids" were negligible. The normal mean total base was 151.9 m. eq. (milli-equivalents per l.) and the total acid 151.7. Pneumonia gave a lower total base, chloride, phosphate and protein with a slow return to normal after the crisis. Undetd. acid was un-

changed. Renal edema showed a low protein % and usually low fixed base. Serum Cl^- was high and increased after Cl^- administration, probably because of the effect of a decreased serum protein upon the Donnan equil. between serum and fluid in the tissues. With diuresis in cardiac patients the body eliminated large amts. of H_2O and Cl^- without parallel decrease in total base. The acidosis of advanced nephritis seemed to be due to decrease in total base caused by loss of base-conserving power of the kidney and to retention of phosphate and sulfate because of renal insufficiency. No ketosis occurred. A no. of observations on diabetic acidosis showed: dehydration with high serum protein, loss of base due to urinary excretion combined with ketones, great drop in HCO_3^- depending on neutralization of ketones, and decrease in serum Cl^-.
J. B. Brown

The composition of the bile following the relief of biliary obstruction. Carl H. Greene, Waltman Walters and Clyde H. Fredrickson. *J. Clin. Investigation* **9**, 295–310(1930).—The compn. of the bile was followed in 9 cases following relief from biliary obstruction. The output of bilirubin was const., its concn., however, varying inversely with the vol. of the bile. The formation of bile acids is inhibited by biliary obstruction with a rapid return to normal if the liver has not been injured. Bile Cl^- concn. is greater than that in blood serum. In cholerrhagia the loss of salts becomes important while the loss of fluids is sufficient to decrease the vol. of urine. Bile urea varies directly with blood urea. The loss of urea through the bile is usually insignificant but in one case it was found to be appreciable. J. B. Brown

Studies on the nitrogen and sulfur metabolism in "Bright's Disease." I. The retention of nitrogen and sulfur in "nephrosis." G. P. Grabfield. *J. Clin. Investigation* **9**, 311–8(1930).—A study of N and S excretion of 5 patients with nephrosis on a diet const. as to N, S, P, calories and H_2O showed great retention of N; a still greater retention of S; high N:S in urine; low N:S ration of the retained protein. J. B. B.

Blood volume and plasma electrolyte changes in the dehydration of infants. Rustin McIntosh, Laslo Kajdi and Dorothy Meeker. *J. Clin. Investigation* **9**, 333–57 (1930).—Total blood vol. and serum electrolyte concn. detns. were made on 11 infants suffering from diarrhea dehydration, both during dehydration and recovery. In the acute condition some patients showed change in blood vol. while in others there was a reduction of 20%, involving mainly the plasma fraction. There was no direct parallelism between this change in vol. and either the degree of dehydration or the severity of the toxic symptoms. The dehydration was usually accompanied by a decrease in total fixed base, Cl^- and HCO_3^- in the serum; the degree of acidosis could not be correlated with blood changes. Without further criteria, no satisfactory discussion can be given of the factors influencing the degree of dehydration of the subcutaneous tissues and the severity of the toxic symptoms. J. B. Brown

The problem of sodium salicylate excretion in the bile. Bela Halpert, Milton T. Hanke and Geo. M. Curtis. *J. Clin. Investigation* **9**, 359–62(1930).—Na salicylate does not appear in the bile of patients with diseases of the biliary system, following the oral ingestion of a medicinal dose. J. B. Brown

Anaphylaxis and atopy. III. Anaphylaxis experiments with atopens. Lucei Adelsberger. *Z. Hyg. Infektionskrankh.* **111**, 577–99(1930).—Production of anaphylaxis by timothy pollen ext. was observed in 1 case out of 12 attempts in guinea pigs. Antianaphylaxis was observed. Cat hair, and cat and goat dandruff gave no anaphylaxis in guinea pigs although they give skin reactions in sensitized men. Rabbit dandruff possessed sensitizing, as well as shock-producing, powers. Surviving guinea pigs were desensitized. Salt-pptd. horse dandruff as well as Coca's ext. cause anaphylaxis. Horse-dandruff anaphylaxis is not the same as horse-serum anaphylaxis. Horse dandruff contains an antigenic component of horse serum, but the presence of a horse-dandruff antigen in horse serum has not been proved. Rachel Brown

Horse-dandruff allergens. Lucie Adelsberger and Werner Ulrich. *Z. Hyg. Infektionskrankh.* **111**, 600–17(1930).—The allergic substance in horse-dandruff ext. is precipitable with alc. and can be obtained in a manner similar to that for obtaining bacterial polysaccharides. No parallelism was observed between the activity of a single ext. in the skin of hypersensitive men and its anaphylactic properties in animals. Furthermore, a soln. contg. an extremely small amt. of protein was anaphylactically active in the guinea pig intestine, while other solns. of higher N content were not.
Rachel Brown

Are the young of fathers immunized with ricin hypersensitive? R. Otto. *Z. Hyg. Infektionskrankh.* **111**, 644–58(1930).—The young of mouse fathers treated with ricin until a short time before mating are generally more sensitive to ricin than the young of normal animals. The sensitivity is due to a toxic poisoning of the spermatazoa

and can be recognized even in the second generation. The specificity of the action has not been detd. Ricin standing for 1–4 months at 37° with 0.8% HCHO gives a degraded ricin-toxoid which has good immunizing properties. RACHEL BROWN

Metabolism of normal and tumor tissue. II. The respiratory quotient and the relationship of respiration to glucolysis. FRANK DICKENS AND FRANTIŠEK ŠIMER. *Biochem. J.* **24**, 1301–26(1930); cf. *C. A.* **25**, 309.—The failure of the oxidation of carbohydrate by tumor tissue occurs at a stage of the intermediary metabolism subsequent to the conversion of hexose to the 3-carbon stage, and prior to the oxidation of the latter. Tumors possess both high glucolysis and low oxidative carbohydrate metabolism—a combination not found in normal tissues. BENJAMIN HARROW

Separation of antibodies from the serum proteins. MAX FRANKEL AND LEO OLITZKI. *Nature* **126**, 723–4(1930).—Antibodies adsorbed in kaolin could be obtained in solns. of glycocoll in 2% NaCl. The eluates of antibodies obtained corresponded to the protein-free enzymes in that they were chemically free from proteins. They did not give the Millon or Esbach reactions or the Jones-Spiegler test. By elution with a soln. contg. about 2% glycocoll and 2% NaCl, only the flagellar agglutinin of typhoid antisera was recovered. On diminishing the quantity of NaCl (0.3–0.5%), the amts. of flagellar agglutinin recovered became much smaller and at the same time small quantities of somatic agglutinins appeared. Diphtheria antitoxin behaved like the flagellar agglutinins. The recovered antibody in the protein-free solns. was, both in the case of diphtheria antitoxin and flagellar typhoid agglutinin, about 20% of the concn. in the original sera. J. A. KENNEDY

Chemical alteration of purified antibody proteins. L. REINER. *Science* **72**, 483–4 (1930).—*p*-Aminobenzenearsonic acid (atoxyl) was used for diazo coupling because of its activity as a chemotherapeutic agent in certain protozoan diseases. The antibody protein was a Type I and II pneumococcus antibody. The p_H was not allowed to change during the whole process of coupling more than from 5.0 to 7.5 approx. A product resulted which was almost insol. around its isoelec. point at p_H 6, and sol. to a dark brown soln. at neutral or alk. reaction, sol. with a light yellow color on the acid side of the isoelec. point. This "antibody-dye" could easily be repptd. by dialysis and adjustment of p_H. On carrying out the process in the same way a second time, identical products were apparently obtained, the As_2O_3/N ratio being in one case 0.028, in the other 0.027. If the products were taken up in the same vol. of physiol. saline as the original, agglutination was observed up to the same diln. as with the original antibody prepn. (1/320). A very marked prezone was found, which was not present in the original prepn. Mice infected with 100,000 lethal doses of virulent pneumococci could be protected fully, *i. e.*, cured with 0.2 cc. of the prepn. contg., resp., 6.6 mg. N and 0.18 mg. As_2O_3, and 7.5 mg. N and 0.2 mg. As_2O_3 per cc., when injected intravenously, simultaneously with the infection or 4 hrs. after, or 20 hrs. after the infection. Normal horse serum-globulin coupled with atoxyl had almost no effect. Half a cc. of the original antibody soln. killed mice almost instantly when injected intravenously, whereas the same amt. of the coupled product had no effect. Introduction of the easily detectable As into the antibody-carrier protein is helpful for a quant. study of the degree of purification of antibodies, as well as a quant. study of the antibody reaction. Further expts. are in progress. J. A. KENNEDY

Immunization with aluminum hydroxide mixtures of poliomyelitis virus. C. P RHOADS. *Science* **72**, 608(1930).—The $Al(OH)_3$ employed was the type C suspension of Willstätter contg. 22.5 g. of Al per l. The virus was either Berkefeld N filtrate of fresh monkey pooled virus or suspension of glycerolated material of the same strain. Mixts. of virus and suspension were allowed to stand 30 min. at room temp. The filtrate and $Al(OH)_3$ mixed in equal vols. became inactive. Inactivation was promoted by acid (p_H 5.5) and prevented by alk. (p_H 8.8) reactions. Repeated subcutaneous injections of the inactivated virus led to active immunity. Immunity thus induced was tested (1) by repeated instillation into the nostrils of glycerolated virus, (2) by intracerebral inoculation of fresh virus 28 days later and (3) by means of the blood serum of the treated monkeys. Each of the 3 sera neutralized the virus. Conclusion: The virus, when adsorbed on $Al(OH)_3$, is incapable of producing poliomyelitis, but is still capable of inducing active immunity in *Macacus rhesus*. J. A. KENNEDY

Reversal of charge of serum and its coagulation and gelatinization with acids. SATYA PRAKASH AND N. R. DHAR. *J. Indian Chem. Soc.* **7**, 723–32(1930); cf. *C. A.* **22**, 4170.—Serum from goat blood is treated with acids at various dilns. and changes in the appearance of the serum are noted at various time intervals. Other than the amts. of reagents used, and in some cases, the resulting p_H of the serum, no data are given. W. D. LANGLEY

The preparation of the type-specific polysaccharides of pneumococcus. WALTHER F. GOEBEL. *J. Biol. Chem.* **89**, 395–9(1930); cf. *C. A.* **21**, 2288.—In the new procedures described the laborious and costly sepn. through fractional pptn. with alc. has been eliminated. The carbohydrate and proteins are pptd. with alc. and the proteins are then removed from a water soln. with CCl_3CO_2H. Approx. 35 g. can be obtained from 175 l. of broth culture of type III and 18.5 g. from 350 l. of broth culture of type I. The polysaccharide from both types reacted with antipneumococcus serum in dilns. of 1:6,000,000. A. P. LOTHROP

Uremia and chloropenia. J. M. MACERA, I. FEIGUES AND J. PEREYRA KAFER. *Semana méd.* (Buenos Aires) **1930**, II, 1718–23.—A single case is studied. The low Cl content of the blood is assocd. with a high Cl content of the tissues and the spinal fluid, with azotemia and azoturia, hypochloruria and an increased alkali reserve. The catabolism of the proteins attracts the Cl into the tissues. In the treatment, NaCl is effective, but not KCl or NH_4Cl. A. E. MEYER

The influence of different p_H values on the results of the Sachs-Georgi reaction. S. SIERAKOWSKI AND MELZAK. *Zentr. Bakt. Parasitenk.*, 1 Abt., **118**, 366–73(1930).—The reaction remains unchanged between an antigen p_H 5.5 and 7.0. Every neg. serum becomes pos. with the antigen at a p_H of 5.0, and every pos. serum becomes neg. at p_H 9.0. The best results are obtained when the antigen is dild. with a mixt. of 0.85% NaCl and 0.2 *N* NaOAc in a ratio of 25:1. Dild. thus a weak antigen gives the same results as a standard antigen. There is no parallelism between the p_H of the serum and the reading of the reaction. JOHN T. MYERS

Hormones in cancer. I. The effect of ovarian, splenic and adrenal extracts upon rat sarcoma No. 10. FRITZ BISCHOFF AND L. C. MAXWELL. *J. Pharmacol.* **40**, 97–113(1930).—None of the exts. appreciably affected the incidence of regression or rate of growth of the tumor. Follicular, corpus luteum and 4 adrenal exts. caused early liquefaction or opening of the tumor. C. RIEGEL

The action and excretion of nitrates. NORMAN M. KEITH, MARY WHELAN AND EDWIN G. BANNICK. *Arch. Internal Med.* **46**, 797–832(1930).—See *C. A.* **24**, 1159. J. B. BROWN

Calcium changes in the brain in ether anesthesia. EDMUND ANDREWS, WILLIAM F. PETERSEN AND REUBEN I. KLEIN. *Ann. Surgery* **92**, 993–7(1930).—Ether anesthesia in dogs is accompanied by a marked rise in the Ca in the brain and liver. These changes are probably to be interpreted as meaning a lesser activity and irritability of the brain cells due to changes in the mineral-salt content in the cells themselves. R. B.

Formaldehyde and mercurochrome in the treatment of rabbits injected with Brucella abortus. RONALD GWATKIN. *J. Am. Vet. Med. Assoc.* **30**, 743–5(1930).—Intravenous injections of 5 cc. HCHO per 3 kg. of body wt. or of 0.4 cc. of a 1% soln. of mercurochrome per kg. had no effect in controlling *B. abortus* infection as judged by the agglutinin titer in rabbits. RACHEL BROWN

The relation of toxicity to dosage of tetrachloroethylene. ELWOOD A. SHARP. *J. Trop. Med.* **33**, 336–9(1930).—C_2Cl_4 is not absorbed to any extent by the human intestinal tract, probably because of its insoly. It is probably non-toxic for man and animals. RACHEL BROWN

Anaphylaxis resulting from the use of an iodide. H. A. SPENCER. *J. Trop. Med.* **33**, 339(1930).—Report of 3 cases of urticaria following treatment with fibrolysin and iodolysin. RACHEL BROWN

Contributions to the toxicology of the higher fungi. I. Lactarius torminosus. HANS STEIDLE. *Arch. exptl. Path. Pharmakol.* **151**, 232–52(1930).—*Lactarius torminosus* is not toxic for protozoa or most poikilothermic animals, except frogs. The expressed juice injected intravenously in the latter, as well as aq. extract of the dried fungus, causes dyspnea, paralysis and even death. The ingestion of the fungus by warm-blooded animals has very little effect; but aq. exts. given parenterally, whether subcutaneously or intravenously, cause vomiting, respiratory distress, fall in temp. and death, with histological changes similar to those found in the frog. *L. torminosus* con-

tains traces of muscarine, and probably choline. Its most characteristic effects are the hyperemia and hemorrhages observed in almost all the tissues, due to a vascular and capillary poison. H. EAGLE

Action of diethylsulfonmethylethylmethane upon normal blood constituents. FREDERICK G. GERMUTH. *Am. J. Pharm.* **102**, 653–8(1930).—The action of di(ethylsulfonyl)methylethylmethane (trional) upon the normal blood constituents of the rabbit has been detd. The tabulated results seem to support the belief that continued employment of trional produces pathological symptoms that are clearly manifested by deviations from the normal in the proportions of those sp. bodies present in the blood, and generally considered in clinical examns. to furnish valuable criteria in relation to diagnosis and prognosis. A decrease in the body wt. of rabbits obtains following prolonged treatment with the sulfone. While this loss in body wt. of the exptl. animals may be ascribed to a natural disinclination for the usual quantity of food during the period of treatment, it is believed that this condition is partially caused by the systemic effects of the hypnotic. A well-defined hematoporphyrinuria is produced by the administration of trional to rabbits. An increase in the uric acid, sulfate, sugar and creatinine contents of the blood is observed when trional is administered by either subcutaneous or intravenous injection for a ten-day period. Under similar conditions a decrease in the Fe, Ca, Mg, chloride, total P, acid-sol. P, protein-combined P and total solids occurs, while the sp. gr. and *n* are lowered. A bibliography is appended. W. G. GAESSLER

The effect of carbon monoxide and of hydrogen sulfide on nerve irritability. FRANCIS O. SCHMITT AND LYLE V. BECK. *Biol. Bull.* **59**, 269–74(1930).—Both CO and H_2S, which presumably inhibit cellular oxidation by combining with the Fe-containing respiratory enzyme, render the nerve non-irritable. The effect of the former appears to be completely reversible. FREDERICK G. GERMUTH

Biochemistry of aluminum. I. Excretion and absorption of aluminum in the pig. KENNETH MACKENZIE. *Biochem. J.* **24**, 1433–41(1930).—No harmful effects on general growth and metabolism results from feeding comparatively large amts. of Al. BENJAMIN HARROW

Investigations on the increase in sensitiveness of adrenaline by thyroxine on surviving mammal hearts. WERNER LÜTOLF. *Z. Biol.* **90**, 334–46(1930).—Thyroxine in large doses (1–20,00) together with adrenaline injuries the heart. In dil. solns (1:400,000–1:800,000) it has neither a strengthening nor weakening effect on heart activity, while in 1–20,000 there is a weakening effect. The influence of adrenaline is often but not regularly enhanced by thyroxine, the frequency being increased 7% and stroke height 28%. The hearts of animals treated with thyroxine became more sensitive to adrenaline. FRANCES KRASNOW

Arsenic derivatives of cysteine. J. M. JOHNSON AND CARL VOEGTLIN. *J. Biol. Chem.* **89**, 27–31(1930); cf. *C. A.* **24**, 5874.—It has been shown that reduced glutathione and certain other sulfhydryl compds. protect rats and trypanosomes against the toxic action of As_2O_3 and its aromatic derivs. and the biol. action of As has been explained by the assumption that it combines chemically with cellular SH compds. which are essential to the life of the cell. Further evidence has been obtained by the prepn. of certain As derivs. of cysteine. *Tricysteinylarsine*, from cysteine-HCl and AsCl in alc. soln., white felted needles, decompd. 260°. *Dicysteinyl-3-amino-4-hydroxyphenylarsine*, from cysteine-HCl and 3-amino-4-hydroxyphenylarsenious oxide in alc. soln., small white needles, decompd. 225–7°. A. P. LOTHROP

Antiphlogistic action of certain drugs. The case with the extirpation of the ciliary ganglion. HIROSHI SUZUKI. *Folia Pharmacol. Japon.* **11**, No. 1, 1–10, Breviaria 1 (1930); cf. *C. A.* **25**, 351.—According to the neurological theory, anti-inflammatory action is controlled, on the one side, by a point of attack in the nerve center and, on the other side, by a point of attack lying in the periphery. On this basis central and peripheral antiphlogistic drugs are differentiated. The ciliary ganglions of rabbits eyes were extirpated and 3 days later the eye was inflamed with mustard oil. An injection of antiphlogistic drugs was made 2 min. after the mustard oil treatment. Subcutaneous injection of antipyrine, quinine, erycon and sinomenin gave an antiphlogistic action. After 3 days, however, the further course of the inflammation is more unfavorable by use of sinomenin than in the control. Extirpation of the ganglion weakens somewhat the action of antipyrine and erycon. Their action appears both central and peripheral. Quinine and sinomenin are not affected by removal of the ganglion and their action is chiefly peripheral. Salicylic acid is very weak. G. H. W. L.

The drugs used in Chinese medicine as antidiabetica. Noriyuki Sugihara. I. Experimental investigation on the influence of the drugs used in Chinese medicine on

the blood sugar of rabbits. PUINGKI MIN. *Folia Pharmacol. Japon.* **11**, No. 1, 11–21, Breviaria 1–2(1930).—Many plants were employed by the Chinese as antidiabetica. Two hundred and fifty g. of each plant was heated with 2000 cc. water on a water bath for 5 hrs. and then filtered. The filtrate was concd. to 500 cc. A rabbit was given *per os* 25 cc. per kg. body wt. According to the dose, *Lonicera japonica, Paeonia obovatae, Trichosanthes kirilowii, Coptis teeta, Licium chinense, Phyllostachys bambusoides, Liriop, graminifolia* and *Bupleurum falcatum* increase the blood sugar rapidly, reach their max. in $^1/_2$ to 1 hr. and then gradually decrease. After 5–6 hrs. the original value is reached. II. *Ibid* 21–33, Breviaria 2–3.—Twelve other Chinese drugs were investigated in a manner similar to that reported above. These all showed an increase in blood sugar and then a fall. One alone, *Rehmannia lutea*, showed no preliminary increase, but reduced the blood sugar from the beginning. G. H. W. LUCAS

The pharmacological action of tetrahydroharmin. FUMIO SETO. *Folia Pharmacol. Japon.* **11**, No. 1, 34–41, Breviaria 3(1930).—*Paganum harmala* contains three alkaloids, harmine, harmatine and tetrahydroharmine. The action of the last resembles that of the two former, but in general is weaker. It has a depressant action on heart and skeletal muscle of frogs, excised rabbit intestine and uterus (in large doses). It stimulates earthworm muscle, lowers blood pressure in rabbits, causes shallow respiration and dilates blood vessels in the rabbit ear. The main difference lies in the fact that the tetrahydroharmine causes remarkable constriction in the vessels in the frog leg, and in a proportional small dose stimulates the excised rabbit uterus. G. H. W. LUCAS

Investigations on the pain-depressant action of some agents used for rheumatism and neuralgia with a toothache comparison. TOICHIRO KONDO. *Folia Pharmacol. Japon.* **11**, No. 1, 84–93, Breviaria 6(1930).—Earlier expts. on the pain of rheumatism and neuralgia left much to be desired, but it was found that certain remedies were beneficial. Investigation was begun to ascertain the effect of these remedies on toothache, according to the method of Nagira. The tooth was cut across, the pulp electrically stimulated, and a twitch of the cheek muscle noted. Antipyrine and erycon lowered the sensitivity on stimulation, and acted also on toothache. Simomenine and salicylic acid were actionless. Quinine also had no effect in toothache. At higher and lower temps., the artificial toothache reflexes were increased, and the above-mentioned remedies acted as pain depressants. G. H. W. LUCAS

The influence of antiutrin and thyroxine on the growth of in-vitro cultures of fibroblast. SEIICHI SEMURA. *Folia Pharmacol. Japon.* **11**, No. 1, 94–105, Breviaria 6–7 (1930).—Very little information has appeared in the literature on the effect of thyroxine and pituitary hormone on the growth of cultivated tissue. Expts. have been undertaken by S. to measure the effects of these on *in vitro* cultures of fibroblast. A stock of fibroblast, 1 to 2 months old, from the ventricle of chick embryo was grown in chick plasma, together with an equal vol. of embryo fluid. In other expts. the nutrient medium was plasma and Ringer soln. The usual cover-glass, hanging-drop method was used. In tissue juice cultures, antiutrin and thyroxine caused an increase in growth. With increasing concn. of these, the growth-promoting action was increased, but very high concns. produced an inhibition. In plasma and Ringer soln. growth was very slow, and degeneration followed. When tissue juice was absent, growth was accelerated considerably, and degeneration did not set in rapidly. G. H. W. LUCAS

The existence of peripheral parasympathetic tonus in the isolated rabbit intestine. MASAMI TAKAHASHI. *Folia Pharmacol. Japon.* **11**, No. 1, 106–25, Breviaria 7–8(1930).—The effects of atropine on pieces of rabbit intestine have been studied by the Magnus method. Very small doses caused a fall in tonus, together with a decrease in frequency and diminution of the pendular movement. A moderate dose, however, after a short arrest, produced increase in tonus with an increase in frequency and strengthened pendular movements. Very small doses of atropine also hindered the stimulating action of acetylcholine, pilocarpine and physostigmine on the intestine. It had no action, however, on adrenaline and Ba. The depressant action of atropine increased when the parasympathetics of the intestine were stimulated by a decrease of Ca or increase of K in the nutrient medium, or by the agents mentioned above. Conversely, the depressant action was considerably weaker when the excitability of the parasympathetics was reduced through a low Ca content of the medium. It was almost lost when the intestine was stimulated with Ba. It was completely independent of adrenaline action. Its action apparently was on the parasympathetic endings. One must assume that isolated intestine still possesses a certain peripheral tonus from the parasympathetics. The peripheral tonus may be due in part to choline. Contrary to published data, T. has found that after repeated washing of a piece of intestine with nutrient soln.

atropine still had its depressant effect. Other factors yet unknown must influence this peripheral tonus. G. H. W. LUCAS

Neutralization of various poisons by thorium X. AVERSENQ, JALONSTRE AND MAURIN. *Compt. rend.* **191**, 734–6(1930).—The injection of 5–10 γ of Th X into a guinea pig 5 min. after the injection of a lethal dose of sparteine sulfate prevents the development of toxic symptoms. A bowl of fish was rendered resistant to a lethal dose of picrotoxin by the addn. of 100 γ of Th X to the water in which they swim. Kephir grains in a favorable medium have their growth arrested by picrotoxin but this poison has no effect in the presence of 10 γ of Th X. Th X is also able partly to neutralize the effects of tetanus toxin. C. M. MCCAY

Studies on muscular inhibition. V. Importance of urea on inhibition and on muscle excitability. GIULO BUCCIARDI. *Boll. soc. ital. biol. sper.* **5**, 641–3(1930).—The degree of inhibition of muscle tissue is greater in weak or medium concns. of urea solns. than in strong concns.; the elec. excitability, however, diminishes rapidly with increasing concns. of urea. PETER MASUCCI

The action of chromium on lipoids. I. Microhistochemical studies. C. CIACCIO. *Boll. soc. ital. biol. sper.* **5**, 697–700(1930).—C. confirms his previous results, namely, that the fat of normal adipose tissue and fat from infiltration give a negative result with his process, whereas the myelin sheath and lipoids of autolyzed organs give positive results. The tissues should remain in the fixing fluid for 24 hrs. and then be placed in the chromate bath 24–48 hrs. at 38–40°. The positive results obtained with commercial olein by Kauffmann and Lehmann are attributed to the presence of free oxidized acid. **II. Chemical studies.** *Ibid* 701–4.—After chrome treatment, olein is completely removed by solvents. The phospholipoids are rendered completely insol. and are not appreciably hydrolyzed. PETER MASUCCI

The inhibiting action of digitonin on the development of adenocarcinoma of the mouse. PIETRO RONDONI. *Boll. soc. ital. biol. sper.* **5**, 722–3(1930).—Mice were injected with digitonin 7–9 days before the grafting of the tumor. There was a marked inhibition in the development of neoplastic tissue in the treated mice compared with the controls. PETER MASUCCI

Studies on parathyroidectomy syndrome. III. Its course in animals under strontium and calcium treatment. M. COMEL. *Boll. soc. ital. biol. sper.* **5**, 729–32 (1930); cf. *C. A.* **24**, 5814.—In the parathyroidectomized animal treated with toxic doses of Sr, it is possible to impede tetany but not the picture of the parathyroidectomy syndrome, which eventually results in the death of the animal in marasma and cachexia. The antitetanic action of Sr is different from that of Ca and has its seat in the nervous system. **IV. The effect of irradiated ergosterol administered in excessive doses and its mechanism.** *Ibid* 732–4.—Irradiated ergosterol in large doses, 0.5–0.7 million rat units, administered to parathyroidectomized dogs impedes the onset of tetany and other functional symptoms characteristic of parathyroid insufficiency. However, there are no marked serological changes; it does not prevent hypocalcemia. There is some increase in blood P so that the ratio Ca/P is not lowered to the level common to tetany. Later, the hypocalcemia disappears rather quickly and the blood Ca becomes normal. Simultaneously, the blood P also decreases and the ratio Ca/P becomes normal. This behavior is attributed to the presence of accessory parathyroid tissue and to the formation of compensating factors. PETER MASUCCI

Changes in the parathyroids under experimental strontium treatment. M. COMEL. *Boll. soc. ital. biol. sper.* **5**, 735–7(1930); cf. *C. A.* **24**, 4854.—In dogs receiving toxic doses of Sr, the parathyroids show no cellular changes but only a marked hyperplasia. PETER MASUCCI

Ergosterism in pups nursed by the mother treated with excessive doses of irradiated ergosterol. M. COMEL. *Boll. soc. ital. biol. sper.* **5**, 738–40(1930).—Under intensive ergosterol treatment, enough ergosterol passes into the milk of the mother to produce toxic symptoms of ergosterism in the pups. PETER MASUCCI

Further data on the action of bulbocapnine on man. UMBERTO DE GIACOMO. *Boll. soc. ital. biol. sper.* **5**, 757–8(1930); cf. *C. A.* **24**, 5870.—Bulbocapnine administered intravenously (100-mg. doses) produced in 25% of the cases cataleptic phenomena without muscular hypertonia. The drug, however, almost invariably provoked a stupor characterized by a psychic and psycho-motor torpor, or brief confusional excitement. PETER MASUCCI

Changes in renal threshold during insulin therapy in diabetics. G. SORGE. *Boll. soc. ital. biol. sper.* **5**, 762–4(1930).—*In certain diabetics, insulin raises the renal threshold for glucose, chlorides and water.* PETER MASUCCI

The influence of bulbocapnine on blood calcium and potassium. S. GULLOTTA.

Boll. soc. ital. biol. sper. **5**, 768–70(1930).—Bulbocapnine disturbs the electrolyte equil. of the blood in a manner analogous to that found by Fischer in somnifen narcosis. A marked lowering in Ca coincides with the somnolence, while a marked lowering of K corresponds to the increase in catalepsy. PETER MASUCCI

The mechanism of action of barium chloride. ALFREDO CHISTONI. *Boll. soc. ital. biol. sper.* **5**, 786–8(1930).—If the vagal tone of the dog is increased by means of pilocarpine (0.1 mg. per kg.) it is possible to obtain an increase in intestinal peristalsis and a purgative action by $BaCl_2$ in doses of one mg. per kg. body wt. The action of $BaCl_2$ is not essentially muscular, but involves the parasympathetic nervous system. PETER MASUCCI

Attempts to prepare compounds of the rare earths for therapeutic use; a contribution to their pharmacologic properties. P. NICCOLINI. *Boll. soc. ital. biol. sper.* **5**, 795–7(1930).—The albuminate, peptonate and nucleinate of Nd were prepd. but these compds. were of no therapeutic value on account of their slight soly. A compd. of La and trypan blue was prepd. which contained 0.2% $LaCl_3$. In general the pharmacologic studies showed it to be non-toxic, but bacteriol. tests revealed the absence of bactericidal properties. The use of rare earth compds. in the treatment of tuberculosis must await the development of sol. org. salts which possess antiseptic powers. PETER MASUCCI

Adrenaline erythrocytosis and leucocytosis. MODESTO DALLA PALMA. *Minerva méd.* **1930, II**, 397–404.—One mg. adrenaline was injected intramuscularly into 20 patients, 15 of whom were affected with splenomegalia. The number of erythrocytes, leucocytes, general reaction, pulse, arterial pressure and splenic contraction were studied and correlated. Erythrocytosis was independent of leucocytosis and ran more parallel to the splenic contraction than the leucocytosis. PETER MASUCCI

The toxicity of the seeds from Artemisia maritima L. compared with that of santonin. MAURICE M. JANOT AND ROBERT MOUTON. *Bull. sci. pharmacol.* **37**, 593–9 (1930).—An infusion 1:100 of the so-called "seeds" (flower heads) of *Artemisia maritima* L. contg. 1.75% of santonin was compared with a soln. of santonin (0.0175%). A soln. of the essential oil of the drug was tested. Expts. with *Lumbricus terrestris* L. and *Carassius auratus* showed a higher toxicity of the drug ext. than of the santonin soln. The soln. of essential oil, as well as a soln. of cineole, main constituent of the oil, is very toxic. *Ascaris megalocephala* was treated with Bunge's soln., with santonin and with the drug ext. The last one caused the strongest toxic symptoms; the first, none at all. Only 1 out of 6 died in the first and in the last test; all survived in the santonine. Conclusion: The time of surviving is not a measure for the efficacy of a vermifuge, as the parasites are expelled while alive. A. E. MEYER

Therapeutic action of sugar in cardiac insufficiency. N. KISTHINIOS AND D. M. GOMEZ. *Presse méd.* **38**, 1363–4(1930).—In cases where ouabain had failed, 80 g. of coned dextrose soln. followed by an injection of 4 units of insulin gave prompt relief. The patient was kept on a Cl-free milk-vegetable diet. A combined treatment with dextrose and ouabain is suggested. A. E. MEYER

Eserine for the regulation of general anesthesia. L. GARRELON, GEO. PASCALIS AND L. THUILLANT. *Presse méd.* **38**, 1365(1930).—In patients resistant to anesthesia an injection of 0.5 mg. physostigmine salicylate caused a prompt effect. It is recommended, besides, for minor operations combined with morphine or local anesthetics. A. E. MEYER

Insulin in the treatment of cardiac diseases. M. LOEPER, A. LEMAIRE AND R. DEGOS. *Presse méd.* **38**, 1361–3(1930).—Insulin, alone or combined with dextrose, relieves cardiac insufficiency and reënforces the action of specific cardiants. Its effect is on the nutrition of the myocardium and it establishes equil. between the formation and decompn. of glycogen. The doses were 5 to 10 units each morning, and 20 min. later 50 g. dextrose. A. E. MEYER

Aniline poisoning by absorption through the skin. ATILIO C. GRAPIOLO AND JUAN TENCONI. *Rev. sudamericana endocrinol. inmunol. quimioterap.* **13**, 809–11(1930).—Report of a case of acute aniline poisoning caused by a black dye used on shoes. The main symptom was cyanosis, accompanied by certain nervous disturbances and cyanopsia. A. E. MEYER

Diabetic coma followed by hypoglucemic coma without interruption. PEDRO ESCUDERO AND GUILLERMO SCHULTZ ORTIZ. *Semana méd.* (Buenos Aires) **1930, II**, 1537–40. After application of large doses of insulin in a case of diabetic coma, the hypoglucemic coma developed before the acidosis disappeared. A. E. MEYER

The action of peptone on the gastric secretion. IRIS TESSIERI. *Semana méd.* (Buenos Aires) **1930, II**, 1579–86.—Peptone increases the duration and quantity of

gastric secretion. Liquids remain longer in the stomach if peptone is present. The acidity is increased, especially when liquid food is given. In certain cases of anachlorhydria the normal constituents of gastric acidity were produced. No effect was observed in gastric cancer and in highly developed gastric insufficiency. A. E. M.

The sugar content of cerebrospinal fluid. I. Studies on the influence of glucose and and of adrenaline hyperglucemia as well as of glucose plus adrenaline hyperglucemia on the spinal-fluid sugar. CARL J. MUNCH-PETERSEN. *Acta Med. Scand.* **74**, 31–58 (1930).—The ratio spinal-fluid sugar × 100/blood sugar after glucose hyperglucemia is usually within 55 to 65, higher values of this ratio indicating an org. disease of the central nervous system. With a hyperglucemia up to 160 mg. % the spinal-fluid sugar shows a max. increase 2.5 hrs. after an injection of adrenaline. S. MORGULIS

Experimental studies on the influence of the enteral administration of yeast biocatalyzers on the chemical processes in muscle and liver during training. J. A. COLLAZO, G. LISS AND C. PI-SUÑER BAYO. *Biochem. Z.* **227**, 326–33(1930).—The enteral administration of yeast causes a marked increase in glycogen and P and diminution in lactic acid and lactacidogen of the muscles as compared to that of control animals The glycogen content of the liver is also increased and so is also the lactic acid content S. MORGULIS

Studies on the growth effect of carotenoids. MARGARETA RYDBOM. *Biochem. Z.* **227**, 482–7(1930).—Two carotenoid esters, lutein distearate and xanthophyll distearate, even in 0.05-mg. daily doses, have no effect on growth. Carotene injected intramuscularly causes strong stimulation of growth. S. MORGULIS

Effect of cations of Ringer solution on the diameter of the blood vessels of the frog. M. KOCHMANN. *Biochem. Z.* **227**, 488–91(1930).—The mixt. of the 3 ions, K, Na and Ca, usually causes vasoconstriction in the Lawen-Trendelenburg prepn. The most favorable mixt. for producing and maintaining vasodilation is one consisting of 92% NaCl (0.5612%), 3% KCl (0.0234%) and 5% $CaCl_2$ (0.0575%), and even slight changes in proportion produce significant and at times irreversible alterations. S. M.

The pharmacological action of the exotoxin of Staphylococcus aureus. C. H. KELLAWAY, F. M. BURNET AND F. ELEANOR WILLIAMS. *J. Path. Bact.* **33**, 912(1930). The intravenous injection of crude agar staphylococcal toxin causes a transient fall in blood pressure of the cat and the rabbit with recovery above normal and then a rapid terminal fall. The initial transient fall is vasomotor in origin; the rise above normal is probably due to an increased output of adrenaline; and the final fall is due to obstruction of the pulmonary circulation. JOHN T. MYERS

The influence of liver extract effective in pernicious anemia upon the diameter of erythrocytes in experimental anemias. G. PAYLING WRIGHT AND BARBARA ARTHUR *J. Path. Bact.* **33**, 1017–34(1930).—Liver ext. mitigates the anemia produced by phenyl hydrazine as indicated by symptoms and an increased diam. of the erythrocytes, but this phenomenon is probably entirely different from the effect in pernicious anemia. JOHN T. MYERS

The influence of testicular extract on dermal permeability and the response to vaccine virus. DOUGLAS MCCLEAN. *J. Path. Bact.* **33**, 1045–70(1930). Intravenous inoculation of the ext. enhances the local lesions of intradermal injections of vaccine virus. It has no effect on the virus response to applications to the closely shaven skin. Testicular ext. has a similar enhancing effect on dermal response to diphtheria toxin. This effect is due to increased dermal permeability, with increased diffusion of the virus. The active substance in the ext. is not pptd. in the nucleoprotein fraction thrown down by weak acids, though a small quantity is adsorbed. It can be pptd. by alc. or ether, and obtained in soln. with only a trace of protein and no carbohydrate or S. While there is no direct evidence that the effect is due to a protamine or histone, somewhat similar results follow the injection of these substances. JOHN T. MYERS

The treatment of dog piroplasmosis with trypaflavine. G. DOMAGK AND W. KIKUTH. *Zentr. Bakt. Parasitenk.*, 1 Abt., **118**, 401–6(1930). JOHN T. MYERS

Idiosyncrasy to quinine, cinchonidine and ethylhydrocupreine and other levorotatory alkaloids of the cinchona series: Further chemical delimitation of the idiosyncrasy; alteration in sensitiveness. W. T. DAWSON AND FRANCIS A. GARBADE. *J. Pharmacol* 39, 417–24(1930).—Skin sensitivity of a quinine-sensitive patient to the following compds is reported: ethyl-, amyl- and isoamyl-quitenine, ethyl-, isopropyl-, propyl- and isobutyl-hydrocupreine, hydroquinine, cupreine, apoquinine, qdinoline. Negative results were obtained with quitenine, cinchotenidine, cinchotenine, quitenidine, quinicine, cinchomicine, hexyl-, isoöctyl- and dodecyl-hydrocupreine, nitro- and amino-hydroquinine, quinamine, plasmochin. Isoamylhydrocupreine gave negative results on the 1st test, positive two months later. C. RIEGEL

Some observations on the effect of pitressin upon the cardiovascular system. CHARLES M. GRUBER AND WM. B. KOUNTZ. *J. Pharmacol.* **39**, 435-47(1930); cf. *C. A.* **24**, 5874.—Pitressin, either in acid or alkaline soln., caused constriction of the coronary vessels of the excised perfused frog heart, and an increase in vol. of the dog heart when injected intravenously. Pitocin caused dilatation of coronary vessels and had no effect on cardiac vol. C. RIEGEL

The effect of adrenaline upon the rate of contraction and upon the conduction time of peristalsis and antiperistalsis in excised ureters. CHARLES M. GRUBER. *J. Pharmacol.* **39**, 449-56(1930).—There was no marked difference between the rate of conduction of peristaltic and antiperistaltic waves in the pig ureter. Adrenaline increased the rate of conduction in both types of waves. Segments taken from the ureter near the kidney were as sensitive to the action of adrenaline as segments taken at some distance from the kidney. C. RIEGEL

A study of the innervation of the pylorus of the terrapin. NOLAN L. KALTREIDER. *J. Pharmacol.* **39**, 469-82(1930).—The effect of the following on the contraction of the excised pyloric sphincter in a bath of oxygenated Ringer soln. was studied: pilocarpine, atropine, adrenaline, ephedrine. Pilocarpine caused rhythmic contractions which were inhibited by atropine (vagal action). Adrenaline and ephedrine inhibited movements initiated by pilocarpine in both the pyloric sphincter and in segments of the small intestine in the majority of cases. Conclusion: The sympathetic fibers to the pylorus are mainly inhibitory, although occassionally excitatory fibers predominate. C. RIEGEL

Synergism of local anesthetics. T. H. RIDER. *J. Pharmacol.* **40**, 7-22(1930).—A synergic effect on the onset of anesthesia in the sciatic nerve of the frog was shown by mixts. of KCl-cocaine, NH_4Cl-cocaine, $MgCl_2$-cocaine and butyn-cocaine. Synergism also was exhibited by the latter mixt. on the duration of anesthesia on the rabbit's cornea C. RIEGEL

Studies on calcium. I. Some comparative pharmacological effects following the intravenous injection of calcium lactate and calcium gluconate in unanesthetized dogs. ARNOLD L. LIEBERMAN. *J. Pharmacol.* **40**, 65-70(1930).—There was a rise in blood pressure, slowing of the pulse rate, more marked and more prolonged with the gluconate. A digitalis like action on the heart was observed. In 2 dogs intravascular clotting occurred. With excessive doses Cheyne Stokes respiration was observed. **II. Urinary output of calcium in normal individuals after peroral administration of calcium lactate and calcium gluconate.** *Ibid* 71-6.—Diuresis occurred. From 5 to 8% of the Ca was recovered in the urine. Distressing symptoms were greater with the lactate. Greater absorption, with a min. of distress, was obtained if the Ca salt was given after a meal. C. RIEGEL

Comparative actions of sympathomimetic compounds: synephrine isomers and ketone. M. L. TAINTER AND M. A. SEIDENFELD. *J. Pharmacol.* **40**, 23-42(1930).—All three synephrine isomers and synephrine ketone caused in cats a rise in blood pressure unmfluenced by removal of the adrenals, the levo form being the most effective. In ergotaminized or cocainized cats the pressor response was unchanged, indicating that the action was more peripheral than that of adrenaline—a direct stimulation of vascular muscle. Evidence of musculotropic action was obtained also with excised spiral of sheep carotid, perfused rabbit ears, segments of rabbit duodenum and on the bronchi of cats and dogs. Racemic synephrine reduced the chemosis produced in the rabbit eye by mustard oil. C. RIEGEL

Comparative actions of sympathomimetic compounds: catechol derivatives. M. L. TAINTER. *J. Pharmacol.* **40**, 43-63(1930).—A comparative study was made of the pressor and pulse rate actions of *l*-, *dl*- and *d*-adrenaline, epinine, adrenalone and catechol in urethanized and atropinized cats. All had pressor action which was prevented by the injection of ergotamine, and sensitized by cocaine injection. The results with catechol, while variable, point to the conclusion that the catechol nucleus of the compds. is necessary for action on the sympathetic system. C. RIEGEL

Toxicity of rotenone, isorotenone and dihydrorotenone to goldfish. W. A. GERSDORFF. *J. Am. Chem. Soc.* **52**, 5051-6(1930); cf. *C. A.* **24**, 4556.—The toxicity of rotenone (I) begins at a higher concn. than that of dihydrorotenone (II) (about twice, according to Powers' formula) and a lower concn. than that of isorotenone (III) (about 1/4). The toxicities of I and II increase with increase in concn. at about the same rate but this rate is lower in the case of III (about 1/8). At higher concns., I is the most toxic and III the least. According to Powers' formula, which is an expression of relative toxicity based on the first 2 variables, these substances have the following decreasing order of toxicity: II, I, III. C. J. WEST

Trypanocidal activity and chemical constitution (EVERETT) **10.** Alkaloid from *Anona reticulata Linnaeus* (SANTOS) **10.** *p*-Aminophenylguanidine hydroiodide (BRAUN) **10.**

12—FOODS

F. C BLANCK AND H. A. LEPPER

Some notes on air filtration in a food factory. S. LANCEFIELD. *Ind. Chemist* **6**, 452(1930). E. H.

A study of Mexican wheats as raw material for the milling and baking industries. EDUARDO B. GUZMÁN. *Rev. quím.* **6**, 17–27(1930).—Descriptions and analyses of the various wheats grown in Mexico are given. L. E. GILSON

Effect of carbohydrates and other impurities on the crystallization of glutamic acid hydrochloride from decomposition products of soy-bean protein. M. MASHINO AND T. SHISHIDO. *J. Soc. Chem. Ind., Japan* **33**, Suppl. binding 421–2(1930); cf. *C. A.* **24**, 3025.—MeOH extn. removes objectionable impurities from soy-bean cake. This ext. was added in varying amts. to the HCl-hydrolyzed soy-bean product, where it diminished yields of glutamic acid-HCl severely. Starches or their degradation sugars had a similar, though less pronounced, effect. Extn. with MeOH might make the 40–45% proteins of the soy bean available for the manuf. of glutamic acid. K. H. E.

A study of the utility of protein peptization by inorganic salt solutions as a means of predicting loaf volume. W. F. GEDDES AND C. H. GOULDEN. *Cereal Chemistry* **7**, 527–56(1930).—Peptization studies have been conducted on 102 straight-grade flours, experimentally milled from com. samples of hard red spring wheat grown in Western Canada in 1928. These samples included wheats grading from No. 2 Northern to No. 6, the predominating forms of damage in the lower grades being immature and frosted kernels. Peptization detns. were conducted on the entire series with 0.5 *N* $MgSO_4$, the Gortner method being used, and on a part of the series with 0.5 *N* KBr and 0.5 *N* KI by a simplified procedure. The samples were baked by the basic, malt and bromate formulas. The mean total protein and peptized protein were quite uniform for the different grades, this uniformity indicating no essential difference between peptizability of the flour proteins from sound wheat and immature and frost-damaged wheat. Baking results with the bromate formula combined with progressively decreasing responses to the differential test indicated inferior baking quality with decreasing grade. High neg. correlations were obtained between total protein and percentage total protein peptized, which were not due to less complete extn. of the high-protein flours. The response of an experimentally milled flour to bromate depends, in part, on the quantity of protein present and in part on other facts usually included in the term "protein quality." Correlations computed between percentage of the total protein peptized and loaf vol. are not a satisfactory measure of the relative value of the peptized and non-peptized fractions for baking purposes, since their magnitude is, in part, a reflection of the relation between total protein and loaf vol. Partial correlations involving the use of total protein as an invariant with peptized and non-peptized protein as variables cannot be utilized because total protein contains both these fractions. A satisfactory comparison of the 2 protein fractions may be made by computing partial correlations, peptized protein, non-peptized protein and loaf vol. being used. The basic baking procedure revealed no significant difference in the relative values of the peptized and non-peptized protein fractions for baking purposes and also gave somewhat lower correlations between protein content of flour and loaf vol. than the malt and bromate methods. The peptization data with 0.5 *N* $MgSO_4$ showed the non-peptized protein to be somewhat superior to peptized protein in its effect on loaf vol., while the results with 0.5 *N* KI revealed the peptized protein to be superior. The data for 0.5 *N* KBr were not so significant. An analysis of the peptization data (with 0.5 *N* $MgSO_4$ and 0.5 *N* KI) obtained by Gortner on flours milled from

wheat differing widely in type and origin reveals greater differences (in favor of the non-peptized protein) than those obtained in these studies, while the data of MacLeod on Marquis wheat grown from the same seed under different environmental conditions revealed no significant difference between the baking values of the 2 fractions. The "optimum coagulation" theory affords an explanation of the peptization data thus far published. L. H. BAILEY

Relation between crude-protein content and loaf volumes obtained by two different methods of baking. R. H. HARRIS. *Cereal Chemistry* 7, 557–70(1930).—A study was made of 59 samples of Marquis wheat grown in the territory more or less adjacent to Saskatoon. The samples were milled experimentally into a 75% patent flour and the flour was baked by the basic method. They were also baked by a formula including 1% of malt and 0.001% $KBrO_3$. With an increase of vol. greater than 10% by the latter method, the samples were rebaked with 3% malt and 0.5% Arkady. Coeffs. of correlation between baking strength and protein content obtained by the latter method were significantly higher and appeared to justify the conclusion drawn by Larmour (1930) that com. use of the protein test is justified as a factor in the classification of hard red spring wheat. L. H. BAILEY

Contribution to the knowledge of colloid chemistry of gluten. III. H. L. BUNGENBERG DE JONG AND W. J. KLAAR. *Cereal Chemistry* 7, 587–91(1930); cf. *C. A.* **24**, 4095.—The relative viscosity of an acid gliadin sol passes through a max. in ±44% acetone by vol. In higher acetone concns. a strong dehydration takes place. A gradual increase of the % rise in relative viscosity in 44% acetone takes place at both sides of the point of maximal hydration of the gliadin sol. Sepn. may be observed microscopically at both sides of this point in aq. medium. L. H. BAILEY

Relation of the overgrinding of flour to dough fermentation. L. P. KARACSONYI AND C. H. BAILEY. *Cereal Chemistry* 7, 571–87(1930).—Overgrinding wheat flours resulted in substantial increases in diastatic activity as measured by the Rumsey autolytic method. The magnitude of the proportional increase was in inverse ratio to the initial diastatic activity of the untreated flour. Gas production and gas retention in freshly mixed doughs, and in doughs previously fermented for 3 hrs. were not substantially modified by overgrinding. This suggests that the Rumsey method for measuring diastatic activity may fail at times to afford an adequate basis for estg. the fermentation potentialities of a wheat flour when measured either in terms of gas production, gas retention or fermentation tolerance. L. H. BAILEY

The composition of cow milk in Finland. A. I. VIRTANEN. *Milchwirtschaft. Forsch.* 9, 355–64(1930).—Samples from different breeds and from different parts of the country are low in protein (3.12%) and high in lactose (4.94%). The fat and protein begin to drop in October and reach a min. in May. The protein drops as low as 2.8%. The sugar begins to increase in January and reaches its max. in March or April with a min. in August or September. When cows go on pasture, fat and protein increase rapidly with a max. of 3.3 to 3.5% in September or October. There exists an antagonism between protein and fat on the one side and lactose on the other. The phenomenon is probably due to feed. Ca and P remain unchanged. Analyses show 23.36 to 25.13% CaO and 29.20 to 30.85% P_2O_5 in ash. GEORGE R. GREENBANK

The relation between the calcium content of Allgau soils and the calcium content of the milk and its coagulability by rennin. K. WURSTER. *Milchwirtschaft. Forsch.* 9, 258–85(1930).—There was little variation in the coagulation by rennin. The feed and lactation conditions had little effect. The variations in Ca content are attributed to the progress in lactation The manner of combination of the Ca has more to do with the coagulation by rennin than the amt. G. R. G.

New method of direct analysis with a cubic centimeter of milk. TRIFON UGARTE. *Anales asocn. quím. Argentina* **18**, 137–63(1930).—Fat is extd. by Et_2O-alc., lactose detd. by 5% K_2CrO_4 soln., Cl by $AgNO_3$ soln., and protein and ash by drying, weighing and incinerating. Results are compared with those of standard methods. E. M. S.

The milk peroxidase. W. GRIMMER AND H. ENGLE. *Milchwirtschaft. Forsch.* **10**, 273–96(1930).—G. and E. find no possible means of sepg. the peroxidase. The peroxidase reaction is increased by digestion of the protein with pancreatin. Heat increases the reaction after flocculation of the albumin. They show that the milk peroxidase is closely related to albumin. It is probably a complex bound to the albumin, little influenced by pancreatin but sepd. from the albumin by the flocculation of the latter by heat The chem. nature of the peroxidase is not explained. G. R. G.

Indication of glucose in milk. CARRELL H. WHITNAH. *J. Am. Chem. Soc.* **53**, 300–4(1931).—A method for estg. small quantities of glucose in milk depends upon the selective fermentation of the glucose and measurement of the rotatory power of fer-

mented and unfermented milk. Changes in rotatory power corresponding to percentages from 0 to 0.35% glucose have been found in normal cow milk. The percentages of glucose, lactose, fat and solids and the d. were detd.; the presence of apparent glucose seems to be independent of any of the other characteristics of the milk which were measured. C. J. WEST

Curd casein and methods of testing. FRIEDEL. *Milchwirtschaft. Ztg.* **34**, 1680–1 (1929).—In order to produce good casein the curd must be fresh, metal-free and of low fat content. Lactose causes caramelizing on drying. Acid casein forms salts on soln. in alkali. Rennet casein is high in ash. Mixts. of acid and rennet curd make poor casein. Buttermilk and sour milk cannot be used. The H_2O content of the curd should be low; it should not exceed 6 to 8%. The fat is detd. by soln. in borax followed by the usual methods of detn. for skim milk. Acid is detd. by the addn. of an excess of 0.1 *N* alkali and back titration with 0.1 *N* acid. Fifty g. of casein should dissolve in 300 cc. of a $2^1/_2$% borax soln. when held at 65° for 10 min. GEORGE R. GREENBANK

The boundary-surface water-fat in butter. N. KING. *Milchwirtschaft. Forsch.* **9**, 501–19(1930).—K. studies the relationship between the structure of butter and the chem. changes in the fat phase. He considers the continuous phase as a liquid fat fraction, which is in direct contact with the water droplets. Chem. and bacteriol. changes occur first in the adjoining surface between the H_2O drops and the fat. The boundary surface between the H_2O droplets and fat is calcd. from the diam. of the H_2O droplets. According to Rahn and Sharp the small droplets are buttermilk and the larger ones wash water. He finds that the greater boundary surface occurs in the smaller droplets; therefore the greater spoilage comes from the buttermilk. Fe and Cu from equipment in poor condition are responsible for more defective butter than the wash water. GEORGE R. GREENBANK

Some color-producing organisms in butter-washing water. G. F. V. MORGAN *New Zealand J. Agr.* **41**, 315–8(1930).—The following color-producing organisms were isolated from butter-washing waters: (1) *Chromobacterium violaceum*, producing violet spots; (2) *Rhodococcus rosaceus*, producing a pink coloration; (3) *Bacterium fluorescens*, producing green coloration; and (4) a short Gram-pos. rod of uncertain classification, forming a bright orange pigment. K. D. JACOB

The preparation of milk for Cheddar-cheese manufacture and its relation to quality. A. B. SHELTON. *Agr. Gaz. N. S. Wales* **41**, 760–4(1930); cf. *C. A.* **24**, 3573. K. D. JACOB

Black discoloration in annatto-colored cheese. G. F. V. MORGAN. *New Zealand J. Agr.* **41**, 100–5(1930).—The discoloration was due to the action of microörganisms on Pb salts present in the annatto ext. used in coloring the cheese. K. D. JACOB

Bananas. The behavior and diseases of the banana in storage and transport. CLAUDE W. WARDLAW AND LAURENCE P. MCGUIRE. *Trop. Agr.* (Trinidad) **7**, 183–9, 214(1930).—Cavendish and Gros Michel varieties keep best at temps. of 53–55° F. The storage atm. should be changed at least once daily. A. L. MEHRING

Tomato varieties and pulping quality. F. C. ELSWORTH. *Agr. Gaz. N. S. Wales* **41**, 741–3(1930).—Data are given on the content of total and sol. solids and skins and seeds in several varieties of tomatoes used for the prepn. of tomato pulp. The Marglobe, Columbia, Norton and Bonny Best varieties give a high yield of total solids and produce a pulp with a desirable color. K. D. JACOB

Sulfur dioxide in dried fruit. F. G. ANDERSSEN. Union S. Africa Dept. Agr., *Sci Bull.* **84**, 14 pp.(1929).—Apricots and sultanas were sulfured for various periods and in various concns. of SO_2, and were partially dried in the shade for 0–4 days before placing in the sun. Partial shade-drying very definitely had the effect of reducing the amt. of SO_2 in the final product. First-grade apricots and probably also pears and peaches could easily be produced with a SO_2 content well below the max. (2000 p. p. m.) allowed by the Brit. Public Health Regulations. Various attempts to reduce the SO_2 content of sultanas below 750 p. p. m., the max. allowed under the regulations, were unsuccessful, all first-grade sultanas contg. at least 1000 p. p. m. SO_2. Fairly green sultanas absorbed less SO_2 than fully ripe ones, but the latter are recommended because of better quality. Sulfured fruit contained much more acid, more reducing sugar and less non-reducing sugar than unsulfured fruit. K. D. JACOB

Diastatic activity of some American honeys. R. E. LOTHROP AND H. S. PAINE *Ind. Eng. Chem.* **23**, 71–4(1931).—German importers of honey test it for diastatic activity. American honey is often penalized for low diastase content, probably because of overheating. In general, honeys with a dark color are high in diastase, while those with a light color are low, although there is a wide variation in honeys of the same floral type. Gothe's method of detg. diastase, which is used by German chemists, is in-

accurate, since the p_H value, which it does not take into consideration, has an effect on diastatic activity. A modification of this method has been developed in which the p_H is controlled. AMY LEVESCONTE

The effect of heat on the diastatic enzymes in honey. H. W. DE BOER. *Chem. Weekblad* **27**, 646–8(1930).—The method of Gothe (*C. A.* **9**, 1077) was used to det. the amt. of diastatic enzymes present in honey from various sources, after heating 1–24 hrs. at temps. of 60–90°. The amt. of diastatic enzyme is not reduced when a typical honey is heated for 24 hrs. at 60° but is completely destroyed by heating for 1 hr. at 90°. W. GORDON ROSE

Cattle feeds of western India. D. L. SAHASRABUDDHE. Bombay Dept. Agr., *Bull.* **161**, 23 pp.(1930).—Analyses of various oil cakes, oil seeds, grains, grain by-products, leaves, stems, roots and silages used as cattle feeds in western India are tabulated. K. D. JACOB

The alimentary value of feeding stuffs and their chemical composition. CARLO TOA. *L'alimentazione* **1**, 11–21(1930).—The chem. compn. and the alimentary value of leaves vary in a given plant with the time of harvest and the state of preservation. The leaves of trees are very similar in chem. compn. to those of leguminous plants, being richer in N compds. and fat. The digestibility of these leaves is not inferior to that of leaves of leguminous plants. Straw from cereals contains raw proteins 2.5–6, fat 1–3, cellulose 34–44 and carbohydrates (pentosans) 33–38%. Straw of beans and peas is more nutritive. The consistence and the taste of straw are improved by treating with steam at 4 atm. and NaOH, which causes a partial hydrolysis of the cellulose and pentosans, forming saccharides more easily attacked by the digestive enzymes, and increasing the nutritive value The husks are a little richer in proteins and carbohydrates and poorer in cellulose. The husks and pods of clover and alfalfa are richer in digestible proteins, the nutritive value of which is not much under that of hay. They contain proteins 4.5–10, fat 0.5–1.3 and carbohydrates 30–40%. Blood can be used for feeding animals. The contents of blood in N compds. are for cows 19.14, calves 16.57, pigs 22.23, sheep 16.81, horses 18.71%. Fresh blood is only used with pigs and poultry. Dry blood contains N compds. 80–84, fat and carbohydrates 2.5, and salts 3%. R. SANSONE

Iodine content of some New Zealand pastures. B. W. SIMPSON. *New Zealand J. Agr.* **41**, 179–82(1930); cf. *C. A.* **25**, 732.—The I content of a no. of samples of New Zealand pasture grasses ranged from 0.011 mg. to 0.191 mg. per 100 g. of dry material, depending on the locality and the time of year at which the samples were taken. In general, the I content reached a max. during June and July and was at a min. during Dec. and Jan. K. D. JACOB.

Balanced cubes. CHARLES CROWTHER. *Fertiliser, Feeding Stuffs and Farm Supplies J.* **15**, 747–8(1930).—The production of animal feeds in the form of pellets of various shapes and sizes is meeting with considerable favor in England. The advantages of this form of feed are: a balanced, non-segregating feed may be produced; accurate rationing may be effected with a min. of labor; the feed is cleaner, more easily handled and stored and keeps fresh and wholesome much longer than ordinary feeds; loss of feed is reduced to a negligible amt.; and feed receptacles are maintained in a more sanitary condition K. D. JACOB

Feeding experiments with fermented beet slices and dried slices containing lactic acid. K. POPÍŠIL AND V. SÁZAVSKÝ. *Listy Cukrovar.* **49**, 33–9(1930).—During the feeding of dried beets, the solid content of milk rose 1.63%. In changing from fermented to dried beets, the lactation and live wt. decreased 1.0%. On a diet of dried beets plus lactic acid the yield of milk was decreased 3.7–6% and the consumption of drinking water was decreased 20–30%. A decline in live wt. occurred in changing to 3.87 kg. dried beets; if 4.3 kg. dried beets was fed, the live wt. remained const.; if 0.6 kg. lactic acid was added to the 4.3 kg. dried beets, an increase in live wt. occurred. In general, the lactic acid had no effect upon lactation. Fermentation of wet beets destroys 33% of the beet and increases the transportation costs. The drying of beets decreases their food value 20%. By increasing the dry matter from 6 to 7%, it may become economically profitable to use dried beet slices in cattle feeding. F. M.

Plant and animal nutrition (ESSKUCHEN) **15.** Rapid determination of moisture of wheat and flour (FAIRBROTHER, WOOD) **7.** Packing and wrapping materials [for foodstuffs] (Fr. pat. 687,126) **18.**

MACLEOD, ANNIE L., AND NASON, EDITH H.: **Chemistry and Cookery.** New York McGraw-Hill Book Co. 545 pp. $3.50.

Food. ALFRED DREESSEN. Ger. 506,597, April 26, 1929. Fresh sea fish is preserved by laying bare the backbone and coating with H_2O_2.

Food. ÈTABLISSEMENTS GROSJEAN FRÈRES. Fr. 687,238, Dec. 26, 1929. A food product is composed of a mixt. of dry grated cheese and vegetable or animal fatty substance such as cacao butter or margarine.

Device for determining the water content of flour, etc., by measuring its electrical resistance. FRIEDRICH AMME. Ger. 508,512, Aug. 2, 1929.

Bread. VOLKMAR KLOPFER and VOLKMAR KLOPFERS NAHRUNGSMITTEL A.-G. Ger. 509,033, Aug. 26, 1928. A method of mfg. whole-wheat bread is described in which a dough prepd. at a moderate temp. from bran and water, contg. enzymes, lactic-acid producers and basic mineral substances, is dried *in vacuo* at a low temp., ground, mixed with flour and baked.

Mixing vegetable phosphatides with flour, cocoa, etc. HERMANN BOLLMANN. Ger. 508,353, July 6, 1928. Uniform distribution of the phosphatides is effected by mixing the ingredients in the usual manner, forming the mixt. into lumps in a screw-press, and separately grinding the lumps.

Leavening agent suitable for use as baking powder or in self-rising flours. AUGUSTUS H. FISKE (to Rumford Chemical Works). U. S. 1,787,193, Dec. 30. In order to improve the keeping qualities of phosphate-contg. leavening agents, the phosphatic ingredient such as mono-Ca phosphate is prepd. with an added content of an Fe compd. so that it may contain 2-3% Fe (calcd. as Fe_2O_3) by adding a suitable proportion of Fe or an Fe compd. to the H_3PO_4 from which the phosphate used is made.

Baking powder. AKT.-GES. FÜR MEDIZINISCHE PRODUKTE. Ger. 509,035, Sept. 4, 1928. Dicarboxylic acids that decomp. smoothly and completely at the baking temp. into volatile compds. are used as ingredients of baking powder Derivs. of the acids may also be used. Malonic acid is a suitable acid.

Milk foods. SALAMON SZÉKELY. Ger. 507,725, April 17, 1927. Addn. to 488,848 (*C. A.* **24**, 2212). The method of 488,848 for working up into a food natural milk enriched with colloidal casein is modified in that after pasteurization the milk is inoculated with lactic acid or yoghurt cultures and fermented

Device for the electrical pasteurization of milk, etc. ADRIAAN H. W. ATEN and WARNER LULOFS. Ger. 506,693, Mar. 23, 1928.

Tank and coil apparatus for pasteurizing, cooling and ripening liquids such as milk or cream in bulk. ARTHUR H. BOILEAU (to Cherry-Burrell Corp.). U. S. 1,786,819, Dec. 30. Structural features.

Apparatus for sterilizing milk by treatment with low-tension direct current. WILHELM WOLFRUM. Austrian 119,506, May 15, 1930.

Sterilizing apparatus for bottled liquids such as milk. HUIJGEN EN WESSEL'S INGENIEURSBUREAU. Ger. 509,868, Dec. 21, 1927.

Vacuum evaporator for milk, sugar, sap, etc. EMIL HELLER. Swiss 140,076, Feb. 7, 1929.

Centrifugal separating apparatus for liquids, especially milk. ERNST BLASCHKE Ger. 509,197, May 5, 1926.

Albumin and milk sugar from milk whey. ELIZABETH M. MEYER. U. S. 1,787,754, Jan. 6. A small proportion (suitably about 1-2%) of KNO_3 is added to the whey, followed by admixt. with $Ca(OH)_2$ and gradual addn. of water with stirring, and the resulting soln. is allowed to sep. into a heavy creamy portion and a supernatant, substantially clear portion, and albumin and milk sugar are recovered from the latter

Colloidal solution of edestin-calcium in whey. JOSEF SIREK. Swiss 139,170, May 13, 1929. $MgSO_4$ and H_3PO_4 are added to milk to remove part of the casein, the rest being removed by neutralization of the H_3PO_4 by $MgCO_3$. NaOH is then added to the casein-free liquid and the whole boiled until the lactalbumin and lactoglobulin are converted to albuminate. H_3PO_4 is added and the whole again boiled until a ppt. separates. The filtrate is neutralized with $MgCO_3$, stirred with lime water and heated to 57°. The liquid is neutralized with H_3PO_4, boiled and filtered. Sugar is added to form a sirup.

Vacuum apparatus for the vacuumizing of milk powder. IRVING S. MERRELL and HELGE SCHIBSTED (to Merrell-Soule Co.). U. S. 1,786,858, Dec. 30. Structural features.

Solid preparations of milk and cream. PHILIPP BORN (to N.-V. Nederlandsche Gruyere-Blokmelk Fabriek). U. S. 1,786,559, Dec. 30. Solid stable prepns. are obtained by heating the milk, etc., with added sugar, with stirring in a vacuum until water is removed to produce a mass capable of retaining its shape (the final product may

contain 6–15% water), forming the product into blocks and coating the blocks with cacao butter.

Cream separator. SCHWARZWALDWERKE LANZ G. M. B. H. Ger. 508,999, Aug. 29, 1929.

Butter. VICTORINE ALICE MARCHAL (NÉE MILLION). Fr. 687,115, Dec. 23, 1929. Rennet is added to milk cream to further the agglomeration of the mols. of fatty substances, whereby the time necessary for making butter is reduced and the yield is increased. $NaHCO_3$ may be added to prevent rancidity.

Preserving meats such as whale meat. D. A. HANSEN. Brit. 333,898, Jan. 28, 1929. The meat is treated with a soln. which is preferably produced from H_3BO_3 and borax under such conditions and so shortly before use that the formation of polyborates takes place while the soln. is in contact with the meat. Other preservatives such as salicylic acid also may be added. Various details of treatment are given.

Fruit juices. MARC MANGINI, FÉLIX MANGINI and JEAN MANGINI. Fr. 686,895, Mar. 13, 1929. Juices contained in fruits are obtained in a concd. form by submitting the fruits in a strong current of air to a rapid evapn. at about 30–40°, until about $^2/_3$ of the liquid is removed, pressing out the residue and adding to this juice the liquid from the maceration in water of the residues, which liquid is first concd. by simple boiling. The necessary amt. of sugar is added.

Device for atomizing such materials as fruit juice, malt extract, milk, cream, eggs, etc. FRANK H. DOUTHITT. Ger. 507,723, and 507,724, Oct. 9, 1929.

Pectin. SOC. ANON. DES ANCIENS ÉTABLISSEMENTS GAETAN BRUN. Fr. 687,681, Jan. 4, 1930. A concd. pectin is made by adding to a soln. of pectin in water a pptg. agent sol. in water such as alc., a mixt. of alc. and ether or acetone, and drying.

Decolorizing and "deflavoring" colloidal solutions such as those of pectin. WM. A. HOOPER, ROBERT DOUGLAS and LOWELL H. CUTHBERT (to General Foods Corp.). U. S. 1,787,467, Jan. 6. The soln. under treatment is percolated through a mixt. of activated C and a filter mass such as cellulose pulp (material of coarse open texture and with a content of at least 50% C on an air-dry basis being used).

Confectionery. AKT.-GES. FÜR MEDIZINISCHE PRODUKTE. Ger. 509,034, Oct. 16, 1929. Margarine for use in the manuf. of puff pastry is mixed with a small quantity of malonic acid, with or without phosphates.

Apparatus for the removal of caffeine from coffee. WILLHELM A. C. HELMKE. Fr. 687,860, Jan. 8, 1930. An app. is described for the continuous removal of caffeine from coffee by successive treatments with steam, solvents, warm water and alc.

Coffee substitute. WILHELM KOCH. Fr. 687,903, Jan. 9, 1930. A substitute for coffee is made by macerating corn and submitting it to an intense fermentation during the maceration, after which it is roasted.

Transparent paper (suitable for packing food products). OTTO KLOTZ. U. S. 1,786,011, Dec. 30. Both sides of a translucent paper are coated with a soln. of gelatin to render it transparent.

13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

Surface energy and chemical engineering. V. The formation of precipitates. W. GIBBS. *Ind. Chemist* **6**, 273-6(1930).—The influence of the conditions upon the character of the pptd. particles in solns. and gases is discussed at length, and in particular the degree of supersatn. and development of the primary ppt. The conditions are pointed out which tend to produce small, large, cryst., amorphous, etc., particles (cf. *C. A.* **24**, 3066). E. G. R. ARDAGH

Industrial ultrafiltration and the metafilter. C. PLANS. *Quim. e ind.* **7**, 253–6 (1930). P. describes the Chamberland type of metafilter, and the ultrafilter press, each with a sketch. The only industrial ultrafilter is of the latter type, the filtering medium being collodion. The funnel type ultrafilter is used principally in the lab. for microanalysis and in bacteriology. S. L. B. ETHERTON

The transmission of heat between moving fluids. A. MONDIEZ. *Chaleur ind.* **11**, 117–25, 188–96(1930).—On the basis of the classical theory, M. develops a series of equations for (1) parallel current and (2) counter current, and compares the two circulations. Weaknesses of the classical theory are pointed out. M. then develops more exact equations. Heat transmission is examd. in countercurrent flow and in the case where one fluid circulates and the other remains const. and uniform. In some cases

countercurrent flow is most desirable and in some cases parallel flow; in some cases comparative direction is immaterial. The analytical method is applied to the tubes of a locomotive superheater. S. L. B. ETHERTON

Purifying reacting materials. SOC. CHIM. DE LA GRANDE PAROISSE, AZOTE ET PRODUITS CHIM. Fr. 687,408, Dec. 30, 1929. Substances to be used in exothermic chem. reactions, particularly in gaseous catalytic reactions, are heated by indirect contact with the reacting substances, passed to a purifying mass placed in a sep. container and then led to the reaction chamber. Fr. 687,409 describes the purification of substances to be used in chem. reactions by mixing them with the reaction products coming from the reaction chamber, passing the mixt. through the purification mass, sepg. the reaction products and passing the purified substances to the reaction chamber.

Purification of gases. I. G. FARBENIND. A.-G. Fr. 688,186, Jan. 14, 1930. Gases contg. C_2H_2, obtained by the treatment of hydrocarbons in the elec. arc, are purified by directing them over porous active material and, if necessary, freeing them by appropriate agents, such as $FeSO_4$, from compds. contg. the radical -CN, before or after the other treatment.

Purification of gases. SIEMENS-SCHUCKERTWERKE A.-G. (Richard Heinrich, inventor). Ger. 508,889, Jan. 25, 1928. Minute particles are removed from gas by leading it into an ionized gas current so that the gas is partly negatively and partly positively ionized before reaching the filter.

Drying gases. OSCAR M. HENRIQUES and THOMAS A. THOMSEN. Fr. 688,564, Jan. 20, 1930. Gases used in the manuf. of anhyd. $AlCl_3$ are dried by passing them over or through incandescent C; the speed and temp. are regulated so that the content of steam is converted to CO and H as completely as possible.

Absorbing gases or vapors. SOC. ANON. DES CHARBONS ACTIFS ET PROCÉDÉS

ÉDOUARD URBAIN. Fr. 687,501, Mar. 20, 1929. In the absorption of gases or vapors by a solid absorbent, the absorbents are used in horizontal layers of regular or irregular grain, traversed by the gas upward; the thickness of the bed is such that the static pressure exercised by the absorbent on its support is at least equal to the weight lost by the gas in its passage through the absorber when the gas traverses the absorbing layer downward under the max. flow realized during the absorption.

Catalytic decomposition of gases and vapors. I. G. FARBENIND. A.-G. (Hans Rotger and Fritz Stöwener, inventors). Ger. 509,582, July 31, 1927. The gases or vapors are led over a highly porous active contact mass with pores diminishing in size in the direction of the gas current In an example, a mixt. of air and SO_2 is passed successively over coarse and fine platinized SiO_2 gel at 475°. Other examples are given.

Separating gases. ÉDOUARD URBAIN Fr. 688,528, April 9, 1929. Gases or vapors contained in a gaseous mixt. are sepd. by washing with cold water contg. a large amt. of absorbent charcoal in suspension, the complete sepn. of the absorbed substances being afterward effected on the charcoal filtered from the water. An example is given of the sepn. of benzene from lighting gas.

Separating constituents of gas mixtures. I G FARBENIND. A.-G Brit. 333,907, April 15, 1929; Fr. 687,357, Dec 28, 1929. Sepn. is effected by diffusion of one or more constituents of the mixt into a body of vapor generated by evapg. a liquid in contact with the gas mixt The liquid is preferably preheated and the gas mixt. used at a temp. sufficient to vaporize the liquid. App. is described in which the liquid is distributed over an annulus of clay balls, Raschig rings or the like, the gas being supplied to a space around the annulus and a cooling pipe being placed within the annulus.

Fractionally separating suspended or emulsified substances. J. D. RIEDEL-E. DE HAEN A G Ger. 509,500, Feb. 15, 1924. The sepn. of suspended or emulsified substances into fractions of different particle size by centrifuging or sedimentation is assisted by adding an org. electrolyte of high mol. wt to the suspension, etc. Thus, NH_4 humate may be added to a graphite hydrosol before centrifugal fractionation. Other suitable addns are lignin sulfonates and soaps

Extracting crude materials with solvents. JOHS CROPP and G. KNOTH. Ger 509,813, Oct 6, 1929 Non volatile materials are extd by making a paste of the crude material with a solvent and submitting the mass to the action of the vapor of the extg. agent in an app. consisting of a multi stage column *Montan wax* is extd. by C_6H_6 vapor from a paste of dried distn coal, C_6H_6 and EtOH Other examples are given.

Polymerizations. I. G FARBENIND. A G Fr 687,721, Jan 6, 1930. In carrying out polymerizations in which a large amt. of heat is evolved, such as the polymerization of butadiene hydrocarbons in the presence of polymerization agents, the reaction vessel is connected to another vessel called a "moderator", which contains no polymerization agent so that the substance to be polymerized can distil over into the moderator when the reaction becomes too violent and can be returned to the reaction vessel when the violent action dies down

Dissolving salts. KALI-FORSCHUNGS-ANSTALT G M B H. (Erich Ritter, inventor). Ger 508,090, Nov. 8, 1925 In dissolving large amts. of salts, economies are effected by heating the solvent with waste steam under an abs. pressure of at least 4 atm.

Filtering liquids. REGINALD H. LEE-PENNELL and ADRIAN W WYLIE. Fr. 687,6[illegible] 4, 1930. In app. for *filtering water* or other liquids upward through a filtering [illegible]r, air under pressure is automatically stored on the evacuating side of the filtering [illegible]ring the normal working of the filter, and is used to accelerate a reverse flow of liquid through the filtering layer when washing the filter.

Pulverizing materials to colloidal or semi-colloidal fineness. ROHM & HAAS CO. Ger. 509,759, Oct 20, 1928. The pulverization takes place with addn. of vapor of low-boiling liquids, optionally mixed with air Thus, paraffin, wax and methyl violet are molten and ground in a colloid mill in the presence of a mixt of petr. ether and ether vapors

Cleaning apparatus chemically. SCHERING-KAHLBAUM A.-G. (Walter Baensch, inventor) Ger 507,636, June 28, 1928. Solvent vapor is passed into the app. where it condenses on the inner surfaces to dissolve soluble impurities It is washed out together with the insol. impurities.

Method of washing pasty, granular or liquid products in a centrifugal machine. LUDWIG ALTPETER. Ger. 509,242, May 1, 1926. Manipulative features are described.

Heating air and water by flue gases from furnace plant. GEORGE K. ENGELHART. Ger. 500,972, July 24, 1925.

Preventing loss of the product of suction-roasting furnaces. BERGWERKSGESELL-

SCHAFT GEORG VON GIESCHE'S ERBEN and WALTER LANGNER. Ger. 506,583, June 18, 1929. The material to be roasted or sintered is placed in material such as paper or fabric, which is pervious to air.

Refrigerating mixture. OSCAR HANNACH (to Wilhelm Kash). U. S. 1,786,842, Dec. 30. NH_4Cl is used with an excess of Na_2CO_3 to form a mixt. producing a decrease in temp. on being dissolved.

Waterproofing and flame-proofing coverings of electrical conductors. JOSEPH A KENNEDY (to Anaconda Wire and Cable Co.). U. S. 1,787,629, Jan. 6. A covering material is first impregnated with wax having a lower m. p. than the flame-proofing compd. subsequently to be applied; it is then coated with a flame-proofing compd. such as stearin pitch, which is liquefiable by heating but at a higher temp. than the m. p. of the wax.

Insulating material. CHARLES A. STYER (to The Canadian Westinghouse Co., Ltd.). Can. 305,860, Nov. 18, 1930. Asbestos tape is baked to remove any carbonaceous material and is then impregnated with tritolyl phosphate.

Insulating material. I. G. FARBENIND. A.-G. Fr. 687,702, Jan. 4, 1930. Elec. insulating materials are composed of mixed cellulose esters of fatty acids of low mol. wt., such as cellulose acetate-butyrate or cellulose monoacetate-dipropionate; they may be made from solns. of the esters in acetone, etc.

Heat- and sound-insulating material. H. BOHLANDER. Brit. 333,957, May 28, 1929. A felt-like material is formed of 2 different kinds of inorg. fiber, one chosen for its strength and the other for its insulating properties, such as asbestos and slag wool, which can be treated with a binder such as starch or water glass and mixed with other materials such as kieselguhr or magnesia. Various details of manuf are described. Cf. *C. A.* **24**, 2217.

Heat insulating material suitable for use in building construction, etc. GEORGE B. STRYKER, JR. (to Weatherproof Products Co.). U. S. 1,786,462, Dec. 30. An insulating mixt. is formed from finely comminuted cotton stalk fiber 67–73, finely comminuted paper waste 25 and dissolved rosin 2–8%.

Mica composition. BAKELITE CORP. Fr. 688,149, Jan. 13, 1930. A moldable compn. suitable for *elec. insulators*, etc., is composed of a phenolic resin and a filling material contg., *e. g.*, 5% of finely divided mica.

Thin insulating layers on wires. REINHOLD RÜDENBERG and WALTER SCHOTTKY (to Siemens-Schuckertwerke A.-G.). U. S. 1,786,920, Dec. 30. Thin insulating layers having a thickness of less than 0.01 mm. are produced on wires by alternate pptn of different insulating substances such as paraffin hydrocarbons from the gaseous state upon the surface of the strongly cooled wire. App. is described.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

The new Elbe water supply plant at Aussig. E. KROB AND TH. GRUSCHKA. *Gas u. Wasserfach* **73**, 1057–65(1930).—This is one of the first plants to use the Adler high-chlorination and dechlorination plants. Bank-filtered water from wells is obtained from two sources, one giving ordinarily pure water and the other a mixt. of ground and surface waters. Ordinarily, the latter source alone requires extensive purification. Addition of alum and (or) iron sulfate is followed by chlorination and settling, after which the water is passed through rapid and slow sand filters. After a second chlorination the water is passed through Depurit active charcoal filters to remove chlorine, etc. The active charcoal filter is regenerated with Na_2CO_3 solutions at monthly intervals and by occasional steaming. The resultant water has no taste, color or odor. A less intensive purification process is used when possible. R. W. RYAN

The water supply of Stuttgart and the use of active charcoal. E. LINK. *Gas u. Wasserfach* **73**, 985–92, 1016–22, 1033–8(1930).—The principal sources of water supply at Stuttgart are the "Landeswasserversorgung" with a source 100 km. distant, the Gallenklinge peak-load and emergency source which takes water from the park lakes, and the Neckar water works, together with a number of smaller works. The Gallenklinge and Neckar waters require special purification. High chlorination (two stages) is used to insure sterility and after clarification and filtration an Adler Mutonator or active charcoal filter is used to remove the excess of Cl and chlorinated compounds. Chlorinated Na_2CO_3 soln. is used for regenerating the charcoal and this is followed by treatment with $CaCl_2$ soln. to remove alkali and to deposit $CaCO_3$. Colorless, odorless

and tasteless water is prepd. by the present methods of treatment. Exptl. and details are given. R. W.

Biological investigation of Stuttgart park lakes as related to water supply. K ENGLER. *Gas u. Wasserfach* **73**, 1081–90(1930); cf. *C. A.* **24**, 3845.—The seasonal and other biol. changes in the water of the Stuttgart park lakes are discussed with respect to causative factors and the effect on the water supply. R. W. RYAN

Progress of Steelton (Pa.) system. GEORGE H. ROBERTS. *Water Works Eng.* **83**, 352(1930).—The development and improvement of the Steelton water system since 1899 are described. C. H. BADGER

Dissolved oxygen condition in the harbor waters of the metropolitan district. WILLIAM T. CARPENTER. *Sewage Works J.* **2**, 276–83(1930).—There has been a marked decrease in the O content of the harbor since 1909. Since 1921 the rate of fall has been less rapid than before Variation in the amount of O present at any point in the harbor may be classed as tidal, seasonal or annual. The data for 1919 show a considerable annual variation due to fluctuations in the flow of upland waters and to air temp The 1929 data show a marked variation, due possibly to the abnormal growth of green water plants stimulated by an abnormal abundance of sunshine. The Harlem and East rivers are in a condition which might, under the proper conditions, give rise to nuisance but which will be made entirely safe on construction of the Ward Island Plant. E. HURWITZ

How a small-town water works (Cocoa, Fla.) reduced its iron content. T. M. EARLY *Water Works Eng.* **83**, 287–8(1930).—The present capacity of the water works is 0.75 m. g. d. Water is taken by pumps through sand traps from 4 groups of wells, each contg 6 shallow wells 3.5 in. in diam., from as near the surface as possible, since at greater depths much H_2S and salt are obtained After aeration the incoming raw water is treated by means of dry-feed machines with 2.25 grains of alum and 3 grains of soda ash per gal. Approx. 1 grain lime per gal. is added to the mixing trough situated between the 2 coagulating basins. Aeration alone raises the p_H value of the water from 5.6 to 6.8. With alum and soda ash only, the p_H could not be brought above 7.0, while with lime the p_H is raised to 7.8 8.2. The color and quality of the water have been much improved and red water has been greatly reduced. C. H. BADGER

Demonstrating proposed treatment by means of miniature plant (Morgantown, W. Va.). LEWIS V. CARPENTER. *Water Works Eng.* **83**, 351–2(1930).—The normal consumption of water is 1.8 m. g. d. Usually, 80% of the supply for 8 months of the yr. gravitates from an earth reservoir which is supplied by a mountain stream. This water is chlorinated. The addnl. source of supply, Monongahela River water is treated with lime and alum, filtered through rapid sand filters and pumped to storage reservoirs. While the river water above the intake is polluted by sewage from approx. 125,000 people during times of low flow the bacteria count is very low, presumably because of the stabilizing effect of 50 m. g. d. of mine water contg. an av. acidity of 400 grains per gal. The river water often has an acidity of 40 p. p. m. and a p_H of 3.6. When the mountain supply is cut off after June 1, the hardness increases from about 15 p. p. m. to from 150 p. p. m. to 300 p. p. m. later. Consequently, many complaints are received from consumers. Based on a future supply of 4 m. g d., filtration of the present mountain supply and zeolite softening of the river supply were recommended. In order to acquaint the people with the various methods of water treatment a miniature plant consisting of a coagulation basin, chem. feed devices, rapid sand filter, gravity type zeolite (greensand) filter and chlorinator was built in the city building. The filters were made from domestic hot water tanks and the coagulation basin and the storage reservoir were made from barrels C. H. BADGER

Experiences with water supply from reservoirs on streams (Talsperren). LEMBERG. *Gas u. Wasserfach* **73**, 1129–36(1930).—Various experiences with water yield, etc., also graphs showing free CO_2, permanganate requirements, bacteria number, etc. are given. R. W. RYAN

Geology and characteristics of Tennessee ground waters. WALTER F. POND. *Water Works Eng.* **83**, 316, 319(1930).—In the mountains of east Tenn. springs yield soft waters, although Fe is sometimes present. In the valley of east Tenn. the occurrence of ground water is quite varied. The larger cities obtain their water supplies from surface streams and springs. These also furnish most farm supplies. The waters are of medium hardness, $Ca(HCO_3)_2$ predominating. In the Cumberland Plateau the waters are apt to contain much Fe. In central Tenn. springs are common. Well waters are uncertain both as to quality and quantity. Shallower waters contain 50–500 p. p. m. dissolved solids with from 30 to 300 p. p. m. of non-carbonate hardness, but they are usually free from excessive Fe or H_2S. The max and min. total dissolved solids for 101 well and

spring waters were 26,410 and 50 p. p. m., resp. In West Tenn., geologically quite different from the rest of the state, the waters contain more mineral content the greater the distance from the outcrop. Waters from the basal Eutaw-Tuscaloosa sands and gravels, Ripley formation and Wilcox formation are $Ca(HCO_3)_2$ waters of low to medium hardness with usually enough Fe present to require its removal. Memphis and most of the larger cities and towns derive their supplies from the Wilcox formation. At Memphis $NaHCO_3$ water is found in the Ripley formation at a depth of 1400–1600 ft. This is ascribed to base exchange. C. H BADGER

Surface water supply of the United States in 1926. III. Ohio River basin. NATHAN C. GROVER, A. W. HARRINGTON, A H. HORTON, LASLEY LEE, J. J. DIRZULAITIS, H. J. GROSBACH, W. R. KING AND E. D. Manganese in river water and its removal. PERKINS BOYNTON. *Am. J. Pub. Health* **20**, 1346–7(1930). J A KENNEDY

Comparative rates of stream purification under natural and controlled conditions. H. W. STREETER. *Ind. Eng. Chem.* **22**, 1343–6(1930); cf. *C. A.* **22**, 4687. – Comparison in reduction of biochem. O demand of the Ill River and of the artificial controlled stream at the Cincinnati station is made The rates of oxidation in this highly polluted river seem to be similar to those under controlled conditions of the exptl stream flow The apparent rate of reduction in biochem O demand is not necessarily a criterion of the true rate of reoxygenation. The demand value of suspended material, immediate demand value of the stream and of readsorbed material from the bottom are controlling factors A large proportion of the O demand of a stream is utilized by deposited material Removal by sedimentation of material, while decreasing the immediate demand, may in the course of time, raise the basic demand The rates of oxidation measured in the artificial stream channel were of "the same order of magnitude" as for the river with the same "density of pollution" EDWARD S. HOPKINS

Purifying water for domestic use. ROBERT SPURR WESTON. *Civil Eng.* **1**, 197–201 (1930). – A review E H

New investigations of the chemical treatment of drinking water. H KLEPTAR *Gesundheits-Ing.* **53**, 641–3(1930). – A study has been made of the concn. of chloramine needed as a sterilizing agent for cultures of *B. coli*, *Staphylococci*, *B. subtilis* and *Staphylococcus aureus*. Sterilization was completed in very short periods if AcOH was added to the extent of 0.5 cc per l The Na deriv. of *p*-toluenesulfonchloramide was used as a disinfecting agent A. I. ELDER

Rational constants for expressing the results of water analysis. A. SULFRIAN. *Seifensieder-Ztg.* **57**, 805–8(1930). cf *C. A.* **24**, 4105. – A general review suggesting the use of S.'s "Millinorm table" as a standard in water analysis, by which the various German, French and British degrees of hardness can be converted into each other and into the chem. equivs. of CaO, MgO, etc., with 0.1 *N* soln. per 100 cc. (= 1/1 *N* per l.) as a basis of calcn. P ESCHER

Volumetric sulfate determinations and limits of error in water analysis. R. SCHMIDT. *Z. anal. Chem.* **82**, 353–61(1930).—Various methods for the detn. of SO_4 in water are discussed and the practical advantages of the iodometric chromate method are pointed out. The 3 most promising adaptations of this method to water analysis

appear to be the procedure recommended by Bruhns, by Nachtigall and Raeder and by Koszegi. B. used a suspension of $BaCrO_4$ as reagent, N. and R. used a soln. of $BaCrO_4$ in 0.1 *N* HCl and K. used $BaCl_2$ as reagent, pptg. the excess Ba^{++} with a measured vol of $K_2Cr_2O_7$. In all 3 methods, the filtered soln. to be titrated finally contained 1 $Cr_2O_7^{--}$ for each 2 SO_4^{--} originally present; this $Cr_2O_7^{--}$ was detd. iodometrically. The results of 38 expts. compared with gravimetric detns. of the SO_4^{--} content of 15 samples of water showed that the method of B. gave the best values, that the method of K. is nearly as good but that the method of N. and R. suffers from an attempt to carry out the pptn. at the boiling temp., whereby some $Cr_2O_7^{--}$ is reduced by org. matter present. The following procedure was adopted as a result of these expts. To 100 cc. of water in a 200 cc. measuring flask add 20 cc. of $BaCrO_4$ soln. contg. about 90 mg. $BaCrO_4$ dissolved in 0.2 *N* HCl. This quantity of reagent suffices for a SO_4^{--} content of 280 mg. per l. (If nitrites are present, first add 0.5 cc. of 5% NaN_3 soln.) Shake well and allow to stand 30 min. Then neutralize by adding NH_4OH carefully until the soln. assumes a light, greenish yellow color; 10 drops of 25% NH_3 usually suffices. Make up to the mark, mix, allow to stand 5 min. and filter through a small dry filter. Discard the first 20–30 cc. of filtrate and take 100 cc. for further analysis. Add 1 g. of KI and 10 cc. of 25% HCl. Titrate with 0.1 *N* $Na_2S_2O_3$. Carry out a blank analysis with the reagents. The results obtained by this procedure are excellent. The greatest deviation from the gravimetric values was 6.3 mg. per l. It is pointed out that even this max. deviation lies within the permissible limits for water analysis. W. T. H.

Use of lime for removal of iron and carbon dioxide. F. M. Veatch *Water Works Eng.* **83**, 311(1930); cf. *C. A.* **24**, 5088. C. H. Badger

Principles of boiler-feed control. A. Sulfrian. *Braunkohle* **29**, 887–9(1930); cf. Regel, *C. A.* **24**, 5399.—Expression of analytical results in milli-equivs. instead of in arbitrary hardness degrees is recommended. K. H. Engel

Water and sewage. F. Sierp *Kolloid-Z.* **47**, 372–8(1929).—A review. A. Fleischer

Automatic sewage pumping plant at Georgetown. Anon. *Engineering* **130**, 754 (1930). E. H.

Colloids in relation to sewage purification. H. Wilson. *The Surveyor* **78**, 561–2 (1930).—Although colloidal material is largely removed in the upper foot of a percolating bed, there is required 5 times the depth for the removal and destruction of dissolved materials. Adsorption is the important factor in removal of colloids. A. L. E.

Effect of temperature on rate of settling of sewage solids. G. M. Ridenour. *Sewage Works J.* **2**, 245–50(1930).—The rate of settling of sewage solids is slightly increased up to 30°, after which it rapidly decreases. The effect is most pronounced in settling periods of from 0 to 30 min. At the end of 2 hrs. the percent removal of solids is practically the same for all temps. between 1° and 37°. The settling of finer particles was not influenced by temp. Less flocculation of sewage particles occurs at higher temps. than at lower temps. At higher temps. the sewage particles settle in a finely divided state. Below 30° a more pronounced flocculation of particles was noticed. E. H.

Ordinary chloroform as a sewage preservative increases oxygen consumed values. R. T. Homewood and H. W. Rue. *Sewage Works J.* **2**, 251–4(1930).—The use of ordinary chloroform as a preservative for sewage and trade wastes increases the oxygen-consumed value (permanganate reduction). The increase is proportional to the amount of chloroform used. The error can be avoided by washing out with water the impurities in ordinary U. S. P. chloroform. E. Hurwitz

The use of single- and multiple-unit tank cars of liquefied chlorine gas in disinfecting sewage. Joseph W. Ellms and G. T. Pond. *Sewage Works J.* **2**, 260–5(1930); cf. *C. A.* **24**, 5300.—Changes in the disinfecting equipment to permit the use of multiple-unit tank cars consisting of 15 one-ton containers of chlorine and single-unit cars consisting of one 15 ton container made possible a large saving in cost of disinfection at the Cleveland plants. E. Hurwitz

The river as purification works. Mahr. *The Surveyor* **78**, 618–9(1930); cf. *C. A.* **25**, 369.—A formula for permissible sewage load on a river is:

$$Q = qt\left(\frac{1/_5\, S}{a} + 60b\right), \text{ where}$$

Q = the river water vol. in (cu. m./sec.), q = the sewage vol. spread over 24 hrs. (cu. m./sec.), t = the mean river depth (m), S = the biochem. O demand of the sewage (g./cu. m.), a = the amt. of reaeration of the river (g./sq. m./day), b = the sludge con-

tent of the sewage (cc./1). Fluctuations in temp. must be kept in mind when considering river purification. A. L. ELDER

Experience with chlorination of sewage along a seacoast near bathing places O. KLINGBERG AND E. SCHROEDTER. *Gesundheits-Ing.* 53, 753–4(1930).—Cl, used to the extent of 6–7 mg. per l., proved satisfactory. A. L. ELDER

Disinfection of sewage. H. BRUNS. *Tech. Gemeindeblatt* 33, 233–6(1930). Sewage chlorinated at the rate of 20 g. per cu. m. showed bacterial reduction from several million to 10–30,000. Coli counts were lowered proportionately. A. L. E

Activated sludge. F. R. O'SHAUGHNESSY. *Sewage Works J.* 2, 255–9(1930). Several personal views and opinions are presented regarding activated sludge and the activated-sludge process. Floc is considered as a matrix upon which the organisms sustain themselves in the presence of moving water. This phenomenon is the basis upon which the whole activated-sludge process rests. E. HURWITZ

Sludge-aeration experiments. I. Rate of disappearance of oxygen in sludge. EMERY J. THERIAULT AND PAUL D. MCNAMEE. *Ind. Eng. Chem.* 22, 1330–6(1930); cf. *C. A.* 24, 450.—Expts. were conducted for about a year in the artificial stream channels, approx. 1 mile in length, of the U. S. Pub. Health lab. at Cincinnati. The purpose of this study is to show the rate of purification under controlled conditions. Storage effect, H-ion concn. changes and diln. were considered. It was concluded that actual oxidation purification by aerated sludge in the channels is effected at about the same rate as that observed in the lab. expt. for a given temp. Expts. indicated that the rapid reduction of org. material in the liquid when sewage and aerated sludge are mixed is due to adsorption by the sludge and not to oxidation. New app. was developed for detg. the O demand of sludge without diln. The diagrams presented are clear and the methods should be of value as they are simple and easy to manipulate. F. S. H

Influence of rotating sludge in digestion tanks on gas production, tank size required and floating scum. F. SIERP. *Gesundheits-Ing.* 53, 810–12(1930).—Stirring increases gas products 10–20%, and decreases the capacity for digestion and trouble due to floating scum in tanks. Gas increase does not compensate the cost of stirring. A. L. E

Gas formation from Emscher tank floating sludge. H. BACH. *Gesundheits-Ing.* 53, 790–2(1930).— The rate of gas formation from different tanks was measured by lab. expts. Gas production was practically complete in 60 days. The ratio of org. matter in raw sludge compared to digested sludge from 4 tanks was 1.25, 2.0, 1.2 and 1.54. The compn. of the gas was usually about 20% CO_2, 70% CH_4 and 10% N, and H_2. A. L. ELDER

Some observations of the effect of pollution contributed to streams. J. K. HOSKINS AND H. R. CROHURST. *Ind. Eng. Chem.* 22, 1340–2(1930).—By using the characteristics of the Ohio River between Cincinnati and Louisville as a basis, this study was undertaken to det. the polluting effect on a large stream of increasing population on its watershed. Comparison of data for the years 1914–15–16 with the past year indicates that the river at these points is in a better condition now than at the time of previous investigations. This is true, although the available dissolved O has decreased. It is believed that interpretation of biochem. O demand results may often be influenced by errors in stream flow measurement or by analytical errors of sufficient magnitude as to lead to erroneous conclusions. EDWARD S. HOPKINS

Survey of the pollution of rivers and lake in the vicinity of Rochester, N. Y. STUART E. COBURN. *Ind. Eng. Chem.* 22, 1336–40(1930).—A general description is given of a sanitary survey of the bathing beaches on Lake Ontario during the summer of 1929. Moderate pollution was present from the discharge of the Genesee River, from Irondequoit sewage-treatment plant, from erosion of banks and from the bathers themselves. It was concluded that the health hazard was negligible. A standard of quality allowing 100 organisms per cc. on presumptive test of the colon-aerogenes family per single sample, in not more than 5% of the individual samples collected, was adopted for the survey. EDWARD S. HOPKINS

The new Michigan law with regard to stream pollution and sewage disposal. WALTER A. SPERRY. *Municipal Sanitation* 1, 157–61(1930). G. L. KELSO

The question of the purification of phenol waste waters. W. A. Perlow Z. *Hyg. Infektionskrankh.* 111, 511–30(1930).— The possibility of bacterial destruction of aromatic compds. which have a strong bactericidal action is established. Activated sludge from household waste shows an outstanding specializing action for the destruction of different chem. compds. The destructive action can be increased by gentle aeration. PhOH is easily destroyed in a concn. of 1–550, but cresol and β-naphthol are less easily destroyed. The activity shows itself in the loss of the amt. of sludge and air mixt. or in the amt. of sludge alone which is necessary for the destruction of a unit of the aro-

matic compd. Treated PhOH waste water not only gives neg. PhOH tests but is also able to support fish life. Filtration through charcoal together with aeration and sludge treatment gives the best results. RACHEL BROWN

Sanitary protection at mining camps. E. B. BESSELIEVRE. *Mining & Met.* **11**, 538-40(1930).—A description is given of the model sewage-treatment plants of the Home Copper Co. at Noranda, Que., and Hudson Bay Mining Co at Flin Flon, Man. The water-purification plant is of the mech. gravity type and has a max. capacity of 1,000,000 gals. per day. The process consists of chem. coagulation, filtration and chlorination. A figure shows the activated-sludge sewage-treatment layout. W. H. B.

Can a public pool be safe? CARL A. HECHMER. *Municipal Sanitation* **1**, 138–41 (1930). -The Chevy Chase, Maryland, swimming pool owned by the National Capitol Natatorium Co. is 200 ft. long and 100 ft. wide with depth range from 1 to 10 ft. The water is circulated through a purification system consisting of an alum pot. pressure filter and chlorinator. The filter is backwashed with pool water, doubly chlorinated. The free Cl content of the water is tested every 2 hrs. by the *o*-tolidine method and is maintained in the influent at 0.4–0.5 p. p. m. and in the effluent at 0.1 p. p. m. Soda ash is added in an attempt to keep the p_H up to 7.6–8.0. Bacterial examns made semi-weekly during the season of 1929 showed 92% of the samples to pass the U. S. Treasury Department Standard for drinking water. Daily cost of water was $11.90 and the daily cost of providing safe water was $19.40. G. L. KELSO

Road tars and fish life. REPORT OF THE JOINT COMMITTEE ON DAMAGE TO FISH-ERIES. *The Surveyor* **78**, 625-6, 641-2(1930).—The purpose of the investigation was to establish whether tar as used for surfacing roads was harmful to fish life; if so, which of its constituents was responsible, the concns necessary for the toxic effects to be noted and precisely how the fish were affected. Yearling perch were selected as the exptl. fish. The first washings from tarred roads are definitely toxic to fish. Naphthalene in concns. greater than 1 part per 100,000 are toxic to shrimp. Loss of equil. was the prominent symptom observed in fish poisoned with tar wastes. Crude tar diluted 1:1000 killed 1 in the ratio of 4. Aq. exts. from road board tar were toxic in concns. of 1 vol. of tar extd. with 100 vols. of water. Aq. exts. from synthetic tar, heavy oils and coal-tar pitch were toxic. Killing strengths in parts per 100,000 for perch were: lowest with acridine, 0.07; phenol 1.0-1.5; phenol 0.9; pyridine 100, isoquinoline 10, guaiacol 7–8, quinoline 4.5-5, naphthalene 4.0. The harmful effects of these substances on milt and ova of brown trout were shown. A. L. ELDER

Determination of S by means of the turbidimeter (PARR, STALEY) **7**. Rapid colorimetric estimation of I in mineral waters and brines (CASE) **7**. Filtering liquids (Fr. pat. 687,692) **13**. Decantation apparatus; water-softening apparatus (Belg. pat. 307,201) **1**.

Purifying and softening water. ARTHUR R. MOBERG (to Fred O. Paige, Jr.). U. S. 1,787,601, Dec. 30. Water is purified and suspended impurities are removed from it by the action of a concd. soln. of $FeCl_3$ contg. peptized Al hydrates. Lime and Na_2CO_3 also may be used.

Apparatus for softening water by use of base-exchange materials. EDWARD T. TURNER. U. S. 1,787,129, Dec. 30. Structural features, particularly relating to a valve system.

Improving the base-exchanging properties of glauconite. OTTO LIEBKNECHT (to Permutit Co.). U. S. 1,787,008, Dec. 30. Glauconite is heated with a soln. of an alkali metal silicate under superatm. pressure. Cf. *C. A.* **24**, 3306.

Apparatus for softening water with zeolitic material. JOHN A. MONTGOMERY. U. S. 1,787,208, Jan. 6. The zeolite is supported on a bed of non-buoyant, granular material such as gravel which has over it a layer of similar but coarser material.

Level-controlling device for liquid containers such as brine-generating tanks of water-softening apparatus. EDWARD T. TURNER. U. S. 1,787,130, Dec. 30. Various details of a valve-control system are described.

Method of cleaning water filters. OSKAR KARY & Co. G. m. b. H. and BRUNO LIETZ. Fr. 688,086, July 10, 1929.

Distillation plant for preparing boiler-feed water. A.-G. BROWN, BOVERI ET CIE. Brit. 331,131, Dec. 5, 1928. Structural features.

Treating boiler-feed water. PETER M. CONTANT (to Neckar Water Softener Corp.). U. S. 1,788,149, Jan. 6. In treating boiler-feed water contg. $NaHCO_3$, the $NaHCO_3$ is decompd., by heating, into Na_2CO_3 and NaOH; these substances and

addnl. $NaHCO_3$ are caused to react with $FeSO_4$ to form Na_2SO_4 and $FeCO_3$. An arrangement of app. is described.

Preventing formation of "fur" in boilers. JEAN SCHNEEBELI. Swiss 139,517, Feb. 14, 1929. A mixt. of copal resin and alkali phosphate is used as the preventative.

Clarifying sewage. ANTON KRIESER. Ger. 500,347, Dec. 20, 1928. The sewage is mechanically agitated with about an equal amt. of petroleum so as to form an emulsion, which is allowed to stand until the two liquid layers have sepd. and the solids have settled

Purifying air vitiated with ammonia. GEO. ST. J. PERROTT and MAX YABLICK (to Mine Safety Appliances Co.). U. S. 1,787,875, Jan. 6. Air vitiated with NH_3 is rendered suitable for breathing by passing it through a dry solid mass of absorbent silicic acid. This pat. is based on an application filed Jan. 10, 1919, now matured into U. S. pat. No. 1,559,980 (*C. A.* 20, 84).

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER AND M. S. ANDERSON

When agriculture enters the chemical industry. WM. J. HALE. *Ind. Eng. Chem.* 22, 1311-5(1930). A discussion of the need of the farmer for closer coöperation between the farm and chem. industry in order to make farming economically possible.

J. R. ADAMS

Soils of the Bombay Presidency. D. L. SAHASRABUDDHE. Bombay Dept. Agr., *Bull.* 160, 84 pp.(1929). Chem. and mech. analyses of the soils are tabulated and general descriptions are given.

K. D. JACOB

The International Congress of Soil Science and the evolution of agriculture to U. S. S. R. EUGENE ROUX. *Compt. rend. acad. agr. France* 16, 816-24(1930). A survey of the soil work presented at the Congress shows that great advances are being made in Russia in spite of the fact that up to the present only about 5% of the land has been cultivated. The examn. of the soil as a 3- or 4-dimensional phenomenon has replaced the earlier morphological study of the soil. The principal soil types are: tundras, podsol, "tchernozem" (black soil), "sérozems" (gray soils) and red soils. The Russian 5-year plan depends to a large extent on the soil types and reports indicate considerable progress. The role of the scientific institutions, particularly the Inst. of Phytotechnic at Léningrad and the Sci. Inst. of Fertilizers at Moscow, is explained in its effect on agriculture.

J. R. ADAMS

Soil and eucalyptus trees in the forests of La Plata. CARLOS A. GRAU. *Anales oficina quím. provincia* (Buenos Aires) 2, 23-31(1928).—Analyses are given of soil and subsoil from a decaying plantation. Soil with a p_H of 4.6 is considered too acid and prejudicial to the trees. Means for improving the plantations are indicated, a fertilizer of guano, crude bones and gypsum is prescribed.

S. L. B. ETHERTON

Notes on soil observations in the Arazdajan steppe of Armenia, U. S. S. R. B. GALSTIAN. *Bull. univ. état R. S. S. Arménie*, No. 5, 5-39(in Armenian), 40-4(in Russian) (1930).—An account of the soil varieties of the steppe with special reference to topography, climate, air currents and water streams as factors affecting the evolution of the soil.

B. S. LEVINE

Soil investigations of the Echmiadzin Experimental-Meliorative station. KH. MIRIMANIAN. *Bull. univ. état R. S. S. Arménie*, No. 5, 45-81(in Armenian), 82-7(in Russian), 88-9(in English)(1930). The *soils* are (*a*) dark-brown, comparatively high in org. matter, (*b*) brown, with org. matter varying from 0.5 to 1%, (*c*) alk., with org. matter exceeding 1% only occasionally, or (*d*) light-brown, with org. matter below 1%. The mechanical fraction consists for the most part of silt and clay with an admixt. of a considerable amount of fine sand. The N content (Kjeldhal method) in the upper layers is 0.188%, decreasing gradually with depth. Carbonates are found only in small quantities as a result of artificial irrigation. P_2O_5 content (HCl ext.) is 0.165%, likewise decreasing with depth, in the HF ext. it reaches 0.814%. Ca and Mg exceed 1% only occasionally in the HCl ext. and 4% in the HF ext. H_2SO_4 is less than 0.09%. Fe and Al in the HCl ext. equals 11%. K varies from 0.7 to 0.94% and Na from 0.1 to 0.3% in the surface layers, in the HF ext. K equals 1.95 and Na 4.94%. Water ext. shows only a slight amt. of solids. Alky. of the water ext. varies from 0.02 to 0.03%, while Cl does not exceed 0.997% and only a trace is found of H_2SO_4.

B. S. L.

Occurrence of podsol soils in Santo Domingo. E. BALZAROTTI. *Soil Research* (*Suppl. to Proc. Intern. Soc. Soil Sci.*) 2, No. 1, 1-10(1930).—Podsol profiles were found in the lowest places of a wide savanna near S. Pedrode Macoris, Dominican Republic.

West Indies. Since neither the av. annual temp. of 27.3°, nor the av. annual pptn. of 1288 mm nor the poor grass vegetation of the savanna is favorable to such soil formations, it was concluded that they were produced under the influence of a high-water table in the dry season. Impermeability of the subsoil accounts for the high-water table.
I. A. DENISON

Agro-geological studies in the tropics. I. High altitudes of the Oriental tropics. M. W. SENATINS. *Soil Research* (*Suppl. to Proc. Intern. Soc. Soil Sci.*) **2**, No. 1, 10–54 (1930).—Field and lab. studies made on soil profiles developed above 2000 m. on the islands of Java and Luzon (Philippine Islands) indicate that podsol soils are not found in the high altitudes of the Oriental tropics, but that the mechanism of the podsolizing process is the same there as in other regions. The data obtained lend support to the modern classification of soils based on the climatic control of rock-weathering and soil formation.
I. A. DENISON

Influence of surface configuration, climate and vegetation on the distribution of soil types in Chile. A. MATTHEI. *Soil Research* (*Suppl. to Proc. Intern. Soc. Soil Sci.*) **2**, No. 1, 57–67 (1930).
I. A. DENISON

The mechanical analysis of soils without acid pretreatment. L. B. OLMSTEAD AND J. J. ALEXANDER. *Soil Research* (*Suppl. to Proc. Intern. Soc. Soil Sci.*) **2**, No. 1, 68–72 (1930). The method described for mech. analysis of soils differs from the international method in that pretreatment with HCl is omitted and $Na_2C_2O_4$ is used as the dispersing agent.
I. A. DENISON

Humic acids. W. FUCHS. *Kolloid Z.* **52**, 248–51, 350–6; **53**, 124–6 (1930).—A review.
A. FLEISCHER

Tropical-soil surveying. I. F. HARDY. *Trop. Agr.* (Trinidad) **7**, 235–6 (1930). A description is given of methods of surveying tropical soils by reconnaissance and botanical exploration. **II.** *Ibid* 274–7.—Chem. and phys. methods are discussed. Soil profiles involving 1880 soil samples of Trinidad and Tobago were examd. by such methods. Tables are presented giving typical results. These results were compared with yields of crops and for areas known to be good and bad agriculturally. The good cacao soils are more sandy, less acid, contain more org. matter and N in the upper layer, have much higher elec. cond. and show a much higher rate of soln. of nutrients by cond. methods. The same points are true of the good coconut soils except that the latter in this case is much heavier than that of the poor soils. The good sugar-cane soil were more sandy, much more alk. and gave higher cond. measurements than the poor ones which frequently also showed evidences of poor drainage near the surface. In good soils such evidence always lay 20 in. or more below the surface. **III** *Ibid* 306–8. The H_2O nutrient and air supplies, the activity of microorganisms and soil temp. are discussed.
A. L. MEHRING

Experiments on soil-breathing. WILHELM SCHMIDT AND PAUL LEHMANN. *Sitzb. Akad. Wiss. Wien*, Abt. IIa, **138**, 823–52 (1929). Of particular importance to the soil is that part of air contained in it which is replaceable when used up and which is in communication with the atm. To study the relation of air in the soil to atm. air, soil samples were enclosed in thick-walled air tight glass vessels. Pressure fluctuations were produced above the samples. These fluctuations were found to produce different results in the samples, depending on the amt. of soil air participating in these fluctuations, on fluctuation period and on water content of the samples.
S. L. MADORSKY

Electrical conductivities of soil extracts. C. H. WRIGHT. *Trop. Agr.* (Trinidad) **7**, 24–6 (1930). Methods of making cond. measurements on soils are reviewed. Soil fertility in Nigeria is closely related to the cond. of the soil soln. If K = mean sp. cond. the soil in millionths of a mho and N the no. of open bolls of cotton per acre in thousand, $N = 18.74\ K^{0.37}$ for American cotton, $8.73\ K^{0.43}$ for African. Empirical formulas for the wt. of cotton per plant in terms of K are also given. The soil can be compared in this way only when sp. cond. is detd. at the same season of the year. The correlation coefficients between sp. cond. and nitrate in the soil were 0.905, 0.916 and 0.918; between sp. cond. and H_2O-sol. Ca, 0.858, 0.790 and 0.772. These correlations show why sp. cond. is an index of fertility. The rise in sp. cond. during the dry season is due to biological activity in the soil.
A. L. MEHRING

Results of comparative investigations on the quinhydrone electrode method. J. J. HEDDINE. *Soil Research* (*Suppl. to Proc. Intern. Soc. Soil Sci.*) **2**, No. 1, 77–139 (1930). Data are presented on p_H detns. of soils by the quinhydrone electrode method, special attention being given to the influence of time after addn. of quinhydrone on the p_H value. Seven research organizations coöperated in the work, values being obtained on seven soils by each organization. p_H values obtained by the H electrode, by the Sb

electrode and colorimetrically are given for comparison. Conclusions from the data will be given in a succeeding paper. I. A. DENISON

The distribution of pasture plants in relation to soil acidity and other factors. W. R. G. ATKINS AND E. W. FENTON. *Sci. Proc. Roy. Dublin Soc.* 19, 533–47(1930).—Population counts in natural pastures and permanency trials of seeded pastures indicated that the p_H of the soil is an important factor in detg. the species of grasses and legumes that will thrive. The approx. p_H range of about 40 species is given. When allowed to roam freely sheep and cows graze closely on herbage growing in soil at p_H 6.5, and will graze on most sites of p_H greater than 5. Grazing practically ceases at p_H 5. J. J. WILLAMAN

The relation between p_H and plant pathology. G. CATALANO. *Boll. Studied Informazioni Real Giardino Coloniale Palermo* 10, 13–43(1929); *Rev. botan. appl. agr. trop.* 10, 812–5(1930).—A summary is given of the actual knowledge on the injury to vegetation caused by acidity or alky. of the soil, on the relation between parasitic maladies and p_H of the soil and on the reaction of the sap of a sick plant. J. R. A.

Electrofiltration: A new method of removing exchangeable bases from soil colloids. AMAR NATH PURI. *Soil Science* 30, 413–9(1930).—A process known as electrofiltration is described for the removal of exchangeable cations from soil colloids. One type of app. consists essentially of a cylinder mounted on a funnel with a perforated Cu disk sealed between them. On top of the disk is a filter paper. Inserted in the cylinder from the top is a Pt gauze. A glass U tube extending below the Pt is used to circulate water for cooling. The Cu disk serves as a cathode and the Pt gauze as an anode. Ten g. of soil is placed in the cylinder and water added from time to time. The movement of colloidal particles upward toward the anode serves to keep the paper from becoming clogged and filtration proceeds rapidly. A second type of app. for the same purpose, somewhat simpler in construction, consists of a funnel fitted with a filter paper, and inside of this is a perforated Cu cone which serves as a cathode. A Pt gauze suspended near the center of the funnel serves as an anode. A current of 0.2 to 0.5 amp. is sufficient to remove the exchangeable bases in 3 to 10 hrs. The bases removed correspond closely with those removed by 0 05 *N* HCl. Electrofiltration can be used as a preliminary treatment for soils for mech. analysis. M. S. ANDERSON

Occurrence of nitrites in soils. G. S. FRAPS AND A. J. STERGES. Texas Agr Expt. Sta., *Bull.* No. 412, 5–16(1930); cf. *C. A.* 24, 4883.—By the diphenylamine method, nitrites were found in large amt. in cultures of soils contg. $(NH_4)_2SO_4$, and in lesser quantities in soils which received no addns. of nitrogenous fertilizers. Soils which do not nitrify $(NH_4)_2SO_4$, or which have only low nitrifying power, may produce large amts. of nitrite. Low production of nitrates in soils may be accompanied by high nitrite production. The relative capacity of a soil to oxidize N may be considerably larger for nitric and nitrous N combined than for nitric N alone. The production of nitrites was small the first week, a little larger the second and much higher the third and fourth weeks of incubation. After 28 days, the production decreased. The most favorable amt. of water was 50% of the water-holding capacity of the soil. The addn of $CaCO_3$ or $MgCO_3$ increased the production of nitrous and nitric N from $(NH_4)_2SO_4$. Nitrites persisted in the cultures for more than 6 weeks in considerable amts. They also persisted practically unchanged for over a week in soil exts., indicating that nitrites are more stable than is ordinarily assumed. Field soils as well as lab. samples contained very small amts. of nitrites. In some soils, urea acted as a source of nitrites. Most of the common soil types produced an abundance of nitrites in soil cultures. C. R. F

The changes of cyanamide in the soil. I. A comparative study in dry-field and paddy-field conditions. HISAJI MURATA. *J. Agr. Chem. Soc. Japan* 6, 261–91(1930); *Bull. Agr. Chem. Soc. Japan* 6, 25–31.—The application of commercial cyanamide to the paddy-rice field gives good results in prevention of Weil's disease, as well as a good fertilizing effect on the rice crop. The rate of NH_3 formation from cyanamide is somewhat lower in paddy-field conditions than in dry-field conditions; in the former condition the decompn. stops at NH_3 formation, no nitrate being formed. In fine sandy loam the disappearance of cyanamide is slow, while in fine sandy loam rich in humus and in the clayey loam the disappearance of cyanamide is relatively rapid and only a small part of the cyanamide is transformed into dicyanodiamide. Y. KIHARA

Chemical denudation in Sweden. JOEL VILHELM ERIKSSON. *Medd. Statens meteorol.-hydrograf. Anstalt* 5, No. 3, 1–92 (in French 93–6) (1929). E. J. C.

Effect of small and large amounts of humus on the fixation of nitrogen by Azotobacter chroöcoccum in the presence of different glucides, of mannitol and of calcium malate as sources of energy. JULIU VOICU AND ELENA LUNGULESCU. *Bul. soc. chim. Romînia* 12, 71–81(1930).—The effect of humus on the disappearance of the source of

energy and the rate of fixation of N in cultures of *Azotobacter chroöcoccum* has been studied. A synthetic culture medium was used. As sources of energy saccharose, glucose, dextrin, starch, mannitol and Ca malate were added in 2% amts. Humus was added to the different media in 5 mg. % and 100 mg. %. The humus, prepd. by a 0.5% NaOH extn. of manure previously extd. by 1% HCl, contained 4.56% N and 3.4% ash. A small quantity of humus accelerates the disappearance of saccharose but retards the disappearance of glucose. The large amt. of humus always accelerates the disappearance of the source of energy and the fixation of N, and increases the yield. The expts. do not confirm the existence of a relation between the acceleration of the fixation of N and the increase in yield. If such a relation exists, it is limited to a certain period of vegetation and detd. by the compn. of the humus. RACHEL BROWN

Recent developments in the preparation and use of fertilizers. WILLIAM H. ROSS. *Ind. Eng. Chem.* **23**, 19–21(1931).—A review is given of certain new and improved methods for the prepn. of fertilizer materials and mixts. Granulation of fertilizer mixt. tends to reduce caking, prevents segregation, and greatly improves the drillability of the fertilizer mixt. The efficiency of fertilizers may be greatly increased by uniformity of distribution and placement in the soil with respect to the seed. The apparent toxicity of certain fertilizer ingredients is also reduced. M. S. ANDERSON

Recent developments in the phosphate industry. K. D. JACOB. *Ind. Eng. Chem.* **23**, 14–8(1931).—Recent developments in the phosphate industry are discussed. Reference is made to the utilization of low-grade rock and to the direct application of colloidal phosphate to soil. Phosphate used as a mineral supplement in feeding stock must be of low F content. The manuf. of H_3PO_4 by both furnace methods and wet processes are commercially feasible. The manuf. of superphosphate, ammoniated superphosphate and triple superphosphate is discussed. M. S. ANDERSON

Chemical and physical composition of certain finely divided natural phosphates from Florida. W. L. HILL, K. D. JACOB, L. T. ALEXANDER AND H. L. MARSHALL. *Ind. Eng. Chem.* **22**, 1392–6(1930).—Results are given of a study of the chem. and phys. compn. of samples of soft and waste-pond phosphates from Florida. Data are also included on the phys. compn. of the samples, effect of temp. on the phys. compn., sp. gr., chem. compn. of the original phosphates and the mech. fractions sepd. therefrom, and the soly. of the P_2O_5 in neutral NH_4 citrate and 2% citric acid solns. J. R. A.

The production of superphosphate from Khibinsk apatite. S. I. VOLFKOVICH AND L. E. BERLIN. *Udobrenie i Urozhai* **2**, 11–24(1930).—Expts. were conducted on: (I) the reaction between H_2SO_4 and apatite of particle size up to 0.3 mm.; (II) the reaction between particles up to 0.7 mm. and (*a*) H_2SO_4, with and without the addn. of $CaCO_3$ to the apatite, (*b*) a mixt. of HCl and H_2SO_4 with $(NH_4)_2SO_4$.; (III) the decompn. by H_2SO_4 of mixts. of phosphates from Vyatka, Egorov, with apatite. Apatite samples consisting of 35–51% of particles of a fineness of 0.15 mm. with 44–49% of a fineness from 0.15 to 0.3 mm. gave a product with poor physical properties. When the 0.3 mm. fraction was cut down to 21–58% the product improved. The lower the fraction of large particles the better the product. The preheating of H_2SO_4 and the addn. of $CaCO_3$ to the apatite had no influence on the course of the reaction. The mixts. of HCl and H_2SO_4 gave a product with good physical properties. The mixt. of H_2SO_4 and NaCl gave a fair product. Addns. of $(NH_4)_2SO_4$ showed an improvement of the physical condition of the product. Mixts. of the various phosphates with apatite also gave fairly good products. J. S. JOFFE

The change of the water-soluble phosphoric acid content of superphosphate during its storing in heap. III. The relation of the variety of raw phosphates and the manufacturing conditions of superphosphate to the decline of the water-soluble phosphoric acid content. TSUTOMU SHŌJI, EIZABURŌ SUZUKI AND EIJU NANAI. *J. Chem. Soc. Ind., Japan* **33**, Suppl. binding, 418–9(1930); cf. *C. A.* **24**, 2245, 4349.—The decline of H_2O-sol. P_2O_5 content of superphosphate is closely related to the kind of raw phosphate but not to the manufacturing conditions. J. R. ADAMS

Reactions occurring during the ammoniation of superphosphate. FRANK G. KEENEN. *Ind. Eng. Chem.* **22**, 1378–82(1930).—Superphosphate can be treated with either anhyd. liquid NH_3 or aqua NH_3 in the proportion of 1 mol. or less of NH_3/mol. of H_2O-sol. P_2O_5 with practically no reversion of the P_2O_5 to the insol. form. The addn. of more NH_3 results in a proportional loss of available P_2O_5. The treatment of superphosphate under plant conditions with more than 2 mols. NH_3/mol. H_2O-sol. P_2O_5 gives an equil. mixt. contg. $NH_4H_2PO_4$, $(NH_4)_2SO_4$, $CaSO_4 \cdot 2H_2O$ and pptd. $Ca_3(PO_4)_2$. Under lab. conditions this same equil. is reached but the reactions follow different courses. J. R. ADAMS

Composition of citrate-insoluble residues from superphosphates and ammoniated

superphosphates. K. D. JACOB, W. L. HILL, W. H. ROSS AND L. F. RADER, JR. *Ind. Eng. Chem.* **22**, 1385–92(1930).—Reducing the wt. of sample of $Ca_3(PO_4)_2$ and highly ammoniated ordinary and triple superphosphates sensibly decreases the citrate-insol P_2O_5, while with phosphate rock and non-ammoniated ordinary and triple superphosphates no appreciable decrease is noticed. $CaSO_4$ reduces the soly. of H_2O-insol. P_2O_5 in neutral NH_4 citrate soln. The citrate soly. of H_2O-insol. P_2O_5 as detd. by the official method of analysis depends on the type and quantity of P_2O_5 present. The citrate-insol residue from $Ca_3(PO_4)_2$ is primarily Ca hydroxyphosphate. The insol. residue from ammoniated and non-ammoniated superphosphates and triple superphosphates contains $FePO_4$ and $AlPO_4$ and unattacked phosphate rock, while in addn. the residue from highly ammoniated ordinary superphosphates contains $Ca_3(PO_4)_2$, Ca hydroxyphosphate and possibly some $CaHPO_4$. In general, ammoniation of triple superphosphates and superphosphates decreases the soly. of Fe, Ca and P_2O_5 in neutral NH_4 citrate soln.

J. R. ADAMS.

Free-ammonia injury with concentrated fertilizers. L. G. WILLIS AND W. H. RANKIN. *Ind. Eng. Chem.* **22**, 1405–7(1930).—Work on cotton seedlings indicates that appreciable quantities of free NH_3 in the soil in contact with the roots is injurious until converted into a non-toxic form with a sol. salt. This effect is most severe with $(NH_4)_2HPO_4$ and also occurs with readily ammonified org. ammoniates such as cotton seed meal. Some Ca salt should be used in coned. fertilizers contg. ingredients which decompose into free NH_3, or all sources of free NH_3 should be eliminated from the formula if no Ca is present in the fertilizer.

J. R. ADAMS.

Potassium fertilization of podsol earths of the Kasan Research Station. N. V. ARKHANGELZSKII. *Inst. Landw. Forwertschaft. Kasan* **1**, 33–49(1929); *Deut. Landw. Rundschau* **6**, 482(1930).—Hay and clover were used in the vegetation house. Flax and potatoes were used in the field. K fertilization is effective if enough N is added. Increasing phosphoric acid from 0.1 g. to 0.3–0.5 g. as P_2O_5 doubled the yield per vessel. Increasing the K from 0.2 to 0.6 g. per vessel diminished the yield. The action of phosphoric acid fertilization from the following sources diminishes in the following order: superphosphate, pure $Ca_3(PO_4)_2$, bone meal, phosphorite. The individual K fertilizers act differently. Acid and neutral K fertilizers are better than the basic K_2CO_3. Of the K salts, sylvanite, which approximates K_2SO_4 in action, was found to be the best.

GEORGE R. GREENBANK

The effect of various potash fertilizers on the firmness and keeping quality of fruits. J. H. WEINBERGER. *Proc. Am. Soc. Hort. Sci.* **26**, 174–9(1929); *Deut. landw. Rundschau* **6**, 521.—Recent contentions that N fertilizers cause poor keeping quality lead to the study of K fertilizers to offset this action. With the soil and climatic conditions of Maryland the use of K fertilizers alone with or without N has not affected the firmness or keeping quality as shown by orchard tests.

GEORGE R. GREENBANK

Some relations of nitrogen to the keeping quality of fruit. J. H. GOURLEY AND E. F. HOPKINS. *Proc. Am. Soc. Hort. Sci.* **26**, 167–71(1929); *Deut. landw. Rundschau* **6**, 521(1930).—Nitrates produce larger, less highly colored fruit, with a greater amt. of H_2O and N, with greater catalase activity. Detns. of p_H, total acid, sol. pectin and respiration show no marked differences. There is no difference in the keeping quality of fruit grown on soil of high or low N content.

GEORGE R. GREENBANK

The effect of nitrate fertilizer on stomatal behavior. ANNE L. PLEASANTS. *Elisha Mitchell Sci. Soc.* **46**, 95–116(1930). Bean plants (*Phaseolus vulgaris*) were grown with and without added nitrates in sand and H_2O cultures, in pot tests with sandy loam and in field tests on light clay loam. A few expts. were also made with other species of plants. Added N appears to make the stomata more responsive to light. They opened more quickly and completely in direct sunshine and closed in less time when the light was removed. The plants grown with added N lost less H_2O per sq. cm. of leaf surface and per g. of dry wt. during both clear and cloudy weather. Nineteen references are appended.

A. L. MEHRING.

Solving "mixed acid" problems by use of determinants. E. P. DEATRICK. *Ind. Eng. Chem.* **23**, 34–5(1931).—The use of determinants is especially valuable in solving simultaneous equations of the type involved in the computation of *fertilizer mixts.* when the ingredients possess varying concns.

M. S. ANDERSON

Plant and animal nutrition. ESSKUCHEN. *Das Superphosphat* **6**, 197–202(1930). A general discussion of the inorg. elements required for optimum growth and nutrition of plants and animals.

K. D. JACOB

Pasture top-dressing in Canterbury. Experimental work during the period 1924–30. A. W. HUDSON AND A. Y. MONTGOMERY. *New Zealand J. Agr.* **41**, 249–52, 326–52(1930).—In 46 of 54 expts. mixts. of superphosphate and ground limestone gav

better results on pastures than either superphosphate or ground limestone alone.
K. D. JACOB

Relation of ash constituents of pasture plants to the oxidation reduction potentials of nutrients. H. P. COOPER AND J. K. WILSON. *Soil Science* **30**, 421-30(1930); cf. C. A. **24**, 4079.—Data are reported on certain ash constituents of the grasses representing the most common plant successions accompanying the depletion of soils in New York pastures. The N and SiO_2-free ash contents of the grasses tend to decrease as soils become depleted. Elements with high standard electrode potentials such as Ca and K often predominate in the ash. K tends to increase as Ca decreases. Many organisms differentially absorb at. nutrient cations in the same qual. order as they are removed from soil colloidal complexes by electrodialysis. Plants which require fertile soils or strong nutrient ions for optimum growth are often intolerant of shade and require large quanta of radiant energy for optimum growth. Such plants also tend to synthesize org. compns., which on oxidation yield much energy and may be of high food value. There is a wide difference in the quality of radiant energy necessary for the reduction of the common nutrient anions. Phosphate is one of the most difficult to reduce.
M. S. ANDERSON

Establishment of lucerne root nodules. W. D. REID. *New Zealand J. Agr.* **41**, 316-24(1930). Mixing superphosphate or $(NH_4)_2SO_4$ with inoculated lucerne seed kills a large % of the nodule-forming organisms. Mixing of limed superphosphate (mixt. of equal wts. of superphosphate and ground limestone), ground rock phosphate or basic slag with inoculated seed gives excellent nodule formation, the limed superphosphate giving the best plant growth. Superphosphate gives satisfactory results provided it is drilled or broadcast before seeding, or is drilled out of contact with the seed at the time of seeding. A sufficient quantity of lucerne inoculum remains viable on the seed for 3 weeks to give good inoculation.
K. D. JACOB

Fertilizing turnips in Canterbury. A. W. HUDSON. *New Zealand J. Agr.* **41**, 306-7(1930). Impairment of the germination of turnip seed by contact with superphosphate can be almost entirely eliminated by mixing the superphosphate with an equal wt. of ground limestone about 1 week before it is used. The fertilizer value of superphosphate is not reduced to any appreciable extent by mixing with ground limestone.
K. D. JACOB

The canary banana. E. HOLMES. *Trop. Agr.* (Trinidad) **7**, 320-5(1930). —Nearly all soils in the Canary Islands are lacking in lime. The reaction of banana soils is usually on the acid side of neutrality. The irrigation water used contains sufficient Na_2CO_3 to prevent the soils from becoming decidedly acid. Practically all bananas in the Canaries are fertilized and the most satisfactory analysis is about 10% N, 3-6% P_2O_5 and 11-15% K_2O. From 2 to 5% each of $FeSO_4$ and $CaSO_4$ are frequently added to the mixt.
A. L. MEHRING

Field control of frenching in tobacco. J. C. F. HOPKINS. *Rhodesia Agr. J.* **27**, 581-90(1930). Frenching in tobacco is a N-deficiency disease. The disease has been successfully controlled in the field by applications of readily available nitrogenous fertilizers. The soil conditions causing frenching are discussed.
A. L. MEHRING

Manufacture and use of insecticides and fungicides. IV. Organic compounds. ARTHUR S. CARLOS. *Fertilizer, Feeding Stuffs & Farm Supplies J.* **15**, 749-50(1930), cf. C. A. **24**, 5416.
K. D. JACOB

Formula and method of preparation of insecticides in common use. G. L. FAWCETT. *Rev. ind. agr. Tucumán* **20**, 91-3(1929).—Directions are given for prepg. Bordeau mixt. Bordeau paste and lime sulfur.
S. L. B. ETHERTON

Codling moth experiments, 1928-29. N. S. NOBLE. *Agr. Gaz. N. S. Wales* **41**, 771-80(1930). Pb arsenate at a concn. of 20 oz. to 50 gal. of water combined with miscible white oil, 1 part in 60 parts of water, was efficient in controlling the codling moth on apples. Slightly better results were obtained by the addn. of casein-lime spreader to the Pb arsenate. Colloidal Pb arsenate was no more efficient than ordinary Pb arsenate at the same strength. Addn. of lime-sulfur to the Pb arsenate seemed to be advantageous, possibly acting as an ovicide or as a repellent, but a pronounced spray residue was left on the fruit. Pb arsenate dusts were much less effective than the sprays. Paris ... Bordeaux mixt showed promise as a repellant but caused russeting of the fruit. Lab. tests indicated that several miscible white oils are somewhat toxic to codling moth eggs, and may remain so for several days after the oil has been applied. Hellebore apparently had no value as a larvicide.
K. D. JACOB

Note on the use of chloropicrin for destruction of ants. CARMOUZE. *Ann. Med. Pharm. Colon.* **27**, 460-3(1929); *Bull. Hyg.* **5**, 608.—Various chemicals have been em-

Insecticides. STANDARD OIL DEVELOPMENT CO. Fr. 686,730, Dec. 16, 1929. An insecticide contains a terpene ester such as terpene acetate in a mineral oil, petroleum jelly, cream, etc.

Producing gases containing nicotine. BRABENDER ELEKTROMASCHINEN G. M. B. H. Ger. 509,084, Feb. 7, 1930. Addn. to 486,530. Gases contg. nicotine for *insecticides*, etc., are continuously produced from nicotine-contg. powder such as tobacco by feeding the powder on to an endless band which conveys it over or between heated bodies.

Insecticide and fungicide. IRA G. MCBETH and JOHN R. ALLISON (to Leffingwell Rancho Co.). U. S. 1,787,585, Jan. 6. A compn. suitable for use on foliage contains an oil and water emulsion and a stabilizing and spreading material including a water-sol protein material such as dried blood albumin in an aq. soln. contg. NH_3. U. S. 1,787,586 describes a compn. comprising a mixt. of 2 uncoalescent emulsions, one contg. a light penetrating oil and the other contg. a heavy slow-drying oil; it may also contain pyridine oleate or nicotine oleate.

Fungicide, etc. I. G. FARBENIND. A.-G. (Wilhelm Bonrath and Fritz Heckmanns, inventors). Ger. 506,394, Nov. 5, 1926. Addn. to 502,204 (*C. A.* **24**, 4907) The distn. residues of isobutyl alcohol are used, alone or with the usual addns., for the destruction of animal and vegetable pests

Fungicides and anti-vermin preparations. I. G. FARBENIND. A.-G. (Georg Wesenberg, inventor). Ger. 506,771, Mar. 21, 1928. Potato meal, etc., is protected from fungus and vermin by a prepn. contg. inorg. salts of N_3H.

Preparation for destroying grubs, blight, etc. CHRISTIAN KÖNIG. Swiss 140,348, Jan. 29, 1930. The prepn. contains tobacco ext. (14% strength), $FeSO_4$, $Ca(OH)_2$ (or CaC_2 residue) and $(NH_4)_2S$.

Parasiticides. ALEXANDER WACKER GES. FÜR ELEKTROCHEMISCHE IND. G. M. B. H. Fr. 687,059, Dec. 20, 1929. Waste inorg. substances from the oil and fat industry, such as used bleaching earth or $CaCO_3$ from the sapon. with CaO, are mixed with known substances used for combating parasites

Solution for separation of seeds. HARRY R. WARREN (to The Warren-Teed Seed Co.). Can. 306,405, Dec. 2, 1930. A soln. for the gravity sepn. of seeds consists of $NaNO_3$ 77, glucose 20, and Na_3PO_4 3 lb. dissolved in water. The soln. stimulates the germinating properties of the seeds. Cf. *C. A.* **24**, 3097.

Seed-goods protecting preparation. I. G. FARBENIND. A.-G. (Adolf Steindorff and Kaspar Pfaff, inventors). Ger. 506,731, Nov. 3, 1925. The prepn. is made by mixing filling material and powd. insecticides and fungicides with methyl cellulose. Thus, the mixt. may contain $Ca_3(AsO_4)_2$, $CuCO_3$ or $HgCl_2$ and talcum, with methyl cellulose.

Cauterization of seed goods. I. G. FARBENIND. A.-G. (Adolf Steindorff, Kaspar Pfaff and Nicolaus Malmus, inventors). Ger. 508,520, Nov. 5, 1925. Addn. to 506,731 (preceding abstr.) Seed goods are cauterized with fungicides contg. methylcellulose, slightly moistened with water, and finally dried.

Organic mercury compounds. I. G. FARBENIND. A.-G. Fr. 688,209, Jan. 14, 1930. See Brit. 329,987 (*C. A.* **24**, 5928).

Pyrethrum extract emulsion. I. G. FARBENIND. A.-G. Ger. 506,889, Oct. 27, 1928. Addn. to 431,699. The ext. is emulsified with a sulfonated mixt. of aromatic compds. such as the by-products of petroleum manuf.

Herbicide. E. RALPH DE ONG (to The Shell Development Co.). Can. 305,500, Nov. 4, 1930. A herbicide comprises an emulsion in water of the ext. (Edeleanu ext.) obtained by the extn. of kerosene distillate with liquid SO_2, combined with a small quantity of As, dissolved in one of the two phases of the emulsion.

Herbicide. E. RALPH DE ONG (to The Shell Development Co.). Can. 305,502, Nov. 4, 1930. A herbicide comprises an emulsion in water of an oxidized mixt. of org. acids derived from petroleum oils (particularly from naphthenic hydrocarbons) with petroleum oil.

16—THE FERMENTATION INDUSTRIES

C. N. PREY

Some minor industrial fermentations. O. E. MAY AND H. T. HERRICK. *Ind. Eng. Chem.* **22**, 1172–6(1930).—A review is given of the production by fermentation of *citric, gluconic,* and *gallic acids* and *glycerol.* Raw materials, methods of fermentation and yields are given. F. DE LEEUW

Constituents of fermentation products obtained by the action of ferments, as also

the distribution of the latter. H. VALENTIN. *Apoth. Ztg.* **45**, 1464-5, 1477-8(1930).—Since the close of the World War various methods have become known for the prepn. of certain popular beverages by the action of definite ferments (bacteria, yeasts, etc.) on sugar-contg. solns. (infusions of tea, etc.). The exciting ferment in most cases is believed to consist essentially of a symbiotic combination of a yeast and a bacterium, the one producing EtOH, the other an acid. The author has carried out a series of 10 fermentation expts. involving ferment cultures from various sources and has characterized certain individual ferments. Among the acids detected in these expts. may be mentioned lactic, malic, tartaric, citric, oxalic, malonic, acetic, succinic and gluconic. The geographical distribution of such ferments is discussed. W. O. E.

The influence of agitation and temperature upon the production of acidity and assimilation of nitrogen during fermentation. W. WINDISCH AND P. KOLBACH. *Wochschr. Bran.* **47**, 327-31, 337-40(1930).—It is shown that slight changes in the mode of exptl. procedure, such as shaking up the fermentation flask once a day, affect the acid formation and N assimilation considerably. Both acidity and N assimilation increase with agitation. There was no true agreement between the lab. expts. and those made in the brewery in vessels. It was found that the ext. in the vessels on large scale decreased at 6.5° at the same rate as the ext. of the same wort in the labs. at 9° when agitated vigorously once a day. The results of the expts. were not sufficient to deduce a relationship as to the effect of temp. on the production of acidity and N assimilation; the expt. proved, however, that the true acid formation and N assimilation could not be detd., because of the fact that at higher temps. products of autolysis masked these compds. There is a relationship between NH_3 assimilation and acid formation in so far as increased NH_3 assimilation led to increased production of acidity. The NH_3 content of the wort reached a min. during fermentation and then increased again. During fermentation in brewery vessels the NH_3 content did not go beyond the minimum, that is to say, no NH_3 formation was observed, the formation of which is probably due to autolysis. The gradual increase in acidity was in general followed by a slight decrease toward the end of the fermentation, more marked at higher temperatures. This decrease, however, was not observed in the fermentation vessels. S. JÓZSA

Formation of sulfurous acid by fermentation. MOSUKE MATSUYAMA AND HIRIOCHI NAKAMURA. *J. Agr. Chem. Soc., Japan* **6**, 307-12, *Bull. Agr. Chem. Soc., Japan* **6**, 19-21(1930). Sulfurous acid in the raw materials for beer brewing disappears in the course of boiling and is produced during the course of the fermentation. The production of sulfurous acid in ale fermentation depends on the kinds of yeast used and the kind and quantity of sulfate in the soln. Y. KIHARA

Methanol in beverages. I. A critical study of methods of investigation and qualitative analysis. NORBERTO A. ESPINOSA. *Anales asocn. quim. Argentina* **18**, 57-73(1930). The Denigès-Villavecchia method ("Química Analítica Aplicada," p. 362), with slight modifications, was adopted. It allows comparison of a series of tests in about 1.5 hrs. and has a limit sensitiveness of 0.0002 cc. of MeOH. The second addn. of H_2SO_4 affects the final color obtained only slightly, unless more than 1 cc. of concd. H_2SO_4 is added. It is possible to make the detn. in the above time without the second H_2SO_4 addn., but the final color is weaker. With the Chapin method the yield of HCHO is 2.5 times that obtained with the Denigès-Villavecchia method. If the Schiff reagent is used in place of the Schuff-Elvove, the limit of sensitivity is 0.00008 cc. MeOH. The most common impurities in beverages which can react like MeOH, *e. g.*, aldehydes, iso-Bu, Am, Pr alcs., AcOH and tartaric acid, do not interfere when present in normal amts. In detn. of ale essences it is quite necessary to give the distillate a preliminary purification. The Rothera qual. test can be used for detn. of acetone. E. M. SYMMES

Extract of malt. C. EDWARD SAGE. *Chemist and Druggist* **113**, 53(1930).—The Brit. Pharm. Codex states that malt ext. consists chiefly of maltose (50% or more) and dextrin, with some dextrose, "and should also contain a fair proportion of diastase." A method for detg. its activity is also given. In 3 samples of ext. of malt S. found very variable Lintner nos. (54, 170 and 6) and total sugars (as maltose, 69, 62 and 49). In 10 samples of malt ext. contg. about 15% of cod-liver oil, Lintner nos. varied from 1.5 to 19 and total sugars from 42 to 54; yet all samples were clinically satisfactory. If ext. of malt is to be official in the Brit. Pharm., the official ruling by the Ministry of Agriculture and Fisheries, 1929, must be recognized; accordingly, pharmaceutical malt exts. must have a diastatic activity (Lintner no.) of not less than 25, a sol. protein content of not less than 5%, and a sp. gr. not less than 1.4. S. WALDBOTT

Form of phosphate in barley and malt for beer brewing. MOSUKE MATSUYAMA AND HIROYOSHI JINNAI. *J. Agr. Chem. Soc., Japan* **6**, 313-6; *Bull. Agr. Chem. Soc., Japan* **6**, 21-2(1930).—P_2O_5 was detd. by Lorenz's method. In both barley and malt

nuclein P was about half the amt. of total P; inorg. P and phosphatide P were next. Org. P in malt was less than in barley, but inorg. P was present in larger amts. in malt.
Y. KIHARA

Oxido-reduction—beer yeast—the influence of desiccation. RENÉ FABRE AND HENRI SIMONNET. *Compt. rend.* **191**, 1075–7(1930).—Expts. on beer yeast confirm previous work on hepatic tissue (*C. A.* **24**, 4816–7) that sulfhydryls of the glutathionic type are liberated in proportion to the no. of dead cells. Fresh yeast gives no NH_4 nitroprussiate reaction—a specific test for sulfhydryls—unless it is first treated with trichloroacetic acid. In chloroform atm. the autolysis is rapid. The greater the degree of desiccation of the yeast, the greater is the quantity of derived sulfhydryls. Desiccated yeast solns. exert a reducing action analogous to that of cystine. Fresh yeast solns. do not.
MARY E. LEAR

The oxidizing action of cryptomeria wood (YAMADA) **11A.** Coffee substitute (fermentation process) (Fr. 687,903) **12.**

SMYTH, HENRY F., AND OBOLD, WALTER L.: **Industrial Microbiology; The Utilization of Bacteria, Yeasts and Molds in Industrial Processes.** Baltimore: The Williams & Wilkins Co. 313 pp.

Organic acids by fermentation. FRANK J. CAHN (to The Commercial Solvents Corp.). Can. 306,081, Nov. 25, 1930. Bagasse or dried, spent sugar-beet cossettes, or wet, leached-out sugar-beet cossettes are impregnated with solns. made by dilg. molasses to 10 to 15% sugar concn. The resulting material is fermented with a selected strain of fungus, such as *Aspergillus*, to produce a desired acid such as citric acid. Cf. *C. A.* **24**, 2831.

Neutralizing citric acid obtained by fermentation. M. S. FILOSOFOV. Russ. 17,805, June 30, 1927. Filter-press mud from the sugar industry is used to neutralize the liquid of fermentation.

Butyl alcohol and acetone by bacteriological fermentation. COMMERCIAL SOLVENTS CORPORATION. Ger. 507,793, Mar. 13, 1926. Nitrogenous nutrients obtained from maize are added to carbohydrates free from, or poor in, proteins and the product subjected to the action of butylalc. acetone bacteria. The steeping water of maize is suitable for addn. Cf. *C. A.* **20**, 2045, **22**, 2235, 2635, **24**, 1700.

Anhydrous alcohol. ZEITSTOFFFABRIK WALDHOF & OTTO LÜHRS. Fr. 687,924, Dec. 18, 1929. Anhyd. alc. is obtained by heating dil. alc. with quick lime under high pressure and causing the vapors to traverse first a layer of abs. alc. without appreciable condensation, to stop any lime carried over and afterward condensing.

Buoyancy volumeter for the estimation of gas evolved in fermentation processes. WILHELM KLEINSORGEN and HELMUT JUSATZ. Ger. 509,848, Nov. 20, 1928.

Raising the reaction velocity of enzymic processes. FRIED. F. NORD. Ger. 507,511, June 4, 1927. See Brit. 291,443 (*C. A.* **23**, 1148).

Influencing the velocity of enzymic reactions. FRIED. F. NORD. Ger. 508,560, Jan. 4, 1929. Addn. to 507,511 (preceding abstr.). The velocity of enzymic reactions, such as the production of malt from barley, wheat, rye, oats, maize, etc., is increased by treating with gaseous or dissolved CH_4, C_2H_4, C_3H_6, C_4H_8, C_4H_{10} or similar unsatd. hydrocarbons and with N_2O. The hydrocarbons may be used singly or mixed. Several examples are given.

Germinating drum for grain, etc. SPECK WERKE DRESDEN DER "MIAG" MÜHLENBAU U. INDUSTRIE A.-G. Ger. 507,510, April 20, 1928. The drum has a central air-circulatory passage.

Re-using the bitter principle in brewing sediment. GOTTFRIED JAKOB. Ger. 507,512, Jan. 23, 1929. The sediment is leached out with water, and the resulting bitter water employed as mashing or sparkling water at a later brewing.

Malt. WILLI WOLFRUM. Ger. 507,982, June 2, 1928. Floor malting by spraying the green malt one or more times with a soln. of nitrogenous plant food, during germination, is described.

Malt-turning device. JOHANNES KRAMER. Ger. 507,626, Aug. 15, 1928.

Wort. BERGEDORFER EISENWERKE A.-G. ASTRA WERKE. Ger. 507,513, April 2, 1925. Addn. to 485,547 (*C. A.* **24**, 1180). The husked and mashed malt of 485,547 is washed out in a centrifuge to obtain the wort from the grain.

Beer. RHEINISCHE MASCHINEN- UND APPARATEBAU-ANSTALT PETER DINCKELS & SOHN G. M. B. H. Ger. 509,597, Oct. 7, 1928. Residual beer is worked up by pas-

teurization. The beer is circulated in a container in which it is alternately heated and cooled. The app. is described.

Yeast. VEREINIGTE MAUTNER'SCHE PRESSHEFE FABRIKEN G. M. B. H. Ger. 508,061, May 24, 1925. Molasses is rendered suitable for use in the manuf. of pressed yeast by simple diln. and filtration, without sterilization by heat and without addn. of reagents. An inert powder may be deposited on the filter cloth to assist the filtration, *e. g.*, talc if the molasses is acid, or $CaCO_3$ if it is alk.

Yeast. M. FISCHL'S SOEHNE and FRANZ ROSENBERG. Fr. 686,784, Dec. 17, 1929. The aeration method is used with periodical addn. of the nutrients in such a way as to cause partial fermentations of increasing vol directly following each other, which constitute fully accomplished fermentation operations, inasmuch as at the beginning of each phase the entire nutrient soln. required for that phase is supplied to the yeast and the propagation is in every single phase carried on up to the full consumption or nearly the full consumption of the fermentable sugar introduced at the beginning of the phase. The yeast produced in the preceding phase is, without sepn., employed as starting yeast for the next phase. The above conditions are worked out mathematically as being the best conditions for working. A suitable app. for the process is described.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Hydrogen peroxide and iperol. ULISSE MALUSARDI. *Ann. Schiapparelli* **4**, 271–7(1930).—A review of the properties of H_2O_2, and of iperol, $CO(NH_2)_2.H_2O_2$. The $CO:NH_2$ group acts as a stabilizer. G. A. BRAVO

Pharmacy in ancient Egypt. M. WAGENAAR. *Pharm. Weekblad* **67**, 1329–34 (1930). Historical. A. W. DOX

Chemical control of fluid extracts and tinctures. MANUEL D. GOROZPE. *Rev. quim.* **6**, 11–3(1930).—The densities, total solids, alkaloids and EtOH contents, as found by actual analysis, of a number of carefully prepd specimens of important tinctures and fluid extracts of the Mexican Pharmacopeia are given. L. E. GILSON

Composition of salts used in Madagascar. P. FERRÉ AND RAZAFINJATO. *Bull. soc. pharm. Centr.* **23**, 118–29(1930); *Bull. Hyg.* **5**, 613.—The natives used the salts of 2 plants, *Sira rondrona* and *Sira hazo*. The salts are obtained by ashing the plants and extg. with H_2O. They contain Na, K, Ca, Mg, Fe and Mn as chlorides, sulfates and silicates. Solns. of *Sira rondrona* are alkaline and contain 47.7% K as KCl. *Sira hazo* is similar, giving an ash contg. the same elements but is more alkaline. G. R. G.

The study of Leonurus sibericus L. I. Chemical study of the alkaloid "leonurine" isolated from **Leonurus sibericus L.** SEIKO KUBOTA AND SEIKICHI NAKASHIMA. *Folia Pharmacol. Japon.*, **11**, No. 2, 153–8, Breviaria 10(1930).—The alkaloid *leonurine* has been isolated from *Leonurus Sibericus* L., a Chinese drug which has been in use in China for several thousand years. The plant contains about 0.05% of the cryst. alkaloid. Amyl alc. is so far the only solvent capable of dissolving the free base. The hydrochloride salt is sol. in cold water and is 1.2% sol. in hot water. The empirical formula is $C_{13}H_{19}N_4O_4$. There appears to be a OCH_3 group in its constitution. It m. 238°. G. H. W. LUCAS

The efficacy of commercial extracts of the anterior hypophysis. A. GUITARTE. *Semana med.* (Buenos Aires) **1930**, II, 1357–8.—The products deteriorate with the age, as observed in expts. with rats. A. E. MEYER

Laurel and its products. GUIDO ROVESTI. *Rivista ital essenze e profumi* **12**, 241–51 (1930). *Laurus nobilis* essence contains eucalyptol 45%, free alcs. (terpineol, geraniol) 18, esters of acetic acid 13, free eugenol 0.53, acetyleugenol 1.1, methyleugenol 3, terpenic hydrocarbons such as β-pinene and phellandrene 13 and sesquiterpene 3–4%. The consts. are: d 0.920–0.930 $[\alpha]_D$ −13 to −21, acid no. 3, ester no. 28–50; it is sol. in 2–3 vol 80% alc. Garda laurel oil obtained by prolonged boiling is greenish yellow and has a pleasant odor; d_{15} 0.926, solidification point 24–25°, m. 32–36°, n_{20} 1.4710, acidity 11.5, saponification no. 205, acid no. of volatile oils 1.5, Hehner value 94, I no. 74.5, I no. of fatty acids 1.82. It contains **melissic acid**, melissic alc., laurane, lauric acid, trilaurin, triacetin, tricaprin, **trimyristicin, triarachidin**, tripalmitin, resins and chlorophyll; it yields a frothy **antiseptic soap.** R. SANSONE

New process of the determination of allyl mustard oil in powdered black mustard. R. MEESEMAECKER AND J. BOIVIN. *J. pharm. chim.* [8], **11**, 478–84(1930).—To 5 g. of finely powd. mustard (no. 9 sieve) add 100 cc. H_2O in a 220-cc. flask, cork and keep the

mixt. for 1 hr. at 68°. Add 100 cc. official NH_4OH and allow to stand for 15 min. Cool, bring the vol. to 200 cc. with H_2O, add 20 cc. of Courtonne reagent and filter. Take of the limpid filtrate 100 cc., add to this in a glass-stoppered flask 5 cc. of 50% H_2SO_4, then 10 cc. of 0.1 *N* I soln. After 15 min. add about 10 cc. C_6H_6 and titrate the excess of I with 0.05 *N* $Na_2S_2O_3$. One l. of 0.1 *N* I corresponds to 5.8 g. of thiosinamine or to 4.85 g. of allyl mustard oil. The results obtained with this method compare well with those of the Codex Supplement 1925, the method is more rapid and avoids distn. and slow pptn. of Ag_2S. The yield diminishes as the time of maceration is increased. The observation of Astruc and Mousseron (*C. A.* **21**, 2759) as to the proper temp. of maceration is confirmed for mustards not deprived of their fatty oil. With mustards from which the oil is extd., the viscosity of the mixt. is greatly diminished, then the optimum temp. for max. yield of essence is 40°. S. Waldbott

A new reaction of diallylmalonylurea (dial). F. Lagarce. *J. pharm. chim.* [8] **12**, 364–5(1930). Treat a few crystals of dial on a watch glass with 2–3 drops of a freshly prepd. 1% soln. of vanillin in pure H_2SO_4. Upon gently warming on a water bath, a cherry-red color is produced, not given by numal (isopropylallylmalonylurea) or the other analogous malonylurea derivs. The reaction is also obtained with aq., alc. and Et_2O solns. of dial. Add the reagent drop by drop to a small quantity of the soln. in a test tube, the heat produced usually brings out the color; if not, after 2 to 3 vols. of the reagent have been added, warm on the water bath. When dial is absent, alc. or Et_2O solns. show a green color. The reaction is not quite sp., since it is also given by allyl alc., terpenes, menthol, camphor, etc. S. Waldbott

Pharmacopeia revision; first report of the Pharmacy Subcommittee. Anon. *Pharm. J.* **125**, 405, 408–9, 427–9; *Chemist and Druggist* **113**, 523–7, 555–6, 580–92 (1930). Detailed recommendations are made for alterations in the text of the Brit. Pharm. Criticisms are invited. S. Waldbott

Evaluation of alkanet root: A colorimetric test. W. A. N. Markwell and J. J. Walker. *Pharm. J.* **125**, 429(1930). Exhaust 5 g. of alkanet in no. 20 powder in a Bolton-Revis continuous extn. app. with a mixt. of 50 cc. of 90% methylated alc. and 50 cc. of crystd. C_6H_6, transfer to a 200 cc. flask, washing with more of the mixed solvent and make up to 200 cc. Transfer 2 cc. of the soln. into a 50 cc. Nessler tube and fill up to 50 cc. with the solvent. If the sample of root is of av. quality, the depth of color should be equal to that of a standard prepd. by mixing 40 cc. of a 0.01% (wt. vol.) $KMnO_4$ soln. with 10 cc. of a 0.1% soln. of $K_2Cr_2O_7$. S. Waldbott

Phospho-tonic wine. Wm. Forster and Wm. Johnston. *Pharm. J.* **125**, 480 (1930). As an improvement on quinine wine, Brit. Pharm., the following mixt. is suggested, yielding a non-pptg. product: compound syrup of hypophosphites, Brit. Pharm. Codex (with 1.1 grains of quinine hypophosphite in each fluid drachm) 1 fluid part; orange wine, Brit. Pharm. free from gelatin and with not more than a trace of phosphates 7 fluid parts. Mix and allow to stand for several weeks, then decant or filter from any slight ppt. formed. S. Waldbott

The purity standards and tests of medicinal substances. W. H. Linnell. *Pharm. J.* **125**, 504–7, 547; *Chemist and Druggist* **113**, 640–1(1930). The various causes affecting purity tests for the 3 classes of medicinal substances are discussed: chemicals, natural products and galenical preps., *e. g.*, the loss or gain of H_2O, oxidation in air, varying soly. of salts ($BaSO_4$, $PbCl_2$ in presence of other substances. The Brit. Pharm. test for the presence of a max. of 2.12% Na_2CO_3 in $NaHCO_3$ is misleading. S. W.

More European pharmacies. Wm. Mair. *Pharm. J.* **125**, 532–4, 593–5(1930); cf. *C. A.* **24**, 5938. An account of the scientific activities of the Ger. Pharmaceutical Soc., the Apothecaries' Union and its club house (photograph), Berlin famous pharmacies and historical notes on old pharmacies in Copenhagen, Stockholm and Vienna. Illustrated. S. Waldbott

Mist. bismuthi composita acida cum pepsino, Brit. Pharm. Codex. J. F. Boyle and J. H. Franklin. *Pharm. J.* **125**, 559–60(1930). To avoid pptn. of Bi, use a max. quantity of H_2O (15 out of 16 parts) to dissolve the Bi Na tartrate (*A*) and pepsin together, then add the other ingredients. A definite standard should be fixed for the compn. of *A*, as some com. samples do not completely dissolve in the above max. quantity of H_2O. Also the carmine soln. should be replaced. F. Goldby. *Ibid.* 655. A modification of the Codex formula is suggested, *viz.*, the use of Bi tartrate in H_2O-sol. scales, tincture of cudbear to replace the soln. of carmine and slightly less than an equiv. soln. of strychnine-HCl to replace the tincture of nux vomica. The resulting mixt. is clear and permanent. S. Waldbott

The necessity of sterilizing "T. I. D." solutions. Arthur E. Bailey and F. A. Croxon. *Pharm. J.* **125**, 615(1930). *Na tetraiodophenolphthalein* used in

as an injection into the gall bladder prior to taking a skiagram is said by authorities to be naturally sterile (probably because the compd. contains over 50% of I). This, however, is not the case. To 5 cc. of a 10% soln. of "T. I. P." was added a 4 mm. Pt loopful of the culture of the organism under test. After intervals of 1,2, 3 min., etc., up to 6 hrs., a loopful of the "doped" soln. was transferred to a tube of nutrient broth and the whole incubated for 48 hrs. *Bacillus coli* and *B. typhosus* were killed within 1 hr., but *B. subtilis* persisted during the 6 hrs. of the expt. Since solns. are always prepd. fresh and often injected within a few min. after prepn., the less resistant bacilli are also liable to be present. S. WALDBOTT

Cosmetics and hair dyes. R. M. B. MACKENNA. *Brit. Med. J.* **1930, I,** 899; *Chemist and Druggist*, **113,** 190–1(1930).—The physiol. and pathol. effects of skin preps. and of hair dyes are discussed. S. WALDBOTT

West Australian sandalwood oil. ERNEST J. PARRY. *Chemist and Druggist* **112,** 65, 171; PERCY MAY. *Ibid* 114; A. R. PENFOLD. *Ibid* **113,** 344(1930); cf. *C. A.* **23,** 174, 931.—Polemical between E. J. P. and M. In 14 com. samples of oil from *Santalum spicatum* (*Eucarya spicata*) M. found very narrow limits of variation: d. 0.970–0.973; optical rotation −5° 30′ to −6° 40′; n_D^{25} 1.5035-1.5072; soly. in 70% alc., 1 in 3.5 vols. to 1 in 4.0 vols.; sesquiterpene alcs. calcd. as santalol 95.0-96.3%. The oil, offered in the French Codex, should generally become official on its own merits, as its therapeutic properties are at least equal to those of oil from *S. album* (cf. *C. A.* **23,** 4533; 5545).—These exptl. results and conclusions are confirmed by A. R. P. The com. oil on the market is not a crude oil but a highly rectified product; nor is it now a mixt. of the distillates of *Eucarya spicata* and *S. lanceolatum* (of large neg. rotation) intended to imitate the official East India oil. Stickwood yields an oil devoid of santalol; oils from roots and butts which are actually used in distg. the oil, contain moderate quantities of santalol.—H. V. MARR. *Ibid* 821-2.—Contrary to a statement by Penfold, stickwood contains santalol as shown in actual manuf. of the oil. The correct name of the species from which the oil is obtained is *Santalum spicatum* A. DC.; the special name *Eucarya* given to it by Sprague and Summerhays is based on insufficient data. In support of this statement C. A. Gardner, *Bull. W. Australian Forestry Dept.*, is quoted. S. WALDBOTT

Everyday problems in the pharmacy. J. R. WALMSLEY. *Pharm. J.* **125,** 507–8; *Chemist and Druggist* **113,** 673-5(1930). Among the topics discussed are: *Storage of drugs*: the new Brit. Pharm. will probably include directions. *Dakin soln.*, kept in amber colored bottles and at south exposure, showed a loss of only 8% of NaOCl in 6 months, but *eusol* (Brit. Pharm. Codex) should be stored only in a cool, dark place for not more than 1 month. The action of *polarized light* on the *glucosides of stored drugs* (cf. *C. A.* **18,** 87; **19,** 781; **20,** 3133; **21,** 3089) is apt to take place when the drugs are stored to sunlight reflected from wet roofs or pavements. *Australian sandalwood oil* is recommended a concoction (cf. preceding abstrs.). *Isopropyl alcohol* is detected by oxidation with $K_2Cr_2O_7$ and H_2SO_4, distg. the acetone and applying the Na nitroprusside test. Pptn. of casein from *pasteurized milk* by *rennet* is much retarded when the milk has been heated to 167° F. instead of 145°, the official min. temp. At 149°, pptn. is slightly hastened (cf. *C. A.* **23,** 5513). A phenol odor in pasteurized milk was not caused by rennet, but by *p* cresol developed in the milk (*C. A.* **24,** 1678). *Grease film* firmly adhering to glassware may be removed by wetting with a little lysol. S. WALDBOTT

Musk, civet and castor. H. STANLEY REDGROVE. *Chemist and Druggist* **112,** 288-9(1930).—A review, with structural formulas of the odoriferous constituents (cf. *C. A.* **23,** 2728, 4297). A tincture made from a strongly odoriferous fatty material recently obtained from the *musk-rat, Ondatra zibethica* (*Fiber zibethicus*), has the combined fragrance of dil. solns. of civet and musk-xylene and may replace this blend in specialties, possibly in enhancing the fragrance of rose-geranium oil. S. W.

Bergamot products. GUIDO ROVESTI. *Rivista ital. essenze e profumi; Chemist and Druggist* **112,** 200-1(1930).—The machine perfected by Ugo Giovanelli for the *mechanical extn.* of the *oil* is illustrated and its use described in detail. Other bergamot products discussed are "second" oils, "petit-grain" bergamot from the leaves and the manuf. of Ca citrate. S. WALDBOTT

The place of drugs in dental surgery. A. T. PITTS. *Chemist and Druggist* **112,** 448-9, 479-80(1930).—**An account of the various ills affecting teeth, and the use of drugs appropriate in the treatment of each case. A 5 to even 10% soln. of H_2CrO_4 is used as an antiseptic in ulcerated gums ("trench mouth") after washing with 3% H_2O_2 soln. Dentifrices should be alk. to neutralize lactic acid formed in fermentation of carbohydrates.** S. WALDBOTT

The theory and structure of emulsions. THOMAS J. SMITH. *Chemist and Druggist* **112,** 537(1930).—An address. S. WALDBOTT

Siam Government Laboratory, 4th Report. A. MARCAN. *Chemist and Druggist* **112,** 746-7(1930).—Consts detd. for oils of *Hydnocarpus anthelmintica* and *H. ilicifolia* King are tabulated. The uncorticated seeds of *Jatropha curcas* (*physic nut*) yielded by hot pressure 26.2%, by extn. with $CHCl_3$ 31.2% of oil, showing, resp., $d_{15.5}$ 0.924, 0.923; sapon. no. 192.6, 202.9; I no. (Wijs) 101.1, 98.2; n_D^{40} 1.4640, 1.4623; acid no. as oleic acid 7.5%, 12.4%. *Oil of turpentine* from *Pinus merkusii* gave $d_{15.5}$ 0.861; initial b. p. 153°; 97% distd. 170°, n_D^{20} 1.467; $[\alpha]_D$ −40.4°; acid no. 0.1; residue, pale yellow 7%. Among other topics discussed are *native Malay poisons* (cf. J. D. Gimlette, *Malay Charms and Poisons, Ibid* **111,** 310(1929); **113,** 593(1930)). S. WALDBOTT

Perfumery products in North Africa. R. M. GATTEFOSSÉ. *Chemist and Druggist* **113,** 333-4(1930).—In Tunisia, orange-flower water and neroli oil have been prepd. early by the Arabs. In Algeria, geranium was the first perfume grown; in recent yrs., oils of lemon, orange, lavender, jasmine and rose are prepd by modern methods. In Morocco, orange products are prominent; also rose, citronella, vetivert and oakmoss are grown. S. WALDBOTT

Chinese medicine. DAVID HOOPER. *Chemist and Druggist* **113,** 713(1930); cf. *C. A.* **21,** 4023.—A lecture on old Chinese drugs based on the "law" of signatures. Chinese poisons and curious animal remedies. S. WALDBOTT

Pharmacy in Siam. A. H. HALE. *Chemist and Druggist* **113,** 742-3(1930).—Strict pharmacy and medical laws are operative in Siam. A pharmaceutical society recently organized intends to investigate the little known materia medica of Siam plant life. S. WALDBOTT

The quality of aconite. H. B. HAAG AND L. W. HAWKINS. *J. Am. Pharm. Assoc.* **19,** 1284-87(1930).—Six specimens of tincture of aconite were obtained from various sources and assayed by the U. S. P. X method (m. l. d. for guinea pigs). The specimens ranged from 10 to 100% of the U. S. P. requirements. The p_H values of the prepns. lay between 3.1 and 4.57. The p_H values of the two showing 100% activity were 3.1 and 3.13. The ages of these two prepns. were not known. H. and W. believe that tincture of aconite should be sold with an expiration date on the label. L. E. WAKEMAN

Pharmaceutical mixture of hyoscyamine and scopolamine. EMIL STARKENSTEIN (to Chemische Fabrik auf Actien vorm. E. Schering). U. S. 1,786,873, Dec. 30. A mixt. of 10 and 1 parts, resp., of these 2 substances (suitably their camphoric compds.) is used for combating sea-sickness.

Synthetic drugs. I. G. FARBENIND. A.-G. Ger. 508,334, Feb. 10, 1928. Aq. solns. of arsenobenzenes are stabilized by means of pyrazolone derivs. of non-acid

character, *e. g.*, 1-phenyl-2,3-dimethyl-5-pyrazolone or 1-phenyl-2,3-dimethyl-4-dimethylamino-5-pyrazolone. The pyrazolone deriv. may be added to the arsenobenzene soln., or it may be mixed with the arsenobenzene and the mixt. then dissolved. The method is particularly applicable to arsenobenzenes contg. a ketone or aldehyde group, or derivs. of these in which the O atom of the CO or CHO group has been replaced by a nitrogenous radical. Examples are given. Cf. *C. A.* 25, 559.

Medicinal preparations. ERNST LOEWENSTEIN. Austrian 119,233, April 15, 1930. Addn. to 115,408. The method of prepg. a diphtheria preventive described in Austrian 115,408 (*C. A.* 24, 1705) is now used to prep. preventives of other infectious diseases, *e. g.*, tuberculosis, syphilis and cholera. Examples are given.

Medicinal preparations. F. HOFFMANN-LA ROCHE & CO. A.-G. Swiss 138,442, May 7, 1928. A medicinal ext. is obtained by extg. gall with an org. solvent such as ether and purifying the product by treatment with dil. alkali. Evapn. gives the medicine in solid form.

Metallic colloids for medicinal purposes. FRITZ E. BISCHOFF (to Henry J. Ullmann). U. S. 1,787,659, Jan. 6. A metal such as Pb is disintegrated in an aq. soln. of gelatin and an aliphatic polyhydroxy compd. such as glucose, fructose, sucrose or glycerol capable of retarding oxidation of the metal and having substantially no reducing action.

Purgative. JOHANN TENGLER. Swiss 138,145, Oct. 31, 1929. A purgative contains nutritive acids (*e. g.*, lactic or fruit acids) emulsified with more than sufficient base (*e. g.*, MgO) completely to neutralize them, in unsaponifiable oil or fat.

Acetylsalicylic acid in stable anhydrous solutions. LEONIDAS WHORTON (to Whorton Pharmacal Co.). U. S. 1,787,924, Jan. 6. In forming a stable soln. of acetylsalicylic acid with glycerol and alc., the acid is supplied to a closed receptacle, dissolved in dehydrated alc., dehydrated glycerol is added and the materials are agitated, and the soln. is maintained *in vacuo* during the operation. App. and various details of procedure are described.

α-Tetrahydronaphthol esters and ethers. I. G. FARBENIND. A.-G. (Ernst Korten, inventor). Ger. 508,094, Nov. 22, 1927. See Brit. 326,762 (*C. A.* 24, 4901).

Purine bases. C. F. BOEHRINGER & SOEHNE G. M. B. H. Fr. 687,732, Jan. 6, 1930. Purine bases such as theobromine and caffeine are extd. from vegetable substances contg. them by means of liquid SO_2.

Molecular compounds of sodium iodide and urea. GEHE & CO. A.-G. and ALFRED ROSENO. Ger. 509,265, Feb. 3, 1929. These compds. are obtained by mixing solns. of NaI and urea and evapg. or adding a precipitant, *e. g.*, $CHCl_3$, or by grinding the reagents together in the presence of a small quantity of solvent. Compds. of 1, 2 and 4 mols. of urea with 1 mol. of NaI are obtainable. The products are *therapeutically useful*. Examples are given.

Stabilizing hydrogen peroxide solutions. CHEMISCHE FABRIK GRÜNAU LANDSHOFF & MEYER A.-G. Ger. 509,702, Apr. 26, 1929. The solns. are stabilized by adding phosphatide emulsion, especially those contg. lecithin. The emulsion may contain nonvolatile alcs. such as glycerol.

Esters of hydnocarpus. F. HOFFMANN-LA ROCHE & CO. A.-G. Swiss 139,326, Nov. 27, 1928. The diethylaminoethanol ester is prepd. by condensing the acid or deriv. in which the OH group is replaced by a readily exchangeable group, with diethylaminoethanol. The substance boils 200–210° and is used as an injectant for leprosy.

Stabilizing irradiated ergosterol. F. HOFFMANN-LA ROCHE & CO., A.-G. Brit. 331,042, July 1, 1929. Stabilization is effected by adding, either before or after the irradiation, a small proportion of a substance such as hydroquinone, or other phenolic compd., other than fluorescein, erythrosin or eosin.

Lupinine. GES. FÜR LUPINENE-IND. M. B. H. Ger. 509,869, May 28, 1925. Bitter principles are removed from lupinine by extg. with aq. solvents. The ext. is rich in carbohydrates, albumin, org. acids and salts. The aq. extg. agent contains some ether or $CHCl_3$ to ext. the alkaloid, which is afterward sepd.

Lens extract for treating and arresting cataracts. ELMER H. STUART (to Eli Lilly and Co.). U. S. 1,787,179, Dec. 30. Lenses of the eyes of animals such as hogs or cattle are repeatedly extd. with sep. quantities of alc. (the whole lenses are extd. first with cold alc. and then the lenses, after being ground, are extd. with alc. heated to the b. p.), the exts. are mixed together and the combined exts. are evapd., with addn. of water before completion of the evapn.; defatting is effected with a hydrocarbon solvent such as gasoline, and after further evapn. the clear liquid is sepd. by filtration and may be preserved for several months at least without appreciable loss of potency.

Vitamin solution. I. G. FARBENIND. A.-G. (Walter Kropp, Fritz Lange and

Arnold Bohne, inventors). Ger. 508,503, Oct. 23, 1928. A stable vitamin soln. is obtained by using liquid aq. sol. amides of the lower fatty acids alone or mixed, as solvents. *N*-Ethylacetamide is mentioned in examples.

Therapeutic preparations from glands. Georg Schröder. Ger. 509,186, Dec. 17, 1925. See Brit. 263,155 (*C. A.* **22**, 141).

Physiologically active preparations. Soc. anon. pour l'ind. chim. à Bâle. Swiss 138,784, Sept. 30, 1927. Addn. to 113,835. Exts. from male inner secretory organs are obtained in highly purified form by treating the ext. with alk. solns. of metal compds. and treating the product with org. solvents which do not dissolve soap. In an example, testicular ext. is treated with $Ca(OH)_2$ and petr. ether.

Physiological preparations. Soc. anon. pour l'ind. chim. à Bâle. Swiss 139,324, Sept. 30, 1927. The fresh male internal secretory organs for the preparation of the ext. are cooled to a temp. sufficiently low to cause them to congeal, pulverized in this condition and extd.

Physiological preparations. Soc. anon pour l'ind. chim. à Bâle. Swiss 139,403, Sept. 30, 1927. Addn to 106,038 Male internal secretory organs are pulverized, extd. and the ext purified by treatment with basic $(AcO)_2Pb$, preferably at low temps The products have a stimulating physiol effect

Ovovitelline product. Swigel Posternak and Theodor Posternak Swiss 139,325, Mar. 12, 1928. An Fe P org compd split off from ovovitelline is obtained by treating a mixt. of the Na salts of the P and Fe-contg. cleavage products of egg yolk (obtained by treating defatted yolk with mineral acid) with AcOH and a sol. Fe salt (*e. g.*, $FeCl_3$), and pptg. the product by addn of a mineral acid (*e. g.*, concd. HCl). Cf. *C. A.* **24**, 1706

Antiserums. Ernst G. Drelsl and Paul von Gara Ger 508,595, Sept. 21, 1929. Antiserums (agglutinating, pptg., etc., serums) are obtained from animals previously sensitized by innoculation, by injecting the correct antigen and obtaining the serum in the usual way. Examples of the innoculation of rabbits with various serums are given.

Absorbable sewing material for surgical uses. Paul Bost Ger. 508,783, July 16, 1926. Fresh muscular tissue is sterilized and spun into sewing threads.

Surgical pads carrying "tell-tale" substances for radiography. Johnson & Johnson (Gt. Britain), Ltd Brit 333,980, June 7, 1929. A strand or strip of the material is treated with substances such as Pb sulfate, Bi subcarbonate, Th oxide or $BaSO_4$, and an adhesive or enamel may be employed for preventing detachment of the coating

Extracting pyrethrum flowers. Wm J Trevillian (to W. T. Rawleigh Co U. S. 1,786,967, Dec. 30. Pyrethrum flowers are treated with a petroleum distillate solvent such as gasoline to ext the active principles and the marc formed by drawing off the solvent. The residual solvent and active principles retained by the marc are then expelled by treatment under high pressure and with a "twisting motion" such as effected by a screw conveyer and pressing device

Disinfectants. Produits Roche, soc. anon. Belg. 369,451, May 31,1930 Oxy derivs of polyphenyl polyoxides are used.

Disinfecting, cosmetic or tanning agent. Cornelius Keleti. Swiss 139,327, June 10, 1927. See Ger 504,693 (*C. A.* **25**, 382).

Removing nicotine from tobacco. Walther Bruck and Julius Pohl Ger 509,016, Nov. 26, 1927. The method of Ger 483,686 (*C. A.* **24**, 2244) is modified by using an aq soln. of tannin or other tanning agent instead of tobacco lye.

Tobacco. I. G. Farbenind A.-G (Karl Vierling, inventor). Ger. 507,604, Feb. 25, 1927. Tobacco is treated with phosphates, citrates, etc., prior to fermenting

The manufacture of sulfuric acid by modern chamber and intensive systems. H. E. Woisin. *Metallges. Periodic Rev.* **1930**, No. 4, 17-26(1930). E. H.

Potash bibliography to 1928 (annotated). J. F. T. Berliner. Bur. Mines, *Bull.* **327**, 578 pp.(1930).—Abstracts of 3967 articles are given and cross-indexed. A. H. E.

Volatilization of potash from wyomingite. S. L. Madorsky. *Ind. Eng. Chem.* **23**, 78–84(1931).—K_2O can be readily removed from wyomingite by volatilization, provided $CaCO_3$ and a halogen salt promoter are present. Representative samples of wyomingite rock contg. about 12% K_2O were heated in a small elec. furnace alone, and mixed with

varying proportions of $CaCO_3$, $CaCl_2$, CaF_2 and NaCl. When the rock was heated alone, 25 to 30% of the K_2O present was volatilized at 1510° in 40 min. The volatilization was progressively increased by the addn. of $CaCO_3$ and various halides. The mixt. with $CaCO_3$ and $CaCl_2$ was the most effective. Complete volatilization was obtained with this mixt. at 1200° or even below this temp Time is not an important factor, since most of the K leaves the crucible in the first 10 min. Temp. is not important, provided it is above 1100° M. S. ANDERSON

Ammonia as a source of hydrogen and nitrogen. J. F. T. BERLINER AND G. W. BURKE. *Trans. Am. Inst. Chem. Eng.*, New Orleans Meeting 1930, 15 pp.(Adv. copy); *Chem Met. Eng.* **37**, 751-4(1930).—The rapid development of the synthetic-NH_3 industry has made anhyd. NH_3 one of the cheapest and purest of the heavy chemicals. Utilizing NH_3 as a source of H is highly practical and economical. Anhyd. NH_3 can be dissocd or "cracked" directly into its component elements by reversal of conditions required for its synthesis. By passing NH_3 vapor over a catalyst heated to about 600° at pressures from below atm. to about 15 atm. or higher, it is practically completely decomposed to N and H. Under normal conditions the reaction approaches very nearly the equil. value of a residual NH_3 content in the H-N mixt. of about 0.03 to 0.05% by vol at atm. pressures and approx. 0.60% by vol. at pressures of about 15 atm. The product of dissocn is a mixt. of 75% by vol of H and 25% by vol. of N, or 17.76% by wt of H and 82.24% by wt. of N. Applications of cracked NH_3 are discussed, as well as its economics in competition with compressed H and N in cylinders. For large demands, the method of obtaining H by cracking NH_3 is not economical. Liquid anhyd. NH_3 contg a high concn. of available H is a means of transporting liquefied or stored H. Equipment for cracking NH_3 is described. C. L. MANTELL

Sodium metasilicate as an industrial alkali. JAMES G VAIL *Trans. Am. Inst. Chem. Eng.*, New Orleans Meeting 1930, 19 pp.(Adv. copy), *Chem Met. Eng.* **37**, 736–40(1930), cf. *C. A* **24**, 5114. Most forms of Na_2SiO_3 crystallize from mother liquors which are sticky Crystals are so sol that satisfactory sepns are not readily obtained. A granular, free flowing product, $Na_2SiO_3\,5H_2O$, has lately been prepd. from a new hydrate The properties of Na_2SiO_3 and a number of tests comparing these properties with other alkalies such as NaOH, Na_3PO_4, borax and $NaHCO_3$ in various cleaning and washing applications are shown Particular emphasis is placed on Al cleaning, lathering of soap, action of alkalies on spore suspensions or vegetative bacteria, cleaning of glassware, removal of oils and other com applications C. Hydrogen chloride. HOLZHYDROLYSE A.-G. Ger. 509,044, Dec. 18, 1928. Details are given of a method of prepg. HCl by heating aq. HCl with H_2SO_4 in a no. of stages at successively increasing temps. The H_2SO_4 is regenerated and used again. App. is shown.

Hydrochloric and hydrobromic acids. RÖHM & HAAS A.-G. (Walter Bauer, inventor). Ger. 506,634, June 3, 1928. See Brit. 312,908 (*C. A.* **24**, 923).

Nitric acid. APPAREILS ET ÉVAPORATEURS KESTNER. Fr. 687,763, Jan. 6, 1930. A condensing app. for nitrous vapors for the production of HNO_3 is described in which the interior walls are sprayed with a liquid, and cold water is caused to flow over the exterior so that excessive corrosion is prevented.

Sulfuric, hydrochloric and nitric acids. HERMANN FRISCHER. Ger. 508,063, Dec. 21, 1926. The manuf. of H_2SO_4 in small chambers from SO_2 with the aid of oxides of N is improved by intimately mixing the gases with the H_2SO_4 formed or in circulation by drawing or forcing the gases and the acid through a sieve or like mixing device. Circulation tubes opening above and below the sieve may be provided. A concn. app. may replace the Glover tower. The same method of mixing may be applied in dissolving HCl and oxides of N.

Sulfuric acid. HUGO PETERSEN. Ger. 508,064, Sept. 4, 1927. See Brit. 296,062 (*C. A.* **23**, 2537).

Sulfuric acid. THE SELDEN CO. Fr. 687,149, Dec. 23, 1929. SO_2 is oxidized to SO_3 by passing a mixt. of SO_2 and O over a contact mass contg. at least one catalytically active silicate or polysilicate which is not a base-exchange substance. Silicates of V or complex silicates contg. V or silicates of other metals of the 5th or 6th group are particularly suitable. The catalyst is preferably dild. with kieselguhr, etc. Several examples are given.

Sulfuric acid. RICHARD ZEH. Ger. 509,703, Mar. 16, 1930. A method for the continuous production of highly concd. H_2SO_4 consists in letting H_2SO_4 flow into a series of downwardly directed cells in a chamber highly heated by burning gas. The evapd. water and the products of the gas combustion are led off.

Recovery of sulfuric acid. CHEMISCHE FABRIK BORK G. M. B. H. Fr. 688,360, Jan. 17, 1930. H_2SO_4 used for washing petroleum, mineral oils or tar is recovered by bringing the acid in a tower into contact with the vapors of tar oils traveling in counter current.

Regenerating sulfuric acid, etc. ALEXANDER WACKER GES. FÜR ELEKTROCHEM. IND. G. M. B. H. (Wolfram Eschenbach, inventor). Ger. 508,321, Jan. 7, 1930. Spent H_2SO_4 is regenerated and concd. by treatment with the compds. obtainable by combining oxides of S with oxides of N. Thus, H_2SO_4, after use in purifying mineral oils, may be treated with $(SO_3)_2NO$ (cf. *C. A.* **21**, 477), whereby the water present is combined to form H_2SO_4 and the org. impurities are oxidized. Other examples are given also. The process may be accelerated by blowing in air or O, and by adding to the mixt. an oxidation catalyst, *e. g.*, a compd. of Fe, Cu, Ce or Zn. Other oxygenated acids of S may be treated in the same way.

Sulfuric acid and chromic salts. SILESIA VEREIN CHEMISCHE FABRIKEN. Ger. 507,918, Oct. 18, 1927. The yield of H_2SO_4 in the production of Cr^{+++} salts by the reduction of alkali chromates or dichromates by H_2S is improved by leading the H_2S into solns. of the chromate or dichromate and adding a considerable excess of acid above that usually required for the oxidation process.

Phosphoric acid. SAMUEL BRULL. Fr. 687,941, Mar. 29, 1929. Phosphoric acid is made by heating natural phosphates with materials rich in Fe such as Fe ores, slags etc., in a blast, cupola or elec. furnace, and submitting the product in the liquid state to an oxidizing atm. to transform the P into gaseous phosphoric acid.

Phosphoric acid. COMPAGNIE MINIÈRE DU M'ZAITA. Fr. 687,946, Mar. 29, 1929. P contained in natural or artificial materials is extd. by melting the materials with Fe ore in a reducing atm. to obtain melts rich in P which, by a second treatment, liberate phosphoric acid.

Phosphoric acid. I. G. FARBENIND. A.-G. Fr. 688,371, Jan. 12, 1930. Phosphoric acids are made by treating P or its lower oxidation products with anhyd. phosphoric acid under high pressure and at a high temp., *e. g.*, 300°.

Phosphoric acid. Soc. d'études scientifiques & d'entreprises industrielles. Fr. 687,799, Jan. 7, 1930. Phosphoric acid and a gaseous mixt. suitable for the manuf. of NH_3 are made by oxidizing P with a gaseous mixt. contg. N, CO_2 and O and removing the compds. of P. The CO resulting from the oxidation of the P is caused to react with steam and the CO_2 formed is removed. The vols. of gases used are chosen so that the H and N remaining are in correct relation for the production of NH_3.

Phosphoric acid. Soc. d'études scientifiques & d'entreprises industrielles. Fr. 687,849, Jan. 8, 1930. P or phosphoric acid and gaseous mixts. contg. H and N or these 2 gases and CO are made simultaneously by reducing crude phosphates by C in the presence of a flux in a blast furnace, treating the reaction mixt. in the blast furnace with a mixt. of N and O contg. more O than does air and reacting the waste gases freed from P or its compds. and contg. CO with steam. The CO_2 formed is sepd. Cf. *C. A.* 25, 562.

Phosphoric acid purification. Augustus H. Fiske (to Rumford Chemical Works). U. S. 1,787,192, Dec. 30. Relatively small quantities of a sol. sulfide such as Na sulfide are added to the dil. acid prior to concn.; this is followed by evapn. in a vessel having a corrodable lining such as Pb with gradually addn. of more sulfide to the acid as it is concg. in order to prevent attack of the metal lining.

Apparatus for making phosphoric acid by catalytic interaction of phosphorus and steam. Comp. nationale de matières colorantes et manufactures de produits chimiques du Nord Réunies, Établissements Kuhlmann. Ger. 508,481, Feb. 25, 1930.

Metazirconic acid. Paul Schmid. Ger. 509,151, Nov. 11, 1925. H_2ZrO_3 is prepd. by treating solid Zr salts with NH_3 under such conditions that the production of a Zr salt soln. is substantially avoided. Thus, a Zr salt may be treated with gaseous NH_3 or with a concd aq. soln. of NH_3. The product may be purified by taking advantage of its relative insoly. in acids. Examples are given.

Hydrogen cyanide and cyanides. Ges. für Kohlentechnik. m. b. H. Ger. 510,055, June 8, 1929. NH_4CNS dye obtained from the working-up of the distn. gases of bituminous fuel is oxidized by HNO_3 and neutralized by NH_4OH to produce HCN and an oxidized residue useful as a *fertilizer*. The HCN can be worked up into cyanides. The HNO_3 may be replaced by the N oxides obtained by burning NH_3 for the prepn. of HNO_3.

Caustic alkalies. Ernst Bürgin and Walter Schmid (to I. G. Farbenind. A.-G.) U. S. 1,786,516, Dec. 30. See Fr. 670,335 (*C. A.* **24**, 1941).

Caustic alkali lyes. I. G. Farbenind. A.-G. Fr. 680,652, Dec. 14, 1929. Concd. caustic alkali lyes are prepd. in a continuous manner by sepg., from the alk. earth carbonate the lye obtained after caustification, starting with alkali carbonate and alk. earth oxide, using for fresh charges the washing lyes obtained during the washing of the alk. earth carbonate, and baking the carbonate for conversion to oxide which is then reintroduced into the cycle.

Alkali lyes. I. G. Farbenind. A.-G. Fr. 688,451, Jan. 18, 1930. Alkali lyes are prepd. by treating alkali sulfates with oxide or hydroxide of Sr in excess. The SrO_4 is transformed to $SrCO_3$ by NH_3 and CO_2 and thence to the oxide and reintroduced into the cycle.

Alkali or alkaline-earth salts. H. Lawarrée. Belg. 369,885, May 31, 1930. A sol. salt is used in a cycle. The salt is such that, by double decompn. with an alkali or alk.-earth salt, it gives the desired alkali salt on the one hand and an insol. Pb salt on the other. The insol. Pb salt is converted into a basic Pb salt, which, by addn. of a suitable acid, is converted into the original Pb salt.

Alkali chromates. Zahn & Co., Bau chem. Fabriken G. m. b. H. and Ludwig Wicke. Ger. 509,133, Nov 1, 1927. Alkali chromates are prepd. by roasting a mixt. of chromite, Na_2CO_3, $Ca(NO_3)_2$ and an addn. that prevents sintering, *e. g.*, CaO. The oxide and the $Ca(NO_3)_2$ may be heated together before the other reagents are added. An example is given.

Alkali nitrates and ammonium chloride from alkali chlorides, nitric acid and ammonia. H. Lawarrée. Belg. 368,616, April 30, 1930. $Pb(NO_3)_2$ obtained by the reaction of HNO_3 with $PbCO_3$ is treated with alkali chloride. The $PbCl_2$ obtained is treated with $(NH_4)_2CO_3$ to give $PbCO_3$. The $(NH_4)_2CO_3$ is obtained by passing through NH_4OH soln. the CO_2 liberated by the action of HNO_3 on the $PbCO_3$. 368,903 provides for the treatment with NH_3 of the $PbCl_2$ obtained by the action of HNO_3 on an alkali chloride in presence of Pb oxychloride or hydroxide.

Alkali phosphates. Metallges. A.-G. Fr. 688,201, Jan. 14, 1930. See Ger. 502,039 (*C. A.* **24**, 4720).

Phosphates and cement. ÉDOUARD URBAIN. Fr. 687,538, Mar. 25, 1929. A K phosphate, phosphoric acid and fused cement are made from an intimate mixt. of natural phosphate, feldspar and sufficient cokefying coal to obtain by heating homogeneous and resistant agglomerates. The air fed to the crucible is preheated to above 550°. The gases leaving the furnace are cooled before combustion and used after combustion for heating the retorts where the mixt. is cokefied and afterward for concg. the dild phosphoric acid.

Stable alkaline ferric solution. WILBERT J. HUFF, DAVID L. JACOBSON and WM H. HILL (to Koppers Co.). U. S. 1,786,490, Dec. 30. A carbohydrate such as glucose is treated with a sol. alkali metal compd. of alk. reaction such as Na_2CO_3 and to the product thus formed is added a sol. Fe salt such as $FeSO_4$ while the soln. is being aerated. The resulting soln. may be used as a catalyst in oxidation reactions.

Alkaline earth cyanamides. SOC. D'ÉTUDES CHIM. POUR L'IND. and ÉDOUARD DE LUSERNA. Fr. 687,129, Dec. 23, 1929. Alk. earth cyanamides, particularly $Ca(NH_2COO)_2$, are made by the action of NH_3 at a raised temp. on alk. earth carbonates to which wood charcoal, anthracite or coke is added, or hydrocarbons which form C at the temp. of reaction may be used.

Recovering cyanide from solutions. RUSSELL R. BRYAN (to Merrill Co.). U. S. 1,787,033, Dec. 30. A soln. contg. cyanide together with an alkali and carbonates such as a waste mill soln. is divided into 2 portions. One portion is treated with CO_2 to neutralize the alkali and treated with SO_2 to form HCN and CO_2 and a current of air is passed through the soln. to vaporize HCN together with CO_2 and SO_2, and the air current is passed through the remaining portion of the original cyanide soln. to utilize its SO_2 and CO_2 content by neutralization of the alkali of the soln. Remaining HCN is absorbed in an alk. soln. to form a cyanide, and the remaining portion of the original soln. is further treated with SO_2. An arrangement of app. is described.

Cyanides. JOHANNES HENDRIK VAN DER MEULEN. Fr. 688,037, Jan. 11, 1930. Thiocyanates, particularly those of alkali and alk. earth metals, are treated in the presence of an oxide, hydroxide or carbonate of Zn with H, or a gas contg. or liberating H, at a high temp. under pressure.

Production of arsenates. GUSTAF N. KIRSEBOM. Can. 307,091, Dec. 30, 1930. Na_3AsO_4 is produced by causing a reducible metal compd., As_2O_3 and fused NaOH to react to form a Na_3AsO_4 melt or slag contg. excess NaOH, dissolving the slag and crystg. Na_3AsO_4 from the resulting soln.

Perborates. ROESSLER & HASSLACHER CHEMICAL CO. Ger. 507,522, Sept. 20, 1928. See Brit. 297,777 (*C. A.* **23**, 2791).

Nitrogen compounds. I. G. FARBENIND. A.-G. Fr. 687,276, Dec. 26, 1929. Halogen derivs. of high paraffin hydrocarbons are heated with NH_3 in aq. or alc. soln. or agents liberating NH_3, preferably under pressure and with or without catalysts. Thus, a chlorinated vaseline oil is heated to 140° in an autoclave with NH_3 in alc., giving a brownish oil. Other examples are given. The products are useful as *soaps*, and, on account of their activity, are important intermediate products for the production of other compds.

Alumina. APPAREILS ET ÉVAPORATEURS KESTNER. Fr. 688,278, April 8, 1929. Al_2O_3 is made by treating leucite with HNO_3 and treating the $Al(NO_3)_3$ obtained with NH_3 in the presence of the KNO_3 obtained in the initial reaction.

Alumina. JEAN C. SLAILIFES. Fr. 686,894, Mar. 13, 1929. Al_2O_3 is prepd. from bauxite or other ores of Al not contg. halogen, by eliminating SiO_2 from the ore with soda or potash lyes before bringing the Al_2O_3 into soln.

Aluminum chloride. OSCAR M. HENRIQUES and THOMAS A. THOMSEN. Fr. 688,565, Jan. 20, 1930. $AlCl_3$ or gases contg. it is purified and rendered innocuous to Fe vessels, by passing it, at 500° or higher, over metallic Fe waste. Fr. 688,566 describes the purification of $AlCl_3$ by subliming it from a bath composed of NaCl and $AlCl_3$.

Aluminum chloride. I. G. FARBENIND. A.-G. Ger. 509,150, Aug. 18, 1928. See Brit. 317,259 (*C. A.* **24**, 1944).

Ammonium sulfate. CHEMISCHE FABRIK KALK G. M. B. H. and HERMANN OFFIMF. Fr. 688,388, Jan. 17, 1930. Plaster contained in superphosphate is transformed to $(NH_4)_2SO_4$ by neutralizing the superphosphate with NH_3 and mixing the product with $(NH_4)_2CO_3$ or NH_4HCO_3 in the presence of a small quantity of water, so that water and excess $(NH_4)_2CO_3$ are expelled. In a modification NH_3, CO_2 and water are added simultaneously in the gaseous state and in the necessary proportions.

Barium cyanide. SOC. D'ÉTUDES POUR LA FABRICATION ET L'EMPLOI DES ENGRAIS CHIM. and L'UNION CHIM. FRANÇAISE. Fr. 686,686, Dec. 16, 1929. An app. is described for the prepn. of $Ba(CN)_2$ in which a mixt. of charcoal and $BaCO_3$ is caused to move

through a vessel conveniently heated where the decompn. of the carbonate takes place, after which the mixt. moves through a zone indirectly heated to 1100–1400° and in which a large no. of openings permit the continuous admission of N to form the cyanide.

Barium hydroxide. PAUL KIRCHEISEN. Ger. 509,261, April 26, 1928. In the manuf. of $Ba(OH)_2$ by hydrolysis of BaS, the latter is preliminarily mixed in the solid state with finely divided S and a little water.

Calcium cyanamide. I. G. FARBENIND. A.-G. Fr. 686,935, Dec. 19, 1929. See Brit 328,743 (*C. A.* **24**, 5442).

Calcium hypochlorite. ROBERT B. MACMULLIN and MAURICE C. TAYLOR (to the Mathieson Alkali Works). Can. 305,209, Oct. 28, 1930. A triple salt of $Ca(OCl)_2$, NaOCl and NaCl is mixed with a chlorinated lime slurry contg. $Ca(OCl)_2$ crystals in a mother liquor contg. $CaCl_2$ at a temp. below 10° to prevent transformation of the triple salt during mixing. The mixt. is warmed to cause transformation of the triple salt and reaction of the NaOCl with the $CaCl_2$ to form a mass of interlocking crystals of $Ca(ClO)_2$, which is dried.

Hypochlorite composition. ROBERT B. MACMULLIN and MAURICE C. TAYLOR (to Mathieson Alkali Works). U. S. 1,787,048, Dec. 30. By bringing together in the presence of water Na, Ca, chloride and OCl ions, at a temp. below about 16°, a triple salt may be obtained of the formula $Ca(OCl)_2.NaOCl.NaCl.12H_2O$ which may be used for *bleaching*. U. S. 1,787,080 describes the production of a triple salt of the same components by adding NaCl to a satd soln. of $Ca(OCl)_2$ at low temp.

Bleaching powder. I. G. FARBENIND. A.-G. (Adolf Remelé, inventor). Ger. 508,167, July 17, 1929. Bleaching powder prepd. by the customary processes and having more than 36% of active Cl is treated with an amt. of unslaked CaO equal to between one half and the whole amt of free water in the powder. The CaO is allowed to slake, and the mixt. is then fully dried by a current of warm air. The product can be stored without decompn.

Double salts of calcium nitrate. LONZA ELEKTRIZITATSWERKE UND CHEMISCHE FABRIKEN A.-G. Fr. 686,728, Dec. 16, 1929. See U. S. 1,776,694 (*C. A.* **24**, 5442).

Solid carbon dioxide. CARL BAUMANN. Swiss 138,986, April 2, 1929. Liquid CO_2 under high pressure is allowed to expand in a closed freezing cell.

Burning of ferric chloride. ERNEST W. WESCOTT (to Sulphur and Smelting Corporation). Can. 306,798, Dec. 16, 1930. Preheated $FeCl_3$ in dispersed or vaporized form is burned with air or O at a temp. exceeding 800°. Addnl. heat is supplied to the reaction zone to insure the formation of coarsely cryst. Fe_2O_3, which settles and is collected in the form of interlocked crystal masses. Fe_2O_3 and Cl are recovered.

Hydrogen peroxide. DEUTSCHE GOLD- UND SILBER-SCHEIDEANSTALT VORM. ROESSLER. Fr. 687,143, Dec. 23, 1929. See Brit. 330,255 (*C. A.* **24**, 5948).

Oxidation of hydrogen sulfide. RICHARD KUHN. Fr. 687,038, Dec. 20, 1929. H_2S is absorbed in a soln. of Na_2CO_3 or a soln. of a Ca salt, and treated with O or air in the presence of complex compds derived from heavy metals on the one hand and org. cyclic compds on the other. Examples are given of the use of a complex Cu salt of α-hydroxyanthraquinone or of quinizarin, a complex Mn salt of alizarin, and hemin dissolved in a soln. of Na_2HPO_4.

Lead carbonate. STANLEY C. SMITH. Ger. 509,262, April 24, 1927. See Brit. 272,053 (*C. A.* **22**, 1658).

Nitrous oxide from ammonium nitrate. WALTER FRIEDERICH. Ger. 506,542, April 28, 1928. See Brit. 310,507 (*C. A.* **24**, 696).

Nitryl chloride. I. G. FARBENIND A.-G. (Karl Dachlauer, inventor). Ger. 509,405, Aug. 30, 1929. NO_2Cl is prepd. by treating HNO_3 with $ClHSO_3$ at 5–10°. The HNO_3 should be dehydrated by addn. of oleum. An example is given.

Potassium carbonate. ALCALINA (SOC. ANON.). Fr. 688,493, Jan. 20, 1930. K_2CO_3 is made by introducing MgO into a soln. of a K salt under a pressure of CO_2 equal to or higher than the critical pressure at which CO_2 is sol. in all proportions in water. KCl is the preferred K salt so as to obtain $MgCl_2$ at the same time.

Potassium metaphosphate. PAUL DUTOIT and ÉDOUARD URBAIN. Fr. 688,246, Mar. 30, 1929. KPO_3 is prepd. from K polysilicates and Ca phosphates used in such proportions that all the potash and all the P_2O_5 are combined in the state of metaphosphate, and the amt. of charcoal and Al_2O_3 necessary for the total displacement of the potash is added. The slag has the compn. of an aluminous cement.

Potassium sulfate. ZAHN & CO. G. M. B. H. Fr. 687,864, Jan. 8, 1930. K_2SO_4 is made direct and by a dry method by submitting 2 mols. of KCl and about 1 mol. of H_2SO_4 to a reaction in a mech. circular furnace without isolating the bisulfate and without breaking up the process into successive steps.

Potassium sulfate and sodium carbonate. CHEMIEVERFAHREN-GES. M. B. H. Fr 687,905, Jan. 9, 1930. A lye (obtained by stirring the $NaHCO_3$ mother-liquor produced in the operation with $CaSO_4$, or $SrSO_4$, followed by the sepn. of the carbonate formed, and pptn. of glaserite and KCl) is treated with crude sylvinite and NH_3. The mother liquor from the glaserite and KCl is used, after partial sepn. of its NH_4Cl by cooling, for the manuf. by the Solvay process of $NaHCO_3$, the mother liquor of which is stirred, as indicated above, with $CaSO_4$ or $SrSO_4$, so that a closed-cycle operation is carried out. The mixt. of glaserite and KCl is transformed to K_2SO_4 by treatment with water.

Potassium sulfate and soda. CARL T. THORSSELL. U. S. 1,787,497, Jan. 6. In the production of K_2SO_4 and soda from crude sylvinitic salt with $CaSO_4$ or $SrSO_4$, $NaHCO_3$ mother liquor obtained from the Solvay process is mixed with $CaSO_4$ or $SrSO_4$, the carbonate formed is sepd., the remaining liquor is treated with crude sylvinitic K salt and NH_3, the glaserite and KCl formed are sepd., the mother liquor is cooled for removing NH_4Cl from it, and the remaining mother liquor is treated for the production of bicarbonate and the mother liquor is again mixed with $CaSO_4$ or $SrSO_4$.

Working up soda-potash mixtures. RICHARD FRIEDRICH and RUDOLF TAUSSIG Ger. 509,260, Nov. 16, 1926. Solns. contg. Na_2CO_3 and K_2CO_3 are treated with sufficient acid to react with part of the K_2CO_3, whereby $NaHCO_3$ is pptd., with or without $KHCO_3$. After sepg. the ppt., the decompn. of the K_2CO_3 is completed by adding a further amt. of acid. Detailed examples are given.

Sodium metaborate. ANDREW KELLY. Fr. 687,200, Dec. 24, 1929. See Brit. 326,378 (*C. A.* **24**, 4361).

Crystallizing borax from solutions containing also potassium chloride. WM. F. BURKE (to American Potash & Chemical Corp.). U. S. 1,787,356, Dec. 30. Liquor satd. with borax and KCl is brought to supersatn. with borax and the supersatd liquor is caused to flow countercurrent to a sludge of borax crystals, through a crystallizer which is relatively high as compared to its diam.

Trisodium phosphate. VICTOR CHEMICAL WORKS. Fr. 687,850, Jan. 8, 1930. Na_3PO_4 is obtained in scale form in which form it is used as a *cleansing agent* by melting it with an amt. of water corresponding to its water of crystn. and spreading it on a cooling surface, *e. g.*, by rotating a wheel dipping into the melt.

Sodium sulfite or bisulfite solution from alkaline lye. ZELLSTOFFFABRIK WALDHOF and OTTO FAUST. Ger. 507,523, Aug. 10, 1928. See Brit. 317,040 (*C. A.* **24**, 1981).

Sodium stannate. WM. T. LITTLE. U. S. 1,787,078, Dec. 30. To obtain cryst. Na stannate, a strong NaOH soln. is added to a Na stannate soln. to effect pptn. of the stannate.

Strontium oxide. I. G. FARBENIND. A.-G. Fr. 687,995, Jan. 10, 1930. SrO is made by calcining $SrCO_3$, wetted with water in a rotating furnace at about 1200°.

Titanium compounds. FOORD VON BICHOWSKY (to The Titania Corp.). Can. 306,145, Nov. 25, 1930. Ti compds., especially TiO_2, are produced by oxidizing Ti-N compds. with HNO_3 contg. a little H_3PO_4 and a catalyst (H_2SO_4 or strong HCl), washing the colloid-like material so obtained, evapg. to dryness and grinding.

Zinc sulfate separation from solutions also containing sodium sulfate. HANS WEIDMANN. U. S. 1,787,806, Jan. 6. The Na_2SO_4 is converted into $NaHSO_4$ by addn. to the soln. of H_2SO_4, and the $ZnSO_4$ is sepd. as its monohydrate by evapg. the soln. at temps. above 100°.

Zinc sulfide. EARL C. GASKILL (to The St. Joseph Lead Co.). Can. 306,140, Nov. 25, 1930. Raw ZnS ore is heated in a furnace with the exclusion of air, superheated steam is passed through the furnace to convey the ZnS vapor into a condensing chamber from which air is excluded and the finely divided cryst. ZnS produced is collected. Cf. *C. A.* **24**, 3387.

Salt. THEODOR LICHTENBERGER. Ger. 507,635, Dec. 17, 1927. Addn. to 461,009. In the evapn. of brine to form table salt, other salts such as KCl, alkali sulfates and carbonates are removed from the surface of the soln., where they sep. out.

Treating salt mixtures. I. G. FARBENIND. A.-G. Fr. 686,807, Dec. 18, 1929. Solid salt mixts., either from natural or industrial sources, particularly those contg. K salts, are extd. with liquid NH_3. Salts which lower the soly. of the salt remaining undissolved may be added to the NH_3.

Dehydrating salt. VICTOR BELLAVOINE. Fr. 687,647, Jan. 3, 1930. Table or cooking salt is dehydrated by placing it in a thin layer on a heated surface and stirring the layer constantly with a reciprocating movement. The salt may be caused to move gradually over the surface.

Apparatus for drying salt by hot gases. MICHAEL Y. LUR'E and ANATOLY P. VOROSHILOV. U. S. 1,787,009, Dec. 30. Structural features.

Lime water. N.-V. NECKAR WATERREINIGER MAATSCHAPPIJ and J. A. HERINGA. Brit. 334,011, July 5, 1929. Water is passed upwardly in a continuous stream at high velocity through a bed of gravel and superposed layer of lime sludge.

Synthetic spinel. I. G. FARBENIND. A.-G. Fr. 687,661, Jan. 3, 1930. A synthetic spinel having an aquamarine color in daylight and artificial light is made by adding 0.3% of TiO_2 to the starting mixt. of Al_2O_3 and MgO. Other substances producing this color may be added as well.

Liquefaction of materials such as in the purification of helium. WM. L. DEBAUFRE AND JOHN W. DAVIS. U. S. 1,786,898, Dec. 30. The major portion of undesired constituents is liquefied by an internal cycle of refrigeration, and the remaining undesired constituents are then liquefied by an external cycle employing liquefied N as the refrigerating medium, without materially reducing the pressure of the gas being processed; and the liquefied constituents are employed as return fluid in the internal cycle. App. is described.

Atomic hydrogen. OTTO REICHENHEIM and ERNST LAU. Ger. 509,043, Feb. 28, 1930. In the prepn. of a gas contg. H by subjecting H_2 at a very low pressure to elec. discharge, the yield of at. H is increased, and its life is prolonged, by mixing an inert gas with the H_2.

Hydrogen-carbon monoxide mixtures. I. G. FARBENIND. A.-G. Ger. 507,917, Dec. 5, 1926. A H-CO mixt. free from, or contg., N is obtained by the partial combustion of natural gaseous hydrocarbons with O or air. The app. is described in which the hydrocarbons are introduced tangentially into a reaction chamber through a number of inlets.

Separation of mixtures of hydrogen and hydrocarbon gases. WARREN K. LEWIS (to The Standard Oil Development Co.). Can. 305,734, Nov. 11, 1930. Mixts. of H and hydrocarbons are passed under high pressure through a body of activated charcoal until it is substantially satd. with hydrocarbons and a gas rich in H is withdrawn. Then a gas rich in hydrocarbon is passed into the satd. charcoal to displace unadsorbed gas held between grains of the charcoal, the pressure on the satd. body of charcoal is reduced and a gas rich in hydrocarbon is withdrawn.

Oxygen and nitrogen from liquid air. MESSER & CO. G. M. B. H. Ger. 509,793, May 15, 1926. Addn. to 505,676 (*C. A.* **25**, 549). Further details of the app. for sepg. liquid air into O and N at reduced pressure by fractionating are given.

Active carbon. VEREIN FÜR CHEMISCHE UND METALLURGISCHE PRODUKTION. Ger. 507,524, June 11, 1925. Addn. to 485,825 (*C. A.* **24**, 1188). In the prepn. of active C from sclerenchymatous tissue such as fruit husks by the method of 485,825, H_3PO_4 is used to mix with the starting materials instead of $ZnCl_2$.

Active carbon. NAAMLOOZE VENNOOTSCHAP NORIT VEREENIGING VERKOOP CENTRAAL. Ger. 506,544, July 19, 1928. An activating retort is described for producing or reviving active C by stirring while heating in a current of activating gases.

Reviving decolorizing carbon. FRIEDRICH W. MEYER. Ger. 507,994, Sept. 9, 1928. The used C is heated to temps. below the glowing temp. by superheated steam in a closed vessel.

Kaolin. ERICH MÜLLER. Fr. 687,653, Jan. 3, 1930. Kaolin of perfectly defined grain is obtained by fractionated washing of previously purified suspensions. A suspension of kaolin of sp. wt. $s = 1.06 - 1.12$ is poured into a vessel up to a height of $h = 6.2(s - 1)$ cm. The matter which still swims after a decantation of about 12 hrs. is removed from the sediment of little value, and the kaolin contained in the said matter is separated and submitted to a final treatment.

Fuller's earth. PFIRSCHINGER MINERALWERKE GEBR. WILDHAGEN & FALK. Ger. 507,760, Nov. 8, 1925. Highly absorptive granular fuller's earth is produced by grinding air dried crude material to the desired size, heating *in vacuo* under pressure with a mineral acid (*e. g.*, a mixt. of 20% HCl and 30% H_2SO_4) and finally washing with water.

Lime kiln. EMANUEL SOBEK. Ger. 507,605, May 2, 1929. Addn. to 451,403. Details of a discharging funnel.

Rotating furnaces for lime, cement, etc. SOC. D'EXPLOITATION DES PROCÉDÉS INDUSTRIELS CANDLOT. Fr. 687,838, Jan. 8, 1930. Construction of recuperative coolers.

Cement powder. I. G. FARBENIND. A.-G. (Karl Frank and Karl Dietz, inventors). Ger. 506,928, Oct. 3, 1928. Non-refractory readily sol. silicates in solid form are mixed with substances with a strong alk. reaction. Thus powd. Na_2SiO_3 is mixed with Na_2SiF_6.

Catalysts. BAMAG MEGUIN A.-G. Fr. 686,696, Dec. 16, 1929. A catalyst, *e. g.*,

for the combustion of NH_3 for the production of nitrous gases, is made in the form of a network from wires of an alloy of Pt and Rh and wires of pure Pt, or wires of pure Pt and wires of pure Rh.

Catalysts containing aluminum. ALEXANDER WACKER GES. FÜR ELEKTROCHEMISCHE IND. G. M. B. H. Fr. 688,077, Jan. 13, 1930. A catalyst suitable, *e. g.*, for transforming AcH into acetic ester, is made by treating a mixt. of Al and alc., preferably in the presence of an indifferent solvent, with an elementary halogen or halogen compds giving with Al a halogenated Al.

Iron oxide catalyst. MARJAN GODLEWICZ. Fr. 687,847, Jan. 8, 1930. An active oxide of Fe (Fe_3O_4) for use as a catalyst is prepd. by pptg. $Fe(OH)_2$ from a soln. of $Fe(NO_3)_2$ by means of NH_3, alkalies or carbonates and heating lightly.

Active iron compounds. MICHAEL TENNENBAUM and CARL VAN EWEYK. Ger. 507,887, Dec. 22, 1926. Addn. to 489,550 (*C. A.* **24**, 2252). The active Fe carbonate obtained by the method of 489,550 is dried with exclusion of air at 100–300° to form an artificial magnetite, which, on further heating in presence of air, gives a strongly magnetic active Fe oxide. Treatment of the magnetite with concd. org. acid and heating the product with a weak base, gives a highly active Fe hydroxide. If the carbonate is treated with dil. acid, a weakly magnetic, strongly active Fe oxide is produced. Examples are given.

Catalyst poisons. METALLGES. A.-G. Fr. 687,688, Jan. 4, 1930. Combustible catalyst poisons such as AsH_3 contained in gases such as those coming from a Dwight-Lloyd app. are rendered inoffensive by passing the gases into a roasting or metallurgical furnace in which the poisons are burnt, after which their sepn. is carried out in known manner.

Catalyst supports. VEREIN FÜR CHEMISCHE UND METALLURGISCHE PRODUKTION. Fr. 688,561, Jan. 20, 1930. Supports for catalysts are composed of silicic acid or strongly acid silicates and are made by heating natural or artificial substances having a high content of silicic acid with salts or oxides such as Al_2O_3 capable of forming silicates, after which the basic constituent of the reaction mixt. is eliminated by treatment with mineral acids. The heating may take place in the presence of an NH_4 salt.

Roasting pyrite ores. SAUREFABRIK SCHWEIZERHALL. Swiss 138,363, Jan. 19, 1929. A multi-stage furnace for thoroughly roasting pre-heated S ores or other sulfurous material is described.

Roasting sulfide ores. SAUREFABRIK SCHWEIZERHALL. (Otto Saladin, inventor.) Ger. 508,340, Feb. 22, 1929. In roasting sulfide ores in a multiple-hearth furnace down which the material is passed in countercurrent to a stream of air, premature cooling of the roasted material is avoided by by-passing the air stream past some of the intermediate hearths through channels in the furnace wall. App. is shown.

Rotary-tube furnace for roasting sulfide ores. ZELLSTOFFFABRIK WALDHOF and METALLGES. A.-G. Ger. 508,341, Mar. 24, 1927.

Plastic compositions. ALEXANDER M. NASTYUKOV. Ger. 509,305, April 3, 1927. The condensation product ("formolite") obtained by treating mineral oils with H_2SO_4 and CH_2O, as described in Brit. 289,920 (*C. A.* **23**, 968), is used, alone or mixed with artificial resins or other plastics, etc., for the manuf. of shaped articles.

Plastic material. V. P. KHRISTYANOVICH AND A. I. SARK. Russ. 42,398, Mar. 8, 1929. Plastic material is prepd. by mixing freshly pptd. SiO_2 with glycerol and powdered or fibrous material such as clay, talcum, sawdust, pulp or cotton wool.

Plastic masses. "HEROLD" A.-G. Ger. 507,997, Aug. 24, 1927. Starch is condensed with CH_2O in the presence of acid-reaction accelerators such as mono- or polybasic aromatic or aliphatic hydroxyacids, unsatd. acids, halogen-substituted acids and aliphatic acids, with a small quantity of inorg. acid. The salts or anhydrides may be used. Examples mention lactic acid, phthalic acid anhydride, H_2SO_4 and $NaHSO_3$.

Agents for dissolving or softening plastic masses. I. G. FARBENIND. A.-G. (Otto Jordan, inventor). Ger. 506,677, Aug. 2, 1925. Agents for dissolving or softening resins, lacs, oils, dyes, essences or other org. plastic masses consist of esters of substituted fatty acids contg. 6 or more C atoms, and having no O in the mol., except in the COOH group. Et methylpropylacetate is mentioned as the example.

Method and plant for molding plastic masses under high pressure. KARL F. HÖLLER and STEFAN SCHLESS. Austrian 119,622, May 15, 1930. Manipulative and structural features are described.

Composition for use in modeling, sculpture, pottery, etc. J. T. TASSAUD. Brit. 334,000, June 27, 1929. Plaster of Paris or a similar material 2–3 is mixed with an oleaginous material such as lard 1 part. The hardened surfaces of articles formed from

the compn. may be treated with varnish, linseed oil or other covering or protecting materials.

Composition from blood suitable for making molded articles. FELIX HOMBERG (to American Nuplax Corp.). U. S. 1,786,488, Dec. 30. Dried blood is mixed with an insol. inorg. filling material such as lithopone, adapted to render the product permeable after molding, the material is molded under the action of heat and pressure to form buttons or other articles, and the product is bleached (suitably by H_2O_2, Cl or SO_2) and treated with a coloring material such as a dye soln. Cf. *C. A.* **24**, 212.

Artificial masses. HANS FRIEDLÄNDER. Ger. 506,883, Sept. 26, 1925. Addn. to 454,831. The method of 454,831 for prepg. artificial masses by soaking a fibrous groundwork with hard wax is modified by using by-products from montan-wax manuf. instead of hard wax. Thus, montan-wax pitch or lignite tar may be used.

Condensation products. SOC. ANON. POUR L'IND. CHIM. À BÂLE. Swiss 138,489 to 138,491, Sept. 18, 1928. Addns. to 130,420. Benzoin, isopropyl alc. and naphthalene-β-sulfonic acid are condensed in equimol. proportions, optionally in the presence of concd. H_2SO_4. The product is a good dispersion agent (138,409). BuOH or EtOH may be used and the respective proportions changed to 5:5:1, (138,490 and 138,491). Cf. *C. A.* **24**, 4363.

Artificial gems (corundum). SIEMENS-SCHUCKERTWERKE A.-G. Ger. 509,132, July 15, 1924. In the method in which the powd. initial materials are conveyed into the fusion zone by a gas stream, efficient distribution of the materials is effected by directing the stream against the surface of a heap of the materials. App. is shown.

Wetting agents. THE TWITCHELL PROCESS CO. Fr. 688,511, Jan. 20, 1930. A liquid for wetting fibrous materials and finely divided substances contains 99% water and 1% of sulfonates of mineral oils of the type produced by the refining of petroleum fractions having a naphthenic base. These sulfonates are distinguished principally by the solv. in water of their Ca and Mg salts.

Detergents. THE TWITCHELL PROCESS CO. Fr. 688,513, Jan. 20, 1930. A detergent is composed of mineral oil sulfonates sol. in oil and those sol. in water, these sulfonates coming, resp., from layers of oil and mud resulting from refining. Cf. *C. A.* **25**, 170.

Non-inflammable polishing and cleaning agent for floors, linoleum, etc. AURÈLE CHAUDEMS. Swiss 140,104, Nov. 30, 1928. The prepn. contains C_2HCl_3, oil of turpentine and beeswax.

Non-inflammable cleansing agent for floors, oil paintings, etc. ALBERT HUBER. Swiss 138,818, Feb. 17, 1929. The prepn. consists of a mixt. of hydrogenated naphthalene 60, cyclohexanol 10, sulfoleate 10, water 20, turpentine 15, NH_4Cl 3 and AcOAm 2 parts, preferably in the proportions as given.

Composition for cleaning metal. JAMES H. GRAVELL. Can. 305,576, Nov. 11, 1930. A material for prepg. metal for painting consists of an admixt. of H_3PO_4, EtOH, BuOH, water and raw starch.

Removing lead fouling from rifle barrels, etc. G. HALBE. Brit. 333,963, May 31, 1929. For removing metal fouling such as Pb from iron or steel surfaces, an alc. soln. of a Hg salt such as $HgCl_2$ is used; castor oil, turpentine, etc., may be added to reduce the tendency of the surface to rust.

Composition for prevention of corrosion. JAMES H. GRAVELL. Can. 305,575, Nov. 11, 1930. A material for preventing corrosion of metal consists of an admixt. of amine phosphate, iron oxide, a liquid hydrocarbon and stearin pitch.

Soot-destroying composition. ALBERT C. BERRYMAN. Can. 305,971, Nov. 25, 1930. A soot destroying compn. consists of NaCl 285 lb., powd. Zn 14 lb., powd. hard coal 6 lb. and powd. charcoal 3.5 lb.

Solution for stripping old paint, etc., from wood, etc. ALBERT WEBER. Ger. 508,661, Sept. 9, 1927. The paint surface is coated with a soln. contg. 72% spirits, 25% C_6H_{12}, tetralin and 1% thioether, and rubbed with sand paper.

Dry bleaching composition. WM. B. STODDARD and VAMAN R. KOKATNUR (to Pilot Lab., Inc.). U. S. 1,787,402, Dec. 30. In drying a bleaching compn. which when wet is an intermediate product such as a peroxide or other "per-compd.," the wet bleaching compn. is mixed with a material such as Na_2SO_4, alum or Na_2HPO_4 contg. a proportion of water of crystn. which is less than its normal content of water of crystn. so that it takes up addnl. water from the compn. to be dried. Cf. *C. A.* **24**, 4364.

Colloidal solutions. JEAN J. PETIT. Fr. 686,880, Mar. 12, 1929. Concd. colloidal solns. (generally contg. at least one org. solvent) have their viscosities considerably lowered without modifying the chem. structure of the colloids which they contain by the addn. of emulsifying agents, which include salts of fatty or resinic acids, Turkey-red

oils, sulforicinates, ester acids of dibasic aliphatic acids with higher alcs., sapon. products of lanolin, saponin and emulsin, oxidation products of paraffins, waxes, etc., naphthenic acids or their derivs. and cyclohexanol or its homologs or derivs. The process is particularly applicable to solns. of cellulose compds. used for making *artificial silk*.

Coating materials. IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 687,597, Jan. 2, 1930. Plastic substances, substantially free from water, used in the *manuf. of lacquers, celluloid, floor coverings* and *artificial leather* are made by incorporating water-wet cellulose esters and ethers with a plasticizing and softening medium which includes a volatile gelatinizer, during which the water seps. and is removed. The gelatinizer may be a water-miscible or partly miscible solvent such as ethylene glycol mono-ethyl ether, Et lactate and Me acetate or a water-immiscible solvent such as Bu acetate and chloroform or mixts. of the 2 kinds. A non-volatile gelatinizing agent such as dibutyl phthalate, tricresyl phosphate, camphor or camphor oils may be used for the gelatinization. Coating materials are made by dissolving the products in suitable solvents with or without the addn. of resins or further plasticizers or softeners. Pigments in the form of water-wet pastes may be added. Examples are given.

Adhesive. WALTER ALEXANDER. U. S. 1,786,417, Dec. 30. An adhesive suitable for use where flexibility is desirable comprises a starch or deriv. such as tapioca starch or flour or "commercial white corn dextrine" together with a water-sol. alk. B compd such as borax and diethylene glycol, and may contain other ingredients also such as NaOH and formaldehyde.

Adhesive suitable for gluing up ply-wood. LAWRENCE BRADSHAW (to Casein Mfg. Co. of America). U. S. 1,787,611, Jan. 6. An adhesive is prepd. comprising an alkali-sol. protein material such as casein or soy-bean meal together with an alkali in at least sufficient quantity to dissolve the protein material, starch-viscose, NaF and water, etc.

Rendering rubber tasteless and suitable for use in chewing gums. CHARLES E. DELLENBARGER (to Paul Carpenter). U. S. 1,786,831, Dec. 30. A compn. which may comprise rubber and a wax such as paraffin is gradually heated to 132–145°. Various flavoring and modifying ingredients may be added.

Packing and wrapping materials. MARINO GENTILE and SAMUEL W. WEIS. Fr. 687,126, Dec. 23, 1929. A packing or wrapping material for *foodstuffs, pharmaceutical products*, etc., is made from a base of a protein substance such as gelatin coated with a cellulose ester such as the nitrate, in which an org. substance such as castor oil is incorporated to give binding qualities to the coating.

Soluble transformation products of diolefins. I. G. FARBENIND. A.-G. Fr. 687,773, Jan. 7, 1930. Butadiene or its homologs, in the presence of solvent or dispersive agents, is treated by finely divided alkali metals or by mixts. contg. them; care is taken that the reactive components are well mixed and it is preferable to add butadiene hydrocarbons as they are consumed. The products are submitted to a hardening process at ordinary or elevated temp. and are used for the manuf. of *resistant masses, coatings, films*, etc.

Ossein. HONORÉ SCIALLANO. Fr. 688,104, Nov. 27, 1929. Ossein is prepd. from bones by dissolving the mineral part of the bones with phosphoric acid regenerated from a previous operation.

Laminated material. VICTOR H. TURKINGTON (to The Bakelite Corp.). Can. 306,935, Dec. 23, 1930. Fibrous sheet material is treated with a reactive resinoid varnish and dibutyl phthalate and subjected to heat and pressure to harden the resinoid. A laminated material for elec. insulation is obtained. Cf. *C. A.* **24**, 6042.

Working up zirconium-lime sinter products. KALI-CHEMIE A.-G. (Friedrich Rüsberg and Paul Schmid, inventors). Ger. 509,515, Nov. 12, 1927. The product is treated with aq. H_2SO_3 to remove part of the $CaCO_3$. The residue is dissolved in HCl and treated with the $Ca(HSO_3)_2$ lye obtained by the prior treatment with aq. H_2SO_3 and allowed to stand. The whole is heated to drive off SO_2, causing basic $Zr(SO_3)_2$ to be pptd. This is filtered off, washed and calcined at 700–800° to give practically pure ZrO_2.

Finely divided magnetic material suitable for cores of loading coils, etc. JOHN H. WHITE and VICTOR E. LEGG (to Bell Telephone Laboratories, Inc.). U. S. 1,787,606, Jan. 6. For increasing the yield of fine dust obtained by comminuting magnetic materials including common elements of the Cr group of the periodic table, such as an alloy contg. Ni 78.5, Fe 13.5 and Mo 4%, the materials such as Ni and Fe are melted with metallic Cu (suitably in the proportion of about 4%) so that premature breaking up into large fragments during mech. hot working is avoided, and the material is then subjected to hot working and comminution. Cf. *C. A.* **24**, 3481.

Phonograph disk records containing cellulose ester. HUBERT LAFFON. U. S.

1,787,484, Jan. 6. A disk of material such as cardboard is impregnated with cellulose ester and plasticizer, impressed as desired, and then coated with transparent "cellulosic varnish."

Printing pastes. H. BOLLMANN and B. REWALD. Brit. 333,959, May 28, 1929. A vegetable or animal phosphatide (suitably a product obtained from soy beans by a process which is described) is added to a starch, dextrin, tragacanth, gum arabic or other thickener, in the production of a printing paste, and may be preliminarily dissolved in a mineral oil such as spindle oil, or used together with fatty oils and wetting agents such as turkey red oil. Pea shell meal, fish roes, brain, egg yolk and soy-bean slime (obtained in the extn. of soy beans with benzene) also may be used as sources of the phosphatides.

Ice-rotting composition. ARTHUR C. WHITE and CHARLES E. CLASON (to Dow Chemical Co.). U. S. 1,787,887, Jan. 6. An ice-rotting substance such as $CaCl_2$ is mixed with a buoyant material such as powd. cork to form air-including agglomerated granules which will float on water. U. S. 1,787,888 describes ice-rotting compns. formed from an ice-rotting material such as $CaCl_2$ and a heat-absorbing material such as lampblack which absorbs heat from the rays of the sun.

Anti-freeze composition. WILLIAM F. HURLEY (to Guiseppe Gismondi). Can. 305,021, Oct. 21, 1930. An anti-freeze compn. comprises an aq. soln. of $CaCl_2$ and the water sol. ash resulting from peanut kernels from which the oil has been expressed.

Cork. FRITZ SCHLOTTERBECK. Ger. 507,689, Sept. 15, 1929. Cork is improved, *i. e.*, its pores enlarged, by heating with NH_3. The cork may be soaked with aq. NH_3 and heated under reduced pressure.

Fiber bands. G. ROTHMUND & Co. Ger. 508,547, April 14, 1926. The fiber is soaked in a C_6H_6 soln. of gutta percha and asphalt and dehydrated. The rolled fiber is then treated with alc., acetone, etc., to harden it.

Band-drier for use in carbonizing wool, rags, etc. HERMANN HAAS. Ger. 509,431, July 7, 1928.

Aqueous dispersions of thermoplastic material such as asphalts, waxes, gums or resins. ALBERT L. CLAPP (to Bennett, Inc.). U. S. 1,787,338, Dec. 30. After prepg. a hot batch of liquefied thermoplastic material and a hot batch of aq. Na silicate soln., the 2 materials are progressively withdrawn as continuously moving streams of comparatively small cross sectional area, from the batches, and the 2 streams are united into a single continuously moving stream and the latter is thoroughly agitated to effect dispersion of the thermoplastic material in the aq. Na silicate soln. The dispersions thus prepd. are suitable for coating, etc. U. S. 1,787,339 relates to app. for use in processes of this character.

Treating seaweed. COMPAGNIE FRANÇAISE DE L'IODE ET DE L'ALGINE. Ger. 508,573, Sept. 10, 1929. Brown algae or seaweed is extd. with water after treatment with a soln. of alkali earth salts. The residue is treated with dil. H_2SO_4, washed and further extd. with an alk. soln. or Mg lye. Cf. *C. A.* **24**, 2563.

Artificial teeth. ANTOINE F. M. VAN RENTERGHEM. Ger. 508,820, June 6, 1928. The teeth are made from a mixt. of phenol-aldehyde resin, tartaric acid and alc. The materials are purified by centrifuge and heated till milky. Pure Sn may be used for the mold.

Use of chloropicrin as a warning agent with hydrocyanic acid in fumigating. HANS LEHRECKE (to Koessler & Hasslacher Chem. Co.). U. S. 1,786,623, Dec. 30.

Insect repellent. DUDLEY H. GRANT (to The Standard Oil Development Co.). Can. 307,013, Dec. 23, 1930. An insect repellent comprises terpinyl acetate, pyrethrum ext. and kerosene. It is adapted to be used with a vehicle whereby it may be applied to human beings, domestic animals, clothing, furniture, etc. Cf. *C. A.* **24**, 2849.

Insecticide. I. G. FARBENIND. A.-G. Ger. 509,086, Oct. 16, 1926. A compn. for destroying lice on the human or animal body comprises an org. solvent soln. of Al naphthenate, with or without a wetting agent.

19 - GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

Machinery and methods of manufacture of sheet glass. W. E. S. TURNER. *Engineering* 130, 755-9 (1930). E. H.

The influence of chemical compositions on the physical properties of soda-lime

glasses. J. W. GILL AND W. C. RUECKEL. *J. Am. Ceram. Soc.* **14**, 21–9(1931).—Nineteen glasses were studied. Conclusions: (1) With SiO_2 const., each 1% increase in dolomitic lime, at the expense of Na_2O, increased the softening point 11–12°, d. 0.004, and n 0.0015. (2) With Na_2O const., the softening point was const. The d. decreased 0.011 and n 0.0030 per 1% increase in SiO_2 at the expense of CaO. (3) With CaO const., the increase in softening point per 1% increase in SiO_2 varied thus: 5% CaO, 21; 8% CaO, 17°; 10% CaO, 15°; 12% CaO, 12°. The d. decreased 0.008 and n 0.0015 per 1% increase in SiO_2 at the expense of Na_2O. (4) A thermochem. relation of the softening points and chem. compns. (calcd.) parallels closely the "liquidus" surfaces of Feild and Roysters' system, CaO–Na_2O–SiO_2. C. H. KERR

Molecular kinetics in the softening range of glasses. G. TAMMANN. *Z. anorg. allgem. Chem.* **193**, 406–8(1930); cf. *C. A.* **25**, 179.—It is considered that the mols. of a glass begin to rotate freely during the softening interval, rather than that the amplitude of vibration increases. T. H. CHILTON

Some anomalous phenomena in glass near its softening point. O. K. BOTVINNIKOV. *Keram. i Steklo* **6**, 431–4(1930).—B. reviews the existing literature on anomalous phenomena in glass near its softening point and describes his investigations. The results are: (1) At certain temps. lying below the softening point of glass, an anomalous change in the coeff. of cubic expansion of glass was observed; this interval coincides with the corresponding intervals for specific heat and viscosity. (2) Three transition points were found for all glasses; this fact disagrees with the investigations of M. O. Sanford and others, who found only 2. M. V. KONDOROV

The properties of re-melted cullet. W. E. S. TURNER. *Pottery Gaz.* **55**, 1761–3(1930); cf. *C. A.* **24**, 2564.—Meltings of glass made in refractory crucibles could not be used for study because of the corrosion of the pots by the glass. Pt crucibles were then used. Evidence gained up to the present shows that if a glass of known compn. is used and the heating is of such a character that its chem. compn. does not change, repeated meltings of that glass should not affect the phys. characteristics. The important thing in glass making is to have the mass homogeneous and, if results were obtained in practice which seem to indicate that the character of the glass changed because of the addition of cullet, the explanation is probably that the homogeneity had been interfered with, rather than that a fundamental change had taken place. R. A. HEINDL

Coloring glass with coal and sulfides. A. K. BORK. *Keram. i Steklo* **6**, 435–7(1930).—The results of investigations showed that pure coal does not color glass either yellow or orange (brown), but that these colors and black generally depend on the formation of Fe sulfide. Also in *Glastech. Ber.* **8**, 275–9(1930). M. V. KONDOROV

Commercial glass transmitting ultra-violet light. PAUL DAVIDOVICH. *J. Optical Soc. Am.* **20**, 627–41(1930). The history of the manuf. of ultra-violet glass from 1854 to date is reviewed. The main features of modern com. ultra-violet transmitting glasses are described with tables showing the progressive shift of the limit of ultra-violet transmission with change of compn. Wave length and transmitting power in percents are given for the following glasses: Brevos, Ultravit, Uviol, Sanalux and Vita. The aging of ultra-violet glass is considered, also the effect of heat on its transparency. M. M.

A study on the drying of clay and clay mixtures. V. BODIN AND P. GAILLARD. *Brit. Clayworker* **39**, 130–3, 164–8(1930). R. A. HEINDL

Drier problems with calculations. JOHN L. CARRUTHERS. *J. Am. Ceram. Soc.* **14**, 8–20(1931). C. H. KERR

Practical geology for brickmakers. JAMES STANWORTH. *Brit. Clayworker* **39**, 198–200, 284–5(1930). R. A. HEINDL

The effect of hydrogen-ion concentration upon the sedimentation of clay. NORVIN BEEMAN. *J. Am. Ceram. Soc.* **14**, 72–87(1931).—The effect of H-ion concn. upon the rate of sedimentation was relatively great, which explains why changes in p_H values produce changes in plasticity and viscosity. Elutriation is an uncertain process without p_H control. C. H. KERR

History of Strasburg firebrick district. E. J. BOGNAR. *Bull. Am. Ceram. Soc.* **10**, 3–7(1931). C. H. KERR

Recent German technical research in the field of brick making. HANS HIRSCH. *Tonind.-Ztg.* **54**, 1273–5, 1303–5, 1330–2, 1356–8(1930).—The SO_3 absorbed from the combustion gases is dependent on the amt. of lime present and on the firing temp. The dissocn. of gypsum takes place at 900° in a reducing atm. and at 1400° in an oxidizing atm. ROBERT F. FERGUSON

Recent patent literature on the manufacture of silica brick. FRIEDRICH REINHART. *Tonind.-Ztg.* **54**, 1373(1930).—All domestic and foreign patents are listed. Most of them show an attempt to invent a brick which will not grow in service because of residual

expansion. These may be classified into groups: addn. of combustible or highly shrinking material to compensate for the increase; and the addn. of catalytic agents to accelerate the expansion during manuf. Some of the catalytic agents which have been mentioned are P_2O_5, Na tungsate, borates, molybdates, phosgene, KCl, feldspar and quartz glass. ROBERT F. FERGUSON

Continuous kilns for the burning of clay products. J. WILLIAMSON. *Brit. Clayworker* **39**, 274–8(1930).—The advantages of the continuous kiln are: (1) 50% saving in fuel; (2) 30 to 60% saving in labor; (3) control is easier; (4) the product is more uniform; (5) losses are greatly reduced; (6) repairs are lower; and (7) greater output is obtained for a given space. R. A. HEINDL

The recent trend of ceramic kiln practice. S. R. HIND. *Brit. Clayworker* **39**, 181–91(1930); cf. *C. A.* **24**, 4367.—The use of car tunnel kilns is increasing. R. A. HEINDL

Heating porcelain kilns with coal gas. FRANZ DIETRICH. *Gas u. Wasserfach* **73**, 1069–74, 1090–6(1930). R. W. RYAN

Investigation of feldspar and its effect in pottery bodies. R. F. GELLER AND A. S. CREAMER. *J. Am. Ceram. Soc.* **14**, 30–71(1931).—Nineteen feldspars were studied, alone and in typical vitreous and semivitreous bodies. Results are given in detail. Some points are: (1) Refractoriness increases and softening range decreases with increase in K_2O. (2) "True" sp. gr. ranged from 2.628 for highest Na_2O to 2.565 for highest K_2O feldspar. (3) The type of feldspar had little or no effect on the firing behavior of the body or on the color by reflected light. (4) Translucency of bodies increased with increase in K_2O content of the feldspar used. (5) Petrographic examn. of 3 bodies showed no great differences in mullite development or quartz soln. (6) Quenching test did not indicate the relative merits of the feldspars, as to "glaze fit." (7) Thermal expansion was highest in bodies contg. high Na_2O feldspars. C. H. KERR

Grog. C. R. F. THRELFALL. *Brit. Clayworker* **39**, 310–17(1930). R. A. HEINDL

The chemical investigations of refractory materials. III. H. J. VAN ROYEN AND HERBERT GREWE. *Arch. Eisenhüttenw.* **4**, 17–21(1930); cf. *C. A.* **23**, 4312.—A method is described for analyzing chrome brick for use in an Fe smelting lab. A sample of the brick is ground in an agate mortar until grit-free, decompd. by fusing with Na_2CO_3, dissolved in dil HCl, and the SiO_2 detd. in the residue (*Ber. Chem.-Aussch. Eisenh.*, No. 110(1927)). The alk. earths are sepd. from the $(NH_4)_2S$ group metals in the filtrate either by $(NH_4)_2S$ or NH_3. By dissolving either of these ppts. in HCl (1:2), diluting to 100 cc. with H_2O, pptg. an aliquot portion with $(NH_4)_2S$, and igniting, (Cr_2O_3 + Fe_2O_3 + Mn_3O_4) may be detd. Fe is detd. in another aliquot portion of the soln. by the $TiCl_4$ method. Cr is detd. in still another portion by the method of Philips (*Ber. Eisen* **27**, 1164–7(1907)). To det. Mn the dried sample is evapd. with HF-H_2SO_4, the residue decompd. by fusing with $NaKCO_3$, the fused mass dissolved in HCl, and Mn in the soln. detd. by the Volhard Wolff method. Al_2O_3 is detd by difference. Ca in the filtrate of the $(NH_4)_2S$ or NH_3 pptn. is detd. by the oxalate method. MgO is detd by pptg. with $(NH_4)_2HPO_4$ from the cold oxalate filtrate as $MgHPO_4$. J. BALOZIAN

Thermal conductivity of refractory materials. H. GOLLA AND H. LAUBE. *Tonind.-Ztg.* **54**, 1413–4, 1431–2, 1458–60(1930).—The app. consists of a hollow sphere of the material to be tested, which is heated from the center with an elec. resistance. The temp. of the outside surface of the sphere, suitably guarded and insulated, is then measured. The cond. in phys. units is given in the form of a table for 24 different refractory materials each at 5 different temps. ROBERT F. FERGUSON

Study of the equilibrium of refractory arches. R. HUSTIN. *Chaleur et ind.* **11** 131–2(1930). An investigation of the expansion of certain bricks under pressure. Brick A had higher dilatation than brick B under one pressure but the reverse was true under two that pressure. Hence each problem of the most suitable refractory brick requires examn. upon its own merits. S. L. B. ETHERTON

Furnace-testing refractories for slag erosion. B. W. STROMBERG. *Chem. & Met. Eng.* **37**, 665–6(1930).—In an oil- and powd. coal-fired furnace representing boiler furnace conditions, refractory brick is tested for slag erosion and penetration. High-grade fire clay brick erodes about 1 in. in 48 hrs.; SiC brick, little or not at all; and SiO_2 brick, about 5 in. E. M. SYMMES

Magnetic separation **purifies feldspar (PEDDRICK) 18.** Composition for use in modeling, sculpture, **pottery, etc. (Brit. pat. 334,000) 18.**

Glass. FRITZ ECKERT. Ger. 508,114, Mar. 5, 1927. Between the clarifying chamber and the place of withdrawal, an addnl. chamber is arranged in which the molten glass is subjected to mech. agitation at a temp. substantially above the working temp. It is then led away and cooled as rapidly as possible to the working temp.

Delivering mold charges of molten glass. ROY E. SWAIN. U. S. 1,788,037, Jan 6. Mech. features.

Glass-blowing apparatus suitable for the manufacture of bottles. JAMES W LYNCH and EDWARD G. BRIDGES (to Lynch Corp.). U. S. 1,788,312, Jan. 6. Structural features.

Apparatus for forming glassware. JAMES W. LYNCH and EDWARD G. BRIDGES (to Lynch Corp.). U. S. 1,787,635, Jan. 6. Structural features.

Apparatus for manufacture of molded glassware. SOC. ANON. D'ÉTUDES ET DE CONSTRUCTIONS D'APPARÉILS MÉCHANIQUES POUR LA VERRERIE. Brit. 334,056, Oct 12, 1928. Structural features

Apparatus (with electrically heated delivery and mold parts) for making molded glass articles. ALBERT C. WILCOX. U. S. 1,787,460, Jan 6 Structural features

Apparatus and procedure for producing glass sheets. CLARENCE P. BYRNES (to Window Glass Machine Co.) U. S. 1,786,892, Dec. 30. A mass of molten glass is subjected to skimming by drawing off its surface in sheet form; a sheet is then drawn from the skimmed glass Various details of app. and operation are described.

Apparatus for sheet-glass production. OTTO C. MILLER (to Libbey-Owens-Ford Glass Co.). U. S. 1,787,391, Dec. 30. Structural features.

Forming glass globes from portions of glass of different colors. JOHN EMERSON (to Inland Glass Works, Inc.) U. S. 1,787,619, Jan. 6. Mech. features.

Rotary furnace for the continuous melting of glass. LUDWIG BOSSE. Ger. 507,857, May 8, 1928.

Glass-fusion furnaces. HARTFORD-EMPIRE CO. Fr. 686,917, Dec. 18, 1929.

Apparatus for fusing the mouths of glass flasks. HALLESCHE PFÄNNERSCHAFT DER MANSFELD A.-G. FÜR BERGBAU UND HÜTTENBETRIEB. Ger. 507,838, Sept 12, 1929.

Tempering glass. SOC. ANON. DES MANUFACTURES DES GLACES ET PRODUITS CHIM DE SAINT-GOBAIN, CHAUNY ET CIREY. Fr. 686,890, Mar. 13, 1929. Sheets of glass are tempered by heating them, suspended vertically, to a uniform temp. corresponding with that at which softening begins to take place, and submitting them to violent jets of air striking the 2 faces normally until completely cold. Cf. *C. A.* **24**, 571.

Safety glass. JACQUES VANDIER. Fr. 688,543, April 11, 1929. In assembling sheets of glass and celluloid by a viscous substance such as Canada balsam for making safety glass, all possibility of the components sliding with respect to one another is eliminated by solidifying the viscous substance on the periphery of the plates, particularly by allowing the atm. to come in contact with the viscous substance to a certain depth.

Reënforced glass. HUMPHREY D. MURRAY and DOUGLAS A. SPENCER. Fr. 686,961, Dec. 19, 1929. The intermediate flexible layer in reënforced glass is made of regenerated cellulose or viscose impregnated with gelatin or a gum sol. in water, and a polyhydric alc. such as glycerol or glucose or a mixt. thereof.

Coloring reënforced glass. HUMPHREY D. MURRAY and DOUGLAS A. SPENCER. Fr. 687,049, Dec. 20, 1929 The intermediate layer of reënforced glass is colored by a diazotype process.

Composite glass and celluloid sheets, etc. J. C. DESTREE. Brit. 334,089, Aug 16, 1929. Structural features.

Laminated glass. N. I. VOLUINKIN. Russ. 61,279, Dec. 28, 1929. Glass plates are held together by a condensation product of phthalic anhydride and glycerol which is placed in powder form on the heated glass surface.

Method of joining metal to glass. MANHATTAN ELECTRICAL SUPPLY CO., INC. Ger. 508,152, Nov. 19, 1927. This corresponds to Brit. 293,292.

Kaolin and clay. ERICH MÜLLER. Fr. 687,701, Jan. 4, 1930. Kaolin and clay are treated by feeding the washing app. therefor in a continuous manner with fresh water and Na_2SiO_3 or K_2SiO_3 of 36–38° Bé., in const. proportion with respect to the wt. of the crude material; the crude material is added in such a way as to form waves on

the surface of the suspension, after which the suspension leaving the app. is neutralized with HCl and treated in known manner.

Drying bricks, etc., before firing. A. MONNIER. Brit. 333,921, April 20, 1929. The drying app. is first supplied with air heated by radiation from the oven, then with air used for cooling the fired products, and finally with hot gases from the oven. Various structural features of app. are described.

Ceramic material. WALTER J. SCOTT (to Western Electric Co., Inc.). Can. 305,248, Oct. 28 1930. Articles of ceramic material are made by mixing talc 75 and kaolin 25 with paraffin dissolved in CCl_4 16 parts, evapg. the CCl_4, molding the resulting mass into the desired form, and heating the molded mass at about 2200°F. to remove the paraffin and to harden the remaining substance.

Ceramic materials. VEREIN FÜR CHEMISCHE UND METALLURGISCHE PRODUKTION. Fr. 687,174, Dec. 23, 1929. In the manuf. of ceramic materials of all kinds from plastic and non-plastic materials, the non-plastic constituent is mixed with an agent capable of dispersing or peptizing the plastic constituent, before working the 2 together. Thus, chamotte and quartz are dampened and impregnated with a soln. of NH_3 or K_2CO_3 and then mixed with plastic clay, whereafter the procedure is as usual. Other examples are given.

Ceramic materials. VEREIN FÜR CHEMISCHE UND METALLURGISCHE PRODUKTION. Fr. 687,756, Jan. 6, 1930. In the prepn. of ceramic materials from a plastic material and organic binders in the form of colloidal solns., the liquefaction of the binder is obtained by the use of a soln. contg. humic substances and NH_3 or NH_4 salts, and then working in known manner.

Artificial ceramic masses. ALFRED KRIEGER. Ger. 508,659, Dec. 3, 1927. Artificial stone and like ceramic masses are formed from an inorg. binding material such as cement, mortar, etc., and phenol-aldehyde condensation products. The product is heated and pressed.

Ceramic product. JULIUS LAMPERHOFF. Ger. 508,365, Dec. 9, 1928. A method of imitating antique pottery is described, according to which a soln. comprising one part each of a fatty acid, ZnO and NH_3 in 6 parts of distd. water is applied over a hardened cold glaze prepd. from a MgO cement. When the article is warmed at 20–22° for some days, fine hair like cracks develop, into which a dark greasy pigment may be rubbed. Addnl. details are given.

Prevention of carbon deposition in regenerators. I. G. FARBENIND. A.-G. (Hans Wolf and Hermann Leuchs, inventors). Ger. 508,771, Mar. 23, 1928. See Brit. 330,[illegible] of [illegible] 24, 5959.

Ceramic kiln. PORZELLANFABRIK KAHLA, ZWEIGNIEDERLASSUNG FREIBERG. (Ludwig Wirth, inventor). Ger. 507,880, June 15, 1928. A method is described of heating the kiln directly by the flue gas and by elec. heating elements.

Rotary ceramic kiln. FRIED. KRUPP GRUSONWERK A.-G. Ger. 506,710, Jan. 19, 1929. Details are given.

Driving means for mechanical stoker for ceramic annular kilns. JOSEF HANNAK. Austrian 119,630, May 15, 1930.

Tunnel kiln for making fireproof stone, etc. HEINRICH KOPPERS A.-G. Ger. 509,787, Mar. 10, 1929. The kiln has a series of regenerators.

Device for producing tubes or rods from fused quartz. ALLGEMEINE ELEKTRIZITÄTS GESELLSCHAFT. Ger. 507,839, Jan. 16, 1926.

Machines for working molten silica. COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 686,989, Dec. 20, 1929.

Materials for furnace linings. GEORGE M. CARRIE and ARTHUR C. HALFERDAHL. Can. 305,[illegible]55, Nov. 18, 1930. A homogeneous magnesia refractory for furnace lining is produced by dead burning an intimate mixt. of crushed magnesian rock, lime-bearing material and iron oxide material, to form a clinkered mass contg. 18 to 22% lime and 5 to 10% iron oxide, and crushing the product.

Refractory material suitable for bricks, furnace linings, etc. STUART M. PHELPS and MACGREGOR C. BOOZE (to American Refractories Institute). U. S. 1,788,123, Jan. 6. Alumina-contg. material which shrinks excessively in firing is mixed with 10% or somewhat less of phosphate rock; the mixt. is calcined to effect suitable pre-shrinkage before the material is put into final use. Various other materials are enumerated which may be used also for facilitating a desired pre-shrinkage on calcination.

Refractory composition suitable for lining glass furnaces. THOMAS S. CURTIS (to Vitrefax Corp.). U. S. 1,786,482, Dec. 30. A mullite aggregate is incorporated into a bonding matrix of amorphous mullite.

Plant arrangement for enameling metal articles and firing them. ALVIN G.

SHERMAN and ALBERT MEADOWS (to Detroit Vapor Stove Co.). U. S. 1,787,175, Dec. 30. Structural features.

Enameling iron. ALEXANDER KREIDL. Ger. 509,381, Oct. 28, 1925. The viscosity of the fused enamel is raised by adding carbonates or other water-insol. compds. of the alk. earths and by raising the Al content. The enamel can then be applied at a high temp., *e. g.*, 950°, while still using only about 6% of the opacifying agent (SnO_2)

Enameling furnace. BOYD M. JOHNSON (to The Carborundum Co.). Can. 306,533, Dec. 9, 1930.

Muffle furnace for enamel work. GEORG TIEGEL. Ger. 507,859, April 11, 1929. The construction of the furnace from ceramic plates and steel of high heat-resisting capacity is described.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Magnesium oxide cement. III. Radiographic studies of basic magnesium chloride. W. FEITKNECHT. *Helv. Chim. Acta* **13**, 1380–90(1930); cf. *C. A.* **21**, 3519. Debye-Scherrer examn. of basic Mg chlorides confirms the views of the cause and mechanism of the hardening of sorel cement (*C. A.* **21**, 3519). In prepns. contg. between 2 and 7 mols. $Mg(OH)_2$, the OH is chemically combined. Similar kinds of crystals of different structures occur for varying amts. of OH. In the hardening process, a direct change of the oxide to the basic salt takes place without the formation of the hydroxide. In excess chloride, one kind of crystals may change to another, an equil. being established. On intense drying they may change to crystals contg. little water. MARY E. LOVE

Advances in the technic of magnesium oxychloride cement. RICHARD PASSE. *Kunststoffe* **20**, 243–4(1930). E. H.

Production of insulating board from cornstalks (HARTFORD) **23**. Composition and properties of certain explosives suitable for the lime, cement and plaster industries (DEFORGE) **24**. The use of rubber in cement tiling (RICE) **30**. Blown bituminous products suitable for roofing, etc. (Brit. pat. 334,032) **22**. Rotating furnaces for lime, cement, etc. (Fr. pat. 687,838) **18**. Artificial ceramic masses (Ger. pat. 508,659) **19**. Apparatus for making cement and other powdered or granular products (Fr. pat. 687,624) **1**. Phosphates and cement (Fr. pat. 687,538) **18**. Residues from the saccharification of wood [as construction material] (Fr. pat. 688,507) **23**.

Schutz der Bauwerke gegen chemische und physikalische Angriffe. Edited by OTTO GRAF AND HERMANN GOEBEL. Berlin: Wilhelm Ernst & Sohn. 224 pp. M. 22. Reviewed in *Ind. Eng. Chem.* **22**, 1262; *Chem. Met. Eng.* **37**, 698(1930).

"High-temperature" cement. ADDIE HUTCHINSON. U. S. 1,787,625, Jan. 6. A cement suitable for pointing up jambs and cracks in coke ovens is formed from silica sand 15, ground silica brick 3, portland cement 2 and soda ash 1.5 parts.

Cooler for cement, ores, etc., comprising a number of coaxial drums. SOC. D'EXPLOITATION DES PROCÉDÉS INDUSTRIELS CANDLOT. Ger. 508,461, Dec. 24, 1929.

Refining fusible cement. SOCIÉTÉ D'ÉTUDES CHIMIQUES POUR L'INDUSTRIE. Ger. 509,593, Oct. 2, 1928. Fusible aluminiferous cement obtained as a by-product from the elec.-furnace prepn. of P from phosphates and C is refined by treating with oxidizing agents such as MnO_2.

Machine for making tubes from asbestos cement. ETERNIT-WERKE LUDWIG HATSCHEK. Austrian 119,610, May 15, 1930.

Rotating furnaces for cement. JOHAN S. FASTING. Fr. 688,410, Jan. 17, 1930. Chains are suspended in the furnace which give a pos. forward movement to the material treated.

Rotary tubular furnace suitable for burning cement. ERICH SCHULZE (to Fried. Krupp Grusonwerk A.-G.). U. S. 1,787,841, Jan. 6.

Concrete. ÉTABLISSEMENTS BRISSET ET SANUA. Fr. 686,705, Dec. 16, 1929. Concrete made from cement is preserved against the action of chem. agents by applying one or more layers of synthetic resin (*e. g.*, that obtained by condensing CH_2O and phenols) and polymerizing by heating to 120–170°.

Molding concrete. CORWILL JACKSON. U. S. 1,787,449, Jan. 6. A mixt. of cement and aggregate is placed in a form with such a proportion of water as to produce

a non-flowing mixt., and the mixt. is then rendered fluid within the form by vibrating a wall of the form at high frequency.

Light concrete. H. IMBERECHTS. Belg. 369,056, April 30, 1930. In order to obtain a light, porous concrete, a substance which has no effect on the setting of the cement, but which can be dissolved after setting, is added to the concrete. The removal of the particles of sol. substances produces fine pores in the concrete.

Bituminous coatings on reënforcing for concrete. N.-V. DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Brit. 333,940, May 24, 1929. The reënforcements are coated with an aq. dispersion of asphalt or the like (which may contain pigments), and then dried. Dispersions may be used such as are described in Brit. 245,418 (*C. A.* **21**, 319) and Brit. 291,393 (*C. A.* **23**, 1262).

Waterproofing cement mortars and concretes. A. STEWART. Brit. 334,053, Aug. 20, 1929. A waterproofing material is prepd. from soft soap 4 lb., "ammonia" 3 gills, alum 4 oz., washing soda 1 lb., lard 8 oz., boiled linseed oil 2 gills and water 5 gills, boiled together.

Artificial aggregate for mortars and concretes. JOHN E. GREENAWALT. U. S. 1,786,713, Dec. 30. A mixt. of finely crushed clay and cinders contg. combustible matter has a combustion-supporting gas such as air passed through it (in an app. which is described) and the charge is sintered by the heat of combustion effected by ignition at its surface. U. S. 1,786,714 describes a method in which an agglutinated mixt. of argillaceous material and water is formed into a plurality of small bodies such as balls which are arranged in a charge on a permeable hearth, fuel being then ignited at the surface of the charge, while a supporter of combustion such as air is passed through the charge away from the ignited surface, to produce a hard, porous, burnt product Apparatus described.

Artificial stone. AUGUST FRICKE. Ger. 508,364, Oct. 6, 1928. This relates to the manuf. of colored asbestos-cement slabs, etc A paste of cement and asbestos powder is applied on an incompletely hardened slab, and the surface of the paste is perforated by mech. means. A colored lacquer is then sprayed on.

Artificial stone. DEUTSCHE HERAKLITH A.-G. Ger. 508,316, Aug. 21, 1928. Addn to 434,348. According to Ger. 434,348, the manuf. of shaped articles from fibrous materials united by a sorel cement is effected by causing the mixt. to bind and harden in closed molds surrounded by a medium, *e. g.*, air, heated to 180–220°. This method is now modified by heating the medium to a temp. above 220° and by using open or perforated molds if desired.

Artificial stone. JOSEF KLEIN. Ger. 509,574, July 7, 1928. Insol. binding material, such as bituminous, oleaginous or resinous materials, are emulsified with a water-sol soap and mixed with mineral filling material. Water is extd. and the residue treated with mineral salts and molded. Cf. *C. A.* **24**, 2573.

Artificial stone. J. MUSTER. Swiss 137,978, Mar. 1, 1929. Ground slag, sawdust, cement and water are mixed to a paste and molded while moist, and the formed stones are laid in a subterranean place for a period, *e. g.*, 2 months.

Artificial stone. THEO URANSCHEK. Austrian 119,267, Feb. 15. 1929. Porous plates, etc., *for building* and *insulating* are prepd. by mixing 1 part of wood wool, straw or other org. fibrous material with 6 parts of an emulsion comprising water-glass soln. of 32–38° Bé and an equal amt. of finely divided asbestos or the like. The mass is then compressed in perforated molds for 0.5–2 hrs. at 200°, and the products are finally dried at 120°.

Paving blocks. CORWA, SCHLACKENVERWERTUNGSGESELLSCHAFT. Fr. 687,287, Dec. 27, 1929. Paving blocks are made from blast-furnace slags, the compn. of which is limited to SiO_2 29–34, and CaO 39–44, by casting the slag at a temp. between 1100° and 1200°. The slag may be submitted to a process of distn. before casting, and the cooling is allowed to take at least 5 days.

Paving material. EDWIN C. WALLACE. U. S. 1,788,258, Jan. 6. A rock contg. hard asphalt is crushed until all the rock will pass a screen of 0.75 in. mesh, fine material is screened out, the coarser material is mixed with 1 to 4% of fluxing oil, and the fine material is then added in about the same proportion as it was present in the original rock before sepn. Cf. *C. A.* **24**, 2267.

Bituminous compositions for paving, etc. N.-V. KONINKLIJKE STEARINE KAARSENFABRIEK GOUDA. Brit. 333,937, Feb. 5, 1929. A bituminous emulsion is mixed with a stony material such as basalt lava, blast-furnace slag or limestone of such porosity that strong adhesion is obtained between the bitumen and the aggregate; the latter may be pretreated with fatty or mineral oils, petroleum residues, resin oils, etc. Cf. *C. A.* **25**, 575.

Light, waterproof agglomerate. F. SPRINGAEL. Belg. 369,552, May 31, 1930. The agglomerate consists of volcanic rocks, or other similar, light, strong material, mixed with a cement and a binder, to which is added Na silicate or other waterproofing material. Cf. *C. A* **24**, 4607.

Constructional materials. BENCJAN JOSEF KOPELOWICZ, LUBA KOPELOWICZ NÉE BAUER, FLORA FEILES NÉE GOLDMAN and SAMUEL HERSCHTHAL. Fr. 688,101, Nov. 16, 1929. A constructional material is made by mixing sawdust with sand and cement and binding them with an aq. soln. of lime, plaster, etc. The sawdust is preferably first freed from resin. Cf. *C. A.* **24**, 2856.

Porous bricks, etc. ALEX DERICHSWEILER. Ger. 468,664, June 20, 1926. In the manuf. of porous bricks, etc., from a mixt. of a cement mass and a powd. metal giving rise to a gas, the metal is incorporated in the form of an emulsion prepd. by treating a mixt. of the powd. metal and oil with hot water. Finer distribution of the gas bubbles within the bricks, etc., is thus obtained. The outer pores may be protected by a thin cement coating. Cf. *C. A* **24**, 608.

Porous bricks, etc. TORKERT G. M. B. H. Ger. 509,239, Nov. 11, 1927. Addn to 468,664. The method of Ger. 468,664 (preceding abstr.) is modified by incorporating the metal-oil emulsion into the cement mass in sep. portions. Thus, $^1/_3$ or $^1/_4$ of the emulsion may be added while the mass is at a temp. of 70°, the remainder being added when the temp. has fallen to 50–60°. A thickening agent, *e. g.*, water glass, and porous fillers may also be incorporated.

Preventing weathering of sandstone. ADOLF SCHRANER-WEISS. Swiss 138,271, Feb. 2, 1929. The stone is impregnated with a soln of S in CS_2 contg. also linseed oil and Na_2SiO_3.

Insulating building material. O. WUSTEFELD-DULLIRT. Belg. 367,527, March 31, 1930. A mixt. of plaster, wood (in the form of dust, sawdust, shavings or "wool"), and water is used. Marble cement, alabaster cement or CaO can be used instead of plaster. Alum or borax may be added

Rendering building materials water-, acid- and alkali-proof. MARTIN VELLER & CIE. Swiss 140,476, May 15, 1929. The materials are treated with a soln. of paraffin wax in CS_2 in the cold.

Sheets or slabs for building construction. A. H. J. WRIGHT. Brit. 333,978, June 6, 1929. A sheet-metal core is treated with a protective coating of casein adhesive, paint or spelter, and after the coating has dried or set, there is applied a sheet of felted material which has been coated with a casein adhesive, and the materials are pressed together while the adhesive is maturing. Various details of manuf. are described

Stucco mixture. GUSTAVE A. NEW (to American Gypsum Co.). U. S. 1,787,162, Dec. 30. A compn. for producing a product of cellular texture suitable for use in building construction comprises a mixt. of calcined gypsum in plastic form and a foam formed from an agitated soln. of blood albumin and lime. U. S. 1,787,163 relates to structural features of gypsum wall-board manuf. Cf. *C. A.* **24**, 1720

Composition for coating walls, etc. ALFRED B. CALLAGHAN (to Caltex Co.). U. S. 1,787,425, Jan. 6. A mixt. is formed of mica 49, clay 30, casein 18, a coloring agent, alum 2 and cream of tartar 1 part, mixed with hot water.

Gypsum composition. CHRISTIAN GAMARRA (to Bemis Industries, Inc.). Can. 305,651, Nov. 11, 1930. Water-resistant, aerated gypsum products are made by mixing $CaCl_2$ and tartaric acid with calcined gypsum contg. carbonate, adding water and permitting the mixt. to set.

Imitation marble finish on hard surfaces. LLOYD V. CASTO (to Oxford Varnish Corp.). U. S. reissue 17,912, Dec. 30. Reissue of original pat. No. 1,682,067 (*C. A.* **22**, 3971).

Laminated roofing comprising layers of asphalt and saturated roofing felt. FREDERICK C. OVERBURY (to Patent and Licensing Corp.). U. S. 1,788,121, Jan. 6. Structural details.

Impregnating timber. G. S. PETROV. Russ. 47,759, May 22, 1929. Timber is impregnated with solns. of condensable, high-molecular sulfonic acids or sulfonated fatty acids obtained by condensing acrolein or furaldehyde with phenols or hydroxy acids. The hydroxy acids are obtained by oxidizing hydrocarbons, glycerides or fatty acids.

Preserving wood. RÜTGERSWERKE-A.-G. Ger. 509,303, Dec. 16, 1928. Wood that is difficult to impregnate is incised in a no. of places, transversely to the grain, before it is dipped into a preservative liquid or treated with the liquid under pressure or suction.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

Examination of solid fuels. A. P. SHAKHNO. *J. Chem. Ind.* (Moscow) **6**, 1665–8 (1929).—A review of the known systems for methodical examn. of the qualities of solid fuels. A table is given comparing in symbolic form the ordinary system of fuel analysis with the systems of Aufchenzer, Parr, Ramsin, Schwakchefer, Cheslem and Russell, and Bunte. The analytical systems should be supplemented by a detn. of the variability and of the susceptibility to spontaneous combustion of coals. D. K.

Grate firing or dust firing for low-grade fuels? ALFRED HERRMANN. *Montan. Rundschau* **22**, 409–16(1930).—Practical tests show that the use of grates for firing low grade fuels is more economical than the use of the powd. fuel. E. SCHOTTE

The coal fields of the United States. General introduction. MARIUS R. CAMPBELL. *U. S. Geol. Survey Paper* **100**, 1–33(1929). **Ohio.** J. A. BOWNOCKER. *Ibid* 35–96. E. H.

Contribution to the study of the constitution of coal. P. LEBEAU AND H. LEROUX. *Ann. combustibles liquides* **5**, 443–54(1930).—The procedure of extn. and fractionation worked out by Cochram and Wheeler (cf. *C. A.* **21**, 2780) is followed by the authors. The isolated products are subjected to carbonization and thermal fractionation is applied (cf. *C. A.* **19**, 3010). Detailed results with a Durham coal are given. With pyridine and $CHCl_3$ a γ-fraction to the amt. of 4.9% is obtained. With $CHCl_3$ alone only 1.1% yield is obtained. The γ_1, γ_2, γ_3 and γ_4 fractions differ for the 2 products. If the coal is heated with pyridine and the pyridine then distd. off in vacuum and then extd. with $CHCl_3$, a γ-fraction quite similar to the one obtained by the method of C. and W. is procured. E. SCHOTTE

Recently developed methods of research in the constitution of coal and their application to Illinois coals. REINHARDT THIESSEN. Ill. State Geol. Survey, Coöperative Mining Series, *Bull.* **33**, 58–89(1930). E. H.

The chemistry of Illinois coal. A review and a forecast. S. W. PARR. Ill. State Geol. Survey, Coöperative Mining Series, *Bull.* **33**, 53–7(1930); cf. *C. A.* **24**, 3098. E. H.

Patent literature on the hydrogenation of coal. J. ALPETER. *Metallbörse* **20**, 2167–8, 2515–6(1930). E. H.

Production of oil by carbonization of brown coal under pressure. R. VON WALTHER, W. BILLENBERG AND W. JENTZSCH. *Z. angew. Chem.* **43**, 1009(1930).—A bituminous coal heated to the temp. of tar formation was further heated under pressure. Instead of 11.2% tar, as under ordinary conditions, 23.3% of oil was formed, 96% of which distd. over below 300°. From the regular tar only 34% distd. off at 300°. The coke obtained also differed and the gas formed consisted of about 58% CH_4 and homologs. E. SCHOTTE

Investigations on lignites. III. Analysis of lignite from Kankyohokudo, Korea. YOSHIO ODA. *J. Soc. Chem. Ind., Japan* **33**, Suppl. binding 398–9(1930); cf. *C. A.* **24**, 5673. The analysis gave H_2O 21.4, ash 8.61, bitumen 8.02, humic acid 4.06, methoxyl content of humic acid 0.96 and cellulose (with fuming HCl) 4.28, (by Schmidt's method) to 72%. In detg. lignin with AcBr, the weight of the residue was found greater than that of the sample by 4.34%. Probably an intermediate in the formation of humic acids from lignin is not solubilized by AcBr, but suffers acetylation and bromination. **IV. Low-temperature distillation of lignite, humic acid, lignin and cellulose.** *Ibid* Suppl. binding 411–4 (in German).—Lignite of medium age (I), humic acid from lignite (II), invert sugar (III), lignin (according to Willstätter) (IV), and paper from rag stock (V) were dry-distd., the temp. being raised 8–10°/min. up to 300° and 3–6°/min. up to 500°. Results from I, II, III, IV and V are: coke 57.4, 57.0 55.8, 39.8, 22.4%; tar and H_2O: I, 22.8, 20.0, 40.4, 61.7; gas 18.5, 20.1, 24.2, 19.7, 15.9; gas analysis: CO_2 51.6, I, 34.2, 14.2, 42.7; C_mH_n 1.6, 1.1, 1.6, 2.2, 2.2; O_2 1.5, 2.6, 2.4, 11.6, 2.7; CO 11.5, 6, 33.6, 21.0, 20.9; H_2 6.9, 2.2, —, 6.3, 1.3; CH_4 10.7, 7.1, 11.4, 20.1, 4.2; C_2H_6 18.1 2.1, —, 2.1; N_2 14.5, 11.6, 14.7, 24.6, 14.9. III and IV showed strong gas formation at low temps. The large tar and H_2O yields of V were not due to incomplete drying of the substance. H_2O from natural humic acid was neutral; it contained AcOH in all other cases. Cellulose, in addn., gave HCO_2H. Only IV, I and III gave MeOH. All distillates gave traces of phenols. Schiff's reaction was pronounced with IV and V, weak with III, and absent with I and II. Residues of IV (atm. distn.) were in some cases completely sol., in other cases partially sol., in NaOH. Addn. of acid to these

solns. pptd. substances similar to natural humic acid. Distn. of V, under vacuum, gave a caramel-like residue, almost insol. in NaOH. K. H. ENGEL

The constituents of lignites and their behavior on low-temperature distillation. I. UBALDINI. *Ann. chim. applicata* **20**, 461–82(1930).—Several lignites were extd. with C_6H_6 as well as with C_6H_6-EtOH mixts., and extd. material, residue, etc., detd. Three types of lignites were studied: one high in bitumens, one low in bitumens and the other high in tar. In all cases C_6H_6-EtOH extd. a much larger proportion of bitumens, increasing from 34.5 to 45.6% in the first, from 11.51 to 16.5% in the second and from 1.12 to 6.98% in the tar type. Similarly, the mixt. extd. about 20% more of the humic acids in each case. A. W. CONTIERI

The Muldenstein lignite distillation plant. ROSENTHAL. *Z. Ver. deut. Ing.* **74**, 1377–80; *Braunkohle* **29**, 900–7(1930).—The exptl. plant of the German State Railway for making locomotive fuel from lignite is described. The retort is a sort of tunnel kiln which may be divided into 5 sections: entrance lock, distn. zone, neutral zone, coke-cooling zone and exit lock. Special cars are used. They have a refractory base on which rests an iron frame carrying sheet metal pockets 30 to 60 mm. thick, sepd. by open passages. They are dumped by lifting the frame. The coke falls on the refractory base and is swept off. The raw coal contains 50% H_2O. It is broken up in a hammer mill and dried to 12% H_2O in a drum drier fired with powd. coal. The cars are filled with dried coal in the entrance lock, are passed through the kiln and are dumped in the exit lock. The coal is distd. by hot gas flowing countercurrent to it. The gas makes the following cycle: It leaves the detarring plant at 60°, is heated to 300° in the coke-cooling zone, to 550° in a recuperator, is cooled to 120° in the distn. zone and passes back to the detarring plant. The excess gas from the distn. of the coal plus producer gas is used to heat the recuperator. Various lignites and bituminous coals all gave good results. Even coal less than 1 mm. in size gave dust-free tar. Finished coke has about 18% volatile matter. The tar has about 0.03% dust content and less than 0.5% H_2O. About 240 kg. cal. per kg. of dried coal is required by the process. The exptl. plant has a capacity of 46 metric tons per day. It can easily be changed to a production plant. Further savings with larger plants now planned are discussed as is the working up of the various products. A. C. HIGGINS

Situation of the technic of semi-carbonization. G. BERTHELOT. *Ann. combustibles liquides* **5**, 535–45(1930).—A review of the technic of semi carbonization in Europe. E. SCHOTT

The partial combustion of methane at various pressures with particular consideration of accompanying acetylene formation. FRANZ FISCHER AND HELMUT PICHLER *Brennstoff-Chem.* **11**, 501–7(1930); cf. *C. A.* **22**, 2652; **23**, 2694.—By use of CH_4-air, CH_4-O and coal gas-O mixts. in various proportions with various flow-rates, temps. and pressures, the decompn. of CH_4 has been detd. and is shown in tabulated analyses and graphs. A heated porcelain tube passing the gas-air mixts. is employed for the low pressures and a bomb for the high pressures. The arrangement and construction are given in diagrams. The importance of time and temp. is demonstrated. A primary formation of —CH and —OH radicals is followed by a secondary decompn. into CO and H, making the prompt removal of the C_2H_2 necessary for recovery. These reactions may be accelerated by large catalytic surfaces. Yields of C_2H_2 as high as 50% of the CH_4 used have been obtained over a temp. range of 600–1500°. The rest of the CH_4 in burning to CO and H_2O furnishes the necessary heat of formation for the C_2H_2. The use of diminished pressure does not materially increase C_2H_2 formation but does retard the secondary decompn. Explosion pressures do not produce greater yields. Oxidation and decompn. reactions of CH_4 are briefly discussed. F. W. JUNG

The development of the benzine synthesis from carbon monoxide and hydrogen at atmospheric pressure. FRANZ FISCHER. *Brennstoff-Chem.* **11**, 489–500(1930). cf. Tropsch and Koch, *C. A.* **24**, 4919.—Motor benzine, colorless, S-free and requiring no further refining, has been prepd. on a semi-com. scale from industrial gas mixts., contg. CO and H, in a train of app. consisting of purifiers, heaters, contact units, etc. Gas liquefaction has been increased from 20 to 50% with a Co-Cu-Th catalyst and the possible use of a cheaper Ni catalyst is indicated. From 1 cu. m. of a mixt. CO-H-C_2H_2, prepd. by incomplete combustion of CH_4 and O, as much as 100 cc. benzine and 50 cc. oil have been obtained. The app. is shown schematically and detailed drawings are given of a no. of the various designs of contact units employed in the tests. Questions involved in com. utilization of the process with reference to necessary costs and feasible mixts. of coal, water, fuel, producer and blast-furnace gases for use in the synthesis are discussed. A b.-p.-compn. curve for the benzine is given together with a bibliography for 1926 to date. F. W. JUNG

Methodical heating. A. BOUCHET. *Chaleur et ind.* **10**, 269–76(1929).—B. derives equations for heat flow in tunnel ovens and applies them, theoretically, to brick ovens. He then deals with the Hoffmann furnace under different conditions, such as, perfect recuperation, fume exit temp. at 200° and at 100°, varying initial temps., radiation, heat penetration, etc. The heat exchange downstream in the furnace is considered when the air for combustion is reheated by the finished products. There is a relation between fuel consumption, excess air, exit fume temp. and the air-reheating temp.
S. L. B. ETHERTON

The heating of industrial furnaces with coke-oven gas and the development of distant gas distribution. A. LEMONNIER. *Chaleur et ind.* **10**, 381–4(1929).—A general discussion. L. advocates the increased production of coke-oven gas and distant gas distribution.
S. L. B. ETHERTON

The state of the gas industry in Germany. F. MULHERT. *Chaleur et ind.* **10**, 283–6(1929).—A general account of various developments. The Elvers system, with residual coke to make poor gas for power plant consumption, has given satisfactory results in Frankfort. The Dellwik-Fleischer system for "Omgas" is briefly considered, as is distant gas distribution, gasification with added O_2 and hydrogenation, including the process that makes H_2 thus: $2P + 8H_2O = 2H_3PO_4 + 5H_2$. Lignite exploitation appears to be successful with the rotating furnaces, such as those of the Kohlveredelungsgesellschaft of the A. E. G. The new wood carbonization process of Schwabbe uses a solution of $MgCl_2$ at 5–6 kg. at 180°. Carbonization is rapid, MeOH and AcOH are recovered, and the wood has a calorific value of 600 cal., which therefore lends itself to gasification in the gas producer.
S. L. B. ETHERTON

Motor vehicle operation and producer gas. KARL DEHN. *Brennstoff-Chem.* **12**, 473–7(1931).—Automotive development is described briefly with particular reference to gas generative equipment, the operative principles of which are reviewed. As one example, the app. of Imbert (cf. *C. A.* **22**, 2830; HELLER. *Z. Ver. deut. Ing.* **72**, 106(1928)), in which one charge, with wood shavings for the generation of producer gas, will last 40 km., is described in detail. Gas of 130–155 B. t. u. per cu. ft. is carbureted 1:1 with air for combustion in the motor, with resulting 30% less power than that developed by benzine. The raising of the compression ratio from 4.5 to 7.0, however, compensates for this power loss by an increase in the thermal efficiency of from 0.36 to 0.44. Other producers are described and the possible use of briquetted brown coal as generator fuel is discussed.
F. W. JUNG

Some problems and suggestions relating to coal tar. W. J. CHADDER AND H. M. SPIERS. *Chemistry and Industry* **49**, 863–70; *Gas World* **93**, 347–52(1930).—The compns. and yields of tars are changing with progressive adoption of continuous and low-temp. retorting methods. Two widely differing tars (from a list of 19 analyses) compared as follows: sp. gr. 1.24, 1.03; tar acids 2.5, 16%; medium pitch 67, 35%; $C_{10}H_8$ 7%, nil; free C 28, 1%. Variations in nature and in yield of tar from any one particular coal may be produced by variations in the size of coal. In vertical retorts, yields were roughly 50% higher with large-sized coal than with small-sized coal. In horizontal retorts, such increase at the max., was 32% with feebly caking and 11% with strongly caking coal. Excessive cracking of tars produces too high sp. gr., excessive $C_{10}H_8$ and free C content. In hot spraying in the foul main, excessive recirculation leads to overconcn. of salts and consequently to troublesome emulsions. Sepn. of the hot tar and liquor is more rapid and complete. Electrostatic sepn. of gas and tar obviates cooling of the gas and is therefore especially applicable in the direct NH_3 recovery process. The sale of refined or road tar for local use necessitates uniformity of product, obtainable through blending of tars. Horizontal retort tars readily furnish correct road tars. Vertical retort tar, which is brought to higher consistency by more complete removal of distillate, contains no easily evapg. oils and is therefore slow-drying. A formula is developed for the blending of straight-run, light and heavy residue tar to match a desired consistency. Such blends may be brought to conform to the highest standard specifications, which could not be achieved by a straight-run distn. The effectiveness of various oils in lowering the consistency has been compared and expressed in consts. Such consts. may be calcd. from an appended nomogram, if the consistency of a known mixt. of tar and oil is first detd.

Light fuels. JEAN H. BREGEAT. Fr. 687,950, Mar. 29, 1929. Asphaltic or paraffinic residues distg. above 350° and coming from various sources are converted to light fuels such as gasoline, kerosene and gas oil by a pyrogenic distn. at above 345° in the presence of less than 3% of a chloride of a bivalent metal which dissociates or volatilizes at a temp. of 350° or above. An example is given of the use of Fe_2Cl_6.

Motor fuel. DANIEL STRYKER (to The Texas Co.). Can. 306,144, Nov. 25, 1930. A motor fuel comprises a liquid hydrocarbon fuel and less than 1% of oxidized heavier liquid or semi-liquid hydrocarbon of the paraffin series which is completely sol. therein. Small quantities of higher fatty acids as stearic, palmitic and oleic acids having high lubricating values may be compounded with the mineral oils.

Motor fuel. SOC. DES BREVETS CATALFX. Fr. 687,483, Mar. 18, 1929. A heavy motor fuel with a combustion point between 60° and 130°, the dry point of its distn. in an Engler flask between 340° and 385° and a residue below 1%, is made by distg. preferably in a vacuum, naphthas, tars, etc., or by rectification under reduced pressure of distillates such as gas oils, anthracene oils, etc., so as to divide them into a distillate and a residue. The distillate is fractionated to obtain a fraction having the desired characteristics. The vapors of the distillate may be mixed with air and passed over a contact material to produce CO, the latter reacting with the contact mass to produce organo-metallic compds.

Solid fuel. THERMOLIZED COAL CORP. Fr. 686,020, Dec. 18, 1929. A solid carbonaceous material such as coal is heated to a temp. below that at which combustion would take place when the material is burnt, whereby moisture and explosive gases are removed and the material swells. The product is ground and used as powd. fuel. An app. is described.

Froth flotation of pulps such as those of coals or sandy pyrites. JULIUS FISTEL, ROBERT GRIESSBACH and CLAUS HEYCK (to I. G. Farbenind. A.-G.). U. S. 1,787,968, Jan. 6. As a flotation reagent there is used an oxidation product such as may be obtained by oxidizing paraffin or montan wax and neutralizing with NH_3.

Fuel briquets. WILLY EICKEL. Ger. 508,548, Oct. 22, 1927. Smokeless and odorless burning briquets are made from powd. coal and binding materials such as sulfite-cellulose, molasses, etc., sol. in water, the finished briquet being covered with an aq.-insol. layer such as pitch, resin, etc.

Briquetting powdered fuel. OTTO REYNARD and FRANK F. TAPPING. Ger. 508,570, Apr. 3, 1928. Solid bituminous binding material in the form of an aq. emulsion is dispersed in oil is used. Examples mention petroleum asphalt, Mexican burning oil and KOH soln.

Regulating device for a liquid carbureting plant. MASCHINEN- UND APPARATEBAUGES. MARTINI & HÜNEKE M. B. H. Ger. 509,834, Oct. 27, 1929. The device is for the regulation of the supply of atomized tetrahydronaphthalene, etc., to gases.

Temperature-control device suitable for use with carburetors. MAURICE GOUDARD (to "Soc. Anon. Solex"). U. S. 1,787,310, Dec. 30. **Structural features.**

Apparatus for carbonizing fuel. JACQUES WEISS. Fr. 687,184, Dec. 24, 1929.

Distilling carbonaceous materials. IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 687,954, Nov. 29, 1928. Solid carbonaceous materials are distd. by passing them in

small pieces through a continuous mass of oil while submitting them to progressively increasing temps. The scale of temp. extends from that temp. at which volatile matters are liberated to the highest temp. compatible with the boiling temp. of the oil used.

Furnace for distilling and drying bituminous fuel. SCHWÄRZEL & FRANK. Ger. 508,666, Oct. 27, 1928. Details of construction and arrangement.

Vertical retort for distilling bituminous fuels. JULIUS PINTSCH A.-G. Ger. 506,572, Jan. 12, 1928. Details of arrangement.

Furnace for low-temperature distillation. C. HONNAY. Belg. 366,755, March 31, 1930. The coal is spread in a thin layer on the hearths of a series of superposed distn. chambers. The coal travels continuously from top to bottom through all the chambers, being conveyed through each chamber by an endless chain carrying scrapers. Heating is effected by means of gas circulating through flues under the hearths. The coal is discharged in the form of semi-coke which can be briquetted without addn. of a binder.

Destructive distillation. TROCKNUNGS-, VERSCHWELUNGS-, UND VERGASUNGS-G. M. B. H. Ger. 508,569, Dec. 10, 1927. Addn. to 490,167 (*C. A.* **24**, 2274). For the treatment of fuel dust, the method of Ger. 490,167 is carried out with layers less than 2 mm. thick and with a temp. only slightly above the dew point of the tar, *e. g.*, 380°.

Apparatus for the destructive distillation of solid particles suspended in a gas stream. TROCKNUNGS-, VERSCHWELUNGS- UND VERGASUNGS-G. M. B. H. Ger. 508,591, Feb. 9, 1927.

Air hearth for the dry preparation of coal, etc. KENELM C. APPLEYARD, COLIN W. H. HOLMES, IVOR L. BRAMWELL and THE BIRTLEY IRON CO., LTD. Ger. 507,770, Dec. 19, 1928.

Distributor for mixture of coal dust and air. ALLGEMEINE ELEKTRIZITÄTS-GES. (Hermann Kremholler, inventor). Ger. 508,819, April 16, 1929. Addn. to 498,123 (*C. A.* **24**, 3678).

Sand separator for coal dust. ZEITZER EISENGIESSEREI UND MASCHINENBAU A.-G. Ger. 507,771, July 5, 1928.

Apparatus for separating materials such as coal and rock by air currents, etc. KENNETH DAVIS (to Peale-Davis Co.). U. S. 1,787,340, Dec. 30. Structural features.

Carbonization of coal. COMPAGNIE HOUILLÈRE DE BESSÈGES. Fr. 688,199, Jan. 11, 1930. Poor or anthracitic coals are agglomerated with an agglutinant such as pitch in amt. not more than 7%, and heated externally from 500° progressively to 900–950°, whereby a very hard artificial anthracite of high d. is obtained.

Distillation of coal, etc. THEODOR LICHTENBERGER, LUDWIG KAISER and FRANZ MEYER. Fr. 688,529, Apr. 10, 1929. Fuel such as coal, lignite, tar, schists, etc., is distd. and gasified in a bath of fused salts, or water gas is produced by introducing steam into fuel in fused salts. The distn. and gasification in fused salts may take place in sep. chambers of the same furnace, the baths of fused salts communicating with one another.

Low-temperature distillation of coal for the production of tar. M. BERBIERS. Belg. 366,519, May 31, 1930. A mixt. of pulverized coal and gas is heated to 500°; the semi-coke is sepd. from the mixt.; the gas liberated by distn. is withdrawn and is mixed with pulverized coal. A. PAPINEAU-COUTURE

Furnace for distilling coal to produce coal gas and water gas simultaneously. EUGENE JEFFERY. Fr. 686,743, Dec. 17, 1929.

Rotary annular plate furnace for coal distillation. TROCKNUNGS-, VERSCHWELUNGS- UND VERGASUNGS-G. M. B. H. Ger. 508,568, Jan. 16, 1927. Details of a safety device to prevent explosion.

Rotary drum coal-distilling retort. KOHLENVEREDLUNG A.-G. Ger. 508,952, Oct. 5, 1927. Details of construction.

Rotary tube furnace for distillation of coal. CONTINENTALE "L & N" KOHLENDESTILLATIONS A. G. Ger. 508,567, Mar. 3, 1928. Details of construction.

Retort for the destructive distillation of coal. EMIL KESSELRING. Swiss 138,544, May 1, 1929. The retort has an endless shaft running round the furnace and round which granulated coal is conveyed.

Vertical oven for distilling coal, etc. KOHLENVEREDLUNG A.-G. Ger. 508,389, April 12, 1927. Addn. to 505,369 (*C. A.* **24**, 5984).

Vertical chamber furnaces for the distillation of coal. FOURS PICARD. Fr. 688,012, Jan. 10, 1930. The lower door forms a water bath for the production of steam.

Heating ring for coal-distillation oven. KOHLENVEREDLUNG A.-G. Ger. 506,142, Jan. 20, 1927. Addn. to 505,369 (*C. A.* **24**, 5984).

Device for delivering powdered material from a coal distillation or drying furnace. TROCKNUNGS-, VERSCHWELUNGS- UND VERGASUNGS- G. M. B. H. Ger. 508,888, Dec. 16, 1927.

Hydrogenating coal, etc. N.-V. DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Fr. 687,421, Dec. 30, 1929. Liquid products are prepd. by heating coal, etc., with H under pressure and in the presence or absence of catalysts, in 2 or more steps and in such a manner that in the first step there is formed besides liquids a gaseous mixt. contg., practically in the state of completely oxidized compds., the total amt. of O present in the starting material, while in the step or steps following, the gaseous products are practically free from O. The coal, etc., is first rapidly heated to a max. temp in the presence of H, then the heating is immediately stopped, the gaseous products are removed while the mass is still hot and cooled to obtain liquid hydrocarbons. The residue is again heated in the presence of H. The uncondensed gases obtained in the second or subsequent step may be used for heating the coal. Mo or Mo and I may be used as catalysts. Cf. *C. A.* **24**, 2275.

Hydrogenating coal, tar, etc. IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 687,955, Nov. 29, 1928. Coal, tar, mineral oils, etc., are hydrogenated under pressures of 300-500 atm. or more, preferably 800–1000 atms. or more, and at a temp. of 420–500°, and with or without a catalyst Cf. *C. A.* **24**, 2865.

Combustion. HANS VOLCKMANN and KARL LUDWIG. Ger. 509,183, Mar. 2, 1930. Addn. to 506,627 (*C. A.* **25**, 443). Details are given of the supply of hot and cold air to a muffle furnace.

Apparatus for desuperheating steam. SVEND M. JORGENSEN (to Superheater Co.). U. S. 1,788,160, Jan. 6. Structural features.

Steam desuperheater. HENRY J. MASTENBROOK (to Swartwout Co.). U. S. 1,787,790, Jan. 6. Structural features.

Improving bituminous material. LASZLÓ BOLGÁR. Ger. 508,960, Oct. 3, 1926. Mineral coal and lignite tar residues or mixts. are improved by melting with H_2SO_4 of not greater than 5% strength. Asphalt and petroleum residues are treated with 10% H_2SO_4 or HNO_3.

Treating lignite, etc. VERLASSENSCHAFT NACH HANS FLEISSNER. Austrian 119,315, Mar. 15, 1928. Lignite and like fuels are improved as regards calorific value by heating in a closed container to a temp higher than that necessary for simple drying but lower than the carbonization temp., the heating being effected by means of or in the presence of steam. Thus, lignite may be heated at 160° for several hrs.

Steam-heated tubular drier for lignite. MAX GENSECKE. Ger. 508,466, May 29, 1929.

Dewatering peat. I. G. FARBENIND. A.-G. (Walter Strathmeyer, inventor). Ger. 508,392, Sept. 28, 1928. Dewatering is facilitated by first heating the peat under pressure to a temp. above 100° with the addn. of an electrolyte, which is removed before the dewatering. Suitably, the peat is treated with SO_2 and heated as stated above the SO_2 being recovered when the pressure is released. App. is shown.

Wax from brown coal. WILHELM EITLER and OTTO BURKHARDT. Ger. 509,636, July 14, 1927. A montan wax-like product is obtained by extg. chlorinated brown coal with hydrocarbons and filtering and evapg. the ext. Examples describe the prepn of waxes, m. 97° and 121°.

Montan wax, etc. A. RIEBECK'SCHE MONTANWERKE A.-G. Ger. 509,373, April 28, 1927. Deresinified montan wax is heated with EtOH or like solvent and filtered hot. The filtrate yields a clearer wax, which is then bleached with oxidizing agents, *e. g.*, $Na_2Cr_2O_7$ and H_2SO_4, in the usual way. An economy of oxidizing agent is thus effected. Waxes extd. directly from bituminous coal may be treated in the same way.

Purifying montan wax. A. RIEBECK'SCHE MONTANWERKE A.-G. Ger. 509,427, Apr. 9, 1927. Montan wax that has been bleached with oxidizing agents is further purified by fusing or grinding with a reagent that dissolves the impurities but not the wax, *e. g.*, dil. EtOH, C_6H_6 or C_2HCl_3, or an ester, ether or ketone. Cf. *C. A.* 24, 2582.

Purifying montan wax distillates. A. RIEBECK'SCHE MONTANWERKE A. G. Ger. 509,428, Nov. 13, 1928. The crude or partly purified distillates are treated with solvents for the impurities, *e. g.*, benzine, CCl_4, cold EtOH or liquid SO_2. The use of acetone is disclaimed.

Montan wax products. I. G. FARBENIND A.-G. Ger. 508,876, Sept. 15, 1922. Saponifiable products are produced by simultaneously chlorinating and oxidizing crude montan wax. The wax may be previously deprived of resin. Thus, $KClO_3$ is added to crude molten montan wax and a mixt. of air and HCl led in. The excess of HCl

is removed by washing, leaving a 90% yield of a product, m. 78.5° and with a sapon. no. of 118. Other examples are given.

Recovery of phenols. I. G. FARBENIND. A.-G. Fr. 687,275, Dec. 26, 1929. Phenols contd. in wash waters from gas purification are recovered by extn. with liquid trialkyl- or triaryl-phosphates, *e. g.*, tricresyl- or tri-butyl-phosphate.

Extracting phenols from ammonia liquor. GEWERKSCHAFT MATHIAS STINNES. Ger. 509,154, May 5, 1929. The circulating org. solvent used for extg. phenols from NH_3 liquor is freed from H_2S by allowing it to stand, *e. g.*, for 1–3 days, before re-extg. the phenols therefrom.

Carbazole. I. G. FARBENIND. A.-G. Fr. 687,957, Sept. 27, 1929. Carbazole is extd. from tar fractions by treating them at above 300° and under pressure with H or gases liberating H, preferably in the presence of catalysts. The unchanged carbazole is sepd. from the product by filtration or distn.

Gas. KURT BEUTHNER. Fr. 687,395, Dec 30, 1929. To remove the distn. gases from the lower part of vertical degasification chambers and to introduce steam, one-half of the hood on which the fuel rests has an open side toward the middle so that the fuel does not fill the space under the hood.

Gas. FIRMA AUG. KLÖNNE. Fr. 687,244, Dec. 26, 1929. The transverse section of the degasification chamber is enlarged at the bottom so that the distn. material does not fill this part of the chamber thus distn. products can be removed and steam introduced.

Gas. I. G. FARBENIND. A.-G. Fr. 687,883, Jan. 9, 1930. A gas having high calorific power is made from bituminous coals by heating them, in a granular or finely divided state, in chambers capable of being heated periodically to 900° and more, and provided with a perforated filling of refractory clay bricks, etc., which form a heat reservoir.

Gases rich in carbon monoxide. "S. I. R. I" SOCIETÀ ITALIANA RICHERCHE INDUSTRIALI. Swiss 140,043, Jan. 30, 1929. A gas with a high CO content is produced by the gasification of finely divided combustible solids in insufficient O to form CO.

Removing oxygen from natural gas. FRANK PORTER (to Kay County Gas Co.). U. S. 1,787,795, Jan. 6. Natural gas (suitably by heating in refractory material) is caused to react with air at a high temp. (which may be about 800–2000°) to produce substances such as CO and H, which are more reactive toward O than satd. hydrocarbons, the more reactive resultant gases thus formed are commingled with a body of the natural gas to be treated and reaction with the O in the gas is effected (suitably at 600–800° in the presence of Cu). App. is described.

Fuel gas. THE WESTERN GAS CONSTRUCTION CO. Ger. 508,589, Oct. 10, 1925. Plant for producing carbureted fuel gas by passing air and steam successively through a gas producer, carbureter and superheater is described.

Oil gas. PAUL HAHN. U. S. 1,788,055, Jan. 6. Oil vapors are passed to a gasifying chamber having staggered and spaced catalytic metal baffle plates, which may be formed of Fe or Ni, arranged to form narrow spaces or nozzles; steam is admitted to the lower portion of the gasifying chamber to mix with the oil vapors, and the mixt. passes upwardly through the spaces between the baffles to form oil gas. Various details of app. are described.

Suction gas. MOTORENFABRIK DEUTZ A.-G. (Kurt Schmidt, inventor). Ger. 509,069, Mar. 24, 1929. Means is described for preventing access of air to the producer shaft through the charging orifice.

Water gas. ALBERT BRISIG. Ger. 509,291, June 16, 1927. A method and app. are described for automatically regulating the gasifying period in accordance with the temp. of a heat recuperator heated by the hot blow gases.

Water gas from coal. HUMPHREYS & GLASGOW, LTD. Ger. 506,865, Nov. 7, 1925. Details of the producer. Cf. *C. A.* **21**, 488.

Carbureted water gas. HUMPHREYS & GLASGOW, LTD. Fr. 686,901, April 24, 1929. The gas as it leaves the generator is divided into 2 currents, one of which passes directly to the reservoir while the other is passed through a carbureter and becomes enriched in oil. Cf. *C. A.* **24**, 5986.

Carbureted water gas. LEON J. WILLIEN and LOUIS STEIN (to United Gas Improvement Co.). Can. 305,227, October 25, 1930. An app. and process for producing carbureted water gas is specified in which oil is introduced into the steam during the run back of the steam and the resultant mixt. is passed from the upper portion of the generator down through the fuel bed.

Water-gas plant. BAMAG-MEGUIN A.-G. Ger. 508,588, Nov. 24, 1926. Addn. to 486,557 (*C. A.* **24**, 1494). High-pressure plant with an automatic throttle is described.

Apparatus for **proportionate mixing of producer gas and "town's gas supply" for**

industrial purposes, etc. PREMIX GAS PLANTS, LTD., and A. DOCKING. Brit. 333,924, April 23, 1929. Structural features.

Gas purification. GILBERT E. SEIL (to Koppers Co.). U. S. 1,786,509, Dec. 30. For removing H_2S from gas, the gas is washed with an alk. wash liquor contg. Fe sulfide and an oxidized starch (which may be prepd. by treating starch with HNO_3) to maintain the Fe sulfide in "stable soln." Cf. *C. A.* **24**, 1205, 2582.

Purifying gases. PREMIX GAS PLANTS, LTD. Fr. 687,220, Dec. 24, 1929. S is removed from gases from gas producers after leaving the scrubbers by heating the gas to about 21° and bringing it in contact with Fe_2O_3. An app. is described.

Desulfurizing gas. I. G. FARBENIND. A.-G. Fr. 686,986, Dec. 20, 1929. The H_2S in part of the gas is catalytically oxidized to SO_2, the SO_2 is eliminated if necessary, after addn. of NH_3, by washing and using the lye of sulfite, bisulfite or polythionates of NH_4, separately, to absorb by washing the H_2S from another part of the gas with formation of hyposulfite. The amts. of H_2S and SO_2 are regulated so that heating of the resulting lyes gives only sulfate and S. Cf. *C. A.* **24**, 1205.

Safety pipe closure to prevent backfire from burners to gas mains. F. MANGIAMELI. Brit. 334,129, Nov. 11, 1929. Structural details of a gas cut-off device.

Gas producer. J. M. RUSBY (to Humphreys & Glasgow, Ltd.). Brit. 334,133, Jan. 21, 1929. Plates are positioned in the upper part of the fuel bed so as to form fissures through which the gases pass. Various details of construction and operation are described. Cf. *C. A.* **25**, 582.

Gas producer. EUGÈNE A. COTTENCFAU and ALBERT V. F. PARIS. Fr. 686,733, Dec. 16, 1929.

Gas producers, furnaces, etc. SIEMENS-SCHUCKERTWERKE A.-G. Ger. 508,817, May 30, 1926. Details of agitating the fuel.

Rotary fire chamber for gas producers. FRITZ BRAND. Ger. 508,816, June 6, 1926.

Gas-production plant for obtaining carbureted water gas from coal. SIDNEY J. B. TULLY and OLIVER E. YEO. Ger. 508,815, Dec. 6, 1927. See Brit. 271,765, *C. A.* **22**, 1673.

Fuel charger for gas generators. FRED B HAYES (to Gas Machinery Co.). U. S. 1,787,248, Dec. 30. Structural features.

Decomposition of hydrocarbons. SOC. DES BREVETS CATALEX. Fr. 687,162, Mar. 15, 1929. An app. is described for the combined pyrogenic and catalytic decompn. of hydrocarbons either for *feeding explosion motors* or for *combustion;* in this app. an emulsion of air and hydrocarbon is formed by a large no. of jets, each jet being formed by the meeting of a vein of atomized hydrocarbon and air. The jets send the emulsion to the catalytic tubes which are placed in an envelope traversed by the burnt gases in a motor or in other cases by other heating fluids.

Product for improving the combustion of liquids in internal-combustion engines. E. DILIS. Belg. 368,043, March 31, 1930. The product consists of an org. solvent in which are dissolved camphor and smaller proportions of menthol and oil of eucalyptus.

Apparatus for purifying oil of internal-combustion engines by distilling light contaminants. CHARLES R. SHORT and CHARLES L. LEE (to General Motors Research Corp.). U. S. 1,787,409, Dec. 30. Structural features.

Removing carbon deposits from cylinders such as those of internal-combustion engines. THOMAS MIDGLEY, JR., and CARROLL A. HOCHWALT (to General Motors Research Corp.). U. S. 1,786,860, Dec. 30. While the metal is heated to above 65° there is applied to the C deposit a mixt. contg. a high b.-p. org. compd. which removes varnish and a lower b.-p. varnish remover to soften and facilitate removal of the deposit. For this purpose there is described the use of a mixt. comprising aniline 25, alc. 25, benzene 25 and naphthalene 25%; the use of other similar substances is also mentioned.

Removing carbon deposits from internal-combustion engines. WHEELER G. LOVELL and THOMAS A. BOYD (to General Motors Research Corp.). U. S. 1,787,789, Jan. 6. While they are heated, the C-coated parts are treated with an aliphatic amine boiling above 64°, such as hydroxyethylamine, to facilitate removal of the deposit. Alc., C_6H_6, aniline or furfural, etc., also may be used.

Storing acetylene. ANDRÉ SOLIGNAC. Fr. 686,825, Dec. 18, 1929. Pumice stone ground to different sizes of grain so that the mixt. of grains has no capillary interstices is used as a filler for vessels contg. dissolved C_2H_2. Cf. *C. A.* **24**, 3888.

Treating tars. COMPAGNIE DES MINES DE VICOIGNE, NOEUX ET DROCOURT. Fr. 688,542, Apr. 11, 1929. The unstable hydrocarbons in tar oils are polymerized or satd. in the presence of metal halides, *e. g.*, the chlorides of Ti and Fe, whereby the losses in the subsequent refining are greatly reduced.

Treating tar. VEREIN FÜR CHEMISCHE UND METALLURGISCHE PRODUKTION. Fr. 688,307, Jan. 15, 1930. See Ger. 493,675 (*C. A.* **24**, 2867).

Distillation of tar. STUART P. MILLER (to The Barrett Co.). Can. 304,941, Oct. 21, 1930. The heated gases from several coke ovens are collected in a heavily insulated header or collecting pipe in which the gases blend to form a fairly uniform mixt. The resulting mixt. is passed into a still while in a highly superheated state, and coke-oven tar is introduced into the still and sprayed into the gases at such a rate that the gases are quickly cooled and the tar is rapidly distd. The tar supply and the gas vol. are so regulated as to effect distn. of the tar to produce around 70% or more of distillate oils and a pitch residue m. about 380° F. or higher. The pitch is withdrawn continuously from the still, and the gases and vapors are removed and cooled to recover the distillate.

Distillation of tar. STUART P. MILLER (to The Barrett Co). Can. 304,943, Oct. 21, 1930. An app. and a method of distg. tar and producing high-melting and low-melting pitch are specified. The tar is distd. by direct and intimate contact with hot coal-carbonization gases at a temp. to effect distn. of the tar and the production of high-melting pitch and hot enriched gases; the gases are withdrawn and cooled in an indirect condenser in indirect contact with tar to be preheated and distd.; the tar is pumped under pressure through a pipe coil located in the condenser in indirect heat-interchanging relation with the hot enriched gases, the supply of tar being so regulated that it is heated to a temp. to effect partial distn. of the tar; the preheated tar is discharged into a vapor box maintained under a vacuum; the vapors are drawn off and condensed; the low-melting pitch is drawn off from the vapor box.

Distillation of tar. STUART P. MILLER (to The Barrett Co). Can. 304,945, Oct. 21, 1930. Coke-oven tar is preheated continuously in a pipe-coil still by waste-heat gases; it is then introduced into a still into direct contact with a current of hot coke-oven gases with thorough spraying of the tar into the gases, scrubbing of the gases and further distn. of the preheated tar. The resulting gases and vapors are drawn off and cooled to condense the oils. Cf. *C. A.* **24**, 229.

Distillation of tar. STUART P. MILLER (to The Barrett Co.). Can 304,946, Oct. 21, 1930. The tar is preheated in a pipe coil by waste-heat gases, and is discharged into a vapor box under reduced pressure; the vapors are sepd. from undistd. residue within the vapor box and separately collected and cooled to recover low-boiling constituents; the residue from the vapor box is introduced into direct contact with hot coal carbonization gases to effect distn.

Apparatus for the distillation of tar, etc. THE BARRETT CO. Fr. 686,723-4-5-6. Dec. 16, 1929.

Apparatus for distilling tar. THE BARRETT CO. Fr. 687,890, Jan. 9, 1930.

Apparatus for distilling tar. THE BARRETT CO. Fr. 688,298, Jan. 15, 1930. Tar is distd. by bringing it into intimate contact with gases at a high temp. so that a pitch residue of high fusion point and an enriched gas are obtained. The enriched hot gases are passed through a condenser in indirect contact with tar which is thereby preheated and from which a part of the light oil is distd.

Semi-coke. COMPAGNIE DES MINES DE BRUAY. Fr. 686,908, Mar. 14, 1929. Fuel is treated in a vessel, the walls of which are permeable to heat and which is heated by a radiant source of const. temp., whereby an improved semi-coke is obtained called "Carbolux."

Coking. JOHANN LÜTZ. Ger. 509,258, Dec. 23, 1927. In the manuf. of metallurgical coke in a continuously operating vertical oven, the column of coal is spaced apart from the wall of the shaft and is heated by radiation. App. is shown.

Coking coal dust. INTERNATIONAL COMBUSTION ENGINEERING CORPORATION. Ger. 508,648, May 22, 1926. Details of the app.

Coking coal, shale, wood, peat, etc. CHARLES B. WINZER. Ger. 508,778, Nov. 15, 1925. Details of the retort plant.

Coke oven. C. OTTO & CO. G. M. B. H. Ger. 509,699, Mar. 13, 1930. Addn. to 492,506 (*C. A.* **24**, 2586). Details of construction.

Coke oven. KARL SASSENHOFF. Ger. 509,513, May 11, 1929. Addn. to 491,312. An oven is described for coking fuels by the method of Ger. 491,312 (*C. A.* **24**, 2278).

Coke oven. N. V. SILICA EN OVENBOUW MIJ. Fr. 687,320, Dec. 27, 1929.

Vertical coke oven. CARL OTTO. U. S. 1,787,490, Jan. 6.

Under-burner coke oven. HINSELMANN KOKSOFENBAU GES. M. B. H. Ger. 509,499, Sept. 7, 1924.

Regenerative coke oven. C. OTTO & CO. G. M. B. H. Ger. 508,887, June 5, 1927.

Twin regenerative coke oven. C. OTTO & Co. G. M. B. H. Ger. 509,259, Dec. 17, 1929. Addn. to 503,895 (*C. A.* **24**, 5987). Details of construction.

Regenerative coking retort. C. OTTO & Co. G. M. B H. Ger. 507,515, July 21, 1927. Addn. to 503,895 (*C. A.* **24**, 5987). Further details of the hot gas and heating channels.

Coke retort. JOSEPH BECKER. Ger. 508,792, April 6, 1923. Addn. to 454,259. Details of construction.

Continuously acting upright coking retort. JOHANN LÜTZ. Ger. 507,788, July 2, 1926. Details of the continuous supply of coal and removal of distn. products.

Coking-retort oven. JOSEPH VANACKEREN (to Koppers Co.). U. S. 1,787,963, Jan. 6.

Charging and offtake apparatus for coke ovens or similar apparatus. WOODALL-DUCKHAM (1920), LTD., and A. M. DUCKHAM. Brit. 334,050, Aug. 16, 1929. Structural features.

Furnace for the low-temperature coking of fuel. COMPAGNIE DES MINES DE BRUAY. Ger. 508,566, July 13, 1926. Details of construction.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

Petroleum in 1929. R. B. HARKNESS. *Ann. Rept. Ont. Dept. Mines* **39**, Pt. 7, 37–41(1930).—Detailed figures of crude-oil production, refinery production and importations for 1929 are given. ALDEN H. EMERY

Chemical and technical progress in the petroleum industry during 1929. RICHARD KISSLING. *Teer & Bitumen* **28**, 469–73(1930).—Outstanding developments as shown in the patent literature are reviewed. An extended list of references pertaining to petroleum research and examn. is appended. K. H. ENGEL

Magnetic double refraction in specimens of petroleum of different origins. A. COTTON AND M. SCHERER. *Ann. combustibles liquides* **5**, 551–2(1930).—See *C. A.* **24**, 3634. E. SCHOTTE

Vapor pressure-temperature relationships of petroleum hydrocarbon fractions. S. D. TURNER AND J. E. POLLOCK. *Trans. Am. Inst. Chem. Eng.*, New Orleans Meeting **1930**, 15 pp.(Adv. copy).—In refinery practice it is frequently necessary to extrapolate a vapor pressure from the temp. at which it was detd. to a working temp., or from one working temp. to another. It has been customary to perform such an operation on a vapor-pressure chart of the normal paraffin hydrocarbons. Unsatisfactory results in design work based on the application of this method, together with fragmentary data from various sources, led to the belief that such an extrapolation was at times not even approx. correct. While the investigation has not covered nearly the whole range of petroleum fractions, or of temps. and pressures of interest to the engineer, it is felt that 2 phases of the work will be of interest; in the first case a very useful correlation is reached, and in the second a new lab. method of investigation is developed. The paper treats of the theoretical considerations involved, the correlation of gasoline data, the vapor pressures detd. by their exptl. method, which is outlined, and the method and results are considered in a critical manner. C. L. MANTELL

Redistillation of light petroleum oils in pipe stills. I. KLIGERMAN AND N. BOGOSLOVSKII. *Azerbaĭdzhanskoe Neftyanoe Khozyaĭstvo* **1929**, No. 12, 64–73.—A mathematical discussion with reference to the pipe-still installation on the Pyatakov plant. V. KALICHEVSKY

Determination of coke residue in petroleum products—Conradson test. B. ROSENBAUM. *Chem.-Ztg.* **54**, 857–8(1930).—The results obtained by applying the Conradson test, as specified in the A. S. T. M. specification No. D-189-27, to 17 com. motor oils are tabulated. D. F. BROWN

National survey of fuel-oil distribution, 1929. E. B. SWANSON. *Am. Petroleum Inst.* 1930, 30 pp.—Deliveries of gas oil and fuel oil during 1929 were 408,735,493 bbls., an increase of 2.8% over 1928. Gains were chiefly due to increased railroad fuel-oil consumption, larger deliveries of bunker oil to steamships, and the greater use of oil as fuel in petroleum refining and in the generation of elec. power. The mfg. demand was slightly larger than in 1928. Com. and domestic heating greatly expanded. Increases occurred in the use in manufactured-gas plants, naval vessels and yards and in exports (due to increased refining in the Caribbean area). The uses, in order of im-

portance, are: steamships; railroads; fuel in oil refineries; mfg.; exports; gas and elec. power; smelters, mines, Fe and steel products; heating; U. S. Navy and miscellaneous. The consuming regions, in order of importance, are: Pacific Coast States, South Central States, Middle Atlantic States, North Central States, New England States, South Atlantic States and Rocky Mt. States. The amt. exported falls between that consumed in the Middle Atlantic States and that consumed in the North Central States. Details of consumption by states are given for each use. ALDEN H. EMERY

Methods of refining Montana crude oil. F. R. STALEY. *Petroleum Eng.* **2**, No. 3, 36, 38(1930).—*Cat-creek crude oil* presents no difficulties in refining and yields 70% of straight-run gasoline. C. WIRTH

Determination of sulfur in heavy oils by the A. S. T. M. lamp method. F. PACHECO. *Chemist Analyst* **20**, No. 1, 10-1(1931).—The method is described, the computation explained and some hints are given concerning the manipulation. W. T. H.

Divergence of viscosities and flash points in oil mixtures. ERICH KADMER. *Chem.-Ztg.* **54**, 871(1930).—In compounding mineral oils of different viscosities and flash points it has been found that the viscosity or flash point of the mixt. is always lower than an additive result. Formulas are given for calcg. these properties of oil mixtures as follows: (1) viscosity $= \frac{a.A + b.B - v(A - B)}{100}$; (2) flash point $= \frac{a.A + b.B - f(A - B)}{100}$, where a and b are the percentages of the components, A and B the viscosities or flash points of the pure components, and v and f are consts., the values of which are given in a table. D. F. BROWN

Esterification number and oxidizability of hydrocarbons and oils. ROBERT Z. BRONSTENBINDER. *Chem.-Ztg.* **54**, 782-3(1930).—B criticizes the present sludging test for transformer oils and proposes in its place the detn. of acid and sapon. no. before and after heating 100 g. of the oil in a 300 cc. Erlenmeyer flask with 1 g. of C. P. CuO at 120° for 7, 70 and 360 hrs. P. ESCHER

The separation of oil-sand mixtures by physical methods. WERNER GRÜNDER. *Petroleum österr. Chem. Tech.-Ztg.* **48**, 119-24(1930); cf. *C. A.* **24**, 5988.—Expts. with Wietze oil sands show that 95% of the oil can be extd. with a suitable electrolyte, such as NaOH soln. About 97% of the oil can be obtained by amalgamation with pulverized coke after NaOH soln. has sepd. the oil from the sand particles. A flow chart is shown. The amalgam may be treated by one of the following methods: (1) It may be fractionally distd. and the residuum either briquetted or used as a binder for briquets. (2) The oil may be pressed out, leaving a high-grade fuel. (3) The amalgam may be used as the starting material for coal hydrogenation. By subsequently treating the oily clay suspension remaining with coal dust, about 50% of this oil can also be removed. EMMA E. CRANDAL

Core drilling bituminous sands of northern Alberta. S. C. ELLS. Can. Dept. Mines, *Mines Branch Rept.* **710**, 28-46(1930).—Descriptions and logs of wells (with analyses for water, bitumen and S) drilled in the bituminous sands of northern Alberta are given. ALDEN H. EMERY

Modern tube stills for oil refineries. MARTIN J. GAVIN. *Oil Bull.* **16**, 1273-5 (1930). E. H.

Aspects of hydrogenation in refining. R. T. HASLAM AND R. P. RUSSELL. *Oil and Gas J.* **29**, No. 28, 32, 33, 63(1930). J. R. STRONG

Treating light oils. G. STAUB. *Petroleum Eng.* **2**, No. 3, 161-4, 166(1930).—A review. C. WIRTH

Electric corona discharge employed. HERBERT R. ROWLAND. *Oil and Gas J.* **29**, No. 28, 28, 92, 95, 97(1930).—The corona discharge serves as an accelerator in vapor-phase cracking. The exptl plant in which this method was perfected has a small wire suspended in the reaction chamber as one electrode. When the plant is operated without the corona, recovery is lower and the antiknock values of the gasoline are less. J. R. STRONG

New method of cracking of heavy oils. C. CHILOWSKY. *Ann. combustibles liquides* **5**, 547-9(1930); cf. *C. A.* **24**, 496, 2577, 4617. E. SCHOTTE

Cracking process claims 80 per cent benzene equivalent for product. ARCH L. FOSTER. *Natl. Petroleum News* **22**, No. 53, 50, 52, 54, 56(1930).—The *Pratt cracking process* will produce a finished distillate with a knock rating of 80% benzene equiv. by cracking a gas oil in a tube still and further cracking a heavy residue in intimate contact with the heated vapors of the gas oil. There is no appreciable C formation in the plant. R. W. KELLY

Composition of gasoline and kerosene from Vickers cracking plant. I. BESPOLOV,

A. MAKHNOVA AND A. DUDENKO. *Azerbaĭdzhanskoe Neftyanoe Khozyaĭstvo* **1930**, No. 9, 104–7; cf. *C. A.* **22**, 1730, 3105; **24**, 952.—Temp. and pressure have more influence on the compn. of cracked gasoline than the recycling ratio. Increase in recycling ratio increases the aromatic content of the kerosene distillate but leaves the chem. compn. of the gasoline practically unaltered. V. KALICHEVSKY

The trend in design and equipment of the modern gasoline plant. FRANK P. PETERSON. *Natl. Petroleum News* **22**, No. 51, 67, 70–2(1930).—Compressors are equipped with interchangeable cylinder sizes to meet the large range of requirements. Heat exchangers and cooling equipment tend to the closed tubular type. Pumps are mostly centrifugal because of lessened packing difficulties. Bubble-cap trays are used in absorber, still and fractionating columns. The control of operation has been made largely automatic. According to the present trend, the volatile hydrocarbons intermediate between gasoline and CH_4 will be fully utilized commercially in the future. R. W. KELLY

Twenty-second semiannual motor-gasoline survey. E. C. LANE, E. L. GARTON AND A. J. KRAEMER. Bur. Mines, *Rept. of Investigations* **3063**, 19 pp.(1930).—Vapor pressures, sp. gr. and distn. data for 298 motor fuels purchased in 20 cities in Aug., 1930, are given in 13 pp. of tables. Only 15 samples (5%) had vapor pressures of 9 lb. per sq. in. or higher (Reid test), 251 samples (84%) were 6 9 lb., 33 (11%) were <6 lb. Vapor pressure of competitive-price gasoline was 4.4 9 9, av. 7.2 lb., and of premium-price gasoline was 4.1–10.0, av. 7.0 lb. The temp. at which 10% of the competitive-priced gasoline evapd. was 115–166°F., av. 142°, while for premium fuel it was 118–163°, av. 141°F. Av. b. p. for competitive gasoline was 221–278° F., av. 261° F. and for premium was 215–270°F., av. 248°F. The sp. gr. for the competitive product was 0.717–0.765, av. 0.746, and for premium was 0.722–0.790, av. 0.746. A. H. E

Oxidation of fuels in motors. ERNEST BERL, K. HEISE AND K. WINNACKER. *Chaleur et ind.* **10**, 179–87, 241–6(1929).—It is usually considered that olefins are more easily oxidized than paraffins, but in the cylinder of the motor paraffins are more easily oxidized than olefins or hydroaromatic or aromatic hydrocarbons. Substances resistant to detonation have a higher temp. of spontaneous inflammation. A table collates the spontaneous-inflammation temps. of pentane, hexane, cyclohexane, cyclohexene, benzene, toluene, xylene, aniline and alc. Four sketches show the limits for spontaneous inflammation of ether, pentane, hexane, and cyclohexane. Addnl. tables and data are given for the substances mentioned. Substances which knock easily are easy to oxidize. Resistance to compression of hydrocarbons with 6 C atoms increases in the order, hexane, cyclohexane, benzene. The temp. of spontaneous inflammation varies with pressure, provided the amount of admixed air remains const. The addn. of antiknocks raises the temp. of spontaneous inflammation very much but not constantly. The addn. of relatively little antiknock raises the temp. of spontaneous inflammation, but more antiknock does not raise this temp. In the case of hexane, antiknocks act as negative catalysts, fixing some O_2. The action of antiknocks contg. heavy metal depends on the liberation of the metal in a finely divided state. Hydrocarbons rich in H_2 decompose into H_2 and non-satd. hydrocarbons. Both then absorb O_2 to form H_2O_2, water and org. peroxides. The latter decompose very quickly into the final products The finely divided metal from antiknocks prevents the formation of peroxides. S. L. B. ETHERTON

The antiknock agents. I. II. III. L. A. HORNIG. *Allgem. österr. Chem. Tech. Ztg.* **48**, 125–6, 129–32, 135–7(1930).—A general discussion, without special application of the thermodynamics considered to the detonation of motor fuels. E. E. C.

Asphaltic bitumen, its properties and applications. J. S. JACKSON. *J. Oil and Colour Chem. Assoc.* **13**, 304–15(1930).—The production, testing and uses of asphaltic bitumens are briefly reviewed. On account of hysteresis effects, great care is required in testing. Emulsification is probably accomplished best with a colloid mill. G. G. SWARD

Asphalt from acid sludge. B. VOINOV AND I. GINSBURG. *Azerbaĭdzhanskoe Neftyanoe Khozyaĭstvo* **1929**, No. 12, 51–64.—Description of expts. made on a com. scale by Azneft. V. KALICHEVSKY

New process for the preparation of special lubricants. ERNST W. STEINITZ. *Chem.-Ztg.* **54**, 837–9(1930).—Recent developments in this field include the improvement of motor oils by the addn. of fatty acids, the perfection of the Voltol process, which is applicable to either mineral oil or a mixt. thereof with vegetable or animal oils, the Continentale A.-G. für Chemie process of increasing the viscosity of fatty oils by heating under vacuum to 150–250° without blowing, the Vogel-Ossag process of blowing fatty and mineral-oil mixts. in stages, and the Daimler process of adding "bridge hydrocar-

bons" composed of compds. belonging to the system X–CH_2–Y, where Y represents an aromatic radical and X an aromatic or aliphatic radical. D. F. BROWN

Potentiometric determination of acidity in insulating oils. R. N. EVANS AND J. E. DAVENPORT. *Ind. Eng. Chem., Anal. Ed.* **3**, 82–5(1931).—The detn. of acidity in oils by the alkali blue procedure gives better results than the A. S. T. M. procedure. In the latter method, MeOH should be substituted for EtOH. Electrometric detns. with typical org. acids show that the potentiometric method is reliable although somewhat tedious. The Ag–AgCl electrode can be used satisfactorily in routine work. W. T. H.

The essential properties of a bearing oil. C. A. GRIFFITHS. *Power* **72**, 791–2 (1930).—Charts show the relation of coeff. of friction to viscosity at const. temp. and to bearing pressure at various temps. D. B. DILL

Some engineering features of the naval-stores industry. V R. CROSWELL AND R. ROCKWELL. *Trans. Am. Inst. Chem. Eng.*, New Orleans Meeting 1930, 24 pp.(Adv. copy).—The paper deals exclusively with the steam-distn. solvent-extn. process. The engineering problems in connection with wood harvesting, chip prepn., eduction of products, distn. and fractionation, handling of solvent naphtha, corrosion and erosion, and steam generation from spent chips are considered. Machinery details and flow-sheets of operations are given. C. L. MANTELL

Physicochemical properties of acid clay. V Decolorization of petroleums by adsorption (KOBAYASHI, YAMAMOTO) **2**. Potentiometric determination of saponification number of mixtures of asphalt and drying oils (DEMAREST, RIEMAN) **26**. Catalysts for dehydrogenation of organic compounds (Brit. pat. 333,975) **10**. Apparatus for determining specific gravity of oils, etc. (U. S. pat. 1,787,132) **1**. Apparatus with superposed evaporating trays suitable for distillation of oils and liquid solvents (U. S. pat. 1,787,399) **1**. Distillation of coals, etc. (Fr. pat. 688,529) **21**. Bituminous coatings on reenforcing for concrete (Brit. pat. 333,940) **20**. MARCUSSON, J., BURCHARTZ, H., AND WILKE, P.: **Die natürlichen und künstlichen** Asphalte. 2nd ed., revised. Leipzig: Wilhelm Engelmann. 254 pp. Paper, M. 17; bound, M. 19.

WESTCOTT, JAMES H.: **Oil—Its Conservation and Waste.** 4th ed., enlarged. New York: Beacon Pub. Co. 273 pp. $3. Reviewed in *Chem. Markets* **27**, 581 (1930).

Refining viscous petroleum oils. EDWARD W. ISOM and ERNEST B. PHILLIPS (to Sinclair Refining Co.). U. S. 1,786,493, Dec. 30. A solid absorbent refining agent such as "terrana earth" is suspended in the raw stock, and the mixt. is passed through a heating zone such as a heating coil, as a rapidly flowing stream, and heated to not substantially above 400° and kept below a temp. at which any substantial cracking would take place in the time the mixt. is in the heating zone; the mixt. thence passes to a vaporizing and digesting zone such as an insulated drum when vapors are taken off, and in this zone a body of liquid is maintained at a temp. of about 325°, and the absorbent refining agent is kept in suspension. Refined viscous oil is discharged from the vaporizing and digesting zone as a residue still carrying the absorbent agent in suspension, and the vol. of liquid in this zone is so regulated that the residue product remains in it a period of time not less than 5 times as long as the mixt. is in the heating zone. Various details of app. are described.

Hydrogenating petroleum, tars, etc. STANDARD OIL DEVELOPMENT CO. Fr. 687,415, Dec. 30, 1929. Liquid hydrocarbons of low b. p. are prepd. by submitting petroleum, tars, coal, etc., in a finely divided state to the action of a gas rich in free H under pressure and at a high temp., drawing off a part of the hydrocarbons thus produced in the liquid state, lowering the pressure of the liquid so that an important part of the liquid vaporizes and condensing the vapor. An app. is described.

Hydrogenating oils, etc. I. G. FARBENIND. A.-G. Fr. 687,294, Dec. 27, 1929. In the hydrogenation of oils, gasolines, etc., contg. substances of high mol. wt. such as asphalt, pitch, etc., the latter are removed before hydrogenation by an adsorbent substance such as SiO_2 contg. Mo and Zn. The adsorbent contg. these substances is sepd.

and hydrogenated separately to produce middle oils, gasoline, etc. The adsorbent may be re-used after heating.

Petroleum naphtha purification and stabilization. JOHN M. GOODWIN (to Texas Co.). U. S. 1,786,650, Dec. 30. The material is treated with a gas contg. H_2S so that a small proportion of H_2S is absorbed, and then treated with concd. H_2SO_4.

Treatment of hydrocarbon residues. RALPH T. GOODWIN (to The Standard Oil Development Co.). Can. 305,511, Nov. 4, 1930. Tar resulting from cracking a hydrocarbon oil in the presence of lime is stabilized by treating the tar with about 0.5–1.5% by vol. of H_2SO_4 of 30° to 60° Bé., heating to about 200° to 275°F., whereby relatively rapid pptn. of sediment is obtained, and sepg. the sediment.

Cracking hydrocarbons. FRANÇOIS P. E. S. DUPLAN. Fr. 688,446, Jan. 18, 1930. Heavy hydrocarbons are transformed into more volatile hydrocarbons by heating them under a pressure which exceeds their vapor pressure for 1 hr. to 1½ hr. at a const. temp. not above 360° and at a speed of between 6 and 72 cm. in a tube of 10 mm. diam. A suitable app. is described.

Apparatus for cracking hydrocarbon vapors. WILLIS F. SIMS and VENUS U. CLOER (to Panhandle Refining Co.). Can. 306,373, Dec. 2, 1930.

Cracking hydrocarbon oils. EUGENE C. HERTHEL and HARRY L. PELZER (to Sinclair Refining Co.). U. S. 1,787,981, Jan. 6. Oil from a body of oil in a vaporizing zone is circulated through heating tubes and back to the body of oil and is heated to a cracking temp. in the tubes; a bed of finely divided solid absorbent material, such as fuller's earth, is maintained within the body of oil so that the circulating oil passes through it, and vapors from the vaporizing zone are taken off under superatm. pressure and refluxed, and the reflux condensate is passed through sep. heating tubes into the vaporizing zone. Heating gases from a fire-box in which fuel is burned are first passed over the last-mentioned heating tubes to heat the reflux condensate and then passed over the first-mentioned heating tubes. Various details of app. are described. Cf. *C. A.* **24**, 495, 25, 199.

Cracking hydrocarbon oils. RALPH C. HOLMES and FREDERICK T. MANLEY (to Texas Co.). U. S. 1,786,947, Dec. 30. The oil is charged into a plurality of series-connected vertical converters, through which it passes in succession, and the converters are heated between their ends to a cracking temp. the most heat being supplied to the first converter of the series. The liquid level in the converters is maintained above the heated intermediate portions, heavier constituents are sepd. from evolved vapors by condensation and the condensate is returned to the first and most strongly heated converter. Various details of app. and procedure are described.

Cracking hydrocarbon oils. CHARLES P. TOLMAN. Ger. 508,587, Sept. 20, 1927. See Fr. 647,721 (*C. A.* 23, 2565).

Refining cracked products of hydrocarbon oils. CARBON P. DUBBS (to Universal Oil Products Co.). U. S. 1,787,570, Jan. 6. Ca hydroxyhydrosulfide is used for removing compds. such as CS_2 and may be formed from $Ca(OH)_2$, water and H_2S in the oil.

Pressure still for cracking hydrocarbon oils. DAVID A. YOUNG (to Sinclair Refining Co.). U. S. 1,788,006, Jan. 6. Structural features of a discharge line for unvaporized oil, extending a substantial distance into the still drum and provided with special valve-operating devices.

Tube still for oil distillation and cracking. HENRY THOMAS (to Sun Oil Co.). U. S. 1,788,213, Jan. 6. Various structural details are described.

Vacuum distillation of hydrocarbon oils. HARRY C. WIESS (to Standard Oil Development Co.). U. S. 1,786,639, Dec. 30. Oil such as a heavy lubricating distillate is heated to a distn. temp., and a light hydrocarbon material such as naphtha is injected into the heated oil (the injected material being liquid under ordinary conditions and having a vapor pressure less than that of water at the corresponding temp. of condensation), and the abs. pressure upon the oil undergoing distn. is reduced to 50 mm. Hg or lower. App. is described.

Hydrogenation of carbonaceous materials. JAMES M. JENNINGS (to The Standard Oil Development Co.). Can. 305,514, Nov. 4, 1930. Heavy, asphalt-contg. hydrocarbon oil is heated in the presence of a solid catalyst (as Cr and Mo oxides), resistant to S poisoning, to 800° to 970°F. under pressure of H in excess of 25 atm., which is sufficient to hold heavy constituents in the liquid phase. A stream of such heavy constituents is continuously removed, heated in admixture with H, and returned to the body of oil. The ratio of asphaltic materials to catalyst is kept below about 0.5.

Distilling crude mineral oil or tar, etc., with steam. WITWE A. MELHARDT, MARGARETHE V. LEONTOWITSCH GEB. MELHARDT, HELENE MELHARDT and GERTRUD MELHARDT. Ger. 509,584, Aug. 12, 1925. The oil, etc., is fed into a distn. chamber

filled with dividing material (*e. g.*, broken glass) and steam fed from below. The app. is described.

Bleaching mineral oils. WILHELM POSTH and FRANZ BESEMANN (to I. G. Farbenind. A.-G.). U. S. 1,788,204, Jan. 6. "Pre-refined" mineral oils are treated with an alk. hypochlorite soln. in the presence of a heavy-metal salt such as Ni, Co or Cu sulfate, capable of accelerating the decompn. of hypochlorites into chlorides and O, the mixt. is heated to about 60° and the oils are sepd. from the spent bleaching soln. and washed.

Apparatus for raising mineral oils. SIMPLEX REFINING CO. Ger. 508,695 April 25, 1927.

Decomposition of salts of mineral-oil acids and of fatty and tar acids. G. S. ISAKOV, A. I. DANILOVICH and A. YU. RABINOVICH. Russ. 54,955, Sept. 19, 1929. These salts are decomposed by volatile acids obtained in the oxidation of mineral oils by air.

Developing oil fields with a plurality of wells. HENRY L. DOHERTY. U. S. 1,787,972, Jan. 6. A plurality of wells are projected into an oil sand, and flow of oil and gas is initiated simultaneously from all the wells after preventing flow from any individual well until all the wells are ready for producing. U. S. 1,787,973 relates to a method of operating a group of oil wells which flow oil because of natural rock pressure, by alternately opening and shutting in certain of the wells to alternate the direction of flow of gas and oil between the wells. The wells are shut in when the ratio of the gas to the oil exceeds a predetd. ratio and opened again after the vol. of the gas in the shut-in wells has dropped to a point permitting production at substantially the ideal gas-oil ratio.

Tank and internal baffle apparatus for separating oil and gas at wells. CLARENCE L. SCHLICHTER. U. S. 1,786,790, Dec. 30. Structural features.

Residues from oil refineries. AKT.-GES. FÜR CHEMIEWERTE. Ger. 505,930, Dec. 15, 1927. The residues from oil refineries, especially acid-treated residues contg. kieselguhr, are rendered useful as asphaltic products by treatment with sulfonated tall oil.

Distilling bituminous products, etc. JEAN H. BRÉGEAT. Fr. 687,172, Mar 16, 1930. Asphaltic paraffinic and bituminous substances, resinous exts. from petroleum and low temp. tars, vitriolic muds and natural asphalt waxes are distd. in a retort provided with stirring means at a temp. above 380° and below 460°, while the level in the retort is kept const. and while the products distg. above 300° are constantly returned to the retort so that the amt. of distillate collected in an hr. is between 5 and 14% of the wt. of material in the retort.

Blown bituminous products suitable for roofing and insulating, etc. N.-V. DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Brit. 334,032, Oct. 23, 1928. Materials such as asphalt, petroleum residues, tar and pitch are treated in a continuous process with gases such as air or O, ozone, NO_2, SO_2, Cl or mixts. of air or O with the other gases. Various details of app. are described.

Dispersion of bituminous materials. N.-V. DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Brit. 334,100, Oct. 9, 1929. Dispersions such as those of asphalt, tar and pitch, prepd. with other materials such as clay, bentonite, colloidal metal oxides or silicates are subjected to mech. treatment such as "intensive beating" to reduce their viscosity, and after this addnl. material can be dispersed without reversal of phase. Numerous details of treatment, adjustment of p_H, etc., are described, as is also the app.

Bituminous dispersions. RICHARD W. LEWIS. U. S. 1,787,418, Dec. 30. Dispersions of asphalt or the like, suitable for use as binders or waterproofing coatings, etc., are prepd. by disintegrating the bituminous material with water and an $Al(OH)_3$ paste and a bentonite (suitably about 10% of each). Instead of asbestine, there may also be used other materials such as finely ground silica, oxides of Fe, chrome yellow, chrome green or Prussian blue.

Low-boiling oils. EDWARD B. PECK (to The Standard Oil Development Co.). Can. 311,773, Nov. 4, 1930. Low-boiling oils suitable for motor fuels are produced by cracking a heavier oil, segregating from the cracked products an oil boiling below about 700°F. and passing it with H through a reaction zone at about 900°F. and under a pressure in excess of 20 atm.

Pressure-control apparatus suitable for oil tanks. JULIAN A. CAMPBELL. U. S. 1,787,865, Jan. 6. Structural features.

Apparatus for supplying fire-extinguishing foam to oil tanks. STUART MOSER (to Standard Oil Co. of Calif.). U. S. 1,787,792, Jan. 6.

Refining benzene, etc. MARCEL MALLET. Fr. 687,842, Jan. 8, 1930. In the refining of benzenes, **gasolines, etc., without altering the antiknock properties of their** unsatd. constituents, **a partial hydrogenation in the vapor phase is carried out in the**

presence of a mixed catalyst composed of an intimate and uniform mixt. of a reduced metal of the Ni group and activated C. The latter plays the part of an accelerator and protector toward the metal on account of its power of absorbing compds. which cause the poisoning of metallic catalysts. The catalyst is regenerated with sepn. of the constituents by treating it with an acid, pptg. the metallic hydrate, concg. and granulating the product.

Refining and deodorizing cracking gasolines. P. M. E. SCHMITZ. Belg. 369,809, May 31, 1930. The gasoline vapor is passed through a tower filled with previously dehydrated and ignited metallic oxides, particularly Fe oxide, which are kept at a temp of over 300° at the bottom of the tower and equal to or slightly lower than the final b. p. of the gasoline at the top of the tower.

Preventing compression knocking of motor fuels. THOMAS MIDGLEY, JR. (to General Motors Corp.). U. S. 1,787,419, Dec. 30. This pat. (granted on an application divided from the application on which U. S. pat. No. 1,573,846 (*C. A.* **20**, 1514) was granted) claims generally the method of burning a "low compression motor fuel" with air in the presence of vapors of a metal compd. such as Et_4Pb or various other phenyl or alkyl compds. of metals such as Pb, Se, Te, Sn, As and Sb.

Antiknock motor fuel. IMPERIAL CHEMICAL INDUSTRIES, LTD. Ger. 505,928, June 7, 1929. An antiknock motor fuel consisting essentially of benzine hydrocarbons is produced by adding metal- or metalloid-free substances which produce free org radicals at high temps. by dissocn Examples are tetraarylhydrazine, diarylnitrosamine and triphenylmethyl derivs. Other antiknock agents may be added, *e. g.*, $Pb(Et)_4$, $Fe(CO)_x$, $PhNH_2$ and metal compds. of β-diketones.

Apparatus for separation of naphtha from natural gas. RUSSEL R. SMITH. Can 305,024, Oct. 21, 1930.

Removal of naphthalene from solvent naphtha. FRANK F MARQUARD. Can 306,628, Dec. 9, 1930. Crude heavy solvent naphtha contg. resins and naphthalene impurity is mixed with wash oil in equal proportions. The mixt. is distd. and the solvent distd. off from the wash oil, which retains the naphthalene. The resins pass over with the distillate, which is substantially free from naphthalene. These resins may be polymerized and removed, leaving a solvent suitable for *paints*.

Lubricating oils. JOHN C. BLACK and WIRT D. RIAL (to Richfield Oil Co. of Calif.). U. S. 1,787,505, Jan. 6. In order to improve the color and demulsifying qualities of lubricating oils such as those from Calif. petroleum, they are heated at a temp of about 140° with a KOH soln. (suitably of about 10° Bé. strength) under pressure, prior to acid treatment.

Lubricating oils. WILHELM PUNGS and ERICH FRESE (to Standard-I G. Co.). U. S. 1,787,951, Jan. 6. An oil such as a mineral or castor oil is improved as to viscosity and lubricating properties by addn. of montan wax bleached by oxidation with chromic acid.

Apparatus for condensing vapors of lubricating oils. SIMPLEX REFINING CO. Ger. 509,426, Aug. 8, 1925. See Brit. 251,928 (*C. A.* **21**, 1546).

Identifying liquids such as lubricating oils. FRANK C. REILLY. U. S. 1,787,995, Jan. 6. Markers (which may be of configuration to serve as trade marks to indicate the name or grade of the oil) are placed in the oil. These may be formed of material of about the same sp. gr. as the oil so that they will remain in suspension and may be of a character such that when the oil is heated they dissolve in it and contribute to its lubricating qualities. Similar indicating devices of "sugary material" may be placed in *table syrups*.

Regenerating used lubricating oils. HERMANN BENSMANN. U. S. 1,787,353, Dec. 30. Used oil such as that from an internal-combustion engine is first heated to about 30°, then gradually further heated to about 60–70° together with polymerizing agents such as $SnCl_4$, $AlCl_3$, H_2SO_4 or H_3PO_4 while stirring, to form asphalt-like substances from the decompn. products of the oil, the sludge is drawn off, and the oil is passed through a settling vessel and treated by means of a filter having a long filtering path with an AlMg *hydrosilicate to remove org. acids and tarry constituents*. An arrangement of app. is described.

Refining used oil. WM. D. HARRIS and ROBERT V. AYCOCK. Fr. 686,900, April 5, 1929. See Can. 298,538 (*C. A.* **24**, 2877).

Cleaning the insulating oil of oil switches. SIEMENS-SCHUCKERTWERKE A.-G. (Adolf Stauch, inventors). Ger. 507,965, July 17, 1924. The oil is continuously cleaned by a layer of colloidal H_2SiO_3 in the bottom of the vessel.

High-melting waxes. FREDERICK W. SULLIVAN, JR. (to Standard Oil Co.). Can.

305,223, Oct. 28, 1930. High-melting paraffin wax is produced from low-melting wax contg. a small proportion of oil of high b. p. by distg. with steam at 520–550°F.

Plug lock for oil-refining apparatus. CLARENCE B. HARBISON (to Ohio Steel Foundry Co.). U. S. 1,787,040, Dec. 30.

Furnace for carbonizing wood, etc. CHAUDRONNERIE ET ATELIERS DE CONSTRUCTION D'ERMONT. Fr. 688,258, April 3, 1929.

Distillation of wood, etc. PHILIP POORE. Fr. 687,454, Dec. 31, 1929. See Brit. 327,415 (*C. A.* **24**, 5150).

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Corrosion problems in the viscose-silk industry. H. R. S. CLOTWORTHY. *Ind. Chemist* **6**, 445–7(1930). E. H.

Newly discovered microscopic structural units of wood fibers. GEO. J. RITTER AND R. M. SEBORG. *Ind. Eng. Chem.* **22**, 1329(1930).—Fusiform bodies, which were previously the smallest known structural units of the wood fibers, have been broken down into smaller units approx. 0.45 micron in diam. and spherical in shape when detached. They are uniformly luminous in all positions between crossed Nicol prisms. The original form is probably angular rather than spherical. L. K. ARNOLD

Production of insulating board from cornstalks. C. E. HARTFORD. *Ind. Eng. Chem.* **22**, 1280–4(1930).—Cornstalks are bought for $10 a ton f. o. b. the factory at Dubuque, Iowa. They are shredded in a swing hammer mill, digested in water under a max. steam pressure of 100 lb. for 2 hrs., washed in 2 trommel washers with 40-mesh screens, and passed through an ensilage cutter. The resulting pulp is sized with 2% rosin and 1% alum, refined in a Claflin and a Jordan refiner, formed into a board on a specially designed machine, pressed in a caterpillar press, cut by an automatic cutter into 16-, 18-, or 20-ft. lengths, and dried in an 8-deck continuous drier. The finished Masonite wood has a heat cond. of 0.320 to 0.345 B. t. u. per in. per sq. ft. per hr. per °F., tensile strength of 205 lb. per sq. in., plaster bond strength of 10.64 lb. per sq. in. and a transverse breaking test of 110 lb. on a 4-in.-wide sample on a 3-in. span. A discussion of the cornstalk supply shows that the factory is poorly located from the material standpoint. L. K. ARNOLD

Hindering fermentation in sizing baths (RINOLDI) **25**. Coating materials [in manufacture of celluloid] (Fr. pat. 687,597) **18**. Colloidal solutions (Fr. pat. 686,880) **18**.

Cellulose. GUSTAF HAGLUND. Ger. 507,969, April 24, 1928. See Swed. 66,729 (*C. A.* **24**, 1507).

Cellulose. VEREIN FÜR CHEMISCHE INDUSTRIE A.-G. (Roland Runkel, inventor). Ger. 507,870, May 21, 1926. Cellulose is obtained from pentosan rich, lignified or incrusted vegetable matter such as beechwood, bamboo rods, etc., by softening the ground-up raw material with an acid or alk. agent (*e. g.*, KOH), sepg. the fibers and treating with Cl and alkali and removing the liquid. The cellulose so produced is useful for *making paper*. Examples are given.

Cellulose. JOAQUIN JULIO DE LA ROZA, SR. Fr. 688,311, Jan. 15, 1930. See Brit. 322,763 (*C. A.* **24**, 2880).

Cellulose fibers. GUSTAV SCHLICK. Ger. 509,541, April 19, 1928. Cellulose fibers are prepd. from artificial silk, films, or guncotton by forcing the cellulose paste, with or without addn. of diluent, bleaching agent, etc., through nozzles so that the fibers remain for some time in a hanging condition in which they dry and form a loose fiber mass at the bottom of the chamber. The fibers may encounter hot air, gas or vapor.

Cellulose and textile fibers from vegetable material such as straw, stalks or wood. CARL A. BRAUN. U. S. 1,786,890, Dec. 30. The material is treated at boiling temp. and corresponding pressure with a sulfite soln. initially contg. caustic alkali and alk. salts of weak acids such as resinates, fatty acid salts, silicates, borates, aluminates or zincates with a small proportion of Na_2CO_3.

Oscillatory device for treating raw fibers. IGO ETRICH. Ger. 508,551, Nov. 9, 1926.

Bleaching cellulose. LADISLAV RYŠ. U. S. 1,787,395, Dec. 30. Pulp or other form of cellulose to be bleached is digested with dil. aq. solns. of alk. compds. such as

NaOH and then subjected to a preliminary bleaching with an aq. soln. of Cl in quantity less than would be required for complete bleaching; the pre-bleached material is then washed and subjected to a further bleaching with hypochlorites (suitably in the presence of catalyst such as salts of Cu, Ni or Co).

Apparatus for determining the hygroscopicity of cellulose. AXEL C. ANDERSEN. Ger. 509,982, May 19, 1927.

Cellulosic substances. PAUL DUTOIT. Swiss 138,305, Oct. 6, 1928. Cellulosic substances are treated with water and H_3PO_4 at 110–120° under pressure to produce fermentable carbohydrates and a combustible product from which *decolorizing or absorbent C* may be produced.

Cellulose solutions. KURT HESS and CARL TROGUS. Ger. 508,014, Mar. 17, 1928. Addn. to 505,221 (*C. A.* **24**, 6013). Free alkali is removed from soda-copper cellulose, prepd. as in Ger. 505,221, by wetting the pressed compd. with water and pressing again, and (or) by adding acids or suitable salts when dissolving the compd.

Solution of cellulose in phosphoric acid. GEO. W. MILES and CAMILLE DREYFUS (to Celanese Corp. of America). U. S. 1,787,542, Jan. 6. A cellulosic material such as linters is mixed with H_3PO_4 of 75% or greater strength and the mixt. is allowed to stand for several hrs. until the cellulose is dissolved, at a temp. below 21°. The resulting soln may be used in *artificial silk manuf* or for other similar purposes.

Cellulose derivatives. CHARLES GRAENACHER. Fr. 687,298, Dec. 27, 1929. New derivs. of cellulose are prepd. by treating cellulose, viscose, etc., with aromatic compds. contg. a NO_2 group capable of being reduced to an NH_2 group and a substituent capable of double decompn., in the presence of an acid-binding agent having no caustic action, and reducing the products. The products may be colored by diazotizing and coupling them with appropriate components. Thus, cotton is treated with 10% NaOH and then in a bath of molten 1-chloro-2,4 dinitrobenzene in the presence of Li_2CO_3. The product is washed and reduced. With diazo-*p*-nitrobenzene the fiber is colored brown. Other examples are given.
